A total of 33 state workshops were conducted at the state level. The objective of the workshop was to orient the city stakeholders on liveability assessment, indicators, components of data collection, timelines, expectations of support and support extended by MoHUA. The state level workshops brought various city level departments on a single platform to understand and discuss the methodology and components of city liveability assessment.

Nodal agency at state level supported by the City and State Coordinator and city level (Municipality corporation/smart city limited) coordinated with city specific data owners/departments for data gathering, collation, and submission. Nodal persons in each department were appointed for timely data collection and submission. Of 116, 112 cities submitted data as per the timeline on 16th April 2018.

Post submission, the city and state coordinators supported by the central team followed up extensively with the cities to support secondary documents as evidence to substantiate their submissions. Secondary documents such as reports, official orders, copy of office register, signed copy of liveability assessment questionnaire furnished by cities against the submitted data. Documents are verified to map the documents for the reponses provided by city and to check the type data provided by city. The document check outcomes were shared with the cities as a part of data quality check.

For checking consistency of data, logical check of data, verifying data from other public sources were undertaken. Quality check was done to ensure data validity and provide opportunity to cities to review the data provided by them and correct in case of wrong data entry.

For 8 selected indicators namely, percentage of services integrated through command and control center, hotel occupancy rate, percentage of schools with access to digital education, number of CCTV cameras per unit road length, percentage of vendors registered and provided formal spaces, availability of passenger information system, percentage of traffic intersection with pedestrian crossing facility, and extent to which universal accessibility is incorporated in public rights of way. Physical audit was conducted in 110 cities by physical auditors appointed and trained by the consortium. In consultation with ULB nodal person, locations and indicators for physical audit was selected in each city. A mobile based application was developed to capture the physical audit related data.

Primary data collection was done for five indicators such as unemployment rates, mode share of public transport, mode share of non-motorized transport, quality of water supplied, and level of noise pollution. Protocols for water and noise test were prepared in consultation with experts. Water quality test involved physical, chemical and bacteriological test of water as per the CPCB norms. For testing quality of water at consumer end, the auditors worked closely with the ULB and Water department. Samples were collected from consumer end and submitted to the lab suggested by city. For noise pollution, in about 20 cities the state pollution board or city level environment department took the responsibility for providing noise pollution data as per the protocols. In rest of the cities, mobile based application was used to measure noise pollution.

During implementation, MoHUA facilitated the process by conducting video conferences with cities to address any queries, reiterate the importance, and ensure that cities adequately engages in the process and submit their responses in time and respond to requests for clarifications.

In addition to secondary data collection, physical audit and primary data collection, citizen survey was conducted to understand their perception and level of satisfaction on various services such as health, education, water supply, electricity, waste management etc. provided by urban local bodies. Over 60000 citizens participated in the survey across India.

The final scores and ranks have been generated based on the scoring methodology that has been discussed extensively and minor modifications made that are summarized as below:

#	**Challenges**	**Proposed Solutions**
1	Only 23 cities of 111 cities have City Mobility Plan (CMP) or any and hence able to provide data for Mode Share of Public Transport and Non-Motorised Transport. To address the data gap, as advised by the MoHUA, the consortia undertook a sample dipstick across all cities covering a sample of 150 Households. Understandably, the dipstick findings will not match the rigor of a CMP.	We recommend the following: 1) Cities which have provided CMP Data will be evaluated on 100% of the maximum score 2) For the cities where the dipstick data is used, the city receives a 50% discount on the overall score Alternatively, another approach is to assign 0 score to all 88 cities that don't have a CMP
2	Variance was observed on data reported by cities on road network and data presented in the smart city proposals during the verifications.	We recommend taking the data reported by the cities in the Smart City Proposals.
3	There is no secondary source/ organization that provides unemployment data at city level. As a result, most cities do not	The indicator on unemployment will be excluded from scores. For final

#	Challenges	Proposed Solutions
	have the data. Fully cognizance of the challenges of generating this data in a short span of time, it was agreed to collect this data through a dipstick survey on lines of NSSO questions. The data generated needs further scrutiny and triangulation with some inputs from experts. This may not be possible in the short window.	ranking, the cities will be scored on 78 indicators.
4	Many cities did not have data on noise pollution and it was decided that data will be collected using a mobile app for all the 111 cities. However, many cities have expressed reservations with the approach especially with respect to the reliability of using this data. Further, some cities have relied on the SPCB to collect the data as per the approach proposed by the consortia. Thus, noise pollution data is currently from two sources: 1. SPCB- 20 cities 2. Noise-based app- 91 cities	The data collected through the primary survey will be used for scoring the cities. Currently, there is no differential scoring for the data from the SPCB and the data collected through the mobile app. However, a certain higher weightage can be provided to those cities which used the state apparatus to collect noise pollution data.
5	For the indicator on quality of water supplied, the methodology document states that samples should be drawn both at the treatment plant outlet as well as the consumer end. However, the data provided by the cities were predominantly from the distribution point. Hence for consumer end results with MoHUA intervention, consortia coordinated with cities to collect the data at the consumer end. The cities facilitated the testing. The outcome of the process is as below: 1. Sample given- 102 cities 2. Report received- 86 cities 3. Report awaited- 16 cities 4. Tests not completed due to lack of cooperation and other reasons – 9	The maximum score for this indicator will be distributed equally (50%) for results based on samples from the treatment plant and consumer end. Cities that did not complete tests or provide the results will be given a score 0 for against consumer end tests.
6	City level population is not projected annually by most of the cities. So, estimates for 2017 population are not available with the cities.	As recommended by MoHUA, 2011 census population is being used for the ranking purpose.
7	The age category specific data for 9 cities is not available at a city level	The age category specific population data has been taken at a district level for these cities.

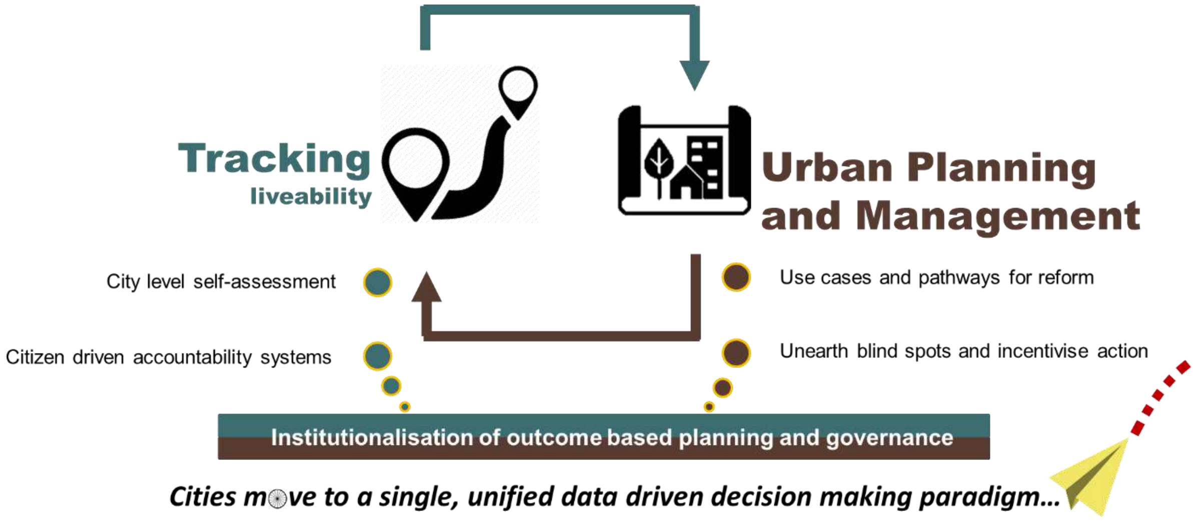
#	Challenges	Proposed Solutions
8	Indicators on non-motorised transports like- Dedicated bicycle tracks, bicycle parking facilities and mode share of non-motorised transport are not relevant for hilly terrains.	As discussed during the PMC meeting, these indicators have been treated as non-applicable for the hilly cities and the weights have been redistributed among other indicators within the same category.
9	The indicator on increase in professional tax is not relevant to cities which do not levy the professional tax.	As discussed during the PMC meeting, this indicator has been non-applicable to the cities belonging to states where professional tax is not levied, and the weights have been redistributed among other indicators within the same category.
10	The indicator on increase in VAT collection is not applicable to Port Blair and Kavaratti, as there was no provision of VAT collection in these cities.	As discussed during the PMC meeting, these indicatosr has been treated as non-applicable for these two cities and the weights have been redistributed among other indicators within the same category.
11	Indicator on coverage of basic services to slum households does not concern cities with no slums (notified/ non-notified.	As discussed during the PMC meeting, this indicators has been treated as non-applicable for these cities and the weights have been redistributed among other indicators within the same category.

1. Introduction

The Ministry of Housing and Urban Affairs (MoHUA) is implementing several flagship urban missions such as the Smart Cities Mission (SCM), Atal Mission for Urban Rejuvenation and Transformation (AMRUT), Heritage City Development and Augmentation Yojana (HRIDAY), Housing for All (HFA). Theses mission along with other transformative initiatives of the Government including National Water Mission, Power for All, National Health Mission are aimed at making Indian cities more 'liveable.' The overarching goal of these initiatives is to move from an input-based approach to a 'citizen centric-outcome based' assessment of urban liveability.

To develop a common minimum framework for cities to assess their existing status and chart their pathway towards providing a better quality of life to their citizens, the MoHUA developed a set of 'Liveability Standards' relevant to cities to generate a Liveability Index and ranking of cities. These standards were launched in June, 2017. The MoHUA has planned to conduct an 'Annual Assessment of Liveability Standards in Cities – an ambitious national project that will involve yearly submission of data by cities across the various indicators, compilation and analysis, development of indices and ranking of cities. The Liveability Index is envisioned as a 360° tool for tracking, planning and transforming Indian cities. The Liveability Index is aimed at the following objectives:

- Providing strong evidence-based approach for future interventions and investments to deliver liveability outcomes
- Catalysing actions to improve the overall quality of the city's liveability and achieve broader development outcomes including the Sustainable Development Goals
- Assessing the implementation of government policies and schemes governing characteristics of cities that can contribute to creating liveable communities

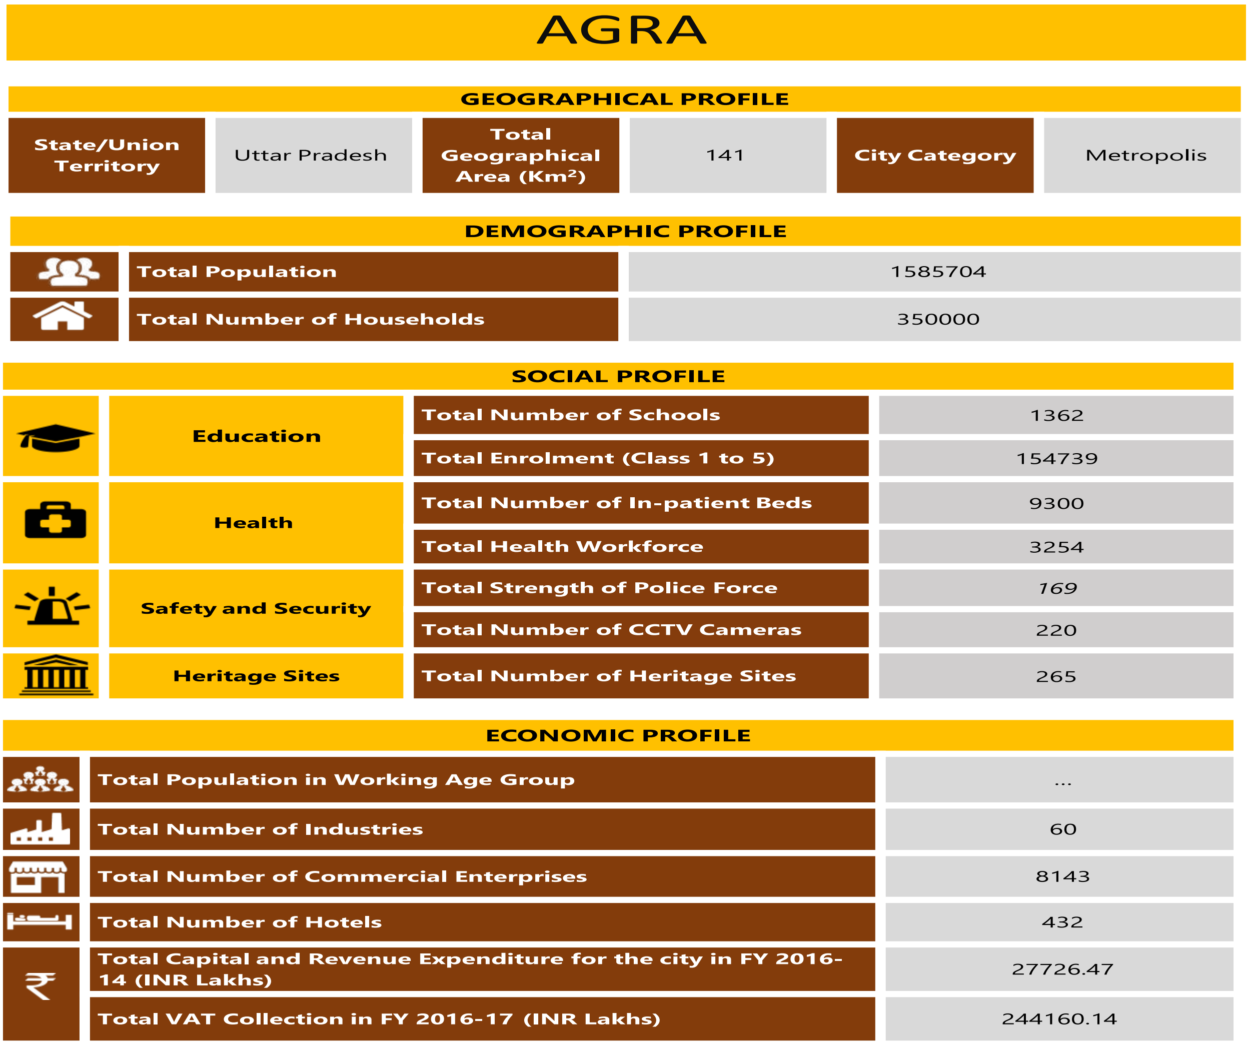


Tracking
liveability
Urban Planning
and Management
City level self-assessment
Citizen driven accountability systems
Use cases and pathways for reform
Unearth blind spots and incentivise action
Institutionalisation of outcome based planning and governance
Cities move to a single, unified data driven decision making paradigm...

The first round of the assessment commenced in January 2018 covering 116 major cities including smart cities, capital cities and cities with population of above one million each. Implementation of the liveability assessment commenced in January 2018 with a national level orientation workshop for the urban local bodies. The workshop aimed at orienting the states and urban local bodies on the overall framework, indicators, data sources, methodology and key milestones and timelines involved in the liveability assessment. Subsequently, a series of State/ Union Territory level orientation workshops were carried out in 33 states/UTs for a detailed discussion on the framework. Online data collection commenced from 9th March through an online data collection platform that supported both online and offline data submission modes. On the date of closure of the online data entry portal i.e., 16th April, 2018 112 cities submitted their data. Subsequently, comprehensive checks on the submitted data was undertaken that involved checking for outliers, logical inconsistencies etc. post which round-1 of data reconciliation was conducted. This draft report is based on round-1 of reconciled data as on 28th April, 2018.

2. City Profile

This chapter presents the city profile -Geographic and Demographic, Social (Education Health, Safety and Security, Heritage), Economic profile, and Physical (Water, sanitation and Waste Management, Electricity, Open space and roads).



AGRA

GEOGRAPHICAL PROFILE

State/Union Territory	Uttar Pradesh	Total Geographical Area (Km²)	141	City Category	Metropolis

DEMOGRAPHIC PROFILE

Total Population	1585704
Total Number of Households	350000

SOCIAL PROFILE

Education	Total Number of Schools	1362
	Total Enrolment (Class 1 to 5)	154739
Health	Total Number of In-patient Beds	9300
	Total Health Workforce	3254
Safety and Security	Total Strength of Police Force	*169*
	Total Number of CCTV Cameras	220
Heritage Sites	Total Number of Heritage Sites	265

ECONOMIC PROFILE

Total Population in Working Age Group	...
Total Number of Industries	60
Total Number of Commercial Enterprises	8143
Total Number of Hotels	432
Total Capital and Revenue Expenditure for the city in FY 2016-14 (INR Lakhs)	27726.47
Total VAT Collection in FY 2016-17 (INR Lakhs)	244160.14

PHYSICAL PROFILE

Water	**Average Quantity of Water Supplied (MLD)**	250
	Total Number of Water Connection	119776
Sanitation Facilities	**Total number of households with access to individual toilets in the city**	186108
	Total number of households in the city with access to community toilets in the city	7620
Solid Waste Management	**Daily average quantity of municipal solid waste collected in the city (Tonnes/day)**	700
	Total number of households covered through door-to-door collection of solid waste	180000
Waste Water	**Daily Average Quantum of Waste Water Generated in the City (MLD)**	233
	Daily average quantum of waste water treated by STPs in the city (MLD)	180
Electricity	**Total number of authorized electrical connections in the city**	428000
	Total electricity supplied to the city (kWh)	14583.33
Public and Open Spaces	**Total area covered by green spaces in the city (m^2)**	3832555.26
Roads and Transport	**Total Length of Road Network in the City (Km)**	1728
	Total length of arterial and sub-arterial road network in the city (Km)	1728
	Total length of footpath (wider than 1.2 metres) in the city along the street network (Km)	99

3. Liveability Framework and Indicators

The Liveability Framework comprises a total of 79 indicators (57 Core Indicators and 22 Supporting Indicators). A core indicator carries 70% weightage and a supporting indicator carries 30% weightage. These indicators are grouped under 15 thematic categories which in turn are part of four pillars of comprehensive development of cities i.e., institutional, social, economic and physical. Based on the performance of cities against the various core and supporting indicators, various 'Category Sub-Indexes' and a composite 'City Liveability Index' will be developed for each city.

3.1 Scoring and Computing Category Indices of Liveability

The set of 79 indicators, associated categories and pillars are presented in the table below:

Table 1 List of Pillars, Categories and Indicators

Pillars of Comprehensive Development	Category	Indicators
Institutional	1. Governance	1.1 Percentage of citizen services available online
		1.2 Percentage of services integrated through Command Centre
		1.3 Percentage of citizens using online services
		1.4 Average delay in grievance redressal
		1.5 Tax collected as percentage of tax billed
		1.6 Extent of cost recovery (O&M) in water supply services
		1.7 Capital spending as percentage of total expenditure
		1.8 Percentage of population covered under Ward Committees/Area *Sabhas*
Social	2. Identity and Culture	2.1 Restoration and reuse of historic buildings
		2.2 Percentage of ecologically important areas covered through projects for restoration
		2.3 Hotel occupancy
		2.4 Percentage of budget allocated towards cultural/sports activities
		2.5 Number of cultural/sports events hosted by city
	3. Education	3.1 Percentage of school-aged population enrolled in schools
		3.2 Percentage of female school-aged population enrolled in schools
		3.3 Primary education student-teacher ratio

Pillars of Comprehensive Development	Category	Indicators
		3.4 Percentage of schools with access to digital education
		3.5 Percentage of students completing primary education
		3.6 Percentage of students completing secondary education
	4. Health	4.1 Number of in-patient hospital beds per 10,000 population
		4.2 Healthcare professionals per 10,000 population
		4.3 Average response time in case of health emergencies
		4.4 Period prevalence of water borne diseases
		4.5 Period prevalence of vector borne diseases
	5. Safety and Security	5.1 Number of CCTV Cameras
		5.2 Number of recorded crimes per lakh population
		5.3 Extent of crimes recorded against women, children and elderly per year
		5.4 Transport-related fatality per lakh population
Economic	6. Economy and Employment	6.1 Increase in VAT/GST collection
		6.2 Increase in collection of Professional Tax
		6.3 Increase in issuance of Construction permits
		6.4 Unemployment rate
		6.5 Percentage of vendors registered and provided formal spaces
Physical	7. Housing and Inclusiveness	7.1 Percentage of Slum/EWS households covered through formal/affordable housing
		7.2 Percentage of slum areas covered through basic services
	8. Public Open Spaces	8.1 Per capita availability of green spaces
		8.2 Per capita availability of public and recreational places
	9. Mixed Land Use and Compactness	9.1 Share of mixed land use area in overall city land use
		9.2 Net Density
	10. Power Supply	10.1 Percentage of city population with authorized electrical services
		10.2 Percentage of electrical connections covered through smart meters
		10.3 Average number of electrical interruptions per year
		10.4 Average length of electrical interruptions per year
		10.5 Percentage of total energy derived from renewable sources

Pillars of Comprehensive Development	Category	Indicators
		10.6 Energy consumption per unit - water supply and sewerage
		10.7 Energy consumption per unit - street lighting
		10.8 Percentage of new and redeveloped buildings following green building norms
		10.9 Total energy consumption per capita
	11. Transportation and Mobility	11.1 Geographical coverage of public transport
		11.2 Availability of public transport
		11.3 Mode share of public transport
		11.4 Percentage of road network with dedicated bicycle tracks
		11.5 Percentage of interchanges with bicycle parking facilities
		11.6 Mode share of non-motorized transport
		11.7 Availability of Passenger Information System
		11.8 Extent of signal synchronization
		11.9 Availability of paid parking spaces
		11.10 Percentage coverage of footpaths – wider than 1.2 m
		11.11 Percentage of traffic intersections with pedestrian crossing facilities
		11.12 Extent to which universal accessibility is incorporated in public rights-of-way
	12. Assured Water Supply	12.1 Household level coverage of direct water supply connections
		12.2 Per capita supply of water
		12.3 Quality of water supplied
		12.4 Level of non-revenue water – NRW
		12.5 Percentage of water connections covered through meters
		12.6 Percentage of plots with rainwater harvesting facility
	13. Waste Water Management	13.1 Coverage of toilets
		13.2 Coverage of sewerage network and/or septage
		13.3 Collection efficiency of sewerage network
		13.4 Extent of reuse and recycling of waste water
		13.5 Coverage of storm water drains
	14. Solid Waste Management	14.1 Household level coverage of municipal solid waste collection

Pillars of Comprehensive Development	Category	Indicators
		14.2 Efficiency of collection of municipal solid waste
		14.3 Extent of municipal solid waste recovered through reuse
	15. Reduced Pollution	15.1 Concentration of SO2- air pollution
		15.2 Concentration of NO2- air pollution
		15.3 Concentration of PM10 - air pollution
		15.4 Level of noise pollution
		15.5 Quality of water in public surface water bodies

3.2 Scoring and Computing Category Indices of Liveability

The performance achieved by cities against 79 indicators, will be assessed against given benchmarks. Where no international/national norms are available, city with the best performance in its group (population range) will be treated as a benchmark. The groups are given in the table below.

Table 2 Details on Population Range

Category	Population range
Category 1	Population ≥ 4 million
Category 2	1 million ≤ Population < 4 million
Category 3	0.5 million ≤ Population < 1 million
Category 4	Population < 0.5 million

3.3 Scoring Approach and Methodology

A city can earn a maximum score of 100 points for 79 indicators across four pillars. The pillar weights are as follows: Institutional (25 points), Social (25 points), Economy and Employment (5 points) and Physical (45 points). Based on the number and nature of indicators i.e., core vs. secondary, indicator wise maximum marks were computed.

100 marks

(Maximum overall score that any city can achieve)

25 marks		25 marks		5 marks		45 marks	
(Maximum score that any city can achieve under **Institutional** Pillar)		(Maximum score that any city can achieve under **Social** Pillar)		(Maximum score that any city can achieve under **Economic** Pillar)		(Maximum score that any city can achieve under **Physical** Pillar)	
1 (Category under Institutional Pillar)		4 (Number of categories under Social Pillar)		1 (Category under Economic Pillar)		9 (Number of categories under Physical Pillar)	
8 (Number of indicators under Institutional)		20 (Number of indicators under Social Pillar)		5 (Category under Economic Pillar)		46 (Number of categories under Physical Pillar)	
7 Core	1 Supporting	13 Core	7 Supporting	4 Core	1 Supporting	33 Core	13 Supporting

Dimensional Index Methodology (DIM) has been used to compute scores for each indicator with reference to “maximum within the comparison group” or “absolute benchmarks”. For indicators where benchmarks are available, cities getting the benchmark score (or above) are given the maximum mark, and the marks awarded to other cities are calculated proportionately. For indicators where benchmarks are not available, the best performing cities in each population group are given the maximum mark, and the marks awarded to other cities (within the population group) are calculated proportionately. For indicators where benchmarks do not exist, the city data has been tested for outliers before scoring.

3.4 Scoring Normalisation:

To construct aggregate scores across cities as well as to make the scores across indicators comparable, indicator values were normalised using a min-max approach. The following formula was used to normalise the indicator values-

$$\frac{indicator\ value\ for\ the\ city - indicator\ value\ for\ the\ worst\ performing\ city}{benchmark - \ indicator\ value\ for\ the\ worst\ performing\ city}$$

This approach would restrict the normalised indicator value between 0 and 1. Cities that met or exceeded the benchmark received a normalised indicator value of 1. Worst performing cities are given a normalised indicator value of 0. After normalisation, the normalised value is weighted according to the category and the indicator being core or supporting.

To illustrate, consider the indicator 12.3 Quality of Water Supplied in the Category 12 for Assured Water Supply. If in City A 50% of the water samples collected qualify the potable water standards specified by the CPHEEO, and only 10% of the samples from worst performing city qualify the standards. Then, the normalised value for the indicator for city A would be 0.44 [(0.5-0.1)/(1-0.1)].

The weight for indicator 12.3 is 1.03, so the final weighted score for City A would come out to 0.45 [1.03*0.44].

4. Data Collection and Verification

4.1 Submission of Data by the cities

The Liveability Assessment is based on secondary data submitted by the urban local bodies and other concerned government agencies (collectively called as data owners). The 79 indicators were broken down into a set of easy to understand and relatable 553 questions mapped to data owners. Submission of the data was enabled through an online data entry portal on the smartnet platform of the Ministry. The portal also allowed the ULBs to download the liveability assessment questionnaire and upload filled in questionnaire. To familiarise and assist cities in identifying, mapping and collation of data points, a city level nodal person was available during the entire period of data submission process.

4.2 Mapping of Data Owners for the City

For the assessment of liveability indices broadly 12 data owners such as Central/state Pollution control board, Development authority, DISCOM/Electricity Board, State Disaster Management Authority, State Education Department, State Health department, State Renewable energy and development agency, State sales and commercial taxes department, town and country planning department, Traffic and police department, Transport authority, and Urban local body were identified to respond to the questions on the portal. However, during state workshop and subsequent city level discussions, more data owners were mapped to respond to different categories and sub categories. The following table provides the details of city level data owners mapped under the 12 data owner.

Table 3: Details of Data Owners

Designated data owners	Subcategories	Data owners at city level
Urban Local Body	For Accounts Related Questions	Accounts Department, Agra Municipal Corporation
Urban Local Body	For Park and Recreation Related Questions	Park and Recreation, Agra Municipal Corporation
Urban Local Body	For Water Supply and Drainage related questions	Water supply office, Agra Municipal Corporation
Urban Local Body	For Heritage sites related data	Heritage and tourism department
Urban Local Body	For Ecological sites related data	Ecological section
Urban Local Body	For Housing related data	Housing section
Urban Local Body	For Building plan related data	Development Authorities
Urban Local Body	For Roads related data	Roads section, Agra Municipal Corporation
Urban Local Body	For Solid waste management related data	Solid waste management section, Agra Municipal Corporation
Urban Local Body	For IT services related data	Agra Smart city limited
Urban Local Body	For Vendor committee related data	Agra Municipal Corporation
Urban Local Body	Any other departments involved in providing data for questions mentioned under Urban Local Body	
Central / state Pollution control Board	Water Quality, Air Quality, Noise Quality	Water supply office
Development Authority	Building Infrastructure	Development Authorities
	Construction planning	Development Authorities
	Green Building	Development Authorities

Designated data owners	Subcategories	Data owners at city level
	Rain water harvesting	Water supply department
	Universal Design Principle	
DISCOM/Electricity Board	Electrical Connection/ Grievance Redressal/ Power supply	Discom/Electricity board
State Disaster management authority		Agra Municipal Corporation
State Education Department		State Education Department
State Health Department	Health care professionals	State Health Department
	Citizen Services	
	Disease Prevalence	
	Health Infrastructure	
State Renewable Energy Development Agency		
State Sales / Commercial Taxes Department		
Town and Country Planning Department	Land Use	Town and country planning department
Traffic and Police Department		
Transport Authorities	Buses	Transport Authorities
	Registered Vehicles	Transport Authorities
	Sub urban rail transport	Not Applicable
	Mono Rail Authority	Not Applicable
	Tramways	Not Applicable
	Marine Transport Authority	Not Applicable

4.3 List of secondary documents available as supportive

City has provided supporting documents/evidences against the responses given by city on the online portal. In support of their responses on the portal, city submitted 16 number of documents. Documents submitted includes reports, official orders, copy of data maintained in official register, signed copy of questionnaire, and signed letters/submissions from concern departments. Verification includes mapping of documents against responses given by city, checking the type/category of documents, and validation of data provided.

The following table presents the data owner wise number of documents:

Table 4: Data owner wise number of secondary documents submitted by city

Data Owners	Number of Documents
Sales and Commercial Taxes	0
State Education Department	7
DISCOM/Electricity Department	0
Traffic and Police Department	3
Development Authority	0
Pollution Control Board	0
State Renewable Energy Department	2
Town and Country Planning	0
State Health Department	1
Transport Authority	1
Disaster Management	0
Urban Local Body	1
Total	15*

4.4 Data Verification

A three-stage data quality check comprising verification of data against secondary documents furnished by data owners, logical inconsistency checks including outliers, and physical audit for select indicators (Refer the exhibit below) is being undertaken. The objective of the data quality check is to ensure that data from the source documents are accurate and verifiable. Sources of data included reports, administrative data, survey results and other statistical records, log books among other.

Physical audit of eight indicators – one indicator from the Institutional pillar, one from the Social pillar, one from the Economy pillar and five from the Physical pillar is also being carried out by the field team to ascertain the degree of reliability of data reported by the cities. The list of these eight indicators is presented below:

1.2 | Percentage of services integrated through Command Centre

2.3 | Hotel occupancy

3.4 | Percentage of schools with access to digital education

5.1 | Number of streets, public places, junctions covered through surveillance systems

6.5 | Percentage of vendors registered and provided formal spaces

11.7 | Availability of Passenger Information System

11.11 | Percentage of traffic intersections with pedestrian crossing facilities

11.12 | Extent to which universal accessibility is incorporated in public rights-of-way

For a set of five indicators namely, unemployment rate, mode share of public transport, mode share of non-motorised transport, quality of water supplied and level of noise pollution, existing datasets were found to be not available consistently across all cities and/or were inadequate. To help cities that do not have data on these five indicators, dipstick assessments are being carried to fill data gaps.

6.4 | Unemployment Rate

11.3 | Mode share of public transport

11.5 | Mode share of Non Motorized Transport

12.3 | Quality of Water Supplied

15.4 | Level of Noise Pollution

4.5 Physical Audit

The following map presents the indicators audited at city level.

5. City score on 15 categories of assessment

Liveability Assessment covered 15 categories and 78 indicators. The below table presents the scores for all 15 indicators namely governance, identity & culture, education, health, safety and security, economy & employment, housing & inclusiveness, public open spaces, mixed land use & compactness, power supply, transport & mobility, assured water supply, waste water management, solid waste management and reduced pollution.

Table 5: Category wise scores

Categories	Scores in Percentage
Governance	63.86%
Identity & Culture	17%
Education	57%
Health	88%
Safety & Security	51%
Economy & Employment	11%
Housing & Inclusiveness	27%

Public Open Spaces	11%
Mixed Land Use & Compactness	2%
Power Supply	79%
Transport & Mobility	31%
Assured Water Supply	72%
Waste Water Management	77%
Solid Waste Management	74%
Reduced Pollution	55%

The rank of the city is based on the performance and scores in each of the category. The final city rank is submitted separately.

Executive Summary

Assessment of liveability indices is an initiative by the Ministry of Housing and Urban Affairs to improve quality of life of citizens and achieve sustainable development goals by encouraging cities to adopt “outcome based” approach for urban planning. Assessment process aimed to provide opportunity to cities to review the development components holistically by involving 79 measurable indicators categorized under governance, health, education, safety, economy, power supply, transportation and mobility, identity, culture, housing, waste management and pollution.

This report highlights the assessment process, key milestones, and the final outcome of the data submitted. Implementation of liveability assessment commenced formally on 19th January 2018. A national level workshop was organized on 13th February 2018 to explain the importance and process of liveability assessment and get feedback on methodology from the city authorities.

This was followed by the next stage of Questionnaire development. The questionnaire was arranged under 12 categories representing 12 data owners namely urban local body, Central and state pollution control board, development authority, DISCOM/Electricity board, State disaster management authority, state education department, state health department, state renewable energy development agency, state sales and commercial taxes department, town and country planning department, traffic and police department and transport authorities.

An online data entry portal was developed to facilitate data submission by the cities. Each city had a unique log in to access the portal and submit the data. Both online and off-line options (download the questionnaire in an excel) to submit the data were available for cities. An email help desk was set up for the cities to raise any queries and seek clarification when responding to the questions.

A team for each state comprising of State Coordinator and City Coordinator (one per city) was deployed that facilitated the process and supported the cities. A total of 6 regional coordinators/ consultants, 29 State Coordinators, and 99 city coordinators were deployed across 116 cities. Training for state coordinators was held from 26th to 28th February 2018 at Chennai to make coordinators understand overall liveability assessment, indicators, data sources, protocols and roles and responsibilities.

City Reconnaissance Meetings were initiated by the state and city coordinators. The discussion began with discussions to finalize the state workshop schedule, mapping of data owners, and assist cities in data collection. The City Coordinators were based in the cities for over 6 weeks and during this time, they liase with ULB and other data owners to explain the liveability framework, online portal, and facilitate the online submission.

A total of 33 state workshops were conducted at the state level. The objective of the workshop was to orient the city stakeholders on liveability assessment, indicators, components of data collection, timelines, expectations of support and support extended by MoHUA. The state level workshops brought various city level departments on a single platform to understand and discuss the methodology and components of city liveability assessment.

Nodal agency at state level supported by the City and State Coordinator and city level (Municipality corporation/smart city limited) coordinated with city specific data owners/departments for data gathering, collation, and submission. Nodal persons in each department were appointed for timely data collection and submission. Of 116, 112 cities submitted data as per the timeline on 16th April 2018.

Post submission, the city and state coordinators supported by the central team followed up extensively with the cities to support secondary documents as evidence to substantiate their submissions. Secondary documents such as reports, official orders, copy of office register, signed copy of liveability assessment questionnaire furnished by cities against the submitted data. Documents are verified to map the documents for the reponses provided by city and to check the type data provided by city. The document check outcomes were shared with the cities as a part of data quality check.

For checking consistency of data, logical check of data, verifying data from other public sources were undertaken. Quality check was done to ensure data validity and provide opportunity to cities to review the data provided by them and correct in case of wrong data entry.

For 8 selected indicators namely, percentage of services integrated through command and control center, hotel occupancy rate, percentage of schools with access to digital education, number of CCTV cameras per unit road length, percentage of vendors registered and provided formal spaces, availability of passenger information system, percentage of traffic intersection with pedestrian crossing facility, and extent to which universal accessibility is incorporated in public rights of way. Physical audit was conducted in 110 cities by physical auditors appointed and trained by the consortium. In consultation with ULB nodal person, locations and indicators for physical audit was selected in each city. A mobile based application was developed to capture the physical audit related data.

Primary data collection was done for five indicators such as unemployment rates, mode share of public transport, mode share of non-motorized transport, quality of water supplied, and level of noise pollution. Protocols for water and noise test were prepared in consultation with experts. Water quality test involved physical, chemical and bacteriological test of water as per the CPCB norms. For testing quality of water at consumer end, the auditors worked closely with the ULB and Water department. Samples were collected from consumer end and submitted to the lab suggested by city. For noise pollution, in about 20 cities the state pollution board or city level

environment department took the responsibility for providing noise pollution data as per the protocols. In rest of the cities, mobile based application was used to measure noise pollution.

During implementation, MoHUA facilitated the process by conducting video conferences with cities to address any queries, reiterate the importance, and ensure that cities adequately engages in the process and submit their responses in time and respond to requests for clarifications.

In addition to secondary data collection, physical audit and primary data collection, citizen survey was conducted to understand their perception and level of satisfaction on various services such as health, education, water supply, electricity, waste management etc. provided by urban local bodies. Over 60000 citizens participated in the survey across India.

The final scores and ranks have been generated based on the scoring methodology that has been discussed extensively and minor modifications made that are summarized as below:

#	**Challenges**	**Proposed Solutions**
1	Only 23 cities of 111 cities have City Mobility Plan (CMP) or any and hence able to provide data for Mode Share of Public Transport and Non-Motorised Transport. To address the data gap, as advised by the MoHUA, the consortia undertook a sample dipstick across all cities covering a sample of 150 Households. Understandably, the dipstick findings will not match the rigor of a CMP.	We recommend the following: 1) Cities which have provided CMP Data will be evaluated on 100% of the maximum score 2) For the cities where the dipstick data is used, the city receives a 50% discount on the overall score Alternatively, another approach is to assign 0 score to all 88 cities that don’t have a CMP
2	Variance was observed on data reported by cities on road network and data presented in the smart city proposals during the verifications.	We recommend taking the data reported by the cities in the Smart City Proposals.
3	There is no secondary source/ organization that provides unemployment data at city level. As a result, most cities do not have the data. Fully cognizance of the challenges of generating this data in a short span of time, it was agreed to collect this data through a dipstick survey on lines of NSSO questions. The	The indicator on unemployment will be excluded from scores. For final ranking, the cities will be scored on 78 indicators.

#	Challenges	Proposed Solutions
	data generated needs further scrutiny and triangulation with some inputs from experts. This may not be possible in the short window.	
4	Many cities did not have data on noise pollution and it was decided that data will be collected using a mobile app for all the 111 cities. However, many cities have expressed reservations with the approach especially with respect to the reliability of using this data. Further, some cities have relied on the SPCB to collect the data as per the approach proposed by the consortia. Thus, noise pollution data is currently from two sources: 1. SPCB- 20 cities 2. Noise-based app- 91 cities	The data collected through the primary survey will be used for scoring the cities. Currently, there is no differential scoring for the data from the SPCB and the data collected through the mobile app. However, a certain higher weightage can be provided to those cities which used the state apparatus to collect noise pollution data.
5	For the indicator on quality of water supplied, the methodology document states that samples should be drawn both at the treatment plant outlet as well as the consumer end. However, the data provided by the cities were predominantly from the distribution point. Hence for consumer end results with MoHUA intervention, consortia coordinated with cities to collect the data at the consumer end. The cities facilitated the testing. The outcome of the process is as below: 1. Sample given- 102 cities 2. Report received- 86 cities 3. Report awaited- 16 cities 4. Tests not completed due to lack of cooperation and other reasons – 9	The maximum score for this indicator will be distributed equally (50%) for results based on samples from the treatment plant and consumer end. Cities that did not complete tests or provide the results will be given a score 0 for against consumer end tests.
6	City level population is not projected annually by most of the cities. So, estimates for 2017 population are not available with the cities.	As recommended by MoHUA, 2011 census population is being used for the ranking purpose.
7	The age category specific data for 9 cities is not available at a city level	The age category specific population data has been taken at a district level for these cities.

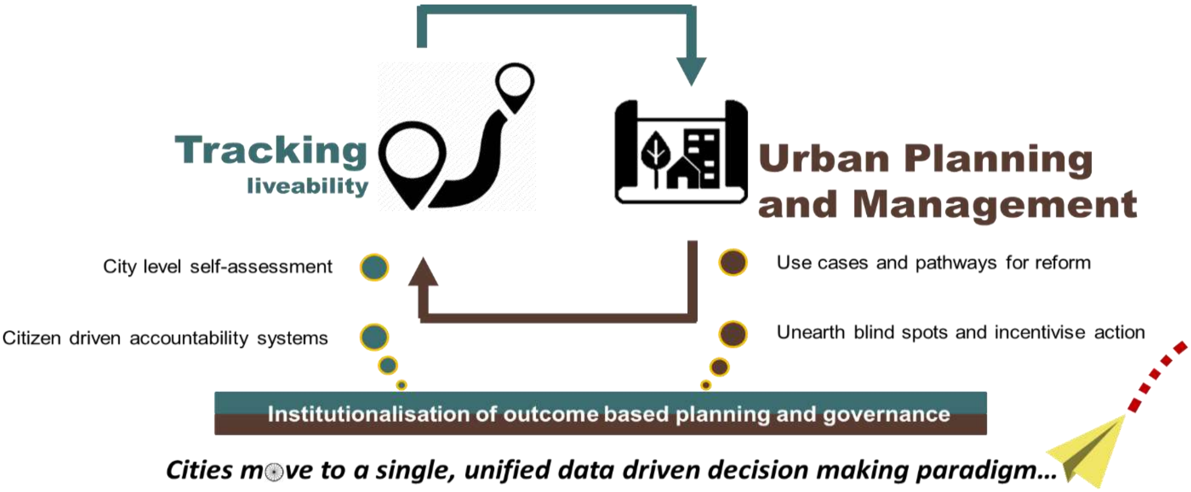
#	Challenges	Proposed Solutions
8	Indicators on non-motorised transports like- Dedicated bicycle tracks, bicycle parking facilities and mode share of non-motorised transport are not relevant for hilly terrains.	As discussed during the PMC meeting, these indicators have been treated as non-applicable for the hilly cities and the weights have been redistributed among other indicators within the same category.
9	The indicator on increase in professional tax is not relevant to cities which do not levy the professional tax.	As discussed during the PMC meeting, this indicator has been non-applicable to the cities belonging to states where professional tax is not levied, and the weights have been redistributed among other indicators within the same category.
10	The indicator on increase in VAT collection is not applicable to Port Blair and Kavaratti, as there was no provision of VAT collection in these cities.	As discussed during the PMC meeting, these indicatosr has been treated as non-applicable for these two cities and the weights have been redistributed among other indicators within the same category.
11	Indicator on coverage of basic services to slum households does not concern cities with no slums (notified/ non-notified.	As discussed during the PMC meeting, this indicators has been treated as non-applicable for these cities and the weights have been redistributed among other indicators within the same category.

1. Introduction

The Ministry of Housing and Urban Affairs (MoHUA) is implementing several flagship urban missions such as the Smart Cities Mission (SCM), Atal Mission for Urban Rejuvenation and Transformation (AMRUT), Heritage City Development and Augmentation Yojana (HRIDAY), Housing for All (HFA). Theses mission along with other transformative initiatives of the Government including National Water Mission, Power for All, National Health Mission are aimed at making Indian cities more 'liveable.' The overarching goal of these initiatives is to move from an input-based approach to a 'citizen centric-outcome based' assessment of urban liveability.

To develop a common minimum framework for cities to assess their existing status and chart their pathway towards providing a better quality of life to their citizens, the MoHUA developed a set of 'Liveability Standards' relevant to cities to generate a Liveability Index and ranking of cities. These standards were launched in June, 2017. The MoHUA has planned to conduct an 'Annual Assessment of Liveability Standards in Cities – an ambitious national project that will involve yearly submission of data by cities across the various indicators, compilation and analysis, development of indices and ranking of cities. The Liveability Index is envisioned as a 360° tool for tracking, planning and transforming Indian cities. The Liveability Index is aimed at the following objectives:

- Providing strong evidence-based approach for future interventions and investments to deliver liveability outcomes
- Catalysing actions to improve the overall quality of the city's liveability and achieve broader development outcomes including the Sustainable Development Goals
- Assessing the implementation of government policies and schemes governing characteristics of cities that can contribute to creating liveable communities



Tracking
liveability
Urban Planning
and Management
City level self-assessment
Citizen driven accountability systems
Use cases and pathways for reform
Unearth blind spots and incentivise action
Institutionalisation of outcome based planning and governance
Cities move to a single, unified data driven decision making paradigm...

The first round of the assessment commenced in January 2018 covering 116 major cities including smart cities, capital cities and cities with population of above one million each. Implementation of the liveability assessment commenced in January 2018 with a national level orientation workshop for the urban local bodies. The workshop aimed at orienting the states and urban local bodies on the overall framework, indicators, data sources, methodology and key milestones and timelines involved in the liveability assessment. Subsequently, a series of State/ Union Territory level orientation workshops were carried out in 33 states/UTs for a detailed discussion on the framework. Online data collection commenced from 9th March through an online data collection platform that supported both online and offline data submission modes. On the date of closure of the online data entry portal i.e., 16th April, 2018 112 cities submitted their data. Subsequently, comprehensive checks on the submitted data was undertaken that involved checking for outliers, logical inconsistencies etc. post which round-1 of data reconciliation was conducted. This draft report is based on round-1 of reconciled data as on 28th April, 2018.

2. City Profile

This chapter presents the city profile -Geographic and Demographic, Social (Education Health, Safety and Security, Heritage), Economic profile, and Physical (Water, sanitation and Waste Management, Electricity, Open space and roads).

AHMEDABAD

GEOGRAPHICAL PROFILE

State/Union Territory	Gujrat	**Total Geographical Area (Km^2)**	466	**City Category**	Megapolis

DEMOGRAPHIC PROFILE

Total Population	5633927
Total Number of Households	1328014

SOCIAL PROFILE

Education	**Total Number of Schools**	1847
	Total Enrolment (Class 1 to 5)	321152
Health	**Total Number of In-patient Beds**	26386
	Total Health Workforce	31500
Safety and Security	**Total Strength of Police Force**	12941
	Total Number of CCTV Cameras	3256
Heritage Sites	**Total Number of Heritage Sites**	2766

ECONOMIC PROFILE

	Total Population in Working Age Group	1358554
	Total Number of Industries	6443
	Total Number of Commercial Enterprises	63186
	Total Number of Hotels	534
₹	**Total Capital and Revenue Expenditure for the city in FY 2016-17 (INR Lakhs)**	457229.26
	Total VAT Collection in FY 2016-17 (INR Lakhs)	244160.14

PHYSICAL PROFILE

	Water	**Average Quantity of Water Supplied (MLD)**	1150
		Total Number of Water Connection	980726
	Sanitation Facilities	**Total number of households with access to individual toilets in the city**	1309487
		Total number of households in the city with access to community toilets in the city	38198
	Solid Waste Management	**Daily average quantity of municipal solid waste collected in the city (Tonnes/day)**	3893
		Total number of households covered through door-to-door collection of solid waste	1433337
	Waste Water	**Daily Average Quantum of Waste Water Generated in the City (MLD)**	800
		Daily average quantum of waste water treated by STPs in the city (MLD)	651
	Electricity	**Total number of authorized electrical connections in the city**	1818130
		Total electricity supplied to the city (kWh)	7017640000
	Public and Open Spaces	**Total area covered by green spaces in the city (m^2)**	26335200
	Roads and Transport	**Total Length of Road Network in the City (Km)**	2470
		Total length of arterial and sub-arterial road network in the city (Km)	520
		Total length of footpath (wider than 1.2 metres) in the city along the street network (Km)	730

3. Liveability Framework and Indicators

The Liveability Framework comprises a total of 79 indicators (57 Core Indicators and 22 Supporting Indicators). A core indicator carries 70% weightage and a supporting indicator carries 30% weightage. These indicators are grouped under 15 thematic categories which in turn are part of four pillars of comprehensive development of cities i.e., institutional, social, economic and physical. Based on the performance of cities against the various core and supporting indicators, various 'Category Sub-Indexes' and a composite 'City Liveability Index' will be developed for each city.

3.1 Scoring and Computing Category Indices of Liveability

The set of 79 indicators, associated categories and pillars are presented in the table below:

Table 1 List of Pillars, Categories and Indicators

Pillars of Comprehensive Development	Category	Indicators
Institutional	1. Governance	1.1 Percentage of citizen services available online
		1.2 Percentage of services integrated through Command Centre
		1.3 Percentage of citizens using online services
		1.4 Average delay in grievance redressal
		1.5 Tax collected as percentage of tax billed
		1.6 Extent of cost recovery (O&M) in water supply services
		1.7 Capital spending as percentage of total expenditure
		1.8 Percentage of population covered under Ward Committees/Area *Sabhas*
Social	**2. Identity and Culture**	2.1 Restoration and reuse of historic buildings
		2.2 Percentage of ecologically important areas covered through projects for restoration
		2.3 Hotel occupancy
		2.4 Percentage of budget allocated towards cultural/sports activities
		2.5 Number of cultural/sports events hosted by city
	3. Education	3.1 Percentage of school-aged population enrolled in schools
		3.2 Percentage of female school-aged population enrolled in schools
		3.3 Primary education student-teacher ratio
		3.4 Percentage of schools with access to digital education

Pillars of Comprehensive Development	Category	Indicators
		3.5 Percentage of students completing primary education
		3.6 Percentage of students completing secondary education
	4. Health	4.1 Number of in-patient hospital beds per 10,000 population
		4.2 Healthcare professionals per 10,000 population
		4.3 Average response time in case of health emergencies
		4.4 Period prevalence of water borne diseases
		4.5 Period prevalence of vector borne diseases
	5. Safety and Security	5.1 Number of CCTV Cameras
		5.2 Number of recorded crimes per lakh population
		5.3 Extent of crimes recorded against women, children and elderly per year
		5.4 Transport-related fatality per lakh population
Economic	**6. Economy and Employment**	6.1 Increase in VAT/GST collection
		6.2 Increase in collection of Professional Tax
		6.3 Increase in issuance of Construction permits
		6.4 Unemployment rate
		6.5 Percentage of vendors registered and provided formal spaces
Physical	**7. Housing and Inclusiveness**	7.1 Percentage of Slum/EWS households covered through formal/affordable housing
		7.2 Percentage of slum areas covered through basic services
	8. Public Open Spaces	8.1 Per capita availability of green spaces
		8.2 Per capita availability of public and recreational places
	9. Mixed Land Use and Compactness	9.1 Share of mixed land use area in overall city land use
		9.2 Net Density
	10. Power Supply	10.1 Percentage of city population with authorized electrical services
		10.2 Percentage of electrical connections covered through smart meters
		10.3 Average number of electrical interruptions per year
		10.4 Average length of electrical interruptions per year

Pillars of Comprehensive Development	Category	Indicators
		10.5 Percentage of total energy derived from renewable sources
		10.6 Energy consumption per unit - water supply and sewerage
		10.7 Energy consumption per unit - street lighting
		10.8 Percentage of new and redeveloped buildings following green building norms
		10.9 Total energy consumption per capita
	11. Transportation and Mobility	11.1 Geographical coverage of public transport
		11.2 Availability of public transport
		11.3 Mode share of public transport
		11.4 Percentage of road network with dedicated bicycle tracks
		11.5 Percentage of interchanges with bicycle parking facilities
		11.6 Mode share of non-motorized transport
		11.7 Availability of Passenger Information System
		11.8 Extent of signal synchronization
		11.9 Availability of paid parking spaces
		11.10 Percentage coverage of footpaths – wider than 1.2 m
		11.11 Percentage of traffic intersections with pedestrian crossing facilities
		11.12 Extent to which universal accessibility is incorporated in public rights-of-way
	12. Assured Water Supply	12.1 Household level coverage of direct water supply connections
		12.2 Per capita supply of water
		12.3 Quality of water supplied
		12.4 Level of non-revenue water – NRW
		12.5 Percentage of water connections covered through meters
		12.6 Percentage of plots with rainwater harvesting facility
	13. Waste Water Management	13.1 Coverage of toilets
		13.2 Coverage of sewerage network and/or septage
		13.3 Collection efficiency of sewerage network

Pillars of Comprehensive Development	Category	Indicators
		13.4 Extent of reuse and recycling of waste water
		13.5 Coverage of storm water drains
	14. Solid Waste Management	14.1 Household level coverage of municipal solid waste collection
		14.2 Efficiency of collection of municipal solid waste
		14.3 Extent of municipal solid waste recovered through reuse
	15. Reduced Pollution	15.1 Concentration of SO2- air pollution
		15.2 Concentration of NO2- air pollution
		15.3 Concentration of PM10 - air pollution
		15.4 Level of noise pollution
		15.5 Quality of water in public surface water bodies

3.2 Scoring and Computing Category Indices of Liveability

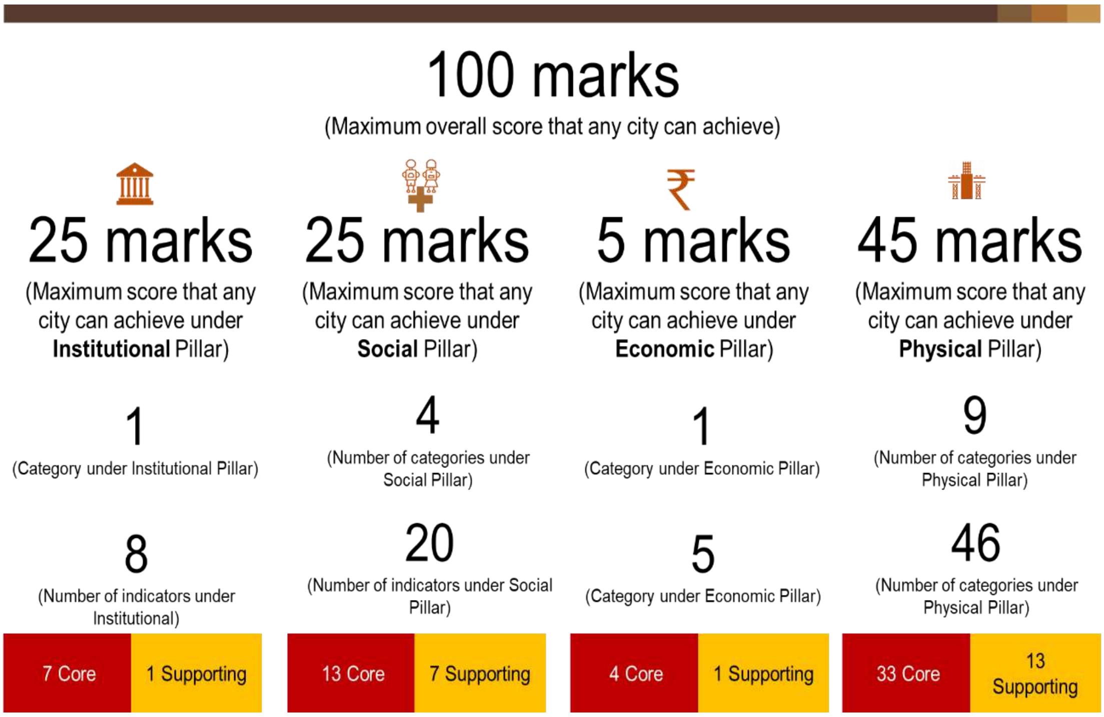
The performance achieved by cities against 79 indicators, will be assessed against given benchmarks. Where no international/national norms are available, city with the best performance in its group (population range) will be treated as a benchmark. The groups are given in the table below.

Table 2 Details on Population Range

Category	Population range
Category 1	Population ≥ 4 million
Category 2	1 million ≤ Population < 4 million
Category 3	0.5 million ≤ Population < 1 million
Category 4	Population < 0.5 million

3.3 Scoring Approach and Methodology

A city can earn a maximum score of 100 points for 79 indicators across four pillars. The pillar weights are as follows: Institutional (25 points), Social (25 points), Economy and Employment (5 points) and Physical (45 points). Based on the number and nature of indicators i.e., core vs. secondary, indicator wise maximum marks were computed.



100 marks
(Maximum overall score that any city can achieve)
25 marks
(Maximum score that any city can achieve under **Institutional** Pillar)
25 marks
(Maximum score that any city can achieve under **Social** Pillar)
5 marks
(Maximum score that any city can achieve under **Economic** Pillar)
45 marks
(Maximum score that any city can achieve under **Physical** Pillar)
1
(Category under Institutional Pillar)
4
(Number of categories under Social Pillar)
1
(Category under Economic Pillar)
9
(Number of categories under Physical Pillar)
8
(Number of indicators under Institutional)
20
(Number of indicators under Social Pillar)
5
(Category under Economic Pillar)
46
(Number of categories under Physical Pillar)
7 Core
1 Supporting
13 Core
7 Supporting
4 Core
1 Supporting
33 Core
13 Supporting

Dimensional Index Methodology (DIM) has been used to compute scores for each indicator with reference to "maximum within the comparison group" or "absolute benchmarks". For indicators where benchmarks are available, cities getting the benchmark score (or above) are given the maximum mark, and the marks awarded to other cities are calculated proportionately. For indicators where benchmarks are not available, the best performing cities in each population group are given the maximum mark, and the marks awarded to other cities (within the population group) are calculated proportionately. For indicators where benchmarks do not exist, the city data has been tested for outliers before scoring.

3.4 Scoring Normalisation:

To construct aggregate scores across cities as well as to make the scores across indicators comparable, indicator values were normalised using a min-max approach. The following formula was used to normalise the indicator values-

$$\frac{indicator\ value\ for\ the\ city - indicator\ value\ for\ the\ worst\ performing\ city}{benchmark -\ indicator\ value\ for\ the\ worst\ performing\ city}$$

This approach would restrict the normalised indicator value between 0 and 1. Cities that met or exceeded the benchmark received a normalised indicator value of 1. Worst performing cities are given a normalised indicator value of 0. After normalisation, the normalised value is weighted according to the category and the indicator being core or supporting.

To illustrate, consider the indicator 12.3 Quality of Water Supplied in the Category 12 for Assured Water Supply. If in City A 50% of the water samples collected qualify the potable water standards specified by the CPHEEO, and only 10% of the samples from worst performing city qualify the standards. Then, the normalised value for the indicator for city A would be 0.44 [(0.5-0.1)/(1-0.1)].

The weight for indicator 12.3 is 1.03, so the final weighted score for City A would come out to 0.45 [1.03*0.44].

4. Data Collection and Verification

4.1 Submission of Data by the cities

The Liveability Assessment is based on secondary data submitted by the urban local bodies and other concerned government agencies (collectively called as data owners). The 79 indicators were broken down into a set of easy to understand and relatable 553 questions mapped to data owners. Submission of the data was enabled through an online data entry portal on the smartnet platform of the Ministry. The portal also allowed the ULBs to download the liveability assessment questionnaire and upload filled in questionnaire. To familiarise and assist cities in identifying, mapping and collation of data points, a city level nodal person was available during the entire period of data submission process.

4.2 Mapping of Data Owners for the City

For the assessment of liveability indices broadly 12 data owners such as Central/state Pollution control board, Development authority, DISCOM/Electricity Board, State Disaster Management Authority, State Education Department, State Health department, State Renewable energy and development agency, State sales and commercial taxes department, town and country planning department, Traffic and police department, Transport authority, and Urban local body were identified to respond to the questions on the portal. However, during state workshop and subsequent city level discussions, more data owners were mapped to respond to different categories and sub categories. The following table provides the details of city level data owners mapped under the 12 data owner.

Table 3:Details of Data Owners

Designated data owners	Subcategories	Data owners at city level
Urban Local Body	For Accounts Related Questions	Mr. Amish Shah, Chief Accounts Officer
Urban Local Body	For Park and Recreation Related Questions	Mr. Jignesh Patel, Director, Parks and Garden
Urban Local Body	For Water Supply and Drainage related questions	Jagdish A. Patel,(I/C) C.E (WRM),General Manager (SRFDCL)
Urban Local Body	For Heritage sites related data	P K Vasudevan Nair, Deputy GM of Heritage Cell
Urban Local Body	For Ecological sites related data	
Urban Local Body	For Housing related data	Harpalsinh M. Zala Add. City Engineer, Housing Project, Slum Networking Project
Urban Local Body	For Building plan related data	Rajesh G Patel,TDO BPSP
Urban Local Body	For Roads related data	Hitesh Contractor,Additional City Engineer
Urban Local Body	For Solid waste management related data	Harshadrai Solanki, Director, Solid Waste Management & Conservancy Services
Urban Local Body	For IT services related data	Yatindra Naik (Physical)Manager,E-governance
Urban Local Body	For Vendor committee related data	
Urban Local Body	Any other departments involved in providing data for	Jagdish Patel, City Engineer Girish Patel, In-charge, city and country

Designated data owners	Subcategories	Data owners at city level
	questions mentioned under Urban Local Body	planning
Central / state Pollution control Board	Water Quality, Air Quality, Noise Quality	Ms. Darshna Patel,Environment Engineer
Development Authority	Building Infrastructure	Rajesh G Patel,TDO BPSP
	Construction planning	Rajesh G Patel,TDO BPSP
	Green Building	Rajesh G Patel,TDO BPSP
	Rain water harvesting	Rajesh G Patel,TDO BPSP
	Universal Design Principle	Rajesh G Patel,TDO BPSP
DISCOM/Electricity Board	Electrical Connection/ Grievance Redressal/ Power supply	Naimesh Panchal, AM Customer Service, Torrent Power Dipak H Suthar,Add. Chief Engineer (Electrical)(Street Light & Project) Devang Darji, Power and DISCOM
State Disaster management authority		M.F.Dastoor Chief Fire Officer
State Education Department		Dr. Lagdhir Desai, Administrative Officer, Edu. Dept. Dr. Ashwin Trivedi, Assistant Administrative Officer, School Board
State Health Department	Health care professionals	Dr. Bhavin Solanki, Medical Officer of Health (I/C)
	Citizen Services	Dr. Bhavin Solanki, Medical Officer of Health (I/C)
	Disease Prevalence	Dr. Bhavin Solanki, Medical Officer of Health (I/C)
	Health Infrastructure	Dr. Bhavin Solanki, Medical Officer of Health (I/C)
State Renewable Energy Development Agency		Discoms / Electricity Board Devang Darji, Add. Chief Eng. Electricity
State Sales / Commercial Taxes Department		Dipak Trivedi, Assessor and Tax Collector (professional Tax) Debashish Banerjee, Assessor and Tax Collector (Prop.Tax),

Designated data owners	Subcategories	Data owners at city level
Town and Country Planning Department	Land Use	Girish Patel, Country and City Palnning
Traffic and Police Department		P.A.Patel, Addl. City Engineer Police Commissioner office, Ahmedabad
Transport Authorities	Buses	1) Deepak Trivedi, General Manager (Operations), Ahmedabad Janmarg Limited (BRTS) 2) RajendraPrasad Pandey Dy. Transport Manager, AMTS
	Registered Vehicles	
	Sub urban rail transport	
	Mono Rail Authority	
	Tramways	
	Marine Transport Authority	

4.3 List of secondary documents available as supportive

City has provided supporting documents/evidences against the responses given by city on the online portal. In support of their responses on the portal, city submitted 60 number of documents. Documents submitted includes reports, official orders, copy of data maintained in official register, signed copy of questionnaire, and signed letters/submissions from concern departments. Verification includes mapping of documents against responses given by city, checking the type/category of documents, and validation of data provided.

The following table presents the data owner wise number of documents:

Table 4: Data owner wise number of secondary documents submitted by city

Data Owners	Number of Documents
Sales and Commercial Taxes	1
State Education Department	1
DISCOM/Electricity Department	1
Traffic and Police Department	1
Development Authority	1
Pollution Control Board	2
State Renewable Energy Department	1
Town and Country Planning	1

State Health Department	1
Transport Authority	1
Disaster Management	1
Urban Local Body	48
Total	60

4.4 Data Verification

A three-stage data quality check comprising verification of data against secondary documents furnished by data owners, logical inconsistency checks including outliers, and physical audit for select indicators (Refer the exhibit below) is being undertaken. The objective of the data quality check is to ensure that data from the source documents are accurate and verifiable. Sources of data included reports, administrative data, survey results and other statistical records, log books among other.

Physical audit of eight indicators – one indicator from the Institutional pillar, one from the Social pillar, one from the Economy pillar and five from the Physical pillar is also being carried out by the field team to ascertain the degree of reliability of data reported by the cities. The list of these eight indicators is presented below:

1.2 | Percentage of services integrated through Command Centre

2.3 | Hotel occupancy

3.4 | Percentage of schools with access to digital education

5.1| Number of streets, public places, junctions covered through surveillance systems

6.5 | Percentage of vendors registered and provided formal spaces

11.7 | Availability of Passenger Information System

11.11 | Percentage of traffic intersections with pedestrian crossing facilities

11.12 | Extent to which universal accessibility is incorporated in public rights-of-way

For a set of five indicators namely, unemployment rate, mode share of public transport, mode share of non-motorised transport, quality of water supplied and level of noise pollution, existing datasets were found to be not available consistently across all cities and/or were inadequate. To help cities that do not have data on these five indicators, dipstick assessments are being carried to fill data gaps.

6.4 | Unemployment Rate

11.3 | Mode share of public transport

11.5 | Mode share of Non Motorized Transport

12.3 | Quality of Water Supplied

15.4 | Level of Noise Pollution

4.5 Physical Audit

The following map presents the indicators audited at city level.

5. City Score on 15 categories of Assessment

Liveability Assessment covered 15 categories and 78 indicators. The below table presents the scores for all 15 indicators namely governance, identity & culture, education, health, safety and security, economy & employment, housing & inclusiveness, public open spaces, mixed land use & compactness, power supply, transport & mobility, assured water supply, waste water management, solid waste management and reduced pollution.

Table 5: Category wise scores

Categories	Scores in Percentage
Governance	78.18%
Identity & Culture	4%
Education	88%
Health	73%
Safety & Security	50%
Economy & Employment	29%
Housing & Inclusiveness	35%
Public Open Spaces	24%
Mixed Land Use & Compactness	50%
Power Supply	44%
Transport & Mobility	36%
Assured Water Supply	78%
Waste Water Management	46%
Solid Waste Management	77%
Reduced Pollution	84%

The rank of the city is based on the performance and scores in each of the category. The final city rank is submitted separately.

Executive Summary

Assessment of liveability indices is an initiative by the Ministry of Housing and Urban Affairs to improve quality of life of citizens and achieve sustainable development goals by encouraging cities to adopt "outcome based" approach for urban planning. Assessment process aimed to provide opportunity to cities to review the development components holistically by involving 79 measurable indicators categorized under governance, health, education, safety, economy, power supply, transportation and mobility, identity, culture, housing, waste management and pollution.

This report highlights the assessment process, key milestones, and the final outcome of the data submitted. Implementation of liveability assessment commenced formally on 19th January 2018. A national level workshop was organized on 13th February 2018 to explain the importance and process of liveability assessment and get feedback on methodology from the city authorities.

This was followed by the next stage of Questionnaire development. The questionnaire was arranged under 12 categories representing 12 data owners namely urban local body, Central and state pollution control board, development authority, DISCOM/Electricity board, State disaster management authority, state education department, state health department, state renewable energy development agency, state sales and commercial taxes department, town and country planning department, traffic and police department and transport authorities.

An online data entry portal was developed to facilitate data submission by the cities. Each city had a unique log in to access the portal and submit the data. Both online and off-line options (download the questionnaire in an excel) to submit the data were available for cities. An email help desk was set up for the cities to raise any queries and seek clarification when responding to the questions.

A team for each state comprising of State Coordinator and City Coordinator (one per city) was deployed that facilitated the process and supported the cities. A total of 6 regional coordinators/ consultants, 29 State Coordinators, and 99 city coordinators were deployed across 116 cities. Training for state coordinators was held from 26th to 28th February 2018 at Chennai to make coordinators understand overall liveability assessment, indicators, data sources, protocols and roles and responsibilities.

City Reconnaissance Meetings were initiated by the state and city coordinators. The discussion began with discussions to finalize the state workshop schedule, mapping of data owners, and assist cities in data collection. The City Coordinators were based in the cities for over 6 weeks and during this time, they liase with ULB and other data owners to explain the liveability framework, online portal, and facilitate the online submission.

A total of 33 state workshops were conducted at the state level. The objective of the workshop was to orient the city stakeholders on liveability assessment, indicators, components of data collection, timelines, expectations of support and support extended by MoHUA. The state level workshops brought various city level departments on a single platform to understand and discuss the methodology and components of city liveability assessment.

Nodal agency at state level supported by the City and State Coordinator and city level (Municipality corporation/smart city limited) coordinated with city specific data owners/departments for data gathering, collation, and submission. Nodal persons in each department were appointed for timely data collection and submission. Of 116, 112 cities submitted data as per the timeline on 16th April 2018.

Post submission, the city and state coordinators supported by the central team followed up extensively with the cities to support secondary documents as evidence to substantiate their submissions. Secondary documents such as reports, official orders, copy of office register, signed copy of liveability assessment questionnaire furnished by cities against the submitted data. Documents are verified to map the documents for the reponses provided by city and to check the type data provided by city. The document check outcomes were shared with the cities as a part of data quality check.

For checking consistency of data, logical check of data, verifying data from other public sources were undertaken. Quality check was done to ensure data validity and provide opportunity to cities to review the data provided by them and correct in case of wrong data entry.

For 8 selected indicators namely, percentage of services integrated through command and control center, hotel occupancy rate, percentage of schools with access to digital education, number of CCTV cameras per unit road length, percentage of vendors registered and provided formal spaces, availability of passenger information system, percentage of traffic intersection with pedestrian crossing facility, and extent to which universal accessibility is incorporated in public rights of way. Physical audit was conducted in 110 cities by physical auditors appointed and trained by the consortium. In consultation with ULB nodal person, locations and indicators for physical audit was selected in each city. A mobile based application was developed to capture the physical audit related data.

Primary data collection was done for five indicators such as unemployment rates, mode share of public transport, mode share of non-motorized transport, quality of water supplied, and level of noise pollution. Protocols for water and noise test were prepared in consultation with experts. Water quality test involved physical, chemical and bacteriological test of water as per the CPCB norms. For testing quality of water at consumer end, the auditors worked closely with the ULB and Water department. Samples were collected from consumer end and submitted to the lab suggested by city. For noise pollution, in about 20 cities the state pollution board or city level

environment department took the responsibility for providing noise pollution data as per the protocols. In rest of the cities, mobile based application was used to measure noise pollution.

During implementation, MoHUA facilitated the process by conducting video conferences with cities to address any queries, reiterate the importance, and ensure that cities adequately engages in the process and submit their responses in time and respond to requests for clarifications.

In addition to secondary data collection, physical audit and primary data collection, citizen survey was conducted to understand their perception and level of satisfaction on various services such as health, education, water supply, electricity, waste management etc. provided by urban local bodies. Over 60000 citizens participated in the survey across India.

The final scores and ranks have been generated based on the scoring methodology that has been discussed extensively and minor modifications made that are summarized as below:

#	**Challenges**	**Proposed Solutions**
1	Only 23 cities of 111 cities have City Mobility Plan (CMP) or any and hence able to provide data for Mode Share of Public Transport and Non-Motorised Transport. To address the data gap, as advised by the MoHUA, the consortia undertook a sample dipstick across all cities covering a sample of 150 Households. Understandably, the dipstick findings will not match the rigor of a CMP.	We recommend the following: 1) Cities which have provided CMP Data will be evaluated on 100% of the maximum score 2) For the cities where the dipstick data is used, the city receives a 50% discount on the overall score Alternatively, another approach is to assign 0 score to all 88 cities that don't have a CMP
2	Variance was observed on data reported by cities on road network and data presented in the smart city proposals during the verifications.	We recommend taking the data reported by the cities in the Smart City Proposals.
3	There is no secondary source/ organization that provides unemployment data at city level. As a result, most cities do not have the data. Fully cognizance of the challenges of generating this data in a short span of time, it was agreed to collect this data through a dipstick survey on lines of NSSO questions. The	The indicator on unemployment will be excluded from scores. For final ranking, the cities will be scored on 78 indicators.

#	Challenges	Proposed Solutions
	data generated needs further scrutiny and triangulation with some inputs from experts. This may not be possible in the short window.	
4	Many cities did not have data on noise pollution and it was decided that data will be collected using a mobile app for all the 111 cities. However, many cities have expressed reservations with the approach especially with respect to the reliability of using this data. Further, some cities have relied on the SPCB to collect the data as per the approach proposed by the consortia. Thus, noise pollution data is currently from two sources: 1. SPCB- 20 cities 2. Noise-based app- 91 cities	The data collected through the primary survey will be used for scoring the cities. Currently, there is no differential scoring for the data from the SPCB and the data collected through the mobile app. However, a certain higher weightage can be provided to those cities which used the state apparatus to collect noise pollution data.
5	For the indicator on quality of water supplied, the methodology document states that samples should be drawn both at the treatment plant outlet as well as the consumer end. However, the data provided by the cities were predominantly from the distribution point. Hence for consumer end results with MoHUA intervention, consortia coordinated with cities to collect the data at the consumer end. The cities facilitated the testing. The outcome of the process is as below: 1. Sample given- 102 cities 2. Report received- 86 cities 3. Report awaited- 16 cities 4. Tests not completed due to lack of cooperation and other reasons – 9	The maximum score for this indicator will be distributed equally (50%) for results based on samples from the treatment plant and consumer end. Cities that did not complete tests or provide the results will be given a score 0 for against consumer end tests.
6	City level population is not projected annually by most of the cities. So, estimates for 2017 population are not available with the cities.	As recommended by MoHUA, 2011 census population is being used for the ranking purpose.
7	The age category specific data for 9 cities is not available at a city level	The age category specific population data has been taken at a district level for these cities.

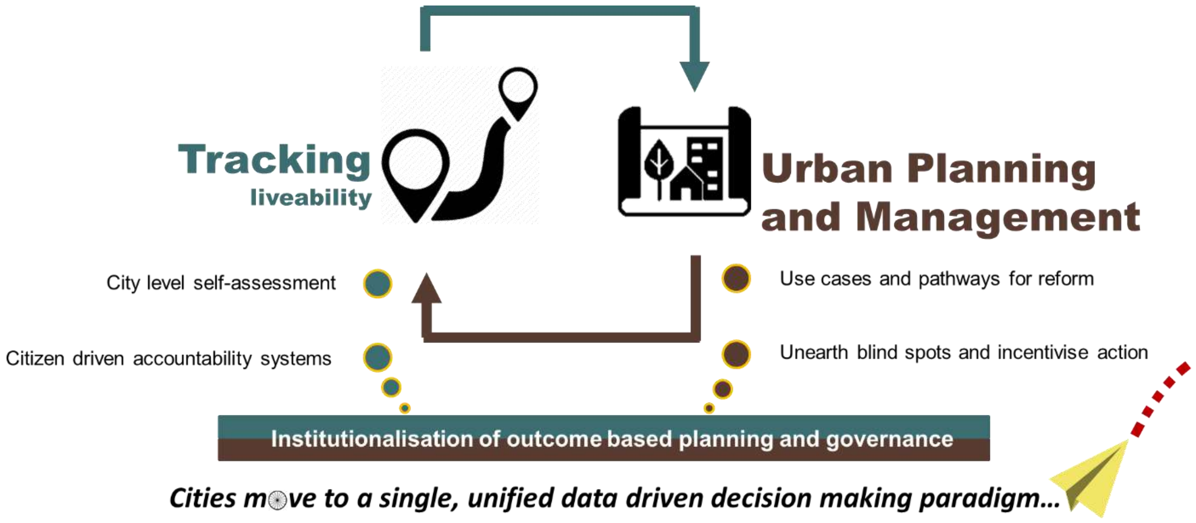
#	Challenges	Proposed Solutions
8	Indicators on non-motorised transports like- Dedicated bicycle tracks, bicycle parking facilities and mode share of non-motorised transport are not relevant for hilly terrains.	As discussed during the PMC meeting, these indicators have been treated as non-applicable for the hilly cities and the weights have been redistributed among other indicators within the same category.
9	The indicator on increase in professional tax is not relevant to cities which do not levy the professional tax.	As discussed during the PMC meeting, this indicator has been non-applicable to the cities belonging to states where professional tax is not levied, and the weights have been redistributed among other indicators within the same category.
10	The indicator on increase in VAT collection is not applicable to Port Blair and Kavaratti, as there was no provision of VAT collection in these cities.	As discussed during the PMC meeting, these indicatosr has been treated as non-applicable for these two cities and the weights have been redistributed among other indicators within the same category.
11	Indicator on coverage of basic services to slum households does not concern cities with no slums (notified/ non-notified.	As discussed during the PMC meeting, this indicators has been treated as non-applicable for these cities and the weights have been redistributed among other indicators within the same category.

1. Introduction

The Ministry of Housing and Urban Affairs (MoHUA) is implementing several flagship urban missions such as the Smart Cities Mission (SCM), Atal Mission for Urban Rejuvenation and Transformation (AMRUT), Heritage City Development and Augmentation Yojana (HRIDAY), Housing for All (HFA). Theses mission along with other transformative initiatives of the Government including National Water Mission, Power for All, National Health Mission are aimed at making Indian cities more 'liveable.' The overarching goal of these initiatives is to move from an input-based approach to a 'citizen centric-outcome based' assessment of urban liveability.

To develop a common minimum framework for cities to assess their existing status and chart their pathway towards providing a better quality of life to their citizens, the MoHUA developed a set of 'Liveability Standards' relevant to cities to generate a Liveability Index and ranking of cities. These standards were launched in June, 2017. The MoHUA has planned to conduct an 'Annual Assessment of Liveability Standards in Cities – an ambitious national project that will involve yearly submission of data by cities across the various indicators, compilation and analysis, development of indices and ranking of cities. The Liveability Index is envisioned as a 360° tool for tracking, planning and transforming Indian cities. The Liveability Index is aimed at the following objectives:

- Providing strong evidence-based approach for future interventions and investments to deliver liveability outcomes
- Catalysing actions to improve the overall quality of the city's liveability and achieve broader development outcomes including the Sustainable Development Goals
- Assessing the implementation of government policies and schemes governing characteristics of cities that can contribute to creating liveable communities



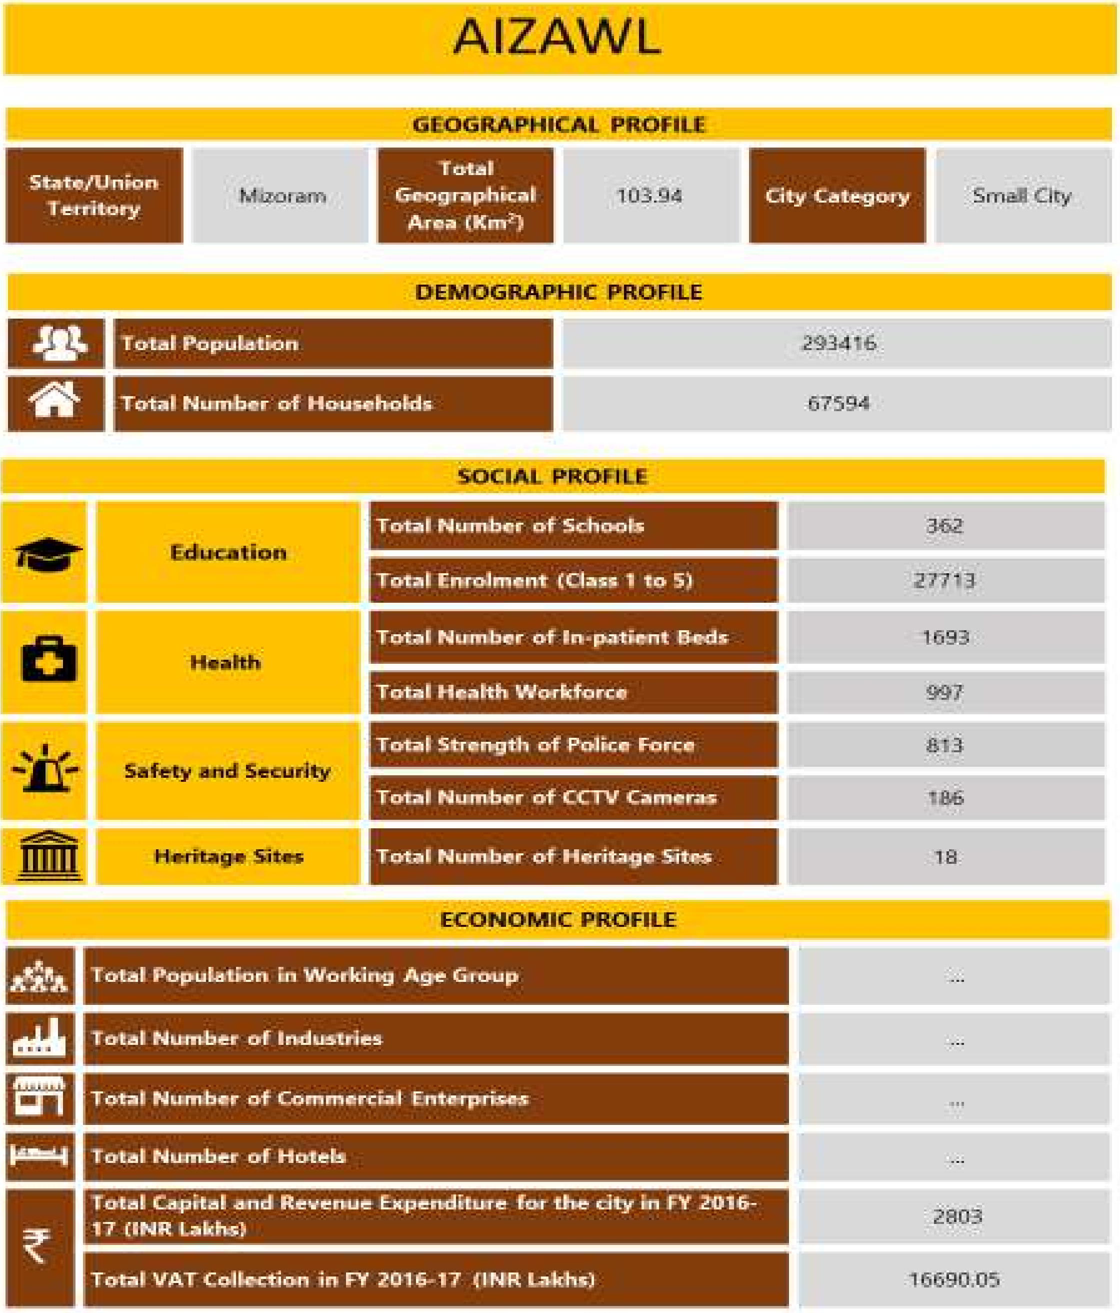
Tracking
liveability
Urban Planning
and Management
City level self-assessment
Citizen driven accountability systems
Use cases and pathways for reform
Unearth blind spots and incentivise action
Institutionalisation of outcome based planning and governance

Cities move to a single, unified data driven decision making paradigm…

The first round of the assessment commenced in January 2018 covering 116 major cities including smart cities, capital cities and cities with population of above one million each. Implementation of the liveability assessment commenced in January 2018 with a national level orientation workshop for the urban local bodies. The workshop aimed at orienting the states and urban local bodies on the overall framework, indicators, data sources, methodology and key milestones and timelines involved in the liveability assessment. Subsequently, a series of State/ Union Territory level orientation workshops were carried out in 33 states/UTs for a detailed discussion on the framework. Online data collection commenced from 9th March through an online data collection platform that supported both online and offline data submission modes. On the date of closure of the online data entry portal i.e., 16th April, 2018 112 cities submitted their data. Subsequently, comprehensive checks on the submitted data was undertaken that involved checking for outliers, logical inconsistencies etc. post which round-1 of data reconciliation was conducted. This draft report is based on round-1 of reconciled data as on 28th April, 2018.

2. City Profile

This chapter presents the city profile -Geographic and Demographic, Social (Education Health, Safety and Security, Heritage), Economic profile, and Physical (Water, sanitation and Waste Management, Electricity, Open space and roads).



AIZAWL

GEOGRAPHICAL PROFILE

State/Union Territory	Mizoram	Total Geographical Area (Km^2)	103.94	City Category	Small City

DEMOGRAPHIC PROFILE

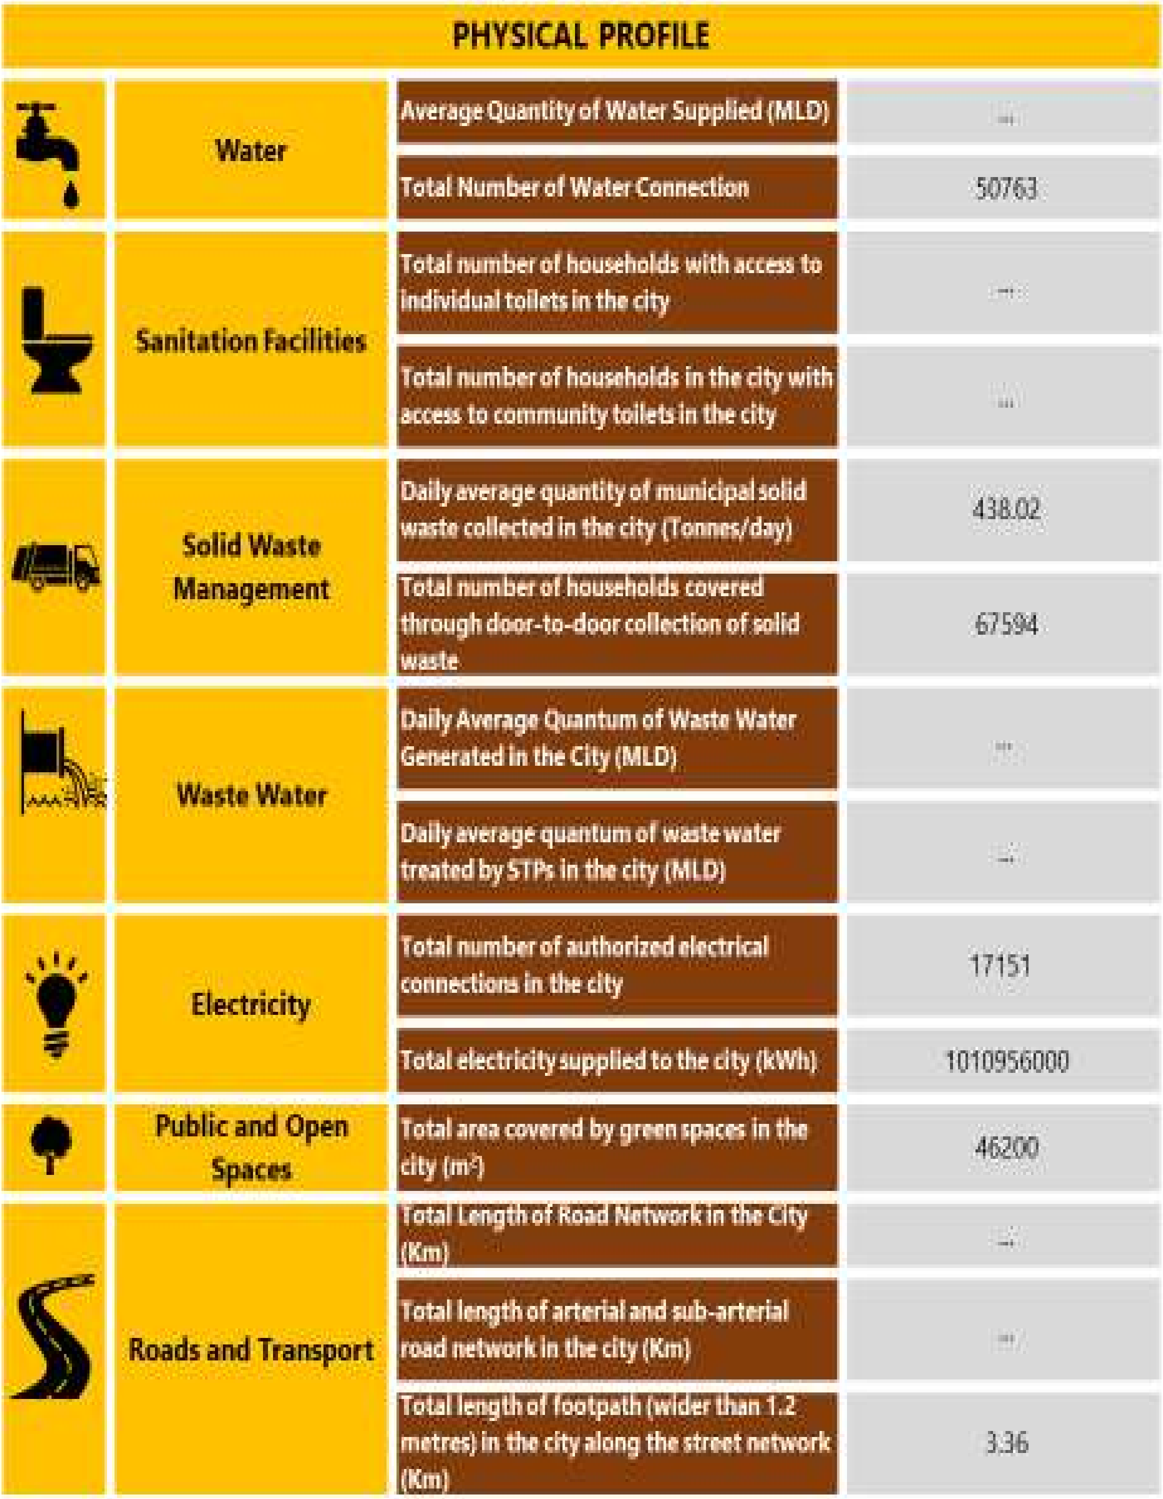
Total Population	293416
Total Number of Households	67594

SOCIAL PROFILE

Education	Total Number of Schools	362
	Total Enrolment (Class 1 to 5)	27713
Health	Total Number of In-patient Beds	1693
	Total Health Workforce	997
Safety and Security	Total Strength of Police Force	813
	Total Number of CCTV Cameras	186
Heritage Sites	Total Number of Heritage Sites	18

ECONOMIC PROFILE

Total Population in Working Age Group	...
Total Number of Industries	...
Total Number of Commercial Enterprises	...
Total Number of Hotels	...
Total Capital and Revenue Expenditure for the city in FY 2016-17 (INR Lakhs)	2803
Total VAT Collection in FY 2016-17 (INR Lakhs)	16690.05



PHYSICAL PROFILE

Water	Average Quantity of Water Supplied (MLD)	---
	Total Number of Water Connection	50763
Sanitation Facilities	Total number of households with access to individual toilets in the city	---
	Total number of households in the city with access to community toilets in the city	---
Solid Waste Management	Daily average quantity of municipal solid waste collected in the city (Tonnes/day)	438.02
	Total number of households covered through door-to-door collection of solid waste	67594
Waste Water	Daily Average Quantum of Waste Water Generated in the City (MLD)	---
	Daily average quantum of waste water treated by STPs in the city (MLD)	---
Electricity	Total number of authorized electrical connections in the city	17151
	Total electricity supplied to the city (kWh)	1010956000
Public and Open Spaces	Total area covered by green spaces in the city (m^2)	46200
Roads and Transport	Total Length of Road Network in the City (Km)	---
	Total length of arterial and sub-arterial road network in the city (Km)	---
	Total length of footpath (wider than 1.2 metres) in the city along the street network (Km)	3.36

3. Liveability Framework and Indicators

The Liveability Framework comprises a total of 79 indicators (57 Core Indicators and 22 Supporting Indicators). A core indicator carries 70% weightage and a supporting indicator carries 30% weightage. These indicators are grouped under 15 thematic categories which in turn are part of four pillars of comprehensive development of cities i.e., institutional, social, economic and physical. Based on the performance of cities against the various core and supporting indicators, various 'Category Sub-Indexes' and a composite 'City Liveability Index' will be developed for each city.

3.1 Scoring and Computing Category Indices of Liveability

The set of 79 indicators, associated categories and pillars are presented in the table below:

Table 1 List of Pillars, Categories and Indicators

Pillars of Comprehensive Development	Category	Indicators
Institutional	1. Governance	1.1 Percentage of citizen services available online
		1.2 Percentage of services integrated through Command Centre
		1.3 Percentage of citizens using online services
		1.4 Average delay in grievance redressal
		1.5 Tax collected as percentage of tax billed
		1.6 Extent of cost recovery (O&M) in water supply services
		1.7 Capital spending as percentage of total expenditure
		1.8 Percentage of population covered under Ward Committees/Area *Sabhas*
Social	**2. Identity and Culture**	2.1 Restoration and reuse of historic buildings
		2.2 Percentage of ecologically important areas covered through projects for restoration
		2.3 Hotel occupancy
		2.4 Percentage of budget allocated towards cultural/sports activities
		2.5 Number of cultural/sports events hosted by city
	3. Education	3.1 Percentage of school-aged population enrolled in schools
		3.2 Percentage of female school-aged population

Pillars of Comprehensive Development	Category	Indicators
		enrolled in schools
		3.3 Primary education student-teacher ratio
		3.4 Percentage of schools with access to digital education
		3.5 Percentage of students completing primary education
		3.6 Percentage of students completing secondary education
	4. Health	4.1 Number of in-patient hospital beds per 10,000 population
		4.2 Healthcare professionals per 10,000 population
		4.3 Average response time in case of health emergencies
		4.4 Period prevalence of water borne diseases
		4.5 Period prevalence of vector borne diseases
	5. Safety and Security	5.1 Number of CCTV Cameras
		5.2 Number of recorded crimes per lakh population
		5.3 Extent of crimes recorded against women, children and elderly per year
		5.4 Transport-related fatality per lakh population
Economic	**6. Economy and Employment**	6.1 Increase in VAT/GST collection
		6.2 Increase in collection of Professional Tax
		6.3 Increase in issuance of Construction permits
		6.4 Unemployment rate
		6.5 Percentage of vendors registered and provided formal spaces
Physical	**7. Housing and Inclusiveness**	7.1 Percentage of Slum/EWS households covered through formal/affordable housing
		7.2 Percentage of slum areas covered through basic services
	8. Public Open Spaces	8.1 Per capita availability of green spaces
		8.2 Per capita availability of public and recreational places
	9. Mixed Land Use and Compactness	9.1 Share of mixed land use area in overall city land use
		9.2 Net Density
	10. Power Supply	10.1 Percentage of city population with authorized electrical services

Pillars of Comprehensive Development	Category	Indicators
		10.2 Percentage of electrical connections covered through smart meters
		10.3 Average number of electrical interruptions per year
		10.4 Average length of electrical interruptions per year
		10.5 Percentage of total energy derived from renewable sources
		10.6 Energy consumption per unit - water supply and sewerage
		10.7 Energy consumption per unit - street lighting
		10.8 Percentage of new and redeveloped buildings following green building norms
		10.9 Total energy consumption per capita
	11. Transportation and Mobility	11.1 Geographical coverage of public transport
		11.2 Availability of public transport
		11.3 Mode share of public transport
		11.4 Percentage of road network with dedicated bicycle tracks
		11.5 Percentage of interchanges with bicycle parking facilities
		11.6 Mode share of non-motorized transport
		11.7 Availability of Passenger Information System
		11.8 Extent of signal synchronization
		11.9 Availability of paid parking spaces
		11.10 Percentage coverage of footpaths – wider than 1.2 m
		11.11 Percentage of traffic intersections with pedestrian crossing facilities
		11.12 Extent to which universal accessibility is incorporated in public rights-of-way
	12. Assured Water Supply	12.1 Household level coverage of direct water supply connections
		12.2 Per capita supply of water
		12.3 Quality of water supplied
		12.4 Level of non-revenue water – NRW
		12.5 Percentage of water connections covered through meters
		12.6 Percentage of plots with rainwater harvesting

Pillars of Comprehensive Development	Category	Indicators
		facility
	13. Waste Water Management	13.1 Coverage of toilets
		13.2 Coverage of sewerage network and/or septage
		13.3 Collection efficiency of sewerage network
		13.4 Extent of reuse and recycling of waste water
		13.5 Coverage of storm water drains
	14. Solid Waste Management	14.1 Household level coverage of municipal solid waste collection
		14.2 Efficiency of collection of municipal solid waste
		14.3 Extent of municipal solid waste recovered through reuse
	15. Reduced Pollution	15.1 Concentration of SO2- air pollution
		15.2 Concentration of NO2- air pollution
		15.3 Concentration of PM10 - air pollution
		15.4 Level of noise pollution
		15.5 Quality of water in public surface water bodies

3.2 Scoring and Computing Category Indices of Liveability

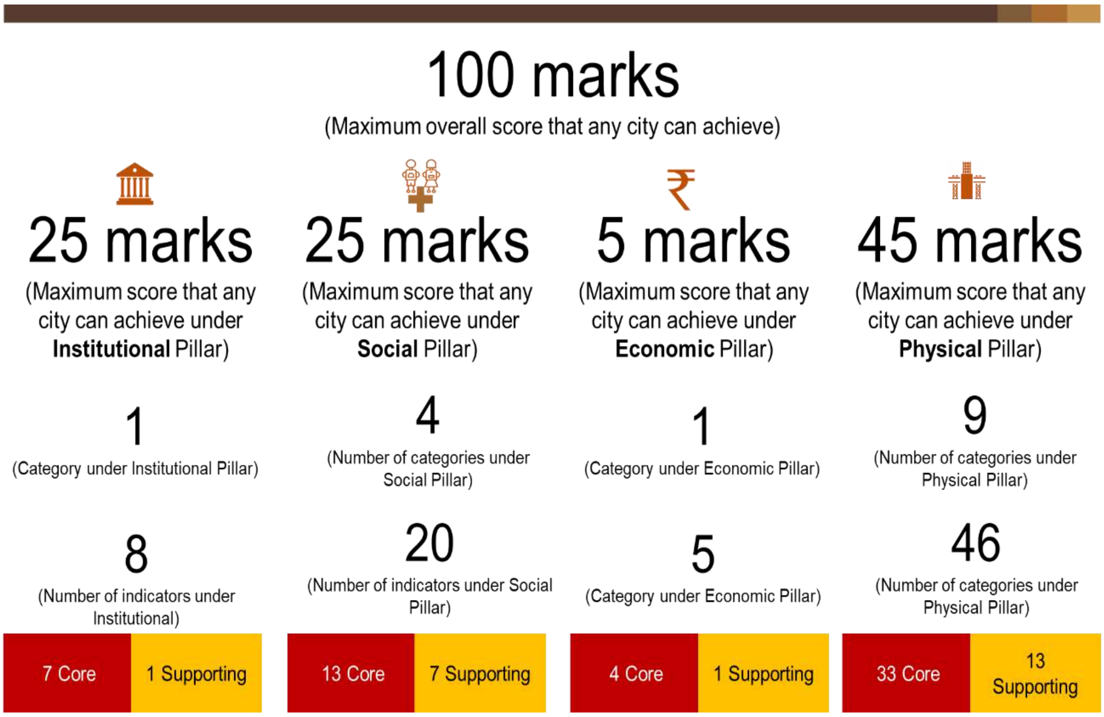
The performance achieved by cities against 79 indicators, will be assessed against given benchmarks. Where no international/national norms are available, city with the best performance in its group (population range) will be treated as a benchmark. The groups are given in the table below.

Table 2 Details on Population Range

Category	Population range
Category 1	Population ≥ 4 million
Category 2	1 million ≤ Population < 4 million
Category 3	0.5 million ≤ Population < 1 million
Category 4	Population < 0.5 million

3.3 Scoring Approach and Methodology

A city can earn a maximum score of 100 points for 79 indicators across four pillars. The pillar weights are as follows: Institutional (25 points), Social (25 points), Economy and Employment (5 points) and Physical (45 points). Based on the number and nature of indicators i.e., core vs. secondary, indicator wise maximum marks were computed.



100 marks
(Maximum overall score that any city can achieve)
25 marks
(Maximum score that any city can achieve under Institutional Pillar)
25 marks
(Maximum score that any city can achieve under Social Pillar)
5 marks
(Maximum score that any city can achieve under Economic Pillar)
45 marks
(Maximum score that any city can achieve under Physical Pillar)
1
(Category under Institutional Pillar)
4
(Number of categories under Social Pillar)
1
(Category under Economic Pillar)
9
(Number of categories under Physical Pillar)
8
(Number of indicators under Institutional)
20
(Number of indicators under Social Pillar)
5
(Category under Economic Pillar)
46
(Number of categories under Physical Pillar)
7 Core
1 Supporting
13 Core
7 Supporting
4 Core
1 Supporting
33 Core
13 Supporting

Dimensional Index Methodology (DIM) has been used to compute scores for each indicator with reference to “maximum within the comparison group” or “absolute benchmarks”. For indicators where benchmarks are available, cities getting the benchmark score (or above) are given the maximum mark, and the marks awarded to other cities are calculated proportionately. For indicators where benchmarks are not available, the best performing cities in each population group are given the maximum mark, and the marks awarded to other cities (within the population group) are calculated proportionately. For indicators where benchmarks do not exist, the city data has been tested for outliers before scoring.

3.4 Scoring Normalisation:

To construct aggregate scores across cities as well as to make the scores across indicators comparable, indicator values were normalised using a min-max approach. The following formula was used to normalise the indicator values-

$$\frac{indicator\ value\ for\ the\ city - indicator\ value\ for\ the\ worst\ performing\ city}{benchmark - \ indicator\ value\ for\ the\ worst\ performing\ city}$$

This approach would restrict the normalised indicator value between 0 and 1. Cities that met or exceeded the benchmark received a normalised indicator value of 1. Worst performing cities are given a normalised indicator value of 0. After normalisation, the normalised value is weighted according to the category and the indicator being core or supporting.

To illustrate, consider the indicator 12.3 Quality of Water Supplied in the Category 12 for Assured Water Supply. If in City A 50% of the water samples collected qualify the potable water standards specified by the CPHEEO, and only 10% of the samples from worst performing city qualify the standards. Then, the normalised value for the indicator for city A would be 0.44 [(0.5-0.1)/(1-0.1)].

The weight for indicator 12.3 is 1.03, so the final weighted score for City A would come out to 0.45 [1.03*0.44].

4. Data Collection and Verification

4.1 Submission of Data by the cities

The Liveability Assessment is based on secondary data submitted by the urban local bodies and other concerned government agencies (collectively called as data owners). The 79 indicators were broken down into a set of easy to understand and relatable 553 questions mapped to data owners. Submission of the data was enabled through an online data entry portal on the smartnet platform of the Ministry. The portal also allowed the ULBs to download the liveability assessment questionnaire and upload filled in questionnaire. To familiarise and assist cities in identifying, mapping and collation of data points, a city level nodal person was available during the entire period of data submission process.

4.2 Mapping of Data Owners for the City

For the assessment of liveability indices broadly 12 data owners such as Central/state Pollution control board, Development authority, DISCOM/Electricity Board, State Disaster Management Authority, State Education Department, State Health department, State Renewable energy and development agency, State sales and commercial taxes department, town and country planning department, Traffic and police department, Transport authority, and Urban local body were identified to respond to the questions on the portal. However, during state workshop and subsequent city level discussions, more data owners were mapped to respond to different categories and sub categories. The following table provides the details of city level data owners mapped under the 12 data owner.

Table 3:Details of Data Owners

Designated data owners	Subcategories	Data owners at city level
Urban Local Body	For Accounts Related Questions	Aizawl Municipal Corporation
Urban Local Body	For Park and Recreation Related Questions	Aizawl Municipal Corporation
Urban Local Body	For Water Supply and Drainage related questions	Aizawl Municipal Corporation
Urban Local Body	For Heritage sites related data	Aizawl Municipal Corporation
Urban Local Body	For Ecological sites related data	Aizawl Municipal Corporation
Urban Local Body	For Housing related data	Aizawl Municipal Corporation
Urban Local Body	For Building plan related data	Aizawl Municipal Corporation
Urban Local Body	For Roads related data	Aizawl Municipal Corporation
Urban Local Body	For Solid waste management related data	Aizawl Municipal Corporation
Urban Local Body	For IT services related data	Aizawl Municipal Corporation
Urban Local Body	For Vendor committee related data	Aizawl Municipal Corporation
Urban Local Body	Any other departments involved in providing data for questions mentioned under Urban Local Body	
For questions under Central / state Pollution control Board	Water Quality, Air Quality, Noise Quality	Mizoram Pollution Control Board
Development Authority	Building Infrastructure	Urban Development and Poverty Alleviation Aizawl Municipal Corporation
	Construction planning	
	Green Building	

Designated data owners	Subcategories	Data owners at city level
	Rain water harvesting	
	Universal Design Principle	
DISCOM/Electricity Board	Electrical Connection/ Grievance Redressal/ Power supply	Power and electricity department
State Disaster management authority		Disaster management and rehabilitation department
State Education Department		State education department, Mizoram
State Health Department	Health care professionals	Health Department, GoM
State Health Department	Citizen Services	
State Health Department	Disease Prevalence	
State Health Department	Health Infrastructure	
State Renewable Energy Development Agency		-
State Sales / Commercial Taxes Department		Taxation Department
Town and Country Planning Department	Land Use	Aizawl Municipal Corporation
Traffic and Police Department		Home Department
Transport Authorities	Buses	Transport Department, Mizoram
Transport Authorities	Registered Vehicles	
Transport Authorities	Sub urban rail transport	
Transport Authorities	Mono Rail Authority	
Transport Authorities	Tramways	
Transport Authorities	Marine Transport Authority	

4.3 List of secondary documents available as supportive

City has provided supporting documents/evidences against the responses given by city on the online portal. In support of their responses on the portal, city submitted 7 number of documents. Documents submitted includes reports, official orders, copy of data maintained in official register, signed copy of questionnaire, and signed letters/submissions from concern departments. Verification includes mapping of documents against responses given by city, checking the type/category of documents, and validation of data provided.

The following table presents the data owner wise number of documents:

Table 4: Data owner wise number of secondary documents submitted by city

Data Owners	Number of Documents
Sales and Commercial Taxes	0
State Education Department	0
DISCOM/Electricity Department	0
Traffic and Police Department	0
Development Authority	0
Pollution Control Board	1
State Renewable Energy Department	0
Town and Country Planning	0
State Health Department	0
Transport Authority	2
Disaster Management	0
Urban Local Body	4
Total	7

4.4 Data Verification

A three-stage data quality check comprising verification of data against secondary documents furnished by data owners, logical inconsistency checks including outliers, and physical audit for select indicators (Refer the exhibit below) is being undertaken. The objective of the data quality check is to ensure that data from the source documents are accurate and verifiable. Sources of data included reports, administrative data, survey results and other statistical records, log books among other.

Physical audit of eight indicators – one indicator from the Institutional pillar, one from the Social pillar, one from the Economy pillar and five from the Physical pillar is also being carried out by the

field team to ascertain the degree of reliability of data reported by the cities. The list of these eight indicators is presented below:

1.2 | Percentage of services integrated through Command Centre

2.3 | Hotel occupancy

3.4 | Percentage of schools with access to digital education

5.1| Number of streets, public places, junctions covered through surveillance systems

6.5 | Percentage of vendors registered and provided formal spaces

11.7 | Availability of Passenger Information System

11.11 | Percentage of traffic intersections with pedestrian crossing facilities

11.12 | Extent to which universal accessibility is incorporated in public rights-of-way

For a set of five indicators namely, unemployment rate, mode share of public transport, mode share of non-motorised transport, quality of water supplied and level of noise pollution, existing datasets were found to be not available consistently across all cities and/or were inadequate. To help cities that do not have data on these five indicators, dipstick assessments are being carried to fill data gaps.

6.4 | Unemployment Rate

11.3 | Mode share of public transport

11.5 | Mode share of Non Motorized Transport

12.3 | Quality of Water Supplied

15.4 | Level of Noise Pollution

4.5 Physical Audit

The following map presents the indicators audited at city level.

5. City Score on 15 categories of Assessment

Liveability Assessment covered 15 categories and 78 indicators. The below table presents the scores for all 15 indicators namely governance, identity & culture, education, health, safety and security, economy & employment, housing & inclusiveness, public open spaces, mixed land use & compactness, power supply, transport & mobility, assured water supply, waste water management, solid waste management and reduced pollution.

Table 5: Category wise scores

Categories	Scores in Percentage
Governance	47.29%
Identity & Culture	0%
Education	76%
Health	98%
Safety & Security	67%

Economy & Employment	43%
Housing & Inclusiveness	100%
Public Open Spaces	1%
Mixed Land Use & Compactness	0%
Power Supply	24%
Transport & Mobility	55%
Assured Water Supply	47%
Waste Water Management	40%
Solid Waste Management	50%
Reduced Pollution	79%

The rank of the city is based on the performance and scores in each of the category. The final city rank is submitted separately.

Executive Summary

Assessment of liveability indices is an initiative by the Ministry of Housing and Urban Affairs to improve quality of life of citizens and achieve sustainable development goals by encouraging cities to adopt "outcome based" approach for urban planning. Assessment process aimed to provide opportunity to cities to review the development components holistically by involving 79 measurable indicators categorized under governance, health, education, safety, economy, power supply, transportation and mobility, identity, culture, housing, waste management and pollution.

This report highlights the assessment process, key milestones, and the final outcome of the data submitted. Implementation of liveability assessment commenced formally on 19th January 2018. A national level workshop was organized on 13th February 2018 to explain the importance and process of liveability assessment and get feedback on methodology from the city authorities.

This was followed by the next stage of Questionnaire development. The questionnaire was arranged under 12 categories representing 12 data owners namely urban local body, Central and state pollution control board, development authority, DISCOM/Electricity board, State disaster management authority, state education department, state health department, state renewable energy development agency, state sales and commercial taxes department, town and country planning department, traffic and police department and transport authorities.

An online data entry portal was developed to facilitate data submission by the cities. Each city had a unique log in to access the portal and submit the data. Both online and off-line options (download the questionnaire in an excel) to submit the data were available for cities. An email help desk was set up for the cities to raise any queries and seek clarification when responding to the questions.

A team for each state comprising of State Coordinator and City Coordinator (one per city) was deployed that facilitated the process and supported the cities. A total of 6 regional coordinators/ consultants, 29 State Coordinators, and 99 city coordinators were deployed across 116 cities. Training for state coordinators was held from 26th to 28th February 2018 at Chennai to make coordinators understand overall liveability assessment, indicators, data sources, protocols and roles and responsibilities.

City Reconnaissance Meetings were initiated by the state and city coordinators. The discussion began with discussions to finalize the state workshop schedule, mapping of data owners, and assist cities in data collection. The City Coordinators were based in the cities for over 6 weeks and during this time, they liase with ULB and other data owners to explain the liveability framework, online portal, and facilitate the online submission.

A total of 33 state workshops were conducted at the state level. The objective of the workshop was to orient the city stakeholders on liveability assessment, indicators, components of data collection, timelines, expectations of support and support extended by MoHUA. The state level workshops brought various city level departments on a single platform to understand and discuss the methodology and components of city liveability assessment.

Nodal agency at state level supported by the City and State Coordinator and city level (Municipality corporation/smart city limited) coordinated with city specific data owners/departments for data gathering, collation, and submission. Nodal persons in each department were appointed for timely data collection and submission. Of 116, 112 cities submitted data as per the timeline on 16th April 2018.

Post submission, the city and state coordinators supported by the central team followed up extensively with the cities to support secondary documents as evidence to substantiate their submissions. Secondary documents such as reports, official orders, copy of office register, signed copy of liveability assessment questionnaire furnished by cities against the submitted data. Documents are verified to map the documents for the reponses provided by city and to check the type data provided by city. The document check outcomes were shared with the cities as a part of data quality check.

For checking consistency of data, logical check of data, verifying data from other public sources were undertaken. Quality check was done to ensure data validity and provide opportunity to cities to review the data provided by them and correct in case of wrong data entry.

For 8 selected indicators namely, percentage of services integrated through command and control center, hotel occupancy rate, percentage of schools with access to digital education, number of CCTV cameras per unit road length, percentage of vendors registered and provided formal spaces, availability of passenger information system, percentage of traffic intersection with pedestrian crossing facility, and extent to which universal accessibility is incorporated in public rights of way. Physical audit was conducted in 110 cities by physical auditors appointed and trained by the consortium. In consultation with ULB nodal person, locations and indicators for physical audit was selected in each city. A mobile based application was developed to capture the physical audit related data.

Primary data collection was done for five indicators such as unemployment rates, mode share of public transport, mode share of non-motorized transport, quality of water supplied, and level of noise pollution. Protocols for water and noise test were prepared in consultation with experts. Water quality test involved physical, chemical and bacteriological test of water as per the CPCB norms. For testing quality of water at consumer end, the auditors worked closely with the ULB and Water department. Samples were collected from consumer end and submitted to the lab suggested by city. For noise pollution, in about 20 cities the state pollution board or city level

environment department took the responsibility for providing noise pollution data as per the protocols. In rest of the cities, mobile based application was used to measure noise pollution.

During implementation, MoHUA facilitated the process by conducting video conferences with cities to address any queries, reiterate the importance, and ensure that cities adequately engages in the process and submit their responses in time and respond to requests for clarifications.

In addition to secondary data collection, physical audit and primary data collection, citizen survey was conducted to understand their perception and level of satisfaction on various services such as health, education, water supply, electricity, waste management etc. provided by urban local bodies. Over 60000 citizens participated in the survey across India.

The final scores and ranks have been generated based on the scoring methodology that has been discussed extensively and minor modifications made that are summarized as below:

#	**Challenges**	**Proposed Solutions**
1	Only 23 cities of 111 cities have City Mobility Plan (CMP) or any and hence able to provide data for Mode Share of Public Transport and Non-Motorised Transport. To address the data gap, as advised by the MoHUA, the consortia undertook a sample dipstick across all cities covering a sample of 150 Households. Understandably, the dipstick findings will not match the rigor of a CMP.	We recommend the following: 1) Cities which have provided CMP Data will be evaluated on 100% of the maximum score 2) For the cities where the dipstick data is used, the city receives a 50% discount on the overall score Alternatively, another approach is to assign 0 score to all 88 cities that don't have a CMP
2	Variance was observed on data reported by cities on road network and data presented in the smart city proposals during the verifications.	We recommend taking the data reported by the cities in the Smart City Proposals.
3	There is no secondary source/ organization that provides unemployment data at city level. As a result, most cities do not have the data. Fully cognizance of the challenges of generating this data in a short span of time, it was agreed to collect this data through a dipstick survey on lines of NSSO questions. The	The indicator on unemployment will be excluded from scores. For final ranking, the cities will be scored on 78 indicators.

#	Challenges	Proposed Solutions
	data generated needs further scrutiny and triangulation with some inputs from experts. This may not be possible in the short window.	
4	Many cities did not have data on noise pollution and it was decided that data will be collected using a mobile app for all the 111 cities. However, many cities have expressed reservations with the approach especially with respect to the reliability of using this data. Further, some cities have relied on the SPCB to collect the data as per the approach proposed by the consortia. Thus, noise pollution data is currently from two sources: 1. SPCB- 20 cities 2. Noise-based app- 91 cities	The data collected through the primary survey will be used for scoring the cities. Currently, there is no differential scoring for the data from the SPCB and the data collected through the mobile app. However, a certain higher weightage can be provided to those cities which used the state apparatus to collect noise pollution data.
5	For the indicator on quality of water supplied, the methodology document states that samples should be drawn both at the treatment plant outlet as well as the consumer end. However, the data provided by the cities were predominantly from the distribution point. Hence for consumer end results with MoHUA intervention, consortia coordinated with cities to collect the data at the consumer end. The cities facilitated the testing. The outcome of the process is as below: 1. Sample given- 102 cities 2. Report received- 86 cities 3. Report awaited- 16 cities 4. Tests not completed due to lack of cooperation and other reasons – 9	The maximum score for this indicator will be distributed equally (50%) for results based on samples from the treatment plant and consumer end. Cities that did not complete tests or provide the results will be given a score 0 for against consumer end tests.
6	City level population is not projected annually by most of the cities. So, estimates for 2017 population are not available with the cities.	As recommended by MoHUA, 2011 census population is being used for the ranking purpose.
7	The age category specific data for 9 cities is not available at a city level	The age category specific population data has been taken at a district level for these cities.

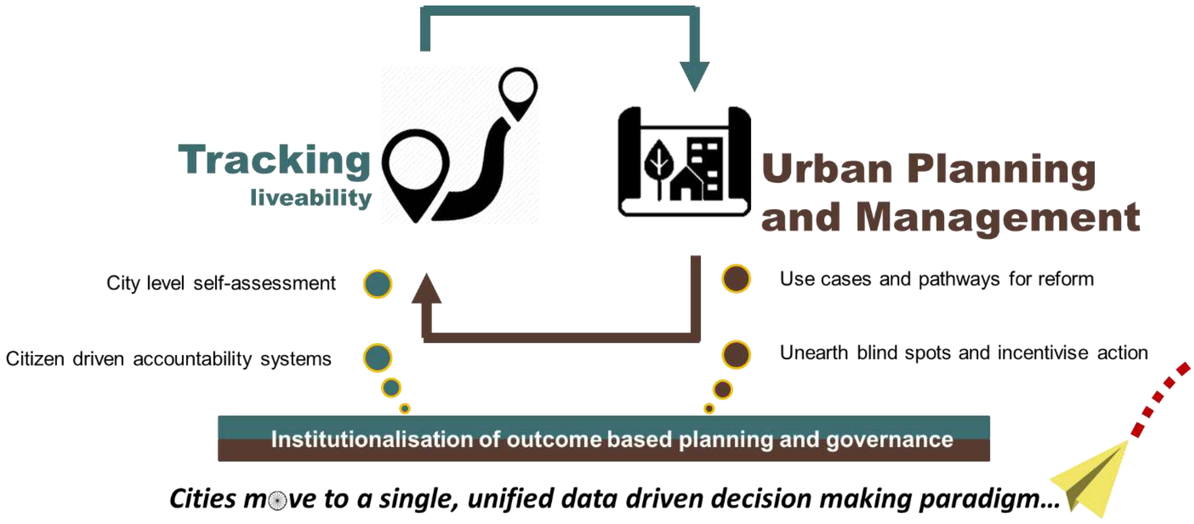
#	Challenges	Proposed Solutions
8	Indicators on non-motorised transports like- Dedicated bicycle tracks, bicycle parking facilities and mode share of non-motorised transport are not relevant for hilly terrains.	As discussed during the PMC meeting, these indicators have been treated as non-applicable for the hilly cities and the weights have been redistributed among other indicators within the same category.
9	The indicator on increase in professional tax is not relevant to cities which do not levy the professional tax.	As discussed during the PMC meeting, this indicator has been non-applicable to the cities belonging to states where professional tax is not levied, and the weights have been redistributed among other indicators within the same category.
10	The indicator on increase in VAT collection is not applicable to Port Blair and Kavaratti, as there was no provision of VAT collection in these cities.	As discussed during the PMC meeting, these indicatosr has been treated as non-applicable for these two cities and the weights have been redistributed among other indicators within the same category.
11	Indicator on coverage of basic services to slum households does not concern cities with no slums (notified/ non-notified.	As discussed during the PMC meeting, this indicators has been treated as non-applicable for these cities and the weights have been redistributed among other indicators within the same category.

1. Introduction

The Ministry of Housing and Urban Affairs (MoHUA) is implementing several flagship urban missions such as the Smart Cities Mission (SCM), Atal Mission for Urban Rejuvenation and Transformation (AMRUT), Heritage City Development and Augmentation Yojana (HRIDAY), Housing for All (HFA). Theses mission along with other transformative initiatives of the Government including National Water Mission, Power for All, National Health Mission are aimed at making Indian cities more 'liveable.' The overarching goal of these initiatives is to move from an input-based approach to a 'citizen centric-outcome based' assessment of urban liveability.

To develop a common minimum framework for cities to assess their existing status and chart their pathway towards providing a better quality of life to their citizens, the MoHUA developed a set of 'Liveability Standards' relevant to cities to generate a Liveability Index and ranking of cities. These standards were launched in June, 2017. The MoHUA has planned to conduct an 'Annual Assessment of Liveability Standards in Cities – an ambitious national project that will involve yearly submission of data by cities across the various indicators, compilation and analysis, development of indices and ranking of cities. The Liveability Index is envisioned as a 360° tool for tracking, planning and transforming Indian cities. The Liveability Index is aimed at the following objectives:

- Providing strong evidence-based approach for future interventions and investments to deliver liveability outcomes
- Catalysing actions to improve the overall quality of the city's liveability and achieve broader development outcomes including the Sustainable Development Goals
- Assessing the implementation of government policies and schemes governing characteristics of cities that can contribute to creating liveable communities



Tracking

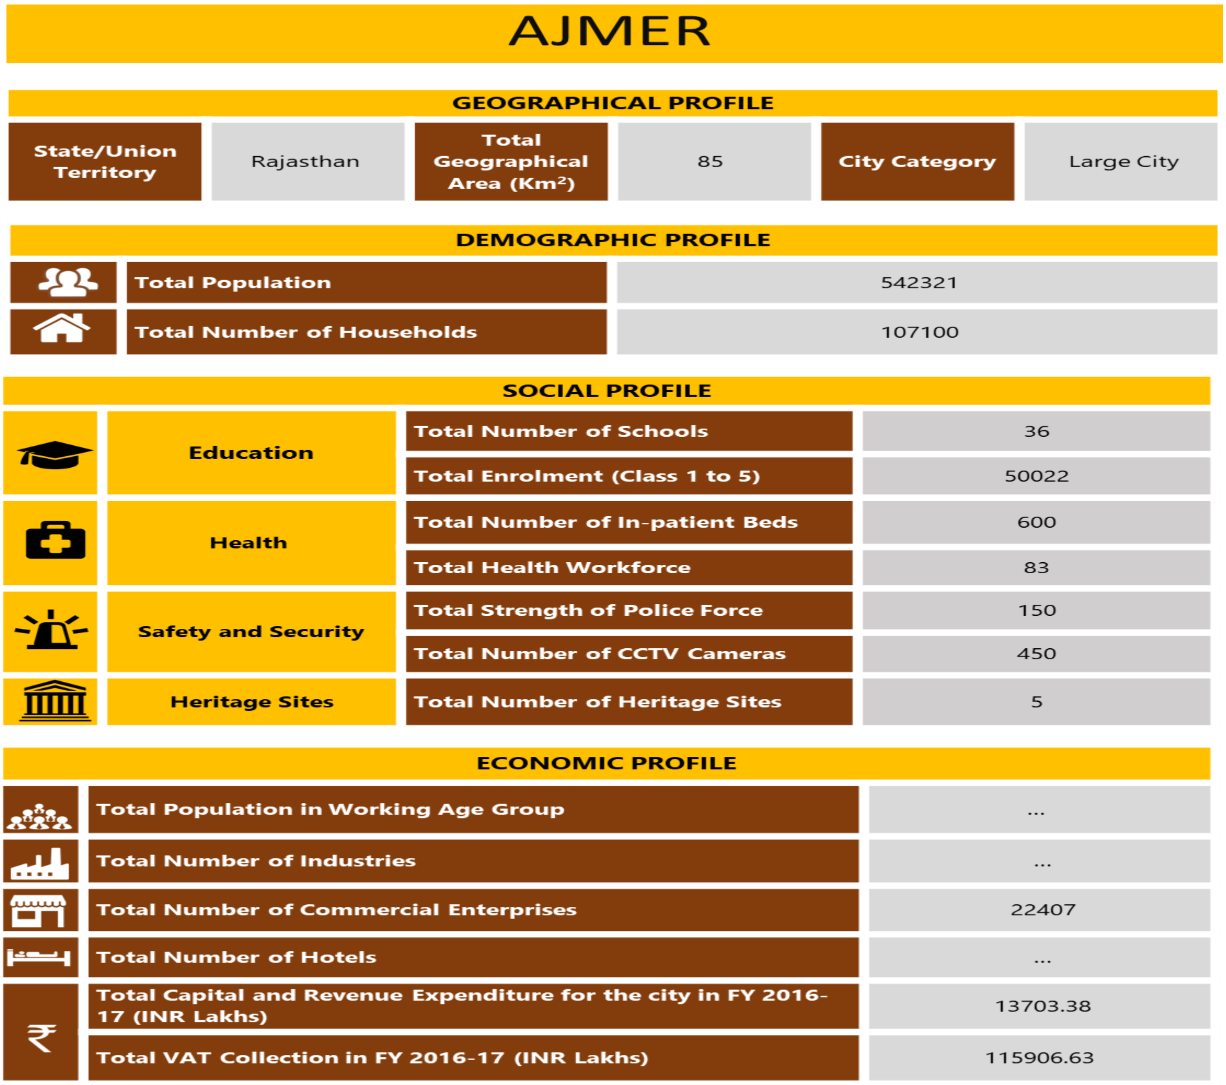
and Management
City level self-assessment
Citizen driven accountability systems
Use cases and pathways for reform
Unearth blind spots and incentivise action
Institutionalisation of outcome based planning and governance

Cities move to a single, unified data driven decision making paradigm...

The first round of the assessment commenced in January 2018 covering 116 major cities including smart cities, capital cities and cities with population of above one million each. Implementation of the liveability assessment commenced in January 2018 with a national level orientation workshop for the urban local bodies. The workshop aimed at orienting the states and urban local bodies on the overall framework, indicators, data sources, methodology and key milestones and timelines involved in the liveability assessment. Subsequently, a series of State/ Union Territory level orientation workshops were carried out in 33 states/UTs for a detailed discussion on the framework. Online data collection commenced from 9th March through an online data collection platform that supported both online and offline data submission modes. On the date of closure of the online data entry portal i.e., 16th April, 2018 112 cities submitted their data. Subsequently, comprehensive checks on the submitted data was undertaken that involved checking for outliers, logical inconsistencies etc. post which round-1 of data reconciliation was conducted. This draft report is based on round-1 of reconciled data as on 28th April, 2018.

2. City Profile

This chapter presents the city profile -Geographic and Demographic, Social (Education Health, Safety and Security, Heritage), Economic profile, and Physical (Water, sanitation and Waste Management, Electricity, Open space and roads).



AJMER

GEOGRAPHICAL PROFILE

State/Union Territory	Rajasthan	Total Geographical Area (Km^2)	85	City Category	Large City

DEMOGRAPHIC PROFILE

Total Population	542321
Total Number of Households	107100

SOCIAL PROFILE

Education	Total Number of Schools	36
	Total Enrolment (Class 1 to 5)	50022
Health	Total Number of In-patient Beds	600
	Total Health Workforce	83

Total VAT Collection in FY 2016-17 (INR Lakhs)	115906.63

PHYSICAL PROFILE

	Water	**Average Quantity of Water Supplied (MLD)**	95
		Total Number of Water Connection	151287
	Sanitation Facilities	**Total number of households with access to individual toilets in the city**	...
		Total number of households in the city with access to community toilets in the city	957
	Solid Waste Management	**Daily average quantity of municipal solid waste collected in the city (Tonnes/day)**	185
		Total number of households covered through door-to-door collection of solid waste	128094
	Waste Water	**Daily Average Quantum of Waste Water Generated in the City (MLD)**	15
		Daily average quantum of waste water treated by STPs in the city (MLD)	15
	Electricity	**Total number of authorized electrical connections in the city**	644595
		Total electricity supplied to the city (kWh)	8249.6
	Public and Open Spaces	**Total area covered by green spaces in the city (m^2)**	...
	Roads and Transport	**Total Length of Road Network in the City (Km)**	129.8
		Total length of arterial and sub-arterial road network in the city (Km)	129.8
		Total length of footpath (wider than 1.2 metres) in the city along the street network (Km)	2.8

3. Liveability Framework and Indicators

The Liveability Framework comprises a total of 79 indicators (57 Core Indicators and 22 Supporting Indicators). A core indicator carries 70% weightage and a supporting indicator carries 30% weightage. These indicators are grouped under 15 thematic categories which in turn are part of four pillars of comprehensive development of cities i.e., institutional, social, economic and physical. Based on the performance of cities against the various core and supporting indicators, various 'Category Sub-Indexes' and a composite 'City Liveability Index' will be developed for each city.

3.1 Scoring and Computing Category Indices of Liveability

The set of 79 indicators, associated categories and pillars are presented in the table below:

Table 1 List of Pillars, Categories and Indicators

Pillars of Comprehensive Development	Category	Indicators
Institutional	1. Governance	1.1 Percentage of citizen services available online
		1.2 Percentage of services integrated through Command Centre
		1.3 Percentage of citizens using online services
		1.4 Average delay in grievance redressal
		1.5 Tax collected as percentage of tax billed
		1.6 Extent of cost recovery (O&M) in water supply services
		1.7 Capital spending as percentage of total expenditure
		1.8 Percentage of population covered under Ward Committees/Area *Sabhas*
Social	**2. Identity and Culture**	2.1 Restoration and reuse of historic buildings
		2.2 Percentage of ecologically important areas covered through projects for restoration
		2.3 Hotel occupancy
		2.4 Percentage of budget allocated towards cultural/sports activities
		2.5 Number of cultural/sports events hosted by city
	3. Education	3.1 Percentage of school-aged population enrolled in

Pillars of Comprehensive Development	Category	Indicators
		schools
		3.2 Percentage of female school-aged population enrolled in schools
		3.3 Primary education student-teacher ratio
		3.4 Percentage of schools with access to digital education
		3.5 Percentage of students completing primary education
		3.6 Percentage of students completing secondary education
	4. Health	4.1 Number of in-patient hospital beds per 10,000 population
		4.2 Healthcare professionals per 10,000 population
		4.3 Average response time in case of health emergencies
		4.4 Period prevalence of water borne diseases
		4.5 Period prevalence of vector borne diseases
	5. Safety and Security	5.1 Number of CCTV Cameras
		5.2 Number of recorded crimes per lakh population
		5.3 Extent of crimes recorded against women, children and elderly per year
		5.4 Transport-related fatality per lakh population
Economic	**6. Economy and Employment**	6.1 Increase in VAT/GST collection
		6.2 Increase in collection of Professional Tax
		6.3 Increase in issuance of Construction permits
		6.4 Unemployment rate
		6.5 Percentage of vendors registered and provided formal spaces
Physical	**7. Housing and Inclusiveness**	7.1 Percentage of Slum/EWS households covered through formal/affordable housing
		7.2 Percentage of slum areas covered through basic services
	8. Public Open Spaces	8.1 Per capita availability of green spaces
		8.2 Per capita availability of public and recreational places
	9. Mixed Land Use and Compactness	9.1 Share of mixed land use area in overall city land use
		9.2 Net Density

Pillars of Comprehensive Development	Category	Indicators
	10. Power Supply	10.1 Percentage of city population with authorized electrical services
		10.2 Percentage of electrical connections covered through smart meters
		10.3 Average number of electrical interruptions per year
		10.4 Average length of electrical interruptions per year
		10.5 Percentage of total energy derived from renewable sources
		10.6 Energy consumption per unit - water supply and sewerage
		10.7 Energy consumption per unit - street lighting
		10.8 Percentage of new and redeveloped buildings following green building norms
		10.9 Total energy consumption per capita
	11. Transportation and Mobility	11.1 Geographical coverage of public transport
		11.2 Availability of public transport
		11.3 Mode share of public transport
		11.4 Percentage of road network with dedicated bicycle tracks
		11.5 Percentage of interchanges with bicycle parking facilities
		11.6 Mode share of non-motorized transport
		11.7 Availability of Passenger Information System
		11.8 Extent of signal synchronization
		11.9 Availability of paid parking spaces
		11.10 Percentage coverage of footpaths – wider than 1.2 m
		11.11 Percentage of traffic intersections with pedestrian crossing facilities
		11.12 Extent to which universal accessibility is incorporated in public rights-of-way
	12. Assured Water Supply	12.1 Household level coverage of direct water supply connections
		12.2 Per capita supply of water
		12.3 Quality of water supplied
		12.4 Level of non-revenue water – NRW
		12.5 Percentage of water connections covered through

Pillars of Comprehensive Development	Category	Indicators
		meters
		12.6 Percentage of plots with rainwater harvesting facility
	13. Waste Water Management	13.1 Coverage of toilets
		13.2 Coverage of sewerage network and/or septage
		13.3 Collection efficiency of sewerage network
		13.4 Extent of reuse and recycling of waste water
		13.5 Coverage of storm water drains
	14. Solid Waste Management	14.1 Household level coverage of municipal solid waste collection
		14.2 Efficiency of collection of municipal solid waste
		14.3 Extent of municipal solid waste recovered through reuse
	15. Reduced Pollution	15.1 Concentration of SO2- air pollution
		15.2 Concentration of NO2- air pollution
		15.3 Concentration of PM10 - air pollution
		15.4 Level of noise pollution
		15.5 Quality of water in public surface water bodies

3.2 Scoring and Computing Category Indices of Liveability

The performance achieved by cities against 79 indicators, will be assessed against given benchmarks. Where no international/national norms are available, city with the best performance in its group (population range) will be treated as a benchmark. The groups are given in the table below.

Table 2 Details on Population Range

Category	Population range
Category 1	Population ≥ 4 million
Category 2	1 million ≤ Population < 4 million
Category 3	0.5 million ≤ Population < 1 million
Category 4	Population < 0.5 million

3.3 Scoring Approach and Methodology

A city can earn a maximum score of 100 points for 79 indicators across four pillars. The pillar weights are as follows: Institutional (25 points), Social (25 points), Economy and Employment (5 points) and Physical (45 points). Based on the number and nature of indicators i.e., core vs. secondary, indicator wise maximum marks were computed.

100 marks

(Maximum overall score that any city can achieve)

25 marks	25 marks	5 marks	45 marks
(Maximum score that any city can achieve under **Institutional** Pillar)	(Maximum score that any city can achieve under **Social** Pillar)	(Maximum score that any city can achieve under **Economic** Pillar)	(Maximum score that any city can achieve under **Physical** Pillar)
1	4	1	9
(Category under Institutional Pillar)	(Number of categories under Social Pillar)	(Category under Economic Pillar)	(Number of categories under Physical Pillar)
8	20	5	46
(Number of indicators under Institutional)	(Number of indicators under Social Pillar)	(Category under Economic Pillar)	(Number of categories under Physical Pillar)
7 Core 1 Supporting	13 Core 7 Supporting	4 Core 1 Supporting	33 Core 13 Supporting

Dimensional Index Methodology (DIM) has been used to compute scores for each indicator with reference to "maximum within the comparison group" or "absolute benchmarks". For indicators where benchmarks are available, cities getting the benchmark score (or above) are given the maximum mark, and the marks awarded to other cities are calculated proportionately. For indicators where benchmarks are not available, the best performing cities in each population group are given the maximum mark, and the marks awarded to other cities (within the population group) are calculated proportionately. For indicators where benchmarks do not exist, the city data has been tested for outliers before scoring.

3.4 Scoring Normalisation:

To construct aggregate scores across cities as well as to make the scores across indicators comparable, indicator values were normalised using a min-max approach. The following formula was used to normalise the indicator values-

$$\frac{indicator\ value\ for\ the\ city - indicator\ value\ for\ the\ worst\ performing\ city}{benchmark - \ indicator\ value\ for\ the\ worst\ performing\ city}$$

This approach would restrict the normalised indicator value between 0 and 1. Cities that met or exceeded the benchmark received a normalised indicator value of 1. Worst performing cities are given a normalised indicator value of 0. After normalisation, the normalised value is weighted according to the category and the indicator being core or supporting.

To illustrate, consider the indicator 12.3 Quality of Water Supplied in the Category 12 for Assured Water Supply. If in City A 50% of the water samples collected qualify the potable water standards specified by the CPHEEO, and only 10% of the samples from worst performing city qualify the standards. Then, the normalised value for the indicator for city A would be 0.44 [(0.5-0.1)/(1-0.1)].

The weight for indicator 12.3 is 1.03, so the final weighted score for City A would come out to 0.45 [1.03*0.44].

4. Data Collection and Verification

4.1 Submission of Data by the cities

The Liveability Assessment is based on secondary data submitted by the urban local bodies and other concerned government agencies (collectively called as data owners). The 79 indicators were broken down into a set of easy to understand and relatable 553 questions mapped to data owners. Submission of the data was enabled through an online data entry portal on the smartnet platform of the Ministry. The portal also allowed the ULBs to download the liveability assessment questionnaire and upload filled in questionnaire. To familiarise and assist cities in identifying, mapping and collation of data points, a city level nodal person was available during the entire period of data submission process.

4.2 Mapping of Data Owners for the City

For the assessment of liveability indices broadly 12 data owners such as Central/state Pollution control board, Development authority, DISCOM/Electricity Board, State Disaster Management Authority, State Education Department, State Health department, State Renewable energy and development agency, State sales and commercial taxes department, town and country planning department, Traffic and police department, Transport authority, and Urban local body were identified to respond to the questions on the portal. However, during state workshop and subsequent city level discussions, more data owners were mapped to respond to different categories and sub categories. The following table provides the details of city level data owners mapped under the 12 data owner.

Table 3:Details of Data Owners

Designated data owners	Subcategories	Data owners at city level
Urban Local Body	For Accounts Related Questions	Nagar Nigam , Tarun , NeeruGurjar
Urban Local Body	For Park and Recreation Related Questions	ADA& Nagar Nigam
Urban Local Body	For Water Supply and Drainage related questions	PHED & Nagar Nigam NirmanShakha
Urban Local Body	For Heritage sites related data	
Urban Local Body	For Ecological sites related data	
Urban Local Body	For Housing related data	
Urban Local Body	For Building plan related data	ADA & Town & Country Planning
Urban Local Body	For Roads related data	PWD
Urban Local Body	For Solid waste management related data	Nagar Nigam NirmanShakha

Transport Authorities	Buses	Transport office
	Registered Vehicles	Transport office
	Sub urban rail transport	Not Applicable
	Mono Rail Authority	Not Applicable
	Tramways	Not Applicable
	Marine Transport Authority	Not Applicable

4.3 List of secondary documents available as supportive

City has provided supporting documents/evidences against the responses given by city on the online portal. In support of their responses on the portal, city submitted 40 number of documents. Documents submitted includes reports, official orders, copy of data maintained in official register, signed copy of questionnaire, and signed letters/submissions from concern departments.

Verification includes mapping of documents against responses given by city, checking the type/category of documents, and validation of data provided.

The following table presents the data owner wise number of documents:

Table 4: Data owner wise number of secondary documents submitted by city

Data Owners	Number of Documents
Sales and Commercial Taxes	0
State Education Department	0
DISCOM/Electricity Department	0
Traffic and Police Department	0
Development Authority	0
Pollution Control Board	0
State Renewable Energy Department	0
Town and Country Planning	0
State Health Department	0
Transport Authority	1
Disaster Management	0
Urban Local Body	39
Total	40*

4.4 Data Verification

A three-stage data quality check comprising verification of data against secondary documents furnished by data owners, logical inconsistency checks including outliers, and physical audit for select indicators (Refer the exhibit below) is being undertaken. The objective of the data quality check is to ensure that data from the source documents are accurate and verifiable. Sources of data included reports, administrative data, survey results and other statistical records, log books among other.

Physical audit of eight indicators – one indicator from the Institutional pillar, one from the Social pillar, one from the Economy pillar and five from the Physical pillar is also being carried out by the field team to ascertain the degree of reliability of data reported by the cities. The list of these eight indicators is presented below:

1.2 | Percentage of services integrated through Command Centre

2.3 | Hotel occupancy

3.4 | Percentage of schools with access to digital education

5.1 | Number of streets, public places, junctions covered through surveillance systems

6.5 | Percentage of vendors registered and provided formal spaces

11.7 | Availability of Passenger Information System

11.11 | Percentage of traffic intersections with pedestrian crossing facilities

11.12 | Extent to which universal accessibility is incorporated in public rights-of-way

For a set of five indicators namely, unemployment rate, mode share of public transport, mode share of non-motorised transport, quality of water supplied and level of noise pollution, existing datasets were found to be not available consistently across all cities and/or were inadequate. To help cities that do not have data on these five indicators, dipstick assessments are being carried to fill data gaps.

6.4 | Unemployment Rate

11.3 | Mode share of public transport

11.5 | Mode share of Non Motorized Transport

12.3 | Quality of Water Supplied

15.4 | Level of Noise Pollution

4.5 Physical Audit

The following map presents the indicators audited at city level.

5. City Score on 15 categories of Assessment

Liveability Assessment covered 15 categories and 78 indicators. The below table presents the scores for all 15 indicators namely governance, identity & culture, education, health, safety and security, economy & employment, housing & inclusiveness, public open spaces, mixed land use & compactness, power supply, transport & mobility, assured water supply, waste water management, solid waste management and reduced pollution.

Table 5: Category wise scores

Categories	Scores in Percentage
Governance	43.08%
Identity & Culture	46%
Education	81%
Health	45%
Safety & Security	62%
Economy & Employment	22%
Housing & Inclusiveness	2%
Public Open Spaces	2%

Mixed Land Use & Compactness	50%
Power Supply	43%
Transport & Mobility	42%
Assured Water Supply	75%
Waste Water Management	61%
Solid Waste Management	61%
Reduced Pollution	3%

The rank of the city is based on the performance and scores in each of the category. The final city rank is submitted separately.

Executive Summary

Assessment of liveability indices is an initiative by the Ministry of Housing and Urban Affairs to improve quality of life of citizens and achieve sustainable development goals by encouraging cities to adopt "outcome based" approach for urban planning. Assessment process aimed to provide opportunity to cities to review the development components holistically by involving 79 measurable indicators categorized under governance, health, education, safety, economy, power supply, transportation and mobility, identity, culture, housing, waste management and pollution.

This report highlights the assessment process, key milestones, and the final outcome of the data submitted. Implementation of liveability assessment commenced formally on 19th January 2018. A national level workshop was organized on 13th February 2018 to explain the importance and process of liveability assessment and get feedback on methodology from the city authorities.

This was followed by the next stage of Questionnaire development. The questionnaire was arranged under 12 categories representing 12 data owners namely urban local body, Central and state pollution control board, development authority, DISCOM/Electricity board, State disaster management authority, state education department, state health department, state renewable energy development agency, state sales and commercial taxes department, town and country planning department, traffic and police department and transport authorities.

An online data entry portal was developed to facilitate data submission by the cities. Each city had a unique log in to access the portal and submit the data. Both online and off-line options (download the questionnaire in an excel) to submit the data were available for cities. An email help desk was set up for the cities to raise any queries and seek clarification when responding to the questions.

A team for each state comprising of State Coordinator and City Coordinator (one per city) was deployed that facilitated the process and supported the cities. A total of 6 regional coordinators/ consultants, 29 State Coordinators, and 99 city coordinators were deployed across 116 cities. Training for state coordinators was held from 26th to 28th February 2018 at Chennai to make coordinators understand overall liveability assessment, indicators, data sources, protocols and roles and responsibilities.

City Reconnaissance Meetings were initiated by the state and city coordinators. The discussion began with discussions to finalize the state workshop schedule, mapping of data owners, and assist cities in data collection. The City Coordinators were based in the cities for over 6 weeks and during this time, they liase with ULB and other data owners to explain the liveability framework, online portal, and facilitate the online submission.

A total of 33 state workshops were conducted at the state level. The objective of the workshop was to orient the city stakeholders on liveability assessment, indicators, components of data collection, timelines, expectations of support and support extended by MoHUA. The state level workshops brought various city level departments on a single platform to understand and discuss the methodology and components of city liveability assessment.

Nodal agency at state level supported by the City and State Coordinator and city level (Municipality corporation/smart city limited) coordinated with city specific data owners/departments for data gathering, collation, and submission. Nodal persons in each department were appointed for timely data collection and submission. Of 116, 112 cities submitted data as per the timeline on 16th April 2018.

Post submission, the city and state coordinators supported by the central team followed up extensively with the cities to support secondary documents as evidence to substantiate their submissions. Secondary documents such as reports, official orders, copy of office register, signed copy of liveability assessment questionnaire furnished by cities against the submitted data. Documents are verified to map the documents for the reponses provided by city and to check the type data provided by city. The document check outcomes were shared with the cities as a part of data quality check.

For checking consistency of data, logical check of data, verifying data from other public sources were undertaken. Quality check was done to ensure data validity and provide opportunity to cities to review the data provided by them and correct in case of wrong data entry.

For 8 selected indicators namely, percentage of services integrated through command and control center, hotel occupancy rate, percentage of schools with access to digital education, number of CCTV cameras per unit road length, percentage of vendors registered and provided formal spaces, availability of passenger information system, percentage of traffic intersection with pedestrian crossing facility, and extent to which universal accessibility is incorporated in public rights of way. Physical audit was conducted in 110 cities by physical auditors appointed and trained by the consortium. In consultation with ULB nodal person, locations and indicators for physical audit was selected in each city. A mobile based application was developed to capture the physical audit related data.

Primary data collection was done for five indicators such as unemployment rates, mode share of public transport, mode share of non-motorized transport, quality of water supplied, and level of noise pollution. Protocols for water and noise test were prepared in consultation with experts. Water quality test involved physical, chemical and bacteriological test of water as per the CPCB norms. For testing quality of water at consumer end, the auditors worked closely with the ULB and Water department. Samples were collected from consumer end and submitted to the lab suggested by city. For noise pollution, in about 20 cities the state pollution board or city level

environment department took the responsibility for providing noise pollution data as per the protocols. In rest of the cities, mobile based application was used to measure noise pollution.

During implementation, MoHUA facilitated the process by conducting video conferences with cities to address any queries, reiterate the importance, and ensure that cities adequately engages in the process and submit their responses in time and respond to requests for clarifications.

In addition to secondary data collection, physical audit and primary data collection, citizen survey was conducted to understand their perception and level of satisfaction on various services such as health, education, water supply, electricity, waste management etc. provided by urban local bodies. Over 60000 citizens participated in the survey across India.

The final scores and ranks have been generated based on the scoring methodology that has been discussed extensively and minor modifications made that are summarized as below:

#	**Challenges**	**Proposed Solutions**
1	Only 23 cities of 111 cities have City Mobility Plan (CMP) or any and hence able to provide data for Mode Share of Public Transport and Non-Motorised Transport. To address the data gap, as advised by the MoHUA, the consortia undertook a sample dipstick across all cities covering a sample of 150 Households. Understandably, the dipstick findings will not match the rigor of a CMP.	We recommend the following: 1) Cities which have provided CMP Data will be evaluated on 100% of the maximum score 2) For the cities where the dipstick data is used, the city receives a 50% discount on the overall score Alternatively, another approach is to assign 0 score to all 88 cities that don't have a CMP
2	Variance was observed on data reported by cities on road network and data presented in the smart city proposals during the verifications.	We recommend taking the data reported by the cities in the Smart City Proposals.
3	There is no secondary source/ organization that provides unemployment data at city level. As a result, most cities do not have the data. Fully cognizance of the challenges of generating this data in a short span of time, it was agreed to collect this data through a dipstick survey on lines of NSSO questions. The	The indicator on unemployment will be excluded from scores. For final ranking, the cities will be scored on 78 indicators.

#	Challenges	Proposed Solutions
	data generated needs further scrutiny and triangulation with some inputs from experts. This may not be possible in the short window.	
4	Many cities did not have data on noise pollution and it was decided that data will be collected using a mobile app for all the 111 cities. However, many cities have expressed reservations with the approach especially with respect to the reliability of using this data. Further, some cities have relied on the SPCB to collect the data as per the approach proposed by the consortia. Thus, noise pollution data is currently from two sources: 1. SPCB- 20 cities 2. Noise-based app- 91 cities	The data collected through the primary survey will be used for scoring the cities. Currently, there is no differential scoring for the data from the SPCB and the data collected through the mobile app. However, a certain higher weightage can be provided to those cities which used the state apparatus to collect noise pollution data.
5	For the indicator on quality of water supplied, the methodology document states that samples should be drawn both at the treatment plant outlet as well as the consumer end. However, the data provided by the cities were predominantly from the distribution point. Hence for consumer end results with MoHUA intervention, consortia coordinated with cities to collect the data at the consumer end. The cities facilitated the testing. The outcome of the process is as below: 1. Sample given- 102 cities 2. Report received- 86 cities 3. Report awaited- 16 cities 4. Tests not completed due to lack of cooperation and other reasons – 9	The maximum score for this indicator will be distributed equally (50%) for results based on samples from the treatment plant and consumer end. Cities that did not complete tests or provide the results will be given a score 0 for against consumer end tests.
6	City level population is not projected annually by most of the cities. So, estimates for 2017 population are not available with the cities.	As recommended by MoHUA, 2011 census population is being used for the ranking purpose.
7	The age category specific data for 9 cities is not available at a city level	The age category specific population data has been taken at a district level for these cities.

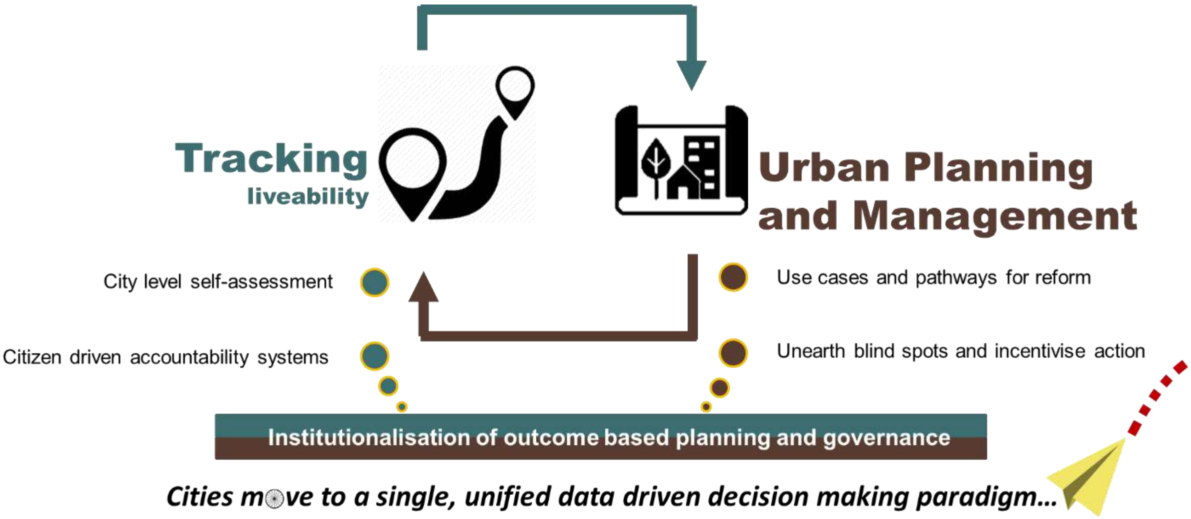
#	Challenges	Proposed Solutions
8	Indicators on non-motorised transports like- Dedicated bicycle tracks, bicycle parking facilities and mode share of non-motorised transport are not relevant for hilly terrains.	As discussed during the PMC meeting, these indicators have been treated as non-applicable for the hilly cities and the weights have been redistributed among other indicators within the same category.
9	The indicator on increase in professional tax is not relevant to cities which do not levy the professional tax.	As discussed during the PMC meeting, this indicator has been non-applicable to the cities belonging to states where professional tax is not levied, and the weights have been redistributed among other indicators within the same category.
10	The indicator on increase in VAT collection is not applicable to Port Blair and Kavaratti, as there was no provision of VAT collection in these cities.	As discussed during the PMC meeting, these indicatosr has been treated as non-applicable for these two cities and the weights have been redistributed among other indicators within the same category.
11	Indicator on coverage of basic services to slum households does not concern cities with no slums (notified/ non-notified.	As discussed during the PMC meeting, this indicators has been treated as non-applicable for these cities and the weights have been redistributed among other indicators within the same category.

1. Introduction

The Ministry of Housing and Urban Affairs (MoHUA) is implementing several flagship urban missions such as the Smart Cities Mission (SCM), Atal Mission for Urban Rejuvenation and Transformation (AMRUT), Heritage City Development and Augmentation Yojana (HRIDAY), Housing for All (HFA). Theses mission along with other transformative initiatives of the Government including National Water Mission, Power for All, National Health Mission are aimed at making Indian cities more 'liveable.' The overarching goal of these initiatives is to move from an input-based approach to a 'citizen centric-outcome based' assessment of urban liveability.

To develop a common minimum framework for cities to assess their existing status and chart their pathway towards providing a better quality of life to their citizens, the MoHUA developed a set of 'Liveability Standards' relevant to cities to generate a Liveability Index and ranking of cities. These standards were launched in June, 2017. The MoHUA has planned to conduct an 'Annual Assessment of Liveability Standards in Cities – an ambitious national project that will involve yearly submission of data by cities across the various indicators, compilation and analysis, development of indices and ranking of cities. The Liveability Index is envisioned as a 360° tool for tracking, planning and transforming Indian cities. The Liveability Index is aimed at the following objectives:

- Providing strong evidence-based approach for future interventions and investments to deliver liveability outcomes
- Catalysing actions to improve the overall quality of the city's liveability and achieve broader development outcomes including the Sustainable Development Goals
- Assessing the implementation of government policies and schemes governing characteristics of cities that can contribute to creating liveable communities



Tracking
liveability
Urban Planning
and Management
City level self-assessment
Citizen driven accountability systems
Use cases and pathways for reform
Unearth blind spots and incentivise action
Institutionalisation of outcome based planning and governance
Cities move to a single, unified data driven decision making paradigm...

The first round of the assessment commenced in January 2018 covering 116 major cities including smart cities, capital cities and cities with population of above one million each. Implementation of the liveability assessment commenced in January 2018 with a national level orientation workshop for the urban local bodies. The workshop aimed at orienting the states and urban local bodies on the overall framework, indicators, data sources, methodology and key milestones and timelines involved in the liveability assessment. Subsequently, a series of State/ Union Territory level orientation workshops were carried out in 33 states/UTs for a detailed discussion on the framework. Online data collection commenced from 9th March through an online data collection platform that supported both online and offline data submission modes. On the date of closure of the online data entry portal i.e., 16th April, 2018 112 cities submitted their data. Subsequently, comprehensive checks on the submitted data was undertaken that involved checking for outliers, logical inconsistencies etc. post which round-1 of data reconciliation was conducted. This draft report is based on round-1 of reconciled data as on 28th April, 2018.

2. City Profile

This chapter presents the city profile -Geographic and Demographic, Social (Education Health, Safety and Security, Heritage), Economic profile, and Physical (Water, sanitation and Waste Management, Electricity, Open space and roads).

ALIGARH

GEOGRAPHICAL PROFILE

State/Union Territory	Uttar Pradesh	Total Geographical Area (Km²)	36.9	City Category	Large City

DEMOGRAPHIC PROFILE

Total Population	874408
Total Number of Households	127229

SOCIAL PROFILE

Education	Total Number of Schools	470
	Total Enrolment (Class 1 to 5)	77244
Health	Total Number of In-patient Beds	1660
	Total Health Workforce	953

ECONOMIC PROFILE

Total Population in Working Age Group	279125
Total Number of Industries	152
Total Number of Commercial Enterprises	2072
Total Number of Hotels	42
Total Capital and Revenue Expenditure for the city in FY 2016-17 (INR Lakhs)	19104.83
Total VAT Collection in FY 2016-17 (INR Lakhs)	28751.34

PHYSICAL PROFILE

Water	**Average Quantity of Water Supplied (MLD)**	127.73
	Total Number of Water Connection	59284
Sanitation Facilities	**Total number of households with access to individual toilets in the city**	125034
	Total number of households in the city with access to community toilets in the city	2195
Solid Waste Management	**Daily average quantity of municipal solid waste collected in the city (Tonnes/day)**	430
	Total number of households covered through door-to-door collection of solid waste	68400
Waste Water	**Daily Average Quantum of Waste Water Generated in the City (MLD)**	110.5
	Daily average quantum of waste water treated by STPs in the city (MLD)	…
Electricity	**Total number of authorized electrical connections in the city**	184742
	Total electricity supplied to the city (kWh)	92589700
Public and Open Spaces	**Total area covered by green spaces in the city (m^2)**	321868.69
Roads and Transport	**Total Length of Road Network in the City (Km)**	717.01
	Total length of arterial and sub-arterial road network in the city (Km)	717.01
	Total length of footpath (wider than 1.2 metres) in the city along the street network (Km)	…

3. Liveability Framework and Indicators

The Liveability Framework comprises a total of 79 indicators (57 Core Indicators and 22 Supporting Indicators). A core indicator carries 70% weightage and a supporting indicator carries 30% weightage. These indicators are grouped under 15 thematic categories which in turn are part of four pillars of comprehensive development of cities i.e., institutional, social, economic and physical. Based on the performance of cities against the various core and supporting indicators,

various 'Category Sub-Indexes' and a composite 'City Liveability Index' will be developed for each city.

3.1 Scoring and Computing Category Indices of Liveability

The set of 79 indicators, associated categories and pillars are presented in the table below:

Table 1 List of Pillars, Categories and Indicators

Pillars of Comprehensive Development	Category	Indicators
Institutional	1. Governance	1.1 Percentage of citizen services available online
		1.2 Percentage of services integrated through Command Centre
		1.3 Percentage of citizens using online services
		1.4 Average delay in grievance redressal
		1.5 Tax collected as percentage of tax billed
		1.6 Extent of cost recovery (O&M) in water supply services
		1.7 Capital spending as percentage of total expenditure
		1.8 Percentage of population covered under Ward Committees/Area *Sabhas*
Social	**2. Identity and Culture**	2.1 Restoration and reuse of historic buildings
		2.2 Percentage of ecologically important areas covered through projects for restoration
		2.3 Hotel occupancy
		2.4 Percentage of budget allocated towards cultural/sports activities
		2.5 Number of cultural/sports events hosted by city
	3. Education	3.1 Percentage of school-aged population enrolled in schools
		3.2 Percentage of female school-aged population enrolled in schools
		3.3 Primary education student-teacher ratio
		3.4 Percentage of schools with access to digital education
		3.5 Percentage of students completing primary education
		3.6 Percentage of students completing secondary education

Pillars of Comprehensive Development	Category	Indicators
	4. Health	4.1 Number of in-patient hospital beds per 10,000 population
		4.2 Healthcare professionals per 10,000 population
		4.3 Average response time in case of health emergencies
		4.4 Period prevalence of water borne diseases
		4.5 Period prevalence of vector borne diseases
	5. Safety and Security	5.1 Number of CCTV Cameras
		5.2 Number of recorded crimes per lakh population
		5.3 Extent of crimes recorded against women, children and elderly per year
		5.4 Transport-related fatality per lakh population
Economic	**6. Economy and Employment**	6.1 Increase in VAT/GST collection
		6.2 Increase in collection of Professional Tax
		6.3 Increase in issuance of Construction permits
		6.4 Unemployment rate
		6.5 Percentage of vendors registered and provided formal spaces
Physical	**7. Housing and Inclusiveness**	7.1 Percentage of Slum/EWS households covered through formal/affordable housing
		7.2 Percentage of slum areas covered through basic services
	8. Public Open Spaces	8.1 Per capita availability of green spaces
		8.2 Per capita availability of public and recreational places
	9. Mixed Land Use and Compactness	9.1 Share of mixed land use area in overall city land use
		9.2 Net Density
	10. Power Supply	10.1 Percentage of city population with authorized electrical services
		10.2 Percentage of electrical connections covered through smart meters
		10.3 Average number of electrical interruptions per year
		10.4 Average length of electrical interruptions per year
		10.5 Percentage of total energy derived from renewable sources
		10.6 Energy consumption per unit - water supply and sewerage

Pillars of Comprehensive Development	Category	Indicators
		10.7 Energy consumption per unit - street lighting
		10.8 Percentage of new and redeveloped buildings following green building norms
		10.9 Total energy consumption per capita
	11. Transportation and Mobility	11.1 Geographical coverage of public transport
		11.2 Availability of public transport
		11.3 Mode share of public transport
		11.4 Percentage of road network with dedicated bicycle tracks
		11.5 Percentage of interchanges with bicycle parking facilities
		11.6 Mode share of non-motorized transport
		11.7 Availability of Passenger Information System
		11.8 Extent of signal synchronization
		11.9 Availability of paid parking spaces
		11.10 Percentage coverage of footpaths – wider than 1.2 m
		11.11 Percentage of traffic intersections with pedestrian crossing facilities
		11.12 Extent to which universal accessibility is incorporated in public rights-of-way
	12. Assured Water Supply	12.1 Household level coverage of direct water supply connections
		12.2 Per capita supply of water
		12.3 Quality of water supplied
		12.4 Level of non-revenue water – NRW
		12.5 Percentage of water connections covered through meters
		12.6 Percentage of plots with rainwater harvesting facility
	13. Waste Water Management	13.1 Coverage of toilets
		13.2 Coverage of sewerage network and/or septage
		13.3 Collection efficiency of sewerage network
		13.4 Extent of reuse and recycling of waste water
		13.5 Coverage of storm water drains
	14. Solid Waste Management	14.1 Household level coverage of municipal solid waste collection

Pillars of Comprehensive Development	Category	Indicators
		14.2 Efficiency of collection of municipal solid waste
		14.3 Extent of municipal solid waste recovered through reuse
	15. Reduced Pollution	15.1 Concentration of SO2- air pollution
		15.2 Concentration of NO2- air pollution
		15.3 Concentration of PM10 - air pollution
		15.4 Level of noise pollution
		15.5 Quality of water in public surface water bodies

3.2 Scoring and Computing Category Indices of Liveability

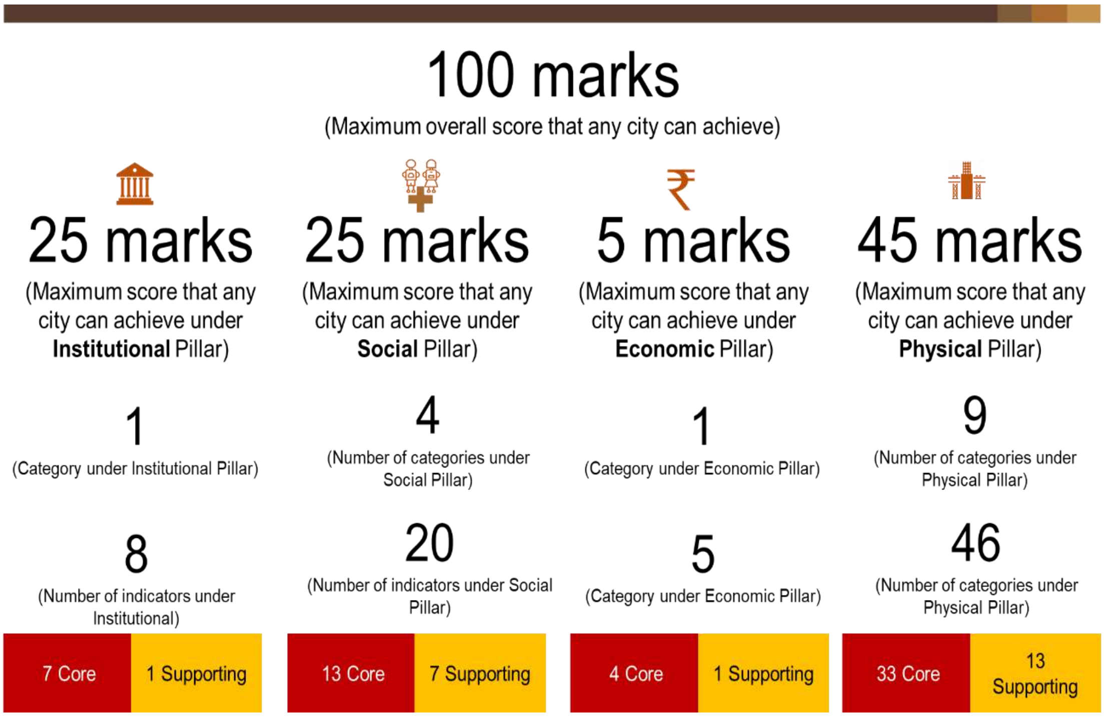
The performance achieved by cities against 79 indicators, will be assessed against given benchmarks. Where no international/national norms are available, city with the best performance in its group (population range) will be treated as a benchmark. The groups are given in the table below.

Table 2 Details on Population Range

Category	Population range
Category 1	Population ≥ 4 million
Category 2	1 million ≤ Population < 4 million
Category 3	0.5 million ≤ Population < 1 million
Category 4	Population < 0.5 million

3.3 Scoring Approach and Methodology

A city can earn a maximum score of 100 points for 79 indicators across four pillars. The pillar weights are as follows: Institutional (25 points), Social (25 points), Economy and Employment (5 points) and Physical (45 points). Based on the number and nature of indicators i.e., core vs. secondary, indicator wise maximum marks were computed.



100 marks

(Maximum overall score that any city can achieve)

25 marks	25 marks	5 marks	45 marks
(Maximum score that any city can achieve under **Institutional** Pillar)	(Maximum score that any city can achieve under **Social** Pillar)	(Maximum score that any city can achieve under **Economic** Pillar)	(Maximum score that any city can achieve under **Physical** Pillar)
1 (Category under Institutional Pillar)	4 (Number of categories under Social Pillar)	1 (Category under Economic Pillar)	9 (Number of categories under Physical Pillar)
8 (Number of indicators under Institutional)	20 (Number of indicators under Social Pillar)	5 (Category under Economic Pillar)	46 (Number of categories under Physical Pillar)
7 Core 1 Supporting	13 Core 7 Supporting	4 Core 1 Supporting	33 Core 13 Supporting

Dimensional Index

Methodology (DIM) has been used to compute scores for each indicator with reference to "maximum within the comparison group" or "absolute benchmarks". For indicators where benchmarks are available, cities getting the benchmark score (or above) are given the maximum mark, and the marks awarded to other cities are calculated proportionately. For indicators where benchmarks are not available, the best performing cities in each population group are given the maximum mark, and the marks awarded to other cities (within the population group) are calculated proportionately. For indicators where benchmarks do not exist, the city data has been tested for outliers before scoring.

3.4 Scoring Normalisation:

To construct aggregate scores across cities as well as to make the scores across indicators comparable, indicator values were normalised using a min-max approach. The following formula was used to normalise the indicator values-

$$\frac{indicator\ value\ for\ the\ city - indicator\ value\ for\ the\ worst\ performing\ city}{benchmark - \ indicator\ value\ for\ the\ worst\ performing\ city}$$

This approach would restrict the normalised indicator value between 0 and 1. Cities that met or exceeded the benchmark received a normalised indicator value of 1. Worst performing cities are given a normalised indicator value of 0. After normalisation, the normalised value is weighted according to the category and the indicator being core or supporting.

To illustrate, consider the indicator 12.3 Quality of Water Supplied in the Category 12 for Assured Water Supply. If in City A 50% of the water samples collected qualify the potable water standards specified by the CPHEEO, and only 10% of the samples from worst performing city qualify the standards. Then, the normalised value for the indicator for city A would be 0.44 [(0.5-0.1)/(1-0.1)].

The weight for indicator 12.3 is 1.03, so the final weighted score for City A would come out to 0.45 [1.03*0.44].

4. Data Collection and Verification

4.1 Submission of Data by the cities

The Liveability Assessment is based on secondary data submitted by the urban local bodies and other concerned government agencies (collectively called as data owners). The 79 indicators were broken down into a set of easy to understand and relatable 553 questions mapped to data owners. Submission of the data was enabled through an online data entry portal on the smartnet platform of the Ministry. The portal also allowed the ULBs to download the liveability assessment questionnaire and upload filled in questionnaire. To familiarise and assist cities in identifying, mapping and collation of data points, a city level nodal person was available during the entire period of data submission process.

4.2 Mapping of Data Owners for the City

For the assessment of liveability indices broadly 12 data owners such as Central/state Pollution control board, Development authority, DISCOM/Electricity Board, State Disaster Management Authority, State Education Department, State Health department, State Renewable energy and development agency, State sales and commercial taxes department, town and country planning department, Traffic and police department, Transport authority, and Urban local body were identified to respond to the questions on the portal. However, during state workshop and subsequent city level discussions, more data owners were mapped to respond to different categories and sub categories. The following table provides the details of city level data owners mapped under the 12 data owner.

Table 3:Details of Data Owners

Designated data owners	Subcategories	Data owners at city level
Urban Local Body	For Accounts Related Questions	Accounts department
Urban Local Body	For Park and Recreation Related Questions	Civil department
Urban Local Body	For Water Supply and Drainage related questions	Jalkal vibhag Nagar
Urban Local Body	For Heritage sites related data	Archeological survey of India /in charge in ULB
Urban Local Body	For Ecological sites related data	Civil Department
Urban Local Body	For Housing related data	Moradabad Development Authority / properties tax department
Urban Local Body	For Building plan related data	Aligarh Development Authority
Urban Local Body	For Roads related data	Public Works Department / civil department
Urban Local Body	For Solid waste management related data	Health Department Nagar Palika Parishad Aligarh
Urban Local Body	For IT services related data	IT department (main office) Nagar palika parishad Aligarh
Urban Local Body	For Vendor committee related data	Tex department ULB
Urban Local Body	Any other departments involved in providing data for questions mentioned under Urban Local Body	Public Works Department ,Employment Exchange, District urban development

Designated data owners	Subcategories	Data owners at city level
		Agency Aligarh
Central / state Pollution control Board	Water Quality, Air Quality, Noise Quality	Uttar Pradesh pollution Control Board Alighar
Development Authority	Building Infrastructure	Rampur development Authority
	Construction planning	Rampur development Authority
	Green Building	Rampur development Authority
	Rain water harvesting	Rampur development Authority
	Universal Design Principle	Rampur development Authority
DISCOM/Electricity Board	Electrical Connection/ Grievance Redressal/ Power supply	Uttar Pradesh Power Corporation Ltd
State Disaster management authority		State Disaster Management [in UP ADM (FR]
State Education Department		Basic Siksha Adhikari/district inspector of school (DIOS)
State Health Department	Health care professionals	UP State Health Department (CMO)
	Citizen Services	UP State Health Department (CMO)
	Disease Prevalence	UP State Health Department (CMO)
	Health Infrastructure	UP State Health Department (CMO)
State Renewable Energy Development Agency		State Renewable Energy Develop. Agency(NEDA)
State Sales / Commercial Taxes Department		Commercial Taxes Department
Town and Country Planning Department	Land Use	Town and Country Planning Department
Traffic and Police Department		Traffic police, Civil police & Grand Railway police
Transport Authorities	Buses	Uttar Pradesh State transport Corporation &

Designated data owners	Subcategories	Data owners at city level
		Regional Transport Office
	Registered Vehicles	Regional Transport Office
	Sub urban rail transport	N A
	Mono Rail Authority	N A
	Tramways	N A
	Marine Transport Authority	N A

4.3 List of secondary documents available as supportive

City has provided supporting documents/evidences against the responses given by city on the online portal. In support of their responses on the portal, city submitted 45 number of documents. Documents submitted includes reports, official orders, copy of data maintained in official register, signed copy of questionnaire, and signed letters/submissions from concern departments. Verification includes mapping of documents against responses given by city, checking the type/category of documents, and validation of data provided.

The following table presents the data owner wise number of documents:

Table 4: Data owner wise number of secondary documents submitted by city

Data Owners	Number of Documents
Sales and Commercial Taxes	0
State Education Department	2
DISCOM/Electricity Department	3
Traffic and Police Department	1
Development Authority	1
Pollution Control Board	7
State Renewable Energy Department	2
Town and Country Planning	1
State Health Department	14
Transport Authority	6
Disaster Management	1
Urban Local Body	7
Total	45*

* The count of documents is based on first round of submission.

4.4 Data Verification

A three-stage data quality check comprising verification of data against secondary documents furnished by data owners, logical inconsistency checks including outliers, and physical audit for select indicators (Refer the exhibit below) is being undertaken. The objective of the data quality check is to ensure that data from the source documents are accurate and verifiable. Sources of data included reports, administrative data, survey results and other statistical records, log books among other.

Physical audit of eight indicators – one indicator from the Institutional pillar, one from the Social pillar, one from the Economy pillar and five from the Physical pillar is also being carried out by the field team to ascertain the degree of reliability of data reported by the cities. The list of these eight indicators is presented below:

1.2 | Percentage of services integrated through Command Centre

2.3 | Hotel occupancy

3.4 | Percentage of schools with access to digital education

5.1 | Number of streets, public places, junctions covered through surveillance systems

6.5 | Percentage of vendors registered and provided formal spaces

11.7 | Availability of Passenger Information System

11.11 | Percentage of traffic intersections with pedestrian crossing facilities

11.12 | Extent to which universal accessibility is incorporated in public rights-of-way

For a set of five indicators namely, unemployment rate, mode share of public transport, mode share of non-motorised transport, quality of water supplied and level of noise pollution, existing datasets were found to be not available consistently across all cities and/or were inadequate. To help cities that do not have data on these five indicators, dipstick assessments are being carried to fill data gaps.

6.4 | Unemployment Rate

11.3 | Mode share of public transport

11.5 | Mode share of Non Motorized Transport

12.3 | Quality of Water Supplied

15.4 | Level of Noise Pollution

4.5 Physical Audit

The following map presents the indicators audited at city level.

7. LA - Street Vendors
8. LA - Universal Design Principles

5. City Score on 15 categories of Assessment

Liveability Assessment covered 15 categories and 78 indicators. The below table presents the scores for all 15 indicators namely governance, identity & culture, education, health, safety and security, economy & employment, housing & inclusiveness, public open spaces, mixed land use & compactness, power supply, transport & mobility, assured water supply, waste water management, solid waste management and reduced pollution.

Table 5: Category wise scores

Categories	Scores in Percentage
Governance	57.42%
Identity & Culture	19%
Education	72%
Health	56%
Safety & Security	68%
Economy & Employment	21%
Housing & Inclusiveness	4%
Public Open Spaces	3%
Mixed Land Use & Compactness	0%
Power Supply	53%
Transport & Mobility	40%
Assured Water Supply	29%
Waste Water Management	41%
Solid Waste Management	84%
Reduced Pollution	21%

The rank of the city is based on the performance and scores in each of the category. The final city rank is submitted separately.

Executive Summary

Assessment of liveability indices is an initiative by the Ministry of Housing and Urban Affairs to improve quality of life of citizens and achieve sustainable development goals by encouraging cities to adopt "outcome based" approach for urban planning. Assessment process aimed to provide opportunity to cities to review the development components holistically by involving 79 measurable indicators categorized under governance, health, education, safety, economy, power supply, transportation and mobility, identity, culture, housing, waste management and pollution.

This report highlights the assessment process, key milestones, and the final outcome of the data submitted. Implementation of liveability assessment commenced formally on 19th January 2018. A national level workshop was organized on 13th February 2018 to explain the importance and process of liveability assessment and get feedback on methodology from the city authorities.

This was followed by the next stage of Questionnaire development. The questionnaire was arranged under 12 categories representing 12 data owners namely urban local body, Central and state pollution control board, development authority, DISCOM/Electricity board, State disaster management authority, state education department, state health department, state renewable energy development agency, state sales and commercial taxes department, town and country planning department, traffic and police department and transport authorities.

An online data entry portal was developed to facilitate data submission by the cities. Each city had a unique log in to access the portal and submit the data. Both online and off-line options (download the questionnaire in an excel) to submit the data were available for cities. An email help desk was set up for the cities to raise any queries and seek clarification when responding to the questions.

A team for each state comprising of State Coordinator and City Coordinator (one per city) was deployed that facilitated the process and supported the cities. A total of 6 regional coordinators/ consultants, 29 State Coordinators, and 99 city coordinators were deployed across 116 cities. Training for state coordinators was held from 26th to 28th February 2018 at Chennai to make coordinators understand overall liveability assessment, indicators, data sources, protocols and roles and responsibilities.

City Reconnaissance Meetings were initiated by the state and city coordinators. The discussion began with discussions to finalize the state workshop schedule, mapping of data owners, and assist cities in data collection. The City Coordinators were based in the cities for over 6 weeks and during this time, they liase with ULB and other data owners to explain the liveability framework, online portal, and facilitate the online submission.

A total of 33 state workshops were conducted at the state level. The objective of the workshop was to orient the city stakeholders on liveability assessment, indicators, components of data collection, timelines, expectations of support and support extended by MoHUA. The state level workshops brought various city level departments on a single platform to understand and discuss the methodology and components of city liveability assessment.

Nodal agency at state level supported by the City and State Coordinator and city level (Municipality corporation/smart city limited) coordinated with city specific data owners/departments for data gathering, collation, and submission. Nodal persons in each department were appointed for timely data collection and submission. Of 116, 112 cities submitted data as per the timeline on 16th April 2018.

Post submission, the city and state coordinators supported by the central team followed up extensively with the cities to support secondary documents as evidence to substantiate their submissions. Secondary documents such as reports, official orders, copy of office register, signed copy of liveability assessment questionnaire furnished by cities against the submitted data. Documents are verified to map the documents for the reponses provided by city and to check the type data provided by city. The document check outcomes were shared with the cities as a part of data quality check.

For checking consistency of data, logical check of data, verifying data from other public sources were undertaken. Quality check was done to ensure data validity and provide opportunity to cities to review the data provided by them and correct in case of wrong data entry.

For 8 selected indicators namely, percentage of services integrated through command and control center, hotel occupancy rate, percentage of schools with access to digital education, number of CCTV cameras per unit road length, percentage of vendors registered and provided formal spaces, availability of passenger information system, percentage of traffic intersection with pedestrian crossing facility, and extent to which universal accessibility is incorporated in public rights of way. Physical audit was conducted in 110 cities by physical auditors appointed and trained by the consortium. In consultation with ULB nodal person, locations and indicators for physical audit was selected in each city. A mobile based application was developed to capture the physical audit related data.

Primary data collection was done for five indicators such as unemployment rates, mode share of public transport, mode share of non-motorized transport, quality of water supplied, and level of noise pollution. Protocols for water and noise test were prepared in consultation with experts. Water quality test involved physical, chemical and bacteriological test of water as per the CPCB norms. For testing quality of water at consumer end, the auditors worked closely with the ULB and Water department. Samples were collected from consumer end and submitted to the lab suggested by city. For noise pollution, in about 20 cities the state pollution board or city level

environment department took the responsibility for providing noise pollution data as per the protocols. In rest of the cities, mobile based application was used to measure noise pollution.

During implementation, MoHUA facilitated the process by conducting video conferences with cities to address any queries, reiterate the importance, and ensure that cities adequately engages in the process and submit their responses in time and respond to requests for clarifications.

In addition to secondary data collection, physical audit and primary data collection, citizen survey was conducted to understand their perception and level of satisfaction on various services such as health, education, water supply, electricity, waste management etc. provided by urban local bodies. Over 60000 citizens participated in the survey across India.

The final scores and ranks have been generated based on the scoring methodology that has been discussed extensively and minor modifications made that are summarized as below:

#	**Challenges**	**Proposed Solutions**
1	Only 23 cities of 111 cities have City Mobility Plan (CMP) or any and hence able to provide data for Mode Share of Public Transport and Non-Motorised Transport. To address the data gap, as advised by the MoHUA, the consortia undertook a sample dipstick across all cities covering a sample of 150 Households. Understandably, the dipstick findings will not match the rigor of a CMP.	We recommend the following: 1) Cities which have provided CMP Data will be evaluated on 100% of the maximum score 2) For the cities where the dipstick data is used, the city receives a 50% discount on the overall score Alternatively, another approach is to assign 0 score to all 88 cities that don't have a CMP
2	Variance was observed on data reported by cities on road network and data presented in the smart city proposals during the verifications.	We recommend taking the data reported by the cities in the Smart City Proposals.
3	There is no secondary source/ organization that provides unemployment data at city level. As a result, most cities do not have the data. Fully cognizance of the challenges of generating this data in a short span of time, it was agreed to collect this data through a dipstick survey on lines of NSSO questions. The	The indicator on unemployment will be excluded from scores. For final ranking, the cities will be scored on 78 indicators.

#	Challenges	Proposed Solutions
	data generated needs further scrutiny and triangulation with some inputs from experts. This may not be possible in the short window.	
4	Many cities did not have data on noise pollution and it was decided that data will be collected using a mobile app for all the 111 cities. However, many cities have expressed reservations with the approach especially with respect to the reliability of using this data. Further, some cities have relied on the SPCB to collect the data as per the approach proposed by the consortia. Thus, noise pollution data is currently from two sources: 1. SPCB- 20 cities 2. Noise-based app- 91 cities	The data collected through the primary survey will be used for scoring the cities. Currently, there is no differential scoring for the data from the SPCB and the data collected through the mobile app. However, a certain higher weightage can be provided to those cities which used the state apparatus to collect noise pollution data.
5	For the indicator on quality of water supplied, the methodology document states that samples should be drawn both at the treatment plant outlet as well as the consumer end. However, the data provided by the cities were predominantly from the distribution point. Hence for consumer end results with MoHUA intervention, consortia coordinated with cities to collect the data at the consumer end. The cities facilitated the testing. The outcome of the process is as below: 1. Sample given- 102 cities 2. Report received- 86 cities 3. Report awaited- 16 cities 4. Tests not completed due to lack of cooperation and other reasons – 9	The maximum score for this indicator will be distributed equally (50%) for results based on samples from the treatment plant and consumer end. Cities that did not complete tests or provide the results will be given a score 0 for against consumer end tests.
6	City level population is not projected annually by most of the cities. So, estimates for 2017 population are not available with the cities.	As recommended by MoHUA, 2011 census population is being used for the ranking purpose.
7	The age category specific data for 9 cities is not available at a city level	The age category specific population data has been taken at a district level for these cities.

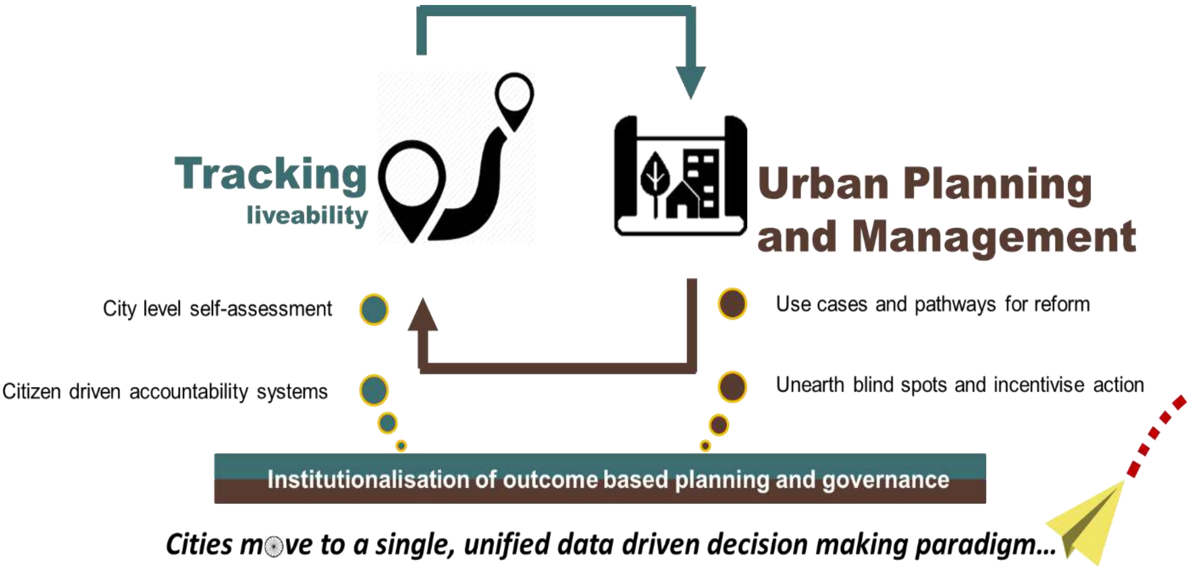
#	Challenges	Proposed Solutions
8	Indicators on non-motorised transports like- Dedicated bicycle tracks, bicycle parking facilities and mode share of non-motorised transport are not relevant for hilly terrains.	As discussed during the PMC meeting, these indicators have been treated as non-applicable for the hilly cities and the weights have been redistributed among other indicators within the same category.
9	The indicator on increase in professional tax is not relevant to cities which do not levy the professional tax.	As discussed during the PMC meeting, this indicator has been non-applicable to the cities belonging to states where professional tax is not levied, and the weights have been redistributed among other indicators within the same category.
10	The indicator on increase in VAT collection is not applicable to Port Blair and Kavaratti, as there was no provision of VAT collection in these cities.	As discussed during the PMC meeting, these indicatosr has been treated as non-applicable for these two cities and the weights have been redistributed among other indicators within the same category.
11	Indicator on coverage of basic services to slum households does not concern cities with no slums (notified/ non-notified.	As discussed during the PMC meeting, this indicators has been treated as non-applicable for these cities and the weights have been redistributed among other indicators within the same category.

1. Introduction

The Ministry of Housing and Urban Affairs (MoHUA) is implementing several flagship urban missions such as the Smart Cities Mission (SCM), Atal Mission for Urban Rejuvenation and Transformation (AMRUT), Heritage City Development and Augmentation Yojana (HRIDAY), Housing for All (HFA). Theses mission along with other transformative initiatives of the Government including National Water Mission, Power for All, National Health Mission are aimed at making Indian cities more 'liveable.' The overarching goal of these initiatives is to move from an input-based approach to a 'citizen centric-outcome based' assessment of urban liveability.

To develop a common minimum framework for cities to assess their existing status and chart their pathway towards providing a better quality of life to their citizens, the MoHUA developed a set of 'Liveability Standards' relevant to cities to generate a Liveability Index and ranking of cities. These standards were launched in June, 2017. The MoHUA has planned to conduct an 'Annual Assessment of Liveability Standards in Cities – an ambitious national project that will involve yearly submission of data by cities across the various indicators, compilation and analysis, development of indices and ranking of cities. The Liveability Index is envisioned as a 360° tool for tracking, planning and transforming Indian cities. The Liveability Index is aimed at the following objectives:

- Providing strong evidence-based approach for future interventions and investments to deliver liveability outcomes
- Catalysing actions to improve the overall quality of the city's liveability and achieve broader development outcomes including the Sustainable Development Goals
- Assessing the implementation of government policies and schemes governing characteristics of cities that can contribute to creating liveable communities



Tracking
liveability
Urban Planning and Management
City level self-assessment
Citizen driven accountability systems
Use cases and pathways for reform
Unearth blind spots and incentivise action
Institutionalisation of outcome based planning and governance
Cities move to a single, unified data driven decision making paradigm…

The first round of the assessment commenced in January 2018 covering 116 major cities including smart cities, capital cities and cities with population of above one million each. Implementation of the liveability assessment commenced in January 2018 with a national level orientation workshop for the urban local bodies. The workshop aimed at orienting the states and urban local bodies on the overall framework, indicators, data sources, methodology and key milestones and timelines involved in the liveability assessment. Subsequently, a series of State/ Union Territory level orientation workshops were carried out in 33 states/UTs for a detailed discussion on the framework. Online data collection commenced from 9th March through an online data collection platform that supported both online and offline data submission modes. On the date of closure of the online data entry portal i.e., 16th April, 2018 112 cities submitted their data. Subsequently, comprehensive checks on the submitted data was undertaken that involved checking for outliers, logical inconsistencies etc. post which round-1 of data reconciliation was conducted. This draft report is based on round-1 of reconciled data as on 28th April, 2018.

2. City Profile

This chapter presents the city profile -Geographic and Demographic, Social (Education Health, Safety and Security, Heritage), Economic profile, and Physical (Water, sanitation and Waste Management, Electricity, Open space and roads).

ALLAHABAD

GEOGRAPHICAL PROFILE

State/Union Territory	Uttar Pradesh	**Total Geographical Area (Km^2)**	164	**City Category**	METROPOLIS

DEMOGRAPHIC PROFILE

Total Population	1168385
Total Number of Households	206972

SOCIAL PROFILE

Education	**Total Number of Schools**	3907
	Total Enrolment (Class 1 to 5)	333020
Health	**Total Number of In-patient Beds**	14242
	Total Health Workforce	638
Safety and Security	**Total Strength of Police Force**	6363
	Total Number of CCTV Cameras	476
Heritage Sites	**Total Number of Heritage Sites**	...

ECONOMIC PROFILE

Total Population in Working Age Group	...
Total Number of Industries	5
Total Number of Commercial Enterprises	17140
Total Number of Hotels	139
Total Capital and Revenue Expenditure for the city in FY 2016-17 (Lakhs)	21727.03
Total VAT Collection in FY 2016-17 (Lakhs)	131540.35

PHYSICAL PROFILE

Water	**Average Quantity of Water Supplied (MLD)**	338
	Total Number of Water Connection	196624
Sanitation Facilities	**Total number of households with access to individual toilets in the city**	139995
	Total number of households in the city with access to community toilets in the city	11100
Solid Waste Management	**Daily average quantity of municipal solid waste collected in the city (Tonnes/day)**	319148
	Total number of households covered through door-to-door collection of solid waste	80
Waste Water	**Daily Average Quantum of Waste Water Generated in the City (MLD)**	275
	Daily average quantum of waste water treated by STPs in the city (MLD)	268
Electricity	**Total number of authorized electrical connections in the city**	244503
	Total electricity supplied to the city (kWh)	1630000
Public and Open Spaces	**Total area covered by green spaces in the city (m^2)**	…
Roads and Transport	**Total Length of Road Network in the City (Km)**	2702.9
	Total length of arterial and sub-arterial road network in the city (Km)	…
	Total length of footpath (wider than 1.2 metres) in the city along the street network (Km)	…

3. Liveability Framework and Indicators

The Liveability Framework comprises a total of 79 indicators (57 Core Indicators and 22 Supporting Indicators). A core indicator carries 70% weightage and a supporting indicator carries 30% weightage. These indicators are grouped under 15 thematic categories which in turn are part of four pillars of comprehensive development of cities i.e., institutional, social, economic and physical. Based on the performance of cities against the various core and supporting indicators, various 'Category Sub-Indexes' and a composite 'City Liveability Index' will be developed for each city.

3.1 Scoring and Computing Category Indices of Liveability

The set of 79 indicators, associated categories and pillars are presented in the table below:

Table 1 List of Pillars, Categories and Indicators

Pillars of Comprehensive Development	Category	Indicators
Institutional	1. Governance	1.1 Percentage of citizen services available online
		1.2 Percentage of services integrated through Command Centre
		1.3 Percentage of citizens using online services
		1.4 Average delay in grievance redressal
		1.5 Tax collected as percentage of tax billed
		1.6 Extent of cost recovery (O&M) in water supply services
		1.7 Capital spending as percentage of total expenditure
		1.8 Percentage of population covered under Ward Committees/Area *Sabhas*
Social	**2. Identity and Culture**	2.1 Restoration and reuse of historic buildings
		2.2 Percentage of ecologically important areas covered through projects for restoration
		2.3 Hotel occupancy

Pillars of Comprehensive Development	Category	Indicators
		2.4 Percentage of budget allocated towards cultural/sports activities
		2.5 Number of cultural/sports events hosted by city
	3. Education	3.1 Percentage of school-aged population enrolled in schools
		3.2 Percentage of female school-aged population enrolled in schools
		3.3 Primary education student-teacher ratio
		3.4 Percentage of schools with access to digital education
		3.5 Percentage of students completing primary education
		3.6 Percentage of students completing secondary education
	4. Health	4.1 Number of in-patient hospital beds per 10,000 population
		4.2 Healthcare professionals per 10,000 population
		4.3 Average response time in case of health emergencies
		4.4 Period prevalence of water borne diseases
		4.5 Period prevalence of vector borne diseases
	5. Safety and Security	5.1 Number of CCTV Cameras
		5.2 Number of recorded crimes per lakh population
		5.3 Extent of crimes recorded against women, children and elderly per year
		5.4 Transport-related fatality per lakh population
Economic	**6. Economy and Employment**	6.1 Increase in VAT/GST collection
		6.2 Increase in collection of Professional Tax

Pillars of Comprehensive Development	Category	Indicators
		6.3 Increase in issuance of Construction permits
		6.4 Unemployment rate
		6.5 Percentage of vendors registered and provided formal spaces
Physical	**7. Housing and Inclusiveness**	7.1 Percentage of Slum/EWS households covered through formal/affordable housing
		7.2 Percentage of slum areas covered through basic services
	8. Public Open Spaces	8.1 Per capita availability of green spaces
		8.2 Per capita availability of public and recreational places
	9. Mixed Land Use and Compactness	9.1 Share of mixed land use area in overall city land use
		9.2 Net Density
	10. Power Supply	10.1 Percentage of city population with authorized electrical services
		10.2 Percentage of electrical connections covered through smart meters
		10.3 Average number of electrical interruptions per year
		10.4 Average length of electrical interruptions per year
		10.5 Percentage of total energy derived from renewable sources
		10.6 Energy consumption per unit - water supply and sewerage
		10.7 Energy consumption per unit - street lighting
		10.8 Percentage of new and redeveloped buildings following green building norms
		10.9 Total energy consumption per capita

Pillars of Comprehensive Development	Category	Indicators
	11. Transportation and Mobility	11.1 Geographical coverage of public transport
		11.2 Availability of public transport
		11.3 Mode share of public transport
		11.4 Percentage of road network with dedicated bicycle tracks
		11.5 Percentage of interchanges with bicycle parking facilities
		11.6 Mode share of non-motorized transport
		11.7 Availability of Passenger Information System
		11.8 Extent of signal synchronization
		11.9 Availability of paid parking spaces
		11.10 Percentage coverage of footpaths – wider than 1.2 m
		11.11 Percentage of traffic intersections with pedestrian crossing facilities
		11.12 Extent to which universal accessibility is incorporated in public rights-of-way
	12. Assured Water Supply	12.1 Household level coverage of direct water supply connections
		12.2 Per capita supply of water
		12.3 Quality of water supplied
		12.4 Level of non-revenue water – NRW
		12.5 Percentage of water connections covered through meters
		12.6 Percentage of plots with rainwater harvesting facility
	13. Waste Water	13.1 Coverage of toilets

Pillars of Comprehensive Development	Category	Indicators
	Management	13.2 Coverage of sewerage network and/or septage
		13.3 Collection efficiency of sewerage network
		13.4 Extent of reuse and recycling of waste water
		13.5 Coverage of storm water drains
	14. Solid Waste Management	14.1 Household level coverage of municipal solid waste collection
		14.2 Efficiency of collection of municipal solid waste
		14.3 Extent of municipal solid waste recovered through reuse
	15. Reduced Pollution	15.1 Concentration of SO2- air pollution
		15.2 Concentration of NO2- air pollution
		15.3 Concentration of PM10 - air pollution
		15.4 Level of noise pollution
		15.5 Quality of water in public surface water bodies

3.2 Scoring and Computing Category Indices of Liveability

The performance achieved by cities against 79 indicators, will be assessed against given benchmarks. Where no international/national norms are available, city with the best performance in its group (population range) will be treated as a benchmark. The groups are given in the table below.

Table 2 Details on Population Range

Category	Population range
Category 1	Population ≥ 4 million
Category 2	1 million ≤ Population < 4 million
Category 3	0.5 million ≤ Population < 1 million
Category 4	Population < 0.5 million

3.3 Scoring Approach and Methodology

A city can earn a maximum score of 100 points for 79 indicators across four pillars. The pillar weights are as follows: Institutional (25 points), Social (25 points), Economy and Employment (5 points) and Physical (45 points). Based on the number and nature of indicators i.e., core vs. secondary, indicator wise maximum marks were computed.

100 marks

(Maximum overall score that any city can achieve)

25 marks (Maximum score that any city can achieve under **Institutional** Pillar)	25 marks (Maximum score that any city can achieve under **Social** Pillar)	5 marks (Maximum score that any city can achieve under **Economic** Pillar)	45 marks (Maximum score that any city can achieve under **Physical** Pillar)
1 (Category under Institutional Pillar)	4 (Number of categories under Social Pillar)	1 (Category under Economic Pillar)	9 (Number of categories under Physical Pillar)
8 (Number of indicators under Institutional)	20 (Number of indicators under Social Pillar)	5 (Category under Economic Pillar)	46 (Number of categories under Physical Pillar)
7 Core 1 Supporting	13 Core 7 Supporting	4 Core 1 Supporting	33 Core 13 Supporting

Dimensional Index Methodology (DIM) has been used to compute scores for each indicator with reference to “maximum within the comparison group” or “absolute benchmarks”. For indicators where benchmarks are available, cities getting the benchmark score (or above) are given the maximum mark, and the marks awarded to other cities are calculated proportionately. For indicators where benchmarks are not available, the best performing cities in each population group are given the maximum mark, and the marks awarded to other cities (within the population group) are calculated proportionately. For indicators where benchmarks do not exist, the city data has been tested for outliers before scoring.

3.4 Scoring Normalisation:

To construct aggregate scores across cities as well as to make the scores across indicators comparable, indicator values were normalised using a min-max approach. The following formula was used to normalise the indicator values-

$$\frac{indicator\ value\ for\ the\ city - indicator\ value\ for\ the\ worst\ performing\ city}{benchmark - \ indicator\ value\ for\ the\ worst\ performing\ city}$$

This approach would restrict the normalised indicator value between 0 and 1. Cities that met or exceeded the benchmark received a normalised indicator value of 1. Worst performing cities are given a normalised indicator value of 0. After normalisation, the normalised value is weighted according to the category and the indicator being core or supporting.

To illustrate, consider the indicator 12.3 Quality of Water Supplied in the Category 12 for Assured Water Supply. If in City A 50% of the water samples collected qualify the potable water standards specified by the CPHEEO, and only 10% of the samples from worst performing city qualify the standards. Then, the normalised value for the indicator for city A would be 0.44 [(0.5-0.1)/(1-0.1)].

The weight for indicator 12.3 is 1.03, so the final weighted score for City A would come out to 0.45 [1.03*0.44].

4. Data Collection and Verification

4.1 Submission of Data by the cities

The Liveability Assessment is based on secondary data submitted by the urban local bodies and other concerned government agencies (collectively called as data owners). The 79 indicators were broken down into a set of easy to understand and relatable 553 questions mapped to data owners. Submission of the data was enabled through an online data entry portal on the smartnet platform of the Ministry. The portal also allowed the ULBs to download the liveability assessment questionnaire and upload filled in questionnaire. To familiarise and assist cities in identifying, mapping and collation of data points, a city level nodal person was available during the entire period of data submission process.

4.2 Mapping of Data Owners for the City

For the assessment of liveability indices broadly 12 data owners such as Central/state Pollution control board, Development authority, DISCOM/Electricity Board, State Disaster Management Authority, State Education Department, State Health department, State Renewable energy and development agency, State sales and commercial taxes department, town and country planning department, Traffic and police department, Transport authority, and Urban local body were identified to respond to the questions on the portal. However, during state workshop and subsequent city level discussions, more data owners were mapped to respond to different categories and sub categories. The following table provides the details of city level data owners mapped under the 12 data owner.

Table 3: Details of Data Owners

Designated data owners	Subcategories	Data owners at city level
Urban Local Body	For Accounts Related Questions	Account and Taxation Department Nagar Nigam
Urban Local Body	For Park and Recreation Related Questions	Environment and Parks Department Nagar Nigam
Urban Local Body	For Water Supply and Drainage related questions	Environment and Parks Department Nagar Nigam
Urban Local Body	For Heritage sites related data	Tourism Department
Urban Local Body	For Ecological sites related data	
Urban Local Body	For Housing related data	Nagar Nigam
Urban Local Body	For Building plan related data	Nagar Nigam
Urban Local Body	For Roads related data	Nagar Nigam
Urban Local Body	For Solid waste management related data	Environment and Parks Department
Urban Local Body	For IT services related data	IT Department Nagar Nigam
Urban Local Body	For Vendor committee related data	Nagar Nigam
Urban Local Body	Any other departments involved in providing data for questions mentioned under Urban Local Body	-
Central / state Pollution control Board	Water Quality, Air Quality, Noise Quality	Pollution Control Board
Development Authority	Building Infrastructure	Allahabad Development Authority
	Construction planning	Allahabad Development Authority
	Green Building	Allahabad Development

Designated data owners	Subcategories	Data owners at city level
		Authority
	Rain water harvesting	Allahabad Development Authority
	Universal Design Principle	Allahabad Development Authority
DISCOM/Electricity Board	Electrical Connection/ Grievance Redressal/ Power supply	Electrical Department
State Disaster management authority		Disaster Management Department
State Education Department		Basic Shiksha Adhikari
State Health Department	Health care professionals	Chief Medical Officer
	Citizen Services	Chief Medical Officer
	Disease Prevalence	Chief Medical Officer
	Health Infrastructure	Chief Medical Officer
State Renewable Energy Development Agency		Uttar Pradesh New and Renewable Energy Department Agency
State Sales / Commercial Taxes Department		Sales Tax Department
Town and Country Planning Department	Land Use	Town and Country Planning Department
Traffic and Police Department		Superintendent of police & Superintendent of traffic
Transport Authorities	Buses	Regional Transport Office
	Registered Vehicles	Regional Transport Office
	Sub urban rail transport	99999
	Mono Rail Authority	99999
	Tramways	99999
	Marine Transport Authority	99999

4.3 List of secondary documents available as supportive

City has provided supporting documents/evidences against the responses given by city on the online portal. In support of their responses on the portal, city submitted 52 numbers of documents. Documents submitted includes reports, official orders, copy of data maintained in official register, signed copy of questionnaire, and signed letters/submissions from concern departments. Verification includes mapping of documents against responses given by city, checking the type/category of documents, and validation of data provided.

The following table presents the data owner wise number of documents:

Table 4: Data owner wise number of secondary documents submitted by city

Data Owners	Number of Documents
Sales and Commercial Taxes	1
State Education Department	4
DISCOM/Electricity Department	6
Traffic and Police Department	1
Development Authority	1
Pollution Control Board	2
State Renewable Energy Department	0
Town and Country Planning	2
State Health Department	9
Transport Authority	2
Disaster Management	1
Urban Local Body	23
Total	52*

4.4 Data Verification

A three-stage data quality check comprising verification of data against secondary documents furnished by data owners, logical inconsistency checks including outliers, and physical audit for select indicators (Refer the exhibit below) is being undertaken. The objective of the data quality check is to ensure that data from the source documents are accurate and verifiable. Sources of data included reports, administrative data, survey results and other statistical records, log books among other.

Physical audit of eight indicators – one indicator from the Institutional pillar, one from the Social pillar, one from the Economy pillar and five from the Physical pillar is also being carried out by the field team to ascertain the degree of reliability of data reported by the cities. The list of these eight indicators is presented below:

1.2 | Percentage of services integrated through Command Centre

2.3 | Hotel occupancy

3.4 | Percentage of schools with access to digital education

5.1 | Number of streets, public places, junctions covered through surveillance systems

6.5 | Percentage of vendors registered and provided formal spaces

11.7 | Availability of Passenger Information System

11.11 | Percentage of traffic intersections with pedestrian crossing facilities

11.12 | Extent to which universal accessibility is incorporated in public rights-of-way

For a set of five indicators namely, unemployment rate, mode share of public transport, mode share of non-motorised transport, quality of water supplied and level of noise pollution, existing datasets were found to be not available consistently across all cities and/or were inadequate. To help cities that do not have data on these five indicators, dipstick assessments are being carried to fill data gaps.

6.4 | Unemployment Rate

11.3 | Mode share of public transport

11.5 | Mode share of Non Motorized Transport

12.3 | Quality of Water Supplied

15.4 | Level of Noise Pollution

4.5 Physical Audit

The following map presents the indicators audited at city level.

5. City Score on 15 categories of Assessment

Liveability Assessment covered 15 categories and 78 indicators. The below table presents the scores for all 15 indicators namely governance, identity & culture, education, health, safety and security, economy & employment, housing & inclusiveness, public open spaces, mixed land use & compactness, power supply, transport & mobility, assured water supply, waste water management, solid waste management and reduced pollution.

Table 5: Category wise scores

Categories	Scores in Percentage
Governance	42.30%
Identity & Culture	26%
Education	91%
Health	64%
Safety & Security	56%
Economy & Employment	10%

Housing & Inclusiveness	0%
Public Open Spaces	0%
Mixed Land Use & Compactness	0%
Power Supply	46%
Transport & Mobility	18%
Assured Water Supply	41%
Waste Water Management	61%
Solid Waste Management	33%
Reduced Pollution	57%

The rank of the city is based on the performance and scores in each of the category. The final city rank is submitted separately.

Executive Summary

Assessment of liveability indices is an initiative by the Ministry of Housing and Urban Affairs to improve quality of life of citizens and achieve sustainable development goals by encouraging cities to adopt "outcome based" approach for urban planning. Assessment process aimed to provide opportunity to cities to review the development components holistically by involving 79 measurable indicators categorized under governance, health, education, safety, economy, power supply, transportation and mobility, identity, culture, housing, waste management and pollution.

This report highlights the assessment process, key milestones, and the final outcome of the data submitted. Implementation of liveability assessment commenced formally on 19th January 2018. A national level workshop was organized on 13th February 2018 to explain the importance and process of liveability assessment and get feedback on methodology from the city authorities.

This was followed by the next stage of Questionnaire development. The questionnaire was arranged under 12 categories representing 12 data owners namely urban local body, Central and state pollution control board, development authority, DISCOM/Electricity board, State disaster management authority, state education department, state health department, state renewable energy development agency, state sales and commercial taxes department, town and country planning department, traffic and police department and transport authorities.

An online data entry portal was developed to facilitate data submission by the cities. Each city had a unique log in to access the portal and submit the data. Both online and off-line options (download the questionnaire in an excel) to submit the data were available for cities. An email help desk was set up for the cities to raise any queries and seek clarification when responding to the questions.

A team for each state comprising of State Coordinator and City Coordinator (one per city) was deployed that facilitated the process and supported the cities. A total of 6 regional coordinators/ consultants, 29 State Coordinators, and 99 city coordinators were deployed across 116 cities. Training for state coordinators was held from 26th to 28th February 2018 at Chennai to make coordinators understand overall liveability assessment, indicators, data sources, protocols and roles and responsibilities.

City Reconnaissance Meetings were initiated by the state and city coordinators. The discussion began with discussions to finalize the state workshop schedule, mapping of data owners, and assist cities in data collection. The City Coordinators were based in the cities for over 6 weeks and during this time, they liase with ULB and other data owners to explain the liveability framework, online portal, and facilitate the online submission.

A total of 33 state workshops were conducted at the state level. The objective of the workshop was to orient the city stakeholders on liveability assessment, indicators, components of data collection, timelines, expectations of support and support extended by MoHUA. The state level workshops brought various city level departments on a single platform to understand and discuss the methodology and components of city liveability assessment.

Nodal agency at state level supported by the City and State Coordinator and city level (Municipality corporation/smart city limited) coordinated with city specific data owners/departments for data gathering, collation, and submission. Nodal persons in each department were appointed for timely data collection and submission. Of 116, 112 cities submitted data as per the timeline on 16th April 2018.

Post submission, the city and state coordinators supported by the central team followed up extensively with the cities to support secondary documents as evidence to substantiate their submissions. Secondary documents such as reports, official orders, copy of office register, signed copy of liveability assessment questionnaire furnished by cities against the submitted data. Documents are verified to map the documents for the reponses provided by city and to check the type data provided by city. The document check outcomes were shared with the cities as a part of data quality check.

For checking consistency of data, logical check of data, verifying data from other public sources were undertaken. Quality check was done to ensure data validity and provide opportunity to cities to review the data provided by them and correct in case of wrong data entry.

For 8 selected indicators namely, percentage of services integrated through command and control center, hotel occupancy rate, percentage of schools with access to digital education, number of CCTV cameras per unit road length, percentage of vendors registered and provided formal spaces, availability of passenger information system, percentage of traffic intersection with pedestrian crossing facility, and extent to which universal accessibility is incorporated in public rights of way. Physical audit was conducted in 110 cities by physical auditors appointed and trained by the consortium. In consultation with ULB nodal person, locations and indicators for physical audit was selected in each city. A mobile based application was developed to capture the physical audit related data.

Primary data collection was done for five indicators such as unemployment rates, mode share of public transport, mode share of non-motorized transport, quality of water supplied, and level of noise pollution. Protocols for water and noise test were prepared in consultation with experts. Water quality test involved physical, chemical and bacteriological test of water as per the CPCB norms. For testing quality of water at consumer end, the auditors worked closely with the ULB and Water department. Samples were collected from consumer end and submitted to the lab suggested by city. For noise pollution, in about 20 cities the state pollution board or city level

environment department took the responsibility for providing noise pollution data as per the protocols. In rest of the cities, mobile based application was used to measure noise pollution.

During implementation, MoHUA facilitated the process by conducting video conferences with cities to address any queries, reiterate the importance, and ensure that cities adequately engages in the process and submit their responses in time and respond to requests for clarifications.

In addition to secondary data collection, physical audit and primary data collection, citizen survey was conducted to understand their perception and level of satisfaction on various services such as health, education, water supply, electricity, waste management etc. provided by urban local bodies. Over 60000 citizens participated in the survey across India.

The final scores and ranks have been generated based on the scoring methodology that has been discussed extensively and minor modifications made that are summarized as below:

#	**Challenges**	**Proposed Solutions**
1	Only 23 cities of 111 cities have City Mobility Plan (CMP) or any and hence able to provide data for Mode Share of Public Transport and Non-Motorised Transport. To address the data gap, as advised by the MoHUA, the consortia undertook a sample dipstick across all cities covering a sample of 150 Households. Understandably, the dipstick findings will not match the rigor of a CMP.	We recommend the following: 1) Cities which have provided CMP Data will be evaluated on 100% of the maximum score 2) For the cities where the dipstick data is used, the city receives a 50% discount on the overall score Alternatively, another approach is to assign 0 score to all 88 cities that don't have a CMP
2	Variance was observed on data reported by cities on road network and data presented in the smart city proposals during the verifications.	We recommend taking the data reported by the cities in the Smart City Proposals.
3	There is no secondary source/ organization that provides unemployment data at city level. As a result, most cities do not have the data. Fully cognizance of the challenges of generating this data in a short span of time, it was agreed to collect this data through a dipstick survey on lines of NSSO questions. The	The indicator on unemployment will be excluded from scores. For final ranking, the cities will be scored on 78 indicators.

#	Challenges	Proposed Solutions
	data generated needs further scrutiny and triangulation with some inputs from experts. This may not be possible in the short window.	
4	Many cities did not have data on noise pollution and it was decided that data will be collected using a mobile app for all the 111 cities. However, many cities have expressed reservations with the approach especially with respect to the reliability of using this data. Further, some cities have relied on the SPCB to collect the data as per the approach proposed by the consortia. Thus, noise pollution data is currently from two sources: 1. SPCB- 20 cities 2. Noise-based app- 91 cities	The data collected through the primary survey will be used for scoring the cities. Currently, there is no differential scoring for the data from the SPCB and the data collected through the mobile app. However, a certain higher weightage can be provided to those cities which used the state apparatus to collect noise pollution data.
5	For the indicator on quality of water supplied, the methodology document states that samples should be drawn both at the treatment plant outlet as well as the consumer end. However, the data provided by the cities were predominantly from the distribution point. Hence for consumer end results with MoHUA intervention, consortia coordinated with cities to collect the data at the consumer end. The cities facilitated the testing. The outcome of the process is as below: 1. Sample given- 102 cities 2. Report received- 86 cities 3. Report awaited- 16 cities 4. Tests not completed due to lack of cooperation and other reasons – 9	The maximum score for this indicator will be distributed equally (50%) for results based on samples from the treatment plant and consumer end. Cities that did not complete tests or provide the results will be given a score 0 for against consumer end tests.
6	City level population is not projected annually by most of the cities. So, estimates for 2017 population are not available with the cities.	As recommended by MoHUA, 2011 census population is being used for the ranking purpose.
7	The age category specific data for 9 cities is not available at a city level	The age category specific population data has been taken at a district level for these cities.

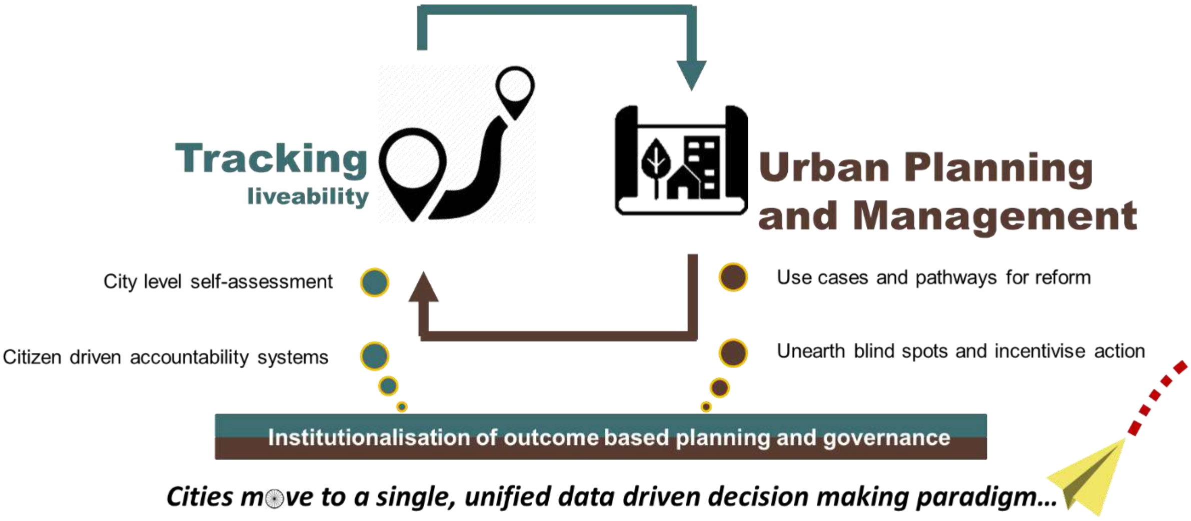
#	Challenges	Proposed Solutions
8	Indicators on non-motorised transports like- Dedicated bicycle tracks, bicycle parking facilities and mode share of non-motorised transport are not relevant for hilly terrains.	As discussed during the PMC meeting, these indicators have been treated as non-applicable for the hilly cities and the weights have been redistributed among other indicators within the same category.
9	The indicator on increase in professional tax is not relevant to cities which do not levy the professional tax.	As discussed during the PMC meeting, this indicator has been non-applicable to the cities belonging to states where professional tax is not levied, and the weights have been redistributed among other indicators within the same category.
10	The indicator on increase in VAT collection is not applicable to Port Blair and Kavaratti, as there was no provision of VAT collection in these cities.	As discussed during the PMC meeting, these indicatosr has been treated as non-applicable for these two cities and the weights have been redistributed among other indicators within the same category.
11	Indicator on coverage of basic services to slum households does not concern cities with no slums (notified/ non-notified.	As discussed during the PMC meeting, this indicators has been treated as non-applicable for these cities and the weights have been redistributed among other indicators within the same category.

1. Introduction

The Ministry of Housing and Urban Affairs (MoHUA) is implementing several flagship urban missions such as the Smart Cities Mission (SCM), Atal Mission for Urban Rejuvenation and Transformation (AMRUT), Heritage City Development and Augmentation Yojana (HRIDAY), Housing for All (HFA). Theses mission along with other transformative initiatives of the Government including National Water Mission, Power for All, National Health Mission are aimed at making Indian cities more 'liveable.' The overarching goal of these initiatives is to move from an input-based approach to a 'citizen centric-outcome based' assessment of urban liveability.

To develop a common minimum framework for cities to assess their existing status and chart their pathway towards providing a better quality of life to their citizens, the MoHUA developed a set of 'Liveability Standards' relevant to cities to generate a Liveability Index and ranking of cities. These standards were launched in June, 2017. The MoHUA has planned to conduct an 'Annual Assessment of Liveability Standards in Cities – an ambitious national project that will involve yearly submission of data by cities across the various indicators, compilation and analysis, development of indices and ranking of cities. The Liveability Index is envisioned as a 360° tool for tracking, planning and transforming Indian cities. The Liveability Index is aimed at the following objectives:

- Providing strong evidence-based approach for future interventions and investments to deliver liveability outcomes
- Catalysing actions to improve the overall quality of the city's liveability and achieve broader development outcomes including the Sustainable Development Goals
- Assessing the implementation of government policies and schemes governing characteristics of cities that can contribute to creating liveable communities



Tracking
liveability
Urban Planning
and Management
City level self-assessment
Citizen driven accountability systems
Use cases and pathways for reform
Unearth blind spots and incentivise action
Institutionalisation of outcome based planning and governance
Cities move to a single, unified data driven decision making paradigm...

The first round of the assessment commenced in January 2018 covering 116 major cities including smart cities, capital cities and cities with population of above one million each. Implementation of the liveability assessment commenced in January 2018 with a national level orientation workshop for the urban local bodies. The workshop aimed at orienting the states and urban local bodies on the overall framework, indicators, data sources, methodology and key milestones and timelines involved in the liveability assessment. Subsequently, a series of State/ Union Territory level orientation workshops were carried out in 33 states/UTs for a detailed discussion on the framework. Online data collection commenced from 9th March through an online data collection platform that supported both online and offline data submission modes. On the date of closure of the online data entry portal i.e., 16th April, 2018 112 cities submitted their data. Subsequently, comprehensive checks on the submitted data was undertaken that involved checking for outliers, logical inconsistencies etc. post which round-1 of data reconciliation was conducted. This draft report is based on round-1 of reconciled data as on 28th April, 2018.

2. City Profile

This chapter presents the city profile -Geographic and Demographic, Social (Education Health, Safety and Security, Heritage), Economic profile, and Physical (Water, sanitation and Waste Management, Electricity, Open space and roads).

AMARAVATI

GEOGRAPHICAL PROFILE

State/Union Territory	Andhra Pradesh	**Total Geographical Area**	217	**City Category**	Small City

DEMOGRAPHIC PROFILE

Total Population	103000
Total Number of Households	37959

SOCIAL PROFILE

Education	**Total Number of Schools**	74
	Total Enrolment (Class 1 to 5)	3988
Health	**Total Number of In-patient Beds**	34
	Total Health Workforce	110
Safety and Security	**Total Strength of Police Force**	...
	Total Number of CCTV Cameras	22
Heritage Sites	**Total Number of Heritage Sites**	3

ECONOMIC PROFILE

Total Population in Working Age Group	73907
Total Number of Industries	...
Total Number of Commercial Enterprises	81
Total Number of Hotels	...
Total Capital and Revenue Expenditure for the city in FY 2016-17 (INR Lakhs)	0
Total VAT Collection in FY 2016-17 (INR Lakhs)	470.16

PHYSICAL PROFILE

	Water	**Average Quantity of Water Supplied (MLD)**	
		Total Number of Water Connections	38130
	Sanitation Facilities	**Total number of households with access to individual toilets in the city**	37959
		Total number of households in the city with access to community toilets in the city	...
	Solid Waste Management	**Daily average quantity of municipal solid waste collected in the city (Tonnes/day)**	14
		Total number of households covered through door-to-door collection of solid waste	37959
	Waste Water	**Daily Average Quantum of Waste Water Generated in the City (MLD)**	...
		Daily average quantum of waste water treated by STPs in the city (MLD)	...
	Electricity	**Total number of authorized electrical connections in the city**	49838
		Total electricity supplied to the city (kWh)	61510253
	Public and Open Spaces	**Total area covered by green spaces in the city (m^2)**	63.93
	Roads and Transport	**Total Length of Road Network in the City (Km)**	196.81
		Total length of arterial and sub-arterial road network in the city (Km)	178.81
		Total length of footpath (wider than 1.2 metres) in the city along the street network (Km)	40

3. Liveability Framework and Indicators

The Liveability Framework comprises a total of 79 indicators (57 Core Indicators and 22 Supporting Indicators). A core indicator carries 70% weightage and a supporting indicator carries 30% weightage. These indicators are grouped under 15 thematic categories which in turn are part of four pillars of comprehensive development of cities i.e., institutional, social, economic and physical. Based on the performance of cities against the various core and supporting indicators, various 'Category Sub-Indexes' and a composite 'City Liveability Index' will be developed for each city.

3.1 Scoring and Computing Category Indices of Liveability

The set of 79 indicators, associated categories and pillars are presented in the table below:

Table 1 List of Pillars, Categories and Indicators

Pillars of Comprehensive Development	Category	Indicators
Institutional	1. Governance	1.1 Percentage of citizen services available online
		1.2 Percentage of services integrated through Command Centre
		1.3 Percentage of citizens using online services
		1.4 Average delay in grievance redressal
		1.5 Tax collected as percentage of tax billed
		1.6 Extent of cost recovery (O&M) in water supply services
		1.7 Capital spending as percentage of total expenditure
		1.8 Percentage of population covered under Ward Committees/Area *Sabhas*
Social	**2. Identity and Culture**	2.1 Restoration and reuse of historic buildings
		2.2 Percentage of ecologically important areas covered through projects for restoration
		2.3 Hotel occupancy
		2.4 Percentage of budget allocated towards

Pillars of Comprehensive Development	Category	Indicators
		cultural/sports activities
		2.5 Number of cultural/sports events hosted by city
	3. Education	3.1 Percentage of school-aged population enrolled in schools
		3.2 Percentage of female school-aged population enrolled in schools
		3.3 Primary education student-teacher ratio
		3.4 Percentage of schools with access to digital education
		3.5 Percentage of students completing primary education
		3.6 Percentage of students completing secondary education
	4. Health	4.1 Number of in-patient hospital beds per 10,000 population
		4.2 Healthcare professionals per 10,000 population
		4.3 Average response time in case of health emergencies
		4.4 Period prevalence of water borne diseases
		4.5 Period prevalence of vector borne diseases
	5. Safety and Security	5.1 Number of CCTV Cameras
		5.2 Number of recorded crimes per lakh population
		5.3 Extent of crimes recorded against women, children and elderly per year
		5.4 Transport-related fatality per lakh population
Economic	**6. Economy and Employment**	6.1 Increase in VAT/GST collection
		6.2 Increase in collection of Professional Tax
		6.3 Increase in issuance of Construction permits
		6.4 Unemployment rate

Pillars of Comprehensive Development	Category	Indicators
		6.5 Percentage of vendors registered and provided formal spaces
Physical	**7. Housing and Inclusiveness**	7.1 Percentage of Slum/EWS households covered through formal/affordable housing
		7.2 Percentage of slum areas covered through basic services
	8. Public Open Spaces	8.1 Per capita availability of green spaces
		8.2 Per capita availability of public and recreational places
	9. Mixed Land Use and Compactness	9.1 Share of mixed land use area in overall city land use
		9.2 Net Density
	10. Power Supply	10.1 Percentage of city population with authorized electrical services
		10.2 Percentage of electrical connections covered through smart meters
		10.3 Average number of electrical interruptions per year
		10.4 Average length of electrical interruptions per year
		10.5 Percentage of total energy derived from renewable sources
		10.6 Energy consumption per unit - water supply and sewerage
		10.7 Energy consumption per unit - street lighting
		10.8 Percentage of new and redeveloped buildings following green building norms
		10.9 Total energy consumption per capita
	11. Transportation	11.1 Geographical coverage of public transport
		11.2 Availability of public transport

Pillars of Comprehensive Development	Category	Indicators
	and Mobility	11.3 Mode share of public transport
		11.4 Percentage of road network with dedicated bicycle tracks
		11.5 Percentage of interchanges with bicycle parking facilities
		11.6 Mode share of non-motorized transport
		11.7 Availability of Passenger Information System
		11.8 Extent of signal synchronization
		11.9 Availability of paid parking spaces
		11.10 Percentage coverage of footpaths – wider than 1.2 m
		11.11 Percentage of traffic intersections with pedestrian crossing facilities
		11.12 Extent to which universal accessibility is incorporated in public rights-of-way
	12. Assured Water Supply	12.1 Household level coverage of direct water supply connections
		12.2 Per capita supply of water
		12.3 Quality of water supplied
		12.4 Level of non-revenue water – NRW
		12.5 Percentage of water connections covered through meters
		12.6 Percentage of plots with rainwater harvesting facility
	13. Waste Water Management	13.1 Coverage of toilets
		13.2 Coverage of sewerage network and/or septage
		13.3 Collection efficiency of sewerage network

Pillars of Comprehensive Development	Category	Indicators
		13.4 Extent of reuse and recycling of waste water
		13.5 Coverage of storm water drains
	14. Solid Waste Management	14.1 Household level coverage of municipal solid waste collection
		14.2 Efficiency of collection of municipal solid waste
		14.3 Extent of municipal solid waste recovered through reuse
	15. Reduced Pollution	15.1 Concentration of SO2- air pollution
		15.2 Concentration of NO2- air pollution
		15.3 Concentration of PM10 - air pollution
		15.4 Level of noise pollution
		15.5 Quality of water in public surface water bodies

3.2 Scoring and Computing Category Indices of Liveability

The performance achieved by cities against 79 indicators, will be assessed against given benchmarks. Where no international/national norms are available, city with the best performance in its group (population range) will be treated as a benchmark. The groups are given in the table below.

Table 2 Details on Population Range

Category	Population range
Category 1	Population ≥ 4 million
Category 2	1 million ≤ Population < 4 million
Category 3	0.5 million ≤ Population < 1 million
Category 4	Population < 0.5 million

3.3 Scoring Approach and Methodology

A city can earn a maximum score of 100 points for 79 indicators across four pillars. The pillar weights are as follows: Institutional (25 points), Social (25 points), Economy and Employment (5 points) and Physical (45 points). Based on the number and nature of indicators i.e., core vs. secondary, indicator wise maximum marks were computed.

100 marks

(Maximum overall score that any city can achieve)

25 marks (Maximum score that any city can achieve under **Institutional** Pillar)	25 marks (Maximum score that any city can achieve under **Social** Pillar)	5 marks (Maximum score that any city can achieve under **Economic** Pillar)	45 marks (Maximum score that any city can achieve under **Physical** Pillar)
1 (Category under Institutional Pillar)	4 (Number of categories under Social Pillar)	1 (Category under Economic Pillar)	9 (Number of categories under Physical Pillar)
8 (Number of indicators under Institutional)	20 (Number of indicators under Social Pillar)	5 (Category under Economic Pillar)	46 (Number of categories under Physical Pillar)
7 Core 1 Supporting	13 Core 7 Supporting	4 Core 1 Supporting	33 Core 13 Supporting

Dimensional Index Methodology (DIM) has been used to compute scores for each indicator with reference to "maximum within the comparison group" or "absolute benchmarks". For indicators where benchmarks are available, cities getting the benchmark score (or above) are given the maximum mark, and the marks awarded to other cities are calculated proportionately. For indicators where benchmarks are not available, the best performing cities in each population group are given the maximum mark, and the marks awarded to other cities (within the population group) are calculated proportionately. For indicators where benchmarks do not exist, the city data has been tested for outliers before scoring.

3.4 Scoring Normalisation:

To construct aggregate scores across cities as well as to make the scores across indicators comparable, indicator values were normalised using a min-max approach. The following formula was used to normalise the indicator values-

$$\frac{indicator\ value\ for\ the\ city - indicator\ value\ for\ the\ worst\ performing\ city}{benchmark - \ indicator\ value\ for\ the\ worst\ performing\ city}$$

This approach would restrict the normalised indicator value between 0 and 1. Cities that met or exceeded the benchmark received a normalised indicator value of 1. Worst performing cities are given a normalised indicator value of 0. After normalisation, the normalised value is weighted according to the category and the indicator being core or supporting.

To illustrate, consider the indicator 12.3 Quality of Water Supplied in the Category 12 for Assured Water Supply. If in City A 50% of the water samples collected qualify the potable water standards specified by the CPHEEO, and only 10% of the samples from worst performing city qualify the standards. Then, the normalised value for the indicator for city A would be 0.44 [(0.5-0.1)/(1-0.1)].

The weight for indicator 12.3 is 1.03, so the final weighted score for City A would come out to 0.45 [1.03*0.44].

4. Data Collection and Verification

4.1 Submission of Data by the cities

The Liveability Assessment is based on secondary data submitted by the urban local bodies and other concerned government agencies (collectively called as data owners). The 79 indicators were broken down into a set of easy to understand and relatable 553 questions mapped to data owners. Submission of the data was enabled through an online data entry portal on the smartnet platform of the Ministry. The portal also allowed the ULBs to download the liveability assessment questionnaire and upload filled in questionnaire. To familiarise and assist cities in identifying, mapping and collation of data points, a city level nodal person was available during the entire period of data submission process.

4.2 Mapping of Data Owners for the City

For the assessment of liveability indices broadly 12 data owners such as Central/state Pollution control board, Development authority, DISCOM/Electricity Board, State Disaster Management Authority, State Education Department, State Health department, State Renewable energy and development agency, State sales and commercial taxes department, town and country planning department, Traffic and police department, Transport authority, and Urban local body were identified to respond to the questions on the portal. However, during state workshop and subsequent city level discussions, more data owners were mapped to respond to different categories and sub categories. The following table provides the details of city level data owners mapped under the 12 data owner.

Table 3:Details of Data Owners

Designated data owners	Subcategories	Data owners at city level
Urban Local Body	For Accounts Related Questions	Accounts Department
Urban Local Body	For Park and Recreation Related Questions	Town Planning,Education,Licence Departments
Urban Local Body	For Water Supply and Drainage related questions	Water Supply and Drainage Department
Urban Local Body	For Heritage sites related data	Town Planning Department
Urban Local Body	For Ecological sites related data	Environment Department
Urban Local Body	For Housing related data	Town Planning Department
Urban Local Body	For Building plan related data	Town Planning Department
Urban Local Body	For Roads related data	City Engineer Department
Urban Local Body	For Solid waste management related data	Solid waste management/Sanitation Department
Urban Local Body	For IT services related data	IT/System Department
Urban Local Body	For Vendor committee related data	License Department
Urban Local Body	Any other departments involved in providing data for questions mentioned under Urban Local Body	Health,Transport,Garden Department etc.
Central / state Pollution control Board	Water Quality, Air Quality, Noise Quality	MPCB Regional office
Development Authority	Building Infrastructure	Town Planning Department

Designated data owners	Subcategories	Data owners at city level
	Construction planning	Town Planning Department
	Green Building	Town Planning Department
	Rain water harvesting	Town Planning Department
	Universal Design Principle	Town Planning Department
DISCOM/Electricity Board	Electrical Connection/ Grievance Redressal/ Power supply	MSEB
State Disaster management authority		Disaster management
State Education Department		Education Department
State Health Department	Health care professionals	Health Department-Civil Surgeon
	Citizen Services	Health Department-Civil Surgeon
	Disease Prevalence	Health Department-Civil Surgeon
	Health Infrastructure	Health Department-Civil Surgeon
State Renewable Energy Development Agency		Deputy Engineer-Electrical Department
State Sales / Commercial Taxes Department		Sales Tax Department
Town and Country Planning Department	Land Use	Town Planning Department
Traffic and Police Department		Traffic and Police Department
Transport Authorities	Buses	Transport Department
	Registered Vehicles	Transport Department
	Sub urban rail transport	Transport Department
	Mono Rail Authority	Transport Department
	Tramways	Transport Department
	Marine Transport Authority	Transport Department

4.3 List of secondary documents available as supportive

City has provided supporting documents/evidences against the responses given by city on the online portal. In support of their responses on the portal, city submitted 101 number of documents. Documents submitted includes reports, official orders, copy of data maintained in official register, signed copy of questionnaire, and signed letters/submissions from concern departments. Verification includes mapping of documents against responses given by city, checking the type/category of documents, and validation of data provided.

The following table presents the data owner wise number of documents:

Table 4: Data owner wise number of secondary documents submitted by city

Data Owners	Number of Documents
Sales and Commercial Taxes	7
State Education Department	4
DISCOM/Electricity Department	10
Traffic and Police Department	5
Development Authority	6
Pollution Control Board	5
State Renewable Energy Department	0
Town and Country Planning	1
State Health Department	19
Transport Authority	5
Disaster Management	3
Urban Local Body	36
Total	101

4.4 Data Verification

A three-stage data quality check comprising verification of data against secondary documents furnished by data owners, logical inconsistency checks including outliers, and physical audit for select indicators (Refer the exhibit below) is being undertaken. The objective of the data quality check is to ensure that data from the source documents are accurate and verifiable. Sources of data included reports, administrative data, survey results and other statistical records, log books among other.

Physical audit of eight indicators – one indicator from the Institutional pillar, one from the Social pillar, one from the Economy pillar and five from the Physical pillar is also being carried out by the

field team to ascertain the degree of reliability of data reported by the cities. The list of these eight indicators is presented below:

1.2 | Percentage of services integrated through Command Centre

2.3 | Hotel occupancy

3.4 | Percentage of schools with access to digital education

5.1| Number of streets, public places, junctions covered through surveillance systems

6.5 | Percentage of vendors registered and provided formal spaces

11.7 | Availability of Passenger Information System

11.11 | Percentage of traffic intersections with pedestrian crossing facilities

11.12 | Extent to which universal accessibility is incorporated in public rights-of-way

For a set of five indicators namely, unemployment rate, mode share of public transport, mode share of non-motorised transport, quality of water supplied and level of noise pollution, existing datasets were found to be not available consistently across all cities and/or were inadequate. To help cities that do not have data on these five indicators, dipstick assessments are being carried to fill data gaps.

6.4 | Unemployment Rate

11.3 | Mode share of public transport

11.5 | Mode share of Non Motorized Transport

12.3 | Quality of Water Supplied

15.4 | Level of Noise Pollution

4.5 Physical Audit

The following map presents the indicators audited at city level.

5 City Score on 15 categories of Assessment

Liveability Assessment covered 15 categories and 78 indicators. The below table presents the scores for all 15 indicators namely governance, identity & culture, education, health, safety and security, economy & employment, housing & inclusiveness, public open spaces, mixed land use & compactness, power supply, transport & mobility, assured water supply, waste water management, solid waste management and reduced pollution.

Table 5: Category wise scores

Categories	Scores in Percentage
Governance	51.74%
Identity & Culture	42%
Education	84%
Health	89%
Safety & Security	66%
Economy & Employment	57%

Housing & Inclusiveness	7%
Public Open Spaces	23%
Mixed Land Use & Compactness	33%
Power Supply	61%
Transport & Mobility	42%
Assured Water Supply	64%
Waste Water Management	37%
Solid Waste Management	64%
Reduced Pollution	66%

The rank of the city is based on the performance and scores in each of the category. The final city rank is submitted separately.

Executive Summary

Assessment of liveability indices is an initiative by the Ministry of Housing and Urban Affairs to improve quality of life of citizens and achieve sustainable development goals by encouraging cities to adopt "outcome based" approach for urban planning. Assessment process aimed to provide opportunity to cities to review the development components holistically by involving 79 measurable indicators categorized under governance, health, education, safety, economy, power supply, transportation and mobility, identity, culture, housing, waste management and pollution.

This report highlights the assessment process, key milestones, and the final outcome of the data submitted. Implementation of liveability assessment commenced formally on 19th January 2018. A national level workshop was organized on 13th February 2018 to explain the importance and process of liveability assessment and get feedback on methodology from the city authorities.

This was followed by the next stage of Questionnaire development. The questionnaire was arranged under 12 categories representing 12 data owners namely urban local body, Central and state pollution control board, development authority, DISCOM/Electricity board, State disaster management authority, state education department, state health department, state renewable energy development agency, state sales and commercial taxes department, town and country planning department, traffic and police department and transport authorities.

An online data entry portal was developed to facilitate data submission by the cities. Each city had a unique log in to access the portal and submit the data. Both online and off-line options (download the questionnaire in an excel) to submit the data were available for cities. An email help desk was set up for the cities to raise any queries and seek clarification when responding to the questions.

A team for each state comprising of State Coordinator and City Coordinator (one per city) was deployed that facilitated the process and supported the cities. A total of 6 regional coordinators/ consultants, 29 State Coordinators, and 99 city coordinators were deployed across 116 cities. Training for state coordinators was held from 26th to 28th February 2018 at Chennai to make coordinators understand overall liveability assessment, indicators, data sources, protocols and roles and responsibilities.

City Reconnaissance Meetings were initiated by the state and city coordinators. The discussion began with discussions to finalize the state workshop schedule, mapping of data owners, and assist cities in data collection. The City Coordinators were based in the cities for over 6 weeks and during this time, they liase with ULB and other data owners to explain the liveability framework, online portal, and facilitate the online submission.

A total of 33 state workshops were conducted at the state level. The objective of the workshop was to orient the city stakeholders on liveability assessment, indicators, components of data collection, timelines, expectations of support and support extended by MoHUA. The state level workshops brought various city level departments on a single platform to understand and discuss the methodology and components of city liveability assessment.

Nodal agency at state level supported by the City and State Coordinator and city level (Municipality corporation/smart city limited) coordinated with city specific data owners/departments for data gathering, collation, and submission. Nodal persons in each department were appointed for timely data collection and submission. Of 116, 112 cities submitted data as per the timeline on 16th April 2018.

Post submission, the city and state coordinators supported by the central team followed up extensively with the cities to support secondary documents as evidence to substantiate their submissions. Secondary documents such as reports, official orders, copy of office register, signed copy of liveability assessment questionnaire furnished by cities against the submitted data. Documents are verified to map the documents for the reponses provided by city and to check the type data provided by city. The document check outcomes were shared with the cities as a part of data quality check.

For checking consistency of data, logical check of data, verifying data from other public sources were undertaken. Quality check was done to ensure data validity and provide opportunity to cities to review the data provided by them and correct in case of wrong data entry.

For 8 selected indicators namely, percentage of services integrated through command and control center, hotel occupancy rate, percentage of schools with access to digital education, number of CCTV cameras per unit road length, percentage of vendors registered and provided formal spaces, availability of passenger information system, percentage of traffic intersection with pedestrian crossing facility, and extent to which universal accessibility is incorporated in public rights of way. Physical audit was conducted in 110 cities by physical auditors appointed and trained by the consortium. In consultation with ULB nodal person, locations and indicators for physical audit was selected in each city. A mobile based application was developed to capture the physical audit related data.

Primary data collection was done for five indicators such as unemployment rates, mode share of public transport, mode share of non-motorized transport, quality of water supplied, and level of noise pollution. Protocols for water and noise test were prepared in consultation with experts. Water quality test involved physical, chemical and bacteriological test of water as per the CPCB norms. For testing quality of water at consumer end, the auditors worked closely with the ULB and Water department. Samples were collected from consumer end and submitted to the lab suggested by city. For noise pollution, in about 20 cities the state pollution board or city level

environment department took the responsibility for providing noise pollution data as per the protocols. In rest of the cities, mobile based application was used to measure noise pollution.

During implementation, MoHUA facilitated the process by conducting video conferences with cities to address any queries, reiterate the importance, and ensure that cities adequately engages in the process and submit their responses in time and respond to requests for clarifications.

In addition to secondary data collection, physical audit and primary data collection, citizen survey was conducted to understand their perception and level of satisfaction on various services such as health, education, water supply, electricity, waste management etc. provided by urban local bodies. Over 60000 citizens participated in the survey across India.

The final scores and ranks have been generated based on the scoring methodology that has been discussed extensively and minor modifications made that are summarized as below:

#	**Challenges**	**Proposed Solutions**
1	Only 23 cities of 111 cities have City Mobility Plan (CMP) or any and hence able to provide data for Mode Share of Public Transport and Non-Motorised Transport. To address the data gap, as advised by the MoHUA, the consortia undertook a sample dipstick across all cities covering a sample of 150 Households. Understandably, the dipstick findings will not match the rigor of a CMP.	We recommend the following: 1) Cities which have provided CMP Data will be evaluated on 100% of the maximum score 2) For the cities where the dipstick data is used, the city receives a 50% discount on the overall score Alternatively, another approach is to assign 0 score to all 88 cities that don't have a CMP
2	Variance was observed on data reported by cities on road network and data presented in the smart city proposals during the verifications.	We recommend taking the data reported by the cities in the Smart City Proposals.
3	There is no secondary source/ organization that provides unemployment data at city level. As a result, most cities do not have the data. Fully cognizance of the challenges of generating this data in a short span of time, it was agreed to collect this data through a dipstick survey on lines of NSSO questions. The	The indicator on unemployment will be excluded from scores. For final ranking, the cities will be scored on 78 indicators.

#	Challenges	Proposed Solutions
	data generated needs further scrutiny and triangulation with some inputs from experts. This may not be possible in the short window.	
4	Many cities did not have data on noise pollution and it was decided that data will be collected using a mobile app for all the 111 cities. However, many cities have expressed reservations with the approach especially with respect to the reliability of using this data. Further, some cities have relied on the SPCB to collect the data as per the approach proposed by the consortia. Thus, noise pollution data is currently from two sources: 1. SPCB- 20 cities 2. Noise-based app- 91 cities	The data collected through the primary survey will be used for scoring the cities. Currently, there is no differential scoring for the data from the SPCB and the data collected through the mobile app. However, a certain higher weightage can be provided to those cities which used the state apparatus to collect noise pollution data.
5	For the indicator on quality of water supplied, the methodology document states that samples should be drawn both at the treatment plant outlet as well as the consumer end. However, the data provided by the cities were predominantly from the distribution point. Hence for consumer end results with MoHUA intervention, consortia coordinated with cities to collect the data at the consumer end. The cities facilitated the testing. The outcome of the process is as below: 1. Sample given- 102 cities 2. Report received- 86 cities 3. Report awaited- 16 cities 4. Tests not completed due to lack of cooperation and other reasons – 9	The maximum score for this indicator will be distributed equally (50%) for results based on samples from the treatment plant and consumer end. Cities that did not complete tests or provide the results will be given a score 0 for against consumer end tests.
6	City level population is not projected annually by most of the cities. So, estimates for 2017 population are not available with the cities.	As recommended by MoHUA, 2011 census population is being used for the ranking purpose.
7	The age category specific data for 9 cities is not available at a city level	The age category specific population data has been taken at a district level for these cities.

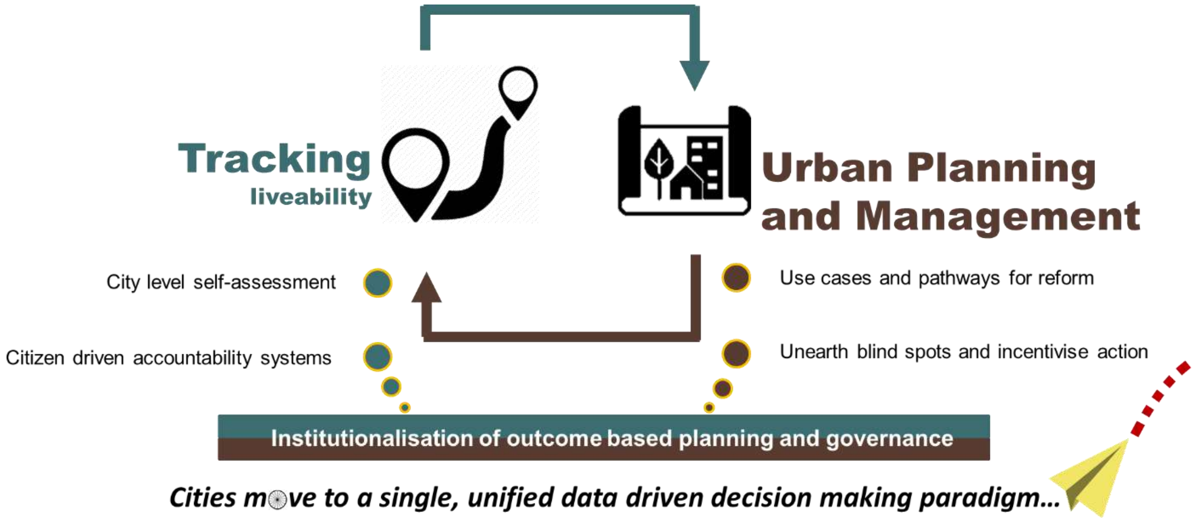
#	Challenges	Proposed Solutions
8	Indicators on non-motorised transports like- Dedicated bicycle tracks, bicycle parking facilities and mode share of non-motorised transport are not relevant for hilly terrains.	As discussed during the PMC meeting, these indicators have been treated as non-applicable for the hilly cities and the weights have been redistributed among other indicators within the same category.
9	The indicator on increase in professional tax is not relevant to cities which do not levy the professional tax.	As discussed during the PMC meeting, this indicator has been non-applicable to the cities belonging to states where professional tax is not levied, and the weights have been redistributed among other indicators within the same category.
10	The indicator on increase in VAT collection is not applicable to Port Blair and Kavaratti, as there was no provision of VAT collection in these cities.	As discussed during the PMC meeting, these indicatosr has been treated as non-applicable for these two cities and the weights have been redistributed among other indicators within the same category.
11	Indicator on coverage of basic services to slum households does not concern cities with no slums (notified/ non-notified.	As discussed during the PMC meeting, this indicators has been treated as non-applicable for these cities and the weights have been redistributed among other indicators within the same category.

1. Introduction

The Ministry of Housing and Urban Affairs (MoHUA) is implementing several flagship urban missions such as the Smart Cities Mission (SCM), Atal Mission for Urban Rejuvenation and Transformation (AMRUT), Heritage City Development and Augmentation Yojana (HRIDAY), Housing for All (HFA). Theses mission along with other transformative initiatives of the Government including National Water Mission, Power for All, National Health Mission are aimed at making Indian cities more 'liveable.' The overarching goal of these initiatives is to move from an input-based approach to a 'citizen centric-outcome based' assessment of urban liveability.

To develop a common minimum framework for cities to assess their existing status and chart their pathway towards providing a better quality of life to their citizens, the MoHUA developed a set of 'Liveability Standards' relevant to cities to generate a Liveability Index and ranking of cities. These standards were launched in June, 2017. The MoHUA has planned to conduct an 'Annual Assessment of Liveability Standards in Cities – an ambitious national project that will involve yearly submission of data by cities across the various indicators, compilation and analysis, development of indices and ranking of cities. The Liveability Index is envisioned as a 360° tool for tracking, planning and transforming Indian cities. The Liveability Index is aimed at the following objectives:

- Providing strong evidence-based approach for future interventions and investments to deliver liveability outcomes
- Catalysing actions to improve the overall quality of the city's liveability and achieve broader development outcomes including the Sustainable Development Goals
- Assessing the implementation of government policies and schemes governing characteristics of cities that can contribute to creating liveable communities



Tracking
liveability

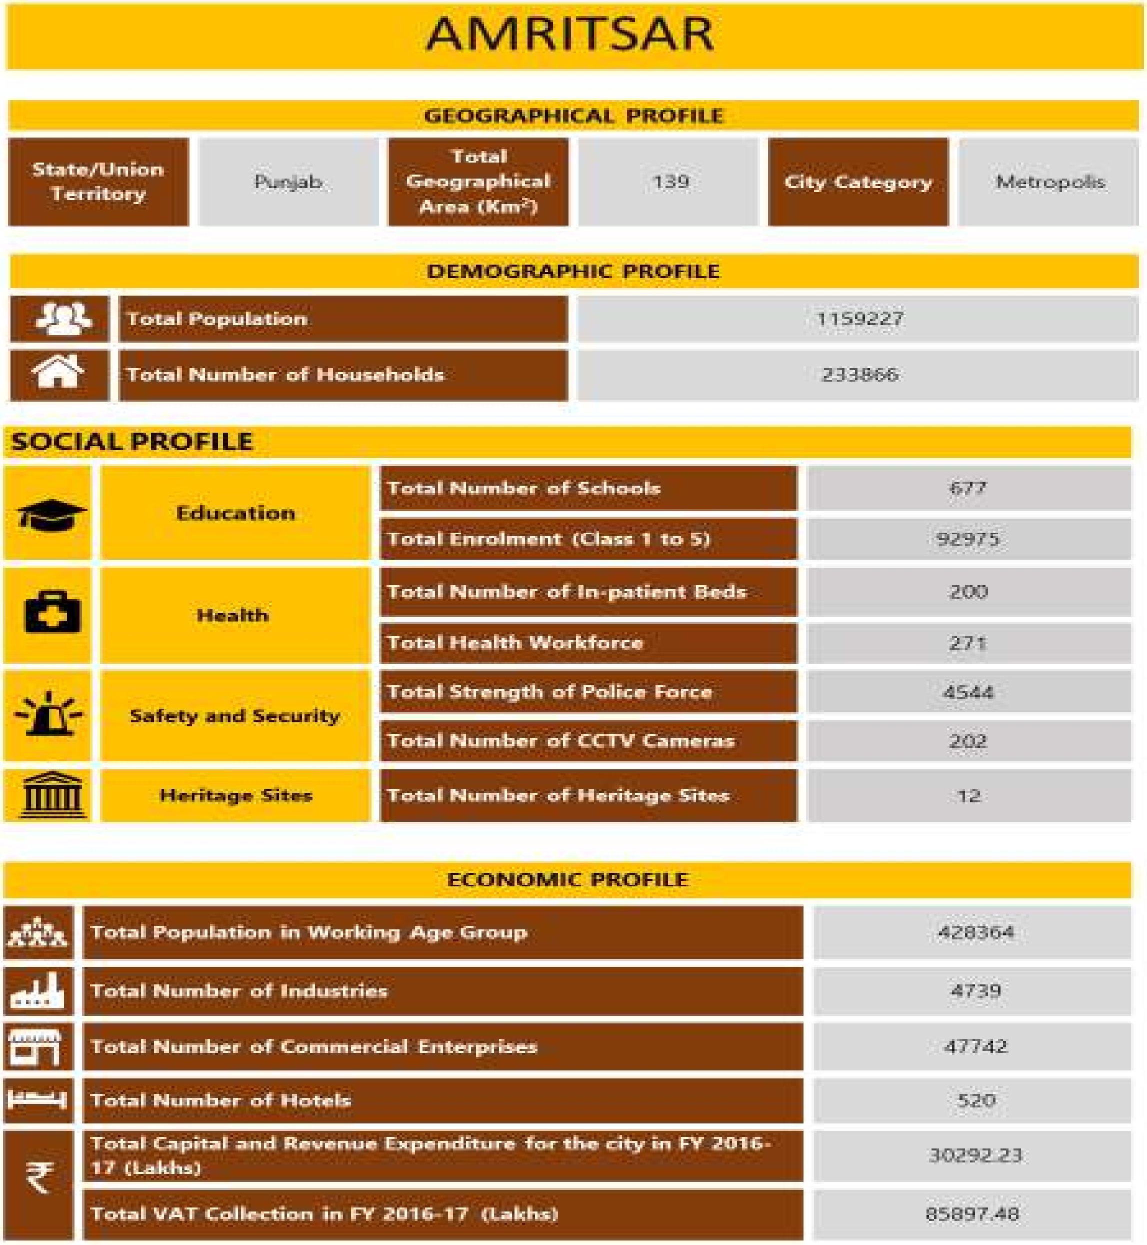
and Management
City level self-assessment
Citizen driven accountability systems
Use cases and pathways for reform
Unearth blind spots and incentivise action
Institutionalisation of outcome based planning and governance

Cities move to a single, unified data driven decision making paradigm...

The first round of the assessment commenced in January 2018 covering 116 major cities including smart cities, capital cities and cities with population of above one million each. Implementation of the liveability assessment commenced in January 2018 with a national level orientation workshop for the urban local bodies. The workshop aimed at orienting the states and urban local bodies on the overall framework, indicators, data sources, methodology and key milestones and timelines involved in the liveability assessment. Subsequently, a series of State/ Union Territory level orientation workshops were carried out in 33 states/UTs for a detailed discussion on the framework. Online data collection commenced from 9th March through an online data collection platform that supported both online and offline data submission modes. On the date of closure of the online data entry portal i.e., 16th April, 2018 112 cities submitted their data. Subsequently, comprehensive checks on the submitted data was undertaken that involved checking for outliers, logical inconsistencies etc. post which round-1 of data reconciliation was conducted. This draft report is based on round-1 of reconciled data as on 28th April, 2018.

2. City Profile

This chapter presents the city profile -Geographic and Demographic, Social (Education Health, Safety and Security, Heritage), Economic profile, and Physical (Water, sanitation and Waste Management, Electricity, Open space and roads).



AMRITSAR

GEOGRAPHICAL PROFILE

State/Union Territory	Punjab	Total Geographical Area (Km²)	139	City Category	Metropolis

DEMOGRAPHIC PROFILE

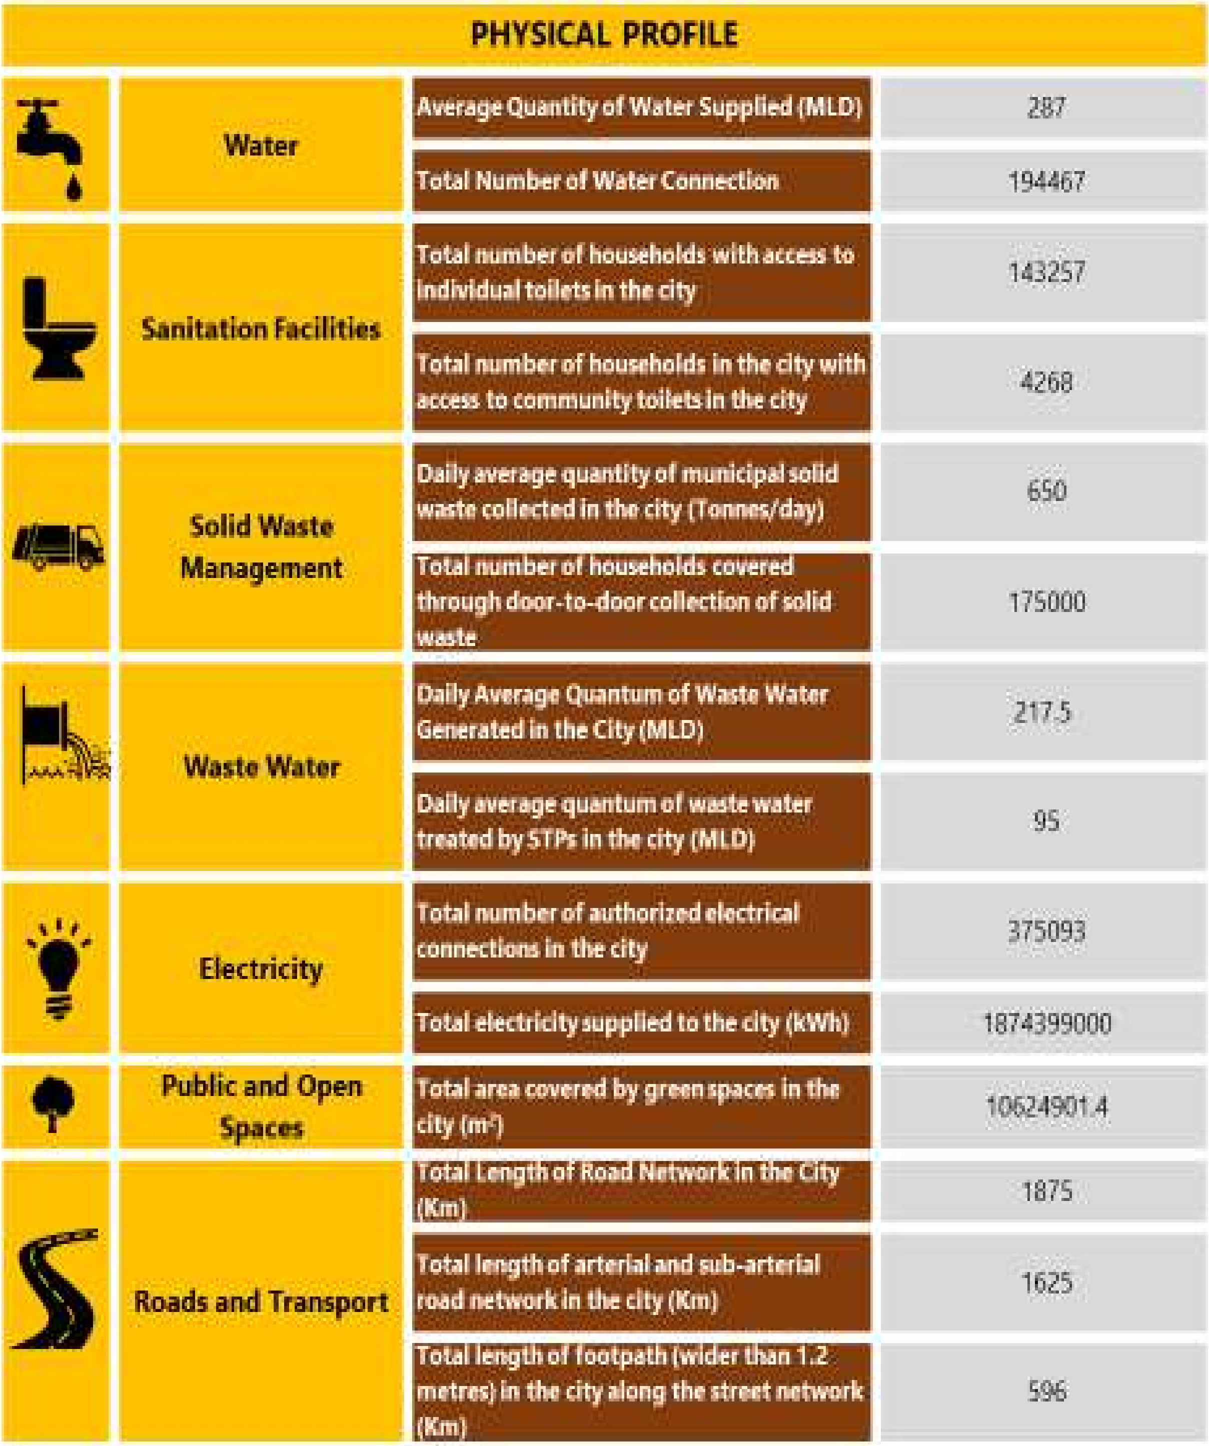
Total Population	1159227
Total Number of Households	233866

SOCIAL PROFILE

Education	Total Number of Schools	677
	Total Enrolment (Class 1 to 5)	92975
Health	Total Number of In-patient Beds	200
	Total Health Workforce	271
Safety and Security	Total Strength of Police Force	4544
	Total Number of CCTV Cameras	202
Heritage Sites	Total Number of Heritage Sites	12

ECONOMIC PROFILE

Total Population in Working Age Group	428364
Total Number of Industries	4739
Total Number of Commercial Enterprises	47742
Total Number of Hotels	520
Total Capital and Revenue Expenditure for the city in FY 2016-17 (Lakhs)	30292.23
Total VAT Collection in FY 2016-17 (Lakhs)	85897.48



PHYSICAL PROFILE

	Water	Average Quantity of Water Supplied (MLD)	287
		Total Number of Water Connection	194467
	Sanitation Facilities	Total number of households with access to individual toilets in the city	143257
		Total number of households in the city with access to community toilets in the city	4268
	Solid Waste Management	Daily average quantity of municipal solid waste collected in the city (Tonnes/day)	650
		Total number of households covered through door-to-door collection of solid waste	175000
	Waste Water	Daily Average Quantum of Waste Water Generated in the City (MLD)	217.5
		Daily average quantum of waste water treated by STPs in the city (MLD)	95
	Electricity	Total number of authorized electrical connections in the city	375093
		Total electricity supplied to the city (kWh)	1874399000
	Public and Open Spaces	Total area covered by green spaces in the city (m^2)	10624901.4
	Roads and Transport	Total Length of Road Network in the City (Km)	1875
		Total length of arterial and sub-arterial road network in the city (Km)	1625
		Total length of footpath (wider than 1.2 metres) in the city along the street network (Km)	596

3. Liveability Framework and Indicators

The Liveability Framework comprises a total of 79 indicators (57 Core Indicators and 22 Supporting Indicators). A core indicator carries 70% weightage and a supporting indicator carries 30% weightage. These indicators are grouped under 15 thematic categories which in turn are part of four pillars of comprehensive development of cities i.e., institutional, social, economic and physical. Based on the performance of cities against the various core and supporting indicators, various 'Category Sub-Indexes' and a composite 'City Liveability Index' will be developed for each city.

3.1 Scoring and Computing Category Indices of Liveability

The set of 79 indicators, associated categories and pillars are presented in the table below:

Table 1 List of Pillars, Categories and Indicators

Pillars of Comprehensive Development	Category	Indicators
Institutional	1. Governance	1.1 Percentage of citizen services available online
		1.2 Percentage of services integrated through Command Centre
		1.3 Percentage of citizens using online services
		1.4 Average delay in grievance redressal
		1.5 Tax collected as percentage of tax billed
		1.6 Extent of cost recovery (O&M) in water supply services
		1.7 Capital spending as percentage of total expenditure
		1.8 Percentage of population covered under Ward Committees/Area *Sabhas*
Social	**2. Identity and Culture**	2.1 Restoration and reuse of historic buildings
		2.2 Percentage of ecologically important areas covered through projects for restoration
		2.3 Hotel occupancy
		2.4 Percentage of budget allocated towards cultural/sports activities
		2.5 Number of cultural/sports events hosted by city
	3. Education	3.1 Percentage of school-aged population enrolled in schools
		3.2 Percentage of female school-aged population

Pillars of Comprehensive Development	Category	Indicators
		enrolled in schools
		3.3 Primary education student-teacher ratio
		3.4 Percentage of schools with access to digital education
		3.5 Percentage of students completing primary education
		3.6 Percentage of students completing secondary education
	4. Health	4.1 Number of in-patient hospital beds per 10,000 population
		4.2 Healthcare professionals per 10,000 population
		4.3 Average response time in case of health emergencies
		4.4 Period prevalence of water borne diseases
		4.5 Period prevalence of vector borne diseases
	5. Safety and Security	5.1 Number of CCTV Cameras
		5.2 Number of recorded crimes per lakh population
		5.3 Extent of crimes recorded against women, children and elderly per year
		5.4 Transport-related fatality per lakh population
Economic	**6. Economy and Employment**	6.1 Increase in VAT/GST collection
		6.2 Increase in collection of Professional Tax
		6.3 Increase in issuance of Construction permits
		6.4 Unemployment rate
		6.5 Percentage of vendors registered and provided formal spaces
Physical	**7. Housing and Inclusiveness**	7.1 Percentage of Slum/EWS households covered through formal/affordable housing
		7.2 Percentage of slum areas covered through basic services
	8. Public Open Spaces	8.1 Per capita availability of green spaces
		8.2 Per capita availability of public and recreational places
	9. Mixed Land Use and Compactness	9.1 Share of mixed land use area in overall city land use
		9.2 Net Density
	10. Power Supply	10.1 Percentage of city population with authorized electrical services

Pillars of Comprehensive Development	Category	Indicators
		10.2 Percentage of electrical connections covered through smart meters
		10.3 Average number of electrical interruptions per year
		10.4 Average length of electrical interruptions per year
		10.5 Percentage of total energy derived from renewable sources
		10.6 Energy consumption per unit - water supply and sewerage
		10.7 Energy consumption per unit - street lighting
		10.8 Percentage of new and redeveloped buildings following green building norms
		10.9 Total energy consumption per capita
	11. Transportation and Mobility	11.1 Geographical coverage of public transport
		11.2 Availability of public transport
		11.3 Mode share of public transport
		11.4 Percentage of road network with dedicated bicycle tracks
		11.5 Percentage of interchanges with bicycle parking facilities
		11.6 Mode share of non-motorized transport
		11.7 Availability of Passenger Information System
		11.8 Extent of signal synchronization
		11.9 Availability of paid parking spaces
		11.10 Percentage coverage of footpaths – wider than 1.2 m
		11.11 Percentage of traffic intersections with pedestrian crossing facilities
		11.12 Extent to which universal accessibility is incorporated in public rights-of-way
	12. Assured Water Supply	12.1 Household level coverage of direct water supply connections
		12.2 Per capita supply of water
		12.3 Quality of water supplied
		12.4 Level of non-revenue water – NRW
		12.5 Percentage of water connections covered through meters
		12.6 Percentage of plots with rainwater harvesting

Pillars of Comprehensive Development	Category	Indicators
		facility
	13. Waste Water Management	13.1 Coverage of toilets
		13.2 Coverage of sewerage network and/or septage
		13.3 Collection efficiency of sewerage network
		13.4 Extent of reuse and recycling of waste water
		13.5 Coverage of storm water drains
	14. Solid Waste Management	14.1 Household level coverage of municipal solid waste collection
		14.2 Efficiency of collection of municipal solid waste
		14.3 Extent of municipal solid waste recovered through reuse
	15. Reduced Pollution	15.1 Concentration of SO2- air pollution
		15.2 Concentration of NO2- air pollution
		15.3 Concentration of PM10 - air pollution
		15.4 Level of noise pollution
		15.5 Quality of water in public surface water bodies

3.2 Scoring and Computing Category Indices of Liveability

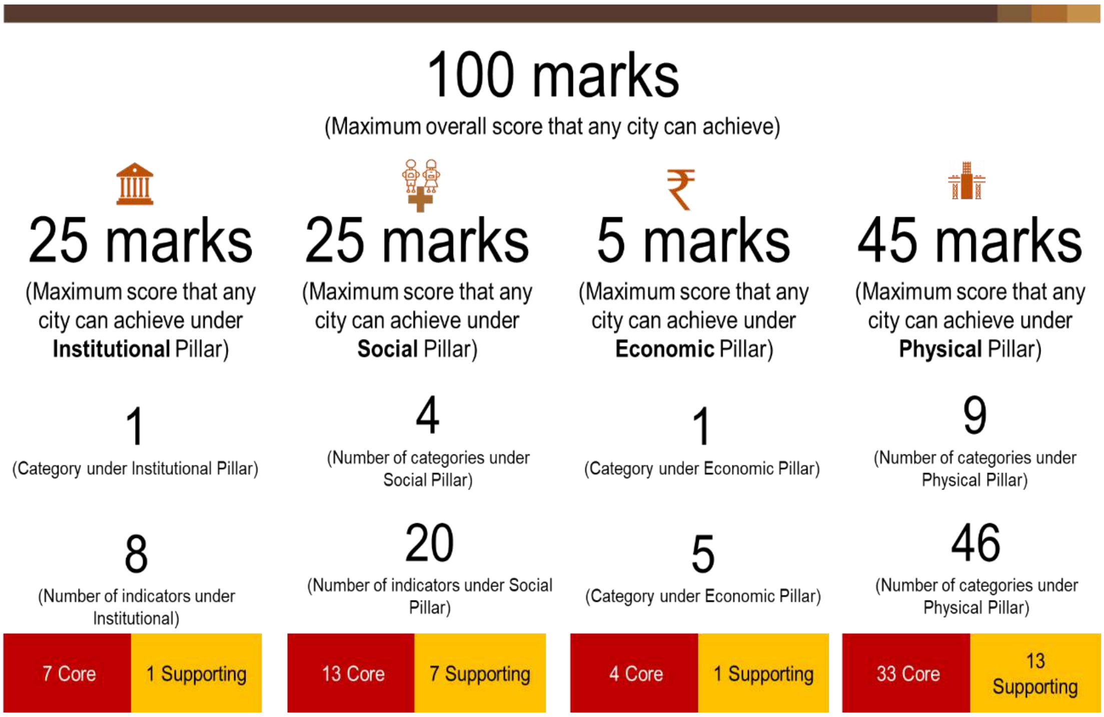
The performance achieved by cities against 79 indicators, will be assessed against given benchmarks. Where no international/national norms are available, city with the best performance in its group (population range) will be treated as a benchmark. The groups are given in the table below.

Table 2 Details on Population Range

Category	Population range
Category 1	Population ≥ 4 million
Category 2	1 million ≤ Population < 4 million
Category 3	0.5 million ≤ Population < 1 million
Category 4	Population < 0.5 million

3.3 Scoring Approach and Methodology

A city can earn a maximum score of 100 points for 79 indicators across four pillars. The pillar weights are as follows: Institutional (25 points), Social (25 points), Economy and Employment (5 points) and Physical (45 points). Based on the number and nature of indicators i.e., core vs. secondary, indicator wise maximum marks were computed.



100 marks

(Maximum overall score that any city can achieve)

25 marks (Maximum score that any city can achieve under **Institutional** Pillar)	25 marks (Maximum score that any city can achieve under **Social** Pillar)	5 marks (Maximum score that any city can achieve under **Economic** Pillar)	45 marks (Maximum score that any city can achieve under **Physical** Pillar)
1 (Category under Institutional Pillar)	4 (Number of categories under Social Pillar)	1 (Category under Economic Pillar)	9 (Number of categories under Physical Pillar)
8 (Number of indicators under Institutional)	20 (Number of indicators under Social Pillar)	5 (Category under Economic Pillar)	46 (Number of categories under Physical Pillar)
7 Core 1 Supporting	13 Core 7 Supporting	4 Core 1 Supporting	33 Core 13 Supporting

Dimensional Index Methodology (DIM) has been used to compute scores for each indicator with reference to “maximum within the comparison group” or “absolute benchmarks”. For indicators where benchmarks are available, cities getting the benchmark score (or above) are given the maximum mark, and the marks awarded to other cities are calculated proportionately. For indicators where benchmarks are not available, the best performing cities in each population group are given the maximum mark, and the marks awarded to other cities (within the population group) are calculated proportionately. For indicators where benchmarks do not exist, the city data has been tested for outliers before scoring.

3.4 Scoring Normalisation:

To construct aggregate scores across cities as well as to make the scores across indicators comparable, indicator values were normalised using a min-max approach. The following formula was used to normalise the indicator values-

$$\frac{indicator\ value\ for\ the\ city - indicator\ value\ for\ the\ worst\ performing\ city}{benchmark -\ indicator\ value\ for\ the\ worst\ performing\ city}$$

This approach would restrict the normalised indicator value between 0 and 1. Cities that met or exceeded the benchmark received a normalised indicator value of 1. Worst performing cities are given a normalised indicator value of 0. After normalisation, the normalised value is weighted according to the category and the indicator being core or supporting.

To illustrate, consider the indicator 12.3 Quality of Water Supplied in the Category 12 for Assured Water Supply. If in City A 50% of the water samples collected qualify the potable water standards specified by the CPHEEO, and only 10% of the samples from worst performing city qualify the standards. Then, the normalised value for the indicator for city A would be 0.44 [(0.5-0.1)/(1-0.1)].

The weight for indicator 12.3 is 1.03, so the final weighted score for City A would come out to 0.45 [1.03*0.44].

4. Data Collection and Verification

4.1 Submission of Data by the cities

The Liveability Assessment is based on secondary data submitted by the urban local bodies and other concerned government agencies (collectively called as data owners). The 79 indicators were broken down into a set of easy to understand and relatable 553 questions mapped to data owners. Submission of the data was enabled through an online data entry portal on the smartnet platform of the Ministry. The portal also allowed the ULBs to download the liveability assessment questionnaire and upload filled in questionnaire. To familiarise and assist cities in identifying, mapping and collation of data points, a city level nodal person was available during the entire period of data submission process.

4.2 Mapping of Data Owners for the City

For the assessment of liveability indices broadly 12 data owners such as Central/state Pollution control board, Development authority, DISCOM/Electricity Board, State Disaster Management Authority, State Education Department, State Health department, State Renewable energy and development agency, State sales and commercial taxes department, town and country planning department, Traffic and police department, Transport authority, and Urban local body were identified to respond to the questions on the portal. However, during state workshop and subsequent city level discussions, more data owners were mapped to respond to different categories and sub categories. The following table provides the details of city level data owners mapped under the 12 data owner.

Table 3:Details of Data Owners

Designated data owners	Subcategories	Data owners at city level
Urban Local Body	For Accounts Related Questions	Deputy Controller (Finance & Accounts)
Urban Local Body	For Park and Recreation Related Questions	Horticulture Department, Municipal Corporation, Amritsar.
Urban Local Body	For Water Supply and Drainage related questions	Operation & Maintenance Cell, Municipal Corporation, Amritsar.
Urban Local Body	For Heritage sites related data	1. Punjab Heritage and Tourism Promotion Board Department. 2. Civil Department, Municipal Corporation, Amritsar.
Urban Local Body	For Ecological sites related data	There are no ecological sites in Amritsar
Urban Local Body	For Housing related data	License & Census Branch, Municipal Corporation, Amritsar.
Urban Local Body	For Building plan related data	Municipal Town Planning Department, Municipal Corporation, Amritsar.
Urban Local Body	For Roads related data	Civil Department, Municipal Corporation, Amritsar.
Urban Local Body	For Solid waste management related data	Health Department, Municipal Corporation, Amritsar.
Urban Local Body	For IT services related data	IT Department, Municipal Corporation, Amritsar.
Urban Local Body	For Vendor committee related data	Estate Department, Municipal Corporation, Amritsar.
Urban Local Body	Any other departments involved in providing data for questions mentioned under Urban Local Body	1. District Sports Office, Guru Nanak Stadium, Gandhi Ground Amritsar (Stadium Related Data). 2. Property Tax Department, Municipal

Designated data owners	Subcategories	Data owners at city level
		Corporation, Amritsar (Property Tax Related Data). 3. Employment Generation & Training Office (District Employment Exchange Related Data). 4. Public Works Development Department (Roads Related Data). 5. Amritsar Improvement Trust, Amritsar (Bicycle Track Related Data). 6. Street Light, Municipal Corporation Amritsar (Street Light Related Data) 7. Death & Birth Department, Municipal Corporation Amritsar (Online Services Birth & Death related data)
For questions under Central / state Pollution control Board	Water Quality, Air Quality, Noise Quality	Punjab Pollution Control Board, Amritsar.
Development Authority	Building Infrastructure	1. Amritsar Development Authority (PUDA-Punjab Urban Development Authority), Amritsar. 2. Municipal Town Planning Department, Municipal Corporation Amritsar.
	Construction planning	1. Amritsar Development Authority (PUDA-Punjab Urban Development Authority), Amritsar. 2. Municipal Town Planning Department, Municipal Corporation Amritsar.
	Green Building	Amritsar Development Authority (PUDA-Punjab Urban Development Authority), Amritsar.
	Rain water harvesting	1. Amritsar Development Authority (PUDA-Punjab Urban Development Authority), Amritsar. 2. Municipal Town Planning Department, Municipal Corporation Amritsar.
	Universal Design Principle	Public Works Department, Amritsar.
DISCOM/Electricity Board	Electrical Connection/ Grievance Redressal/ Power supply	Punjab State Power Corporation Limited
State Disaster		Joint Commissioner, Municipal

Designated data owners	Subcategories	Data owners at city level
management authority		Corporation, Amritsar
State Education Department		1. Block Education Elementary Office (Primary), Punjab School Education Board. 2. District Education Office (Secondary), Punjab School Education Board.
State Health Department	Health care professionals	Chief Medical Office
State Health Department	Citizen Services	Chief Medical Office
State Health Department	Disease Prevalence	Chief Medical Office
State Health Department	Health Infrastructure	Indian Medical Association
State Renewable Energy Development Agency		Punjab Energy Development Authority, Zila Parishad Complex, Amritsar
State Sales / Commercial Taxes Department		Sales Tax & Excise Department, Amritsar
Town and Country Planning Department	Land Use	1. District Town Planner, Amritsar 2. Municipal Town Planner, Municipal Corporation Amritsar.
Traffic and Police Department		Traffic Police Department, Amritsar
Transport Authorities	Buses	General Manager Roadways
Transport Authorities	Registered Vehicles	Regional Transport Officer, Amritsar
Transport Authorities	Sub urban rail transport	Not exist in Amritsar city
Transport Authorities	Mono Rail Authority	Not exist in Amritsar city
Transport Authorities	Tramways	Not exist in Amritsar city
Transport Authorities	Marine Transport Authority	Not exist in Amritsar city

4.3 List of secondary documents available as supportive

City has provided supporting documents/evidences against the responses given by city on the online portal. In support of their responses on the portal, city submitted 95 number of documents. Documents submitted includes reports, official orders, copy of data maintained in official register, signed copy of questionnaire, and signed letters/submissions from concern departments. Verification includes mapping of documents against responses given by city, checking the type/category of documents, and validation of data provided.

The following table presents the data owner wise number of documents:

Table 4: Data owner wise number of secondary documents submitted by city

Data Owners	Number of Documents
Sales and Commercial Taxes	2
State Education Department	1
DISCOM/Electricity Department	8
Traffic and Police Department	3
Development Authority	3
Pollution Control Board	3
State Renewable Energy Department	2
Town and Country Planning	7
State Health Department	9
Transport Authority	0
Disaster Management	0
Urban Local Body	57
Total	95

4.4 Data Verification

A three-stage data quality check comprising verification of data against secondary documents furnished by data owners, logical inconsistency checks including outliers, and physical audit for select indicators (Refer the exhibit below) is being undertaken. The objective of the data quality check is to ensure that data from the source documents are accurate and verifiable. Sources of data included reports, administrative data, survey results and other statistical records, log books among other.

Physical audit of eight indicators – one indicator from the Institutional pillar, one from the Social pillar, one from the Economy pillar and five from the Physical pillar is also being carried out by the field team to ascertain the degree of reliability of data reported by the cities. The list of these eight indicators is presented below:

1.2 | Percentage of services integrated through Command Centre

2.3 | Hotel occupancy

3.4 | Percentage of schools with access to digital education

5.1| Number of streets, public places, junctions covered through surveillance systems

6.5 | Percentage of vendors registered and provided formal spaces

11.7 | Availability of Passenger Information System

11.11 | Percentage of traffic intersections with pedestrian crossing facilities

11.12 | Extent to which universal accessibility is incorporated in public rights-of-way

For a set of five indicators namely, unemployment rate, mode share of public transport, mode share of non-motorised transport, quality of water supplied and level of noise pollution, existing datasets were found to be not available consistently across all cities and/or were inadequate. To help cities that do not have data on these five indicators, dipstick assessments are being carried to fill data gaps.

6.4 | Unemployment Rate

11.3 | Mode share of public transport

11.5 | Mode share of Non Motorized Transport

12.3 | Quality of Water Supplied

15.4 | Level of Noise Pollution

4.5 Physical Audit

The following map presents the indicators audited at city level.

5. City Score on 15 categories of Assessment

Liveability Assessment covered 15 categories and 78 indicators. The below table presents the scores for all 15 indicators namely governance, identity & culture, education, health, safety and security, economy & employment, housing & inclusiveness, public open spaces, mixed land use & compactness, power supply, transport & mobility, assured water supply, waste water management, solid waste management and reduced pollution.

Table 5: Category wise scores

Categories	Scores in Percentage
Governance	44.89%
Identity & Culture	26%
Education	76%
Health	88%
Safety & Security	66%
Economy & Employment	12%
Housing & Inclusiveness	2%
Public Open Spaces	38%
Mixed Land Use & Compactness	1%

Power Supply	49%
Transport & Mobility	5%
Assured Water Supply	78%
Waste Water Management	32%
Solid Waste Management	57%
Reduced Pollution	63%

The rank of the city is based on the performance and scores in each of the category. The final city rank is submitted separately.

Executive Summary

Assessment of liveability indices is an initiative by the Ministry of Housing and Urban Affairs to improve quality of life of citizens and achieve sustainable development goals by encouraging cities to adopt "outcome based" approach for urban planning. Assessment process aimed to provide opportunity to cities to review the development components holistically by involving 79 measurable indicators categorized under governance, health, education, safety, economy, power supply, transportation and mobility, identity, culture, housing, waste management and pollution.

This report highlights the assessment process, key milestones, and the final outcome of the data submitted. Implementation of liveability assessment commenced formally on 19th January 2018. A national level workshop was organized on 13th February 2018 to explain the importance and process of liveability assessment and get feedback on methodology from the city authorities.

This was followed by the next stage of Questionnaire development. The questionnaire was arranged under 12 categories representing 12 data owners namely urban local body, Central and state pollution control board, development authority, DISCOM/Electricity board, State disaster management authority, state education department, state health department, state renewable energy development agency, state sales and commercial taxes department, town and country planning department, traffic and police department and transport authorities.

An online data entry portal was developed to facilitate data submission by the cities. Each city had a unique log in to access the portal and submit the data. Both online and off-line options (download the questionnaire in an excel) to submit the data were available for cities. An email help desk was set up for the cities to raise any queries and seek clarification when responding to the questions.

A team for each state comprising of State Coordinator and City Coordinator (one per city) was deployed that facilitated the process and supported the cities. A total of 6 regional coordinators/ consultants, 29 State Coordinators, and 99 city coordinators were deployed across 116 cities. Training for state coordinators was held from 26th to 28th February 2018 at Chennai to make coordinators understand overall liveability assessment, indicators, data sources, protocols and roles and responsibilities.

City Reconnaissance Meetings were initiated by the state and city coordinators. The discussion began with discussions to finalize the state workshop schedule, mapping of data owners, and assist cities in data collection. The City Coordinators were based in the cities for over 6 weeks and during this time, they liase with ULB and other data owners to explain the liveability framework, online portal, and facilitate the online submission.

A total of 33 state workshops were conducted at the state level. The objective of the workshop was to orient the city stakeholders on liveability assessment, indicators, components of data collection, timelines, expectations of support and support extended by MoHUA. The state level workshops brought various city level departments on a single platform to understand and discuss the methodology and components of city liveability assessment.

Nodal agency at state level supported by the City and State Coordinator and city level (Municipality corporation/smart city limited) coordinated with city specific data owners/departments for data gathering, collation, and submission. Nodal persons in each department were appointed for timely data collection and submission. Of 116, 112 cities submitted data as per the timeline on 16th April 2018.

Post submission, the city and state coordinators supported by the central team followed up extensively with the cities to support secondary documents as evidence to substantiate their submissions. Secondary documents such as reports, official orders, copy of office register, signed copy of liveability assessment questionnaire furnished by cities against the submitted data. Documents are verified to map the documents for the reponses provided by city and to check the type data provided by city. The document check outcomes were shared with the cities as a part of data quality check.

For checking consistency of data, logical check of data, verifying data from other public sources were undertaken. Quality check was done to ensure data validity and provide opportunity to cities to review the data provided by them and correct in case of wrong data entry.

For 8 selected indicators namely, percentage of services integrated through command and control center, hotel occupancy rate, percentage of schools with access to digital education, number of CCTV cameras per unit road length, percentage of vendors registered and provided formal spaces, availability of passenger information system, percentage of traffic intersection with pedestrian crossing facility, and extent to which universal accessibility is incorporated in public rights of way. Physical audit was conducted in 110 cities by physical auditors appointed and trained by the consortium. In consultation with ULB nodal person, locations and indicators for physical audit was selected in each city. A mobile based application was developed to capture the physical audit related data.

Primary data collection was done for five indicators such as unemployment rates, mode share of public transport, mode share of non-motorized transport, quality of water supplied, and level of noise pollution. Protocols for water and noise test were prepared in consultation with experts. Water quality test involved physical, chemical and bacteriological test of water as per the CPCB norms. For testing quality of water at consumer end, the auditors worked closely with the ULB and Water department. Samples were collected from consumer end and submitted to the lab suggested by city. For noise pollution, in about 20 cities the state pollution board or city level

environment department took the responsibility for providing noise pollution data as per the protocols. In rest of the cities, mobile based application was used to measure noise pollution.

During implementation, MoHUA facilitated the process by conducting video conferences with cities to address any queries, reiterate the importance, and ensure that cities adequately engages in the process and submit their responses in time and respond to requests for clarifications.

In addition to secondary data collection, physical audit and primary data collection, citizen survey was conducted to understand their perception and level of satisfaction on various services such as health, education, water supply, electricity, waste management etc. provided by urban local bodies. Over 60000 citizens participated in the survey across India.

The final scores and ranks have been generated based on the scoring methodology that has been discussed extensively and minor modifications made that are summarized as below:

#	**Challenges**	**Proposed Solutions**
1	Only 23 cities of 111 cities have City Mobility Plan (CMP) or any and hence able to provide data for Mode Share of Public Transport and Non-Motorised Transport. To address the data gap, as advised by the MoHUA, the consortia undertook a sample dipstick across all cities covering a sample of 150 Households. Understandably, the dipstick findings will not match the rigor of a CMP.	We recommend the following: 1) Cities which have provided CMP Data will be evaluated on 100% of the maximum score 2) For the cities where the dipstick data is used, the city receives a 50% discount on the overall score Alternatively, another approach is to assign 0 score to all 88 cities that don't have a CMP
2	Variance was observed on data reported by cities on road network and data presented in the smart city proposals during the verifications.	We recommend taking the data reported by the cities in the Smart City Proposals.
3	There is no secondary source/ organization that provides unemployment data at city level. As a result, most cities do not have the data. Fully cognizance of the challenges of generating this data in a short span of time, it was agreed to collect this data through a dipstick survey on lines of NSSO questions. The	The indicator on unemployment will be excluded from scores. For final ranking, the cities will be scored on 78 indicators.

#	Challenges	Proposed Solutions
	data generated needs further scrutiny and triangulation with some inputs from experts. This may not be possible in the short window.	
4	Many cities did not have data on noise pollution and it was decided that data will be collected using a mobile app for all the 111 cities. However, many cities have expressed reservations with the approach especially with respect to the reliability of using this data. Further, some cities have relied on the SPCB to collect the data as per the approach proposed by the consortia. Thus, noise pollution data is currently from two sources: 1. SPCB- 20 cities 2. Noise-based app- 91 cities	The data collected through the primary survey will be used for scoring the cities. Currently, there is no differential scoring for the data from the SPCB and the data collected through the mobile app. However, a certain higher weightage can be provided to those cities which used the state apparatus to collect noise pollution data.
5	For the indicator on quality of water supplied, the methodology document states that samples should be drawn both at the treatment plant outlet as well as the consumer end. However, the data provided by the cities were predominantly from the distribution point. Hence for consumer end results with MoHUA intervention, consortia coordinated with cities to collect the data at the consumer end. The cities facilitated the testing. The outcome of the process is as below: 1. Sample given- 102 cities 2. Report received- 86 cities 3. Report awaited- 16 cities 4. Tests not completed due to lack of cooperation and other reasons – 9	The maximum score for this indicator will be distributed equally (50%) for results based on samples from the treatment plant and consumer end. Cities that did not complete tests or provide the results will be given a score 0 for against consumer end tests.
6	City level population is not projected annually by most of the cities. So, estimates for 2017 population are not available with the cities.	As recommended by MoHUA, 2011 census population is being used for the ranking purpose.
7	The age category specific data for 9 cities is not available at a city level	The age category specific population data has been taken at a district level for these cities.

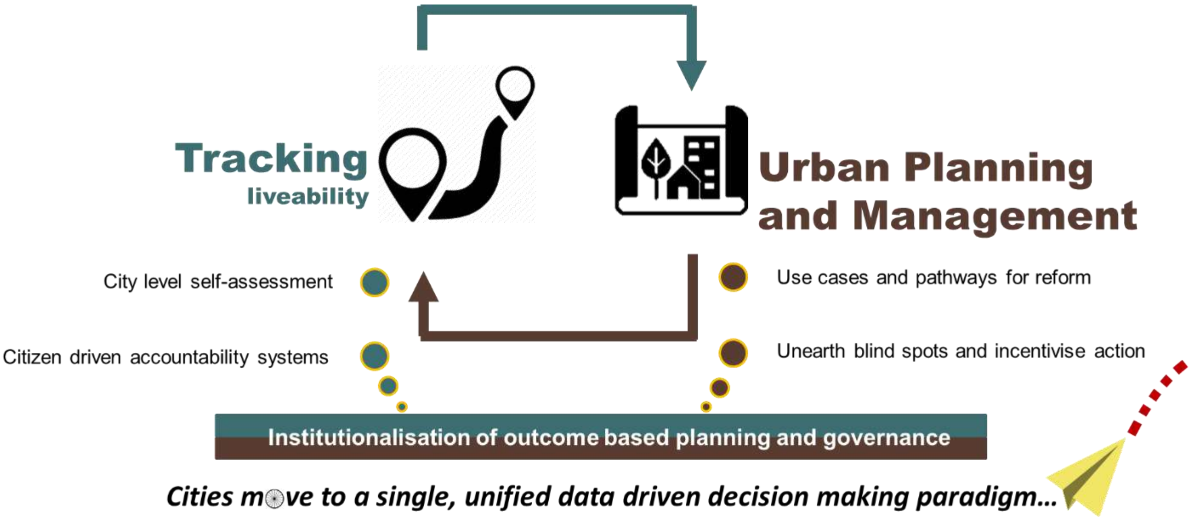
#	Challenges	Proposed Solutions
8	Indicators on non-motorised transports like- Dedicated bicycle tracks, bicycle parking facilities and mode share of non-motorised transport are not relevant for hilly terrains.	As discussed during the PMC meeting, these indicators have been treated as non-applicable for the hilly cities and the weights have been redistributed among other indicators within the same category.
9	The indicator on increase in professional tax is not relevant to cities which do not levy the professional tax.	As discussed during the PMC meeting, this indicator has been non-applicable to the cities belonging to states where professional tax is not levied, and the weights have been redistributed among other indicators within the same category.
10	The indicator on increase in VAT collection is not applicable to Port Blair and Kavaratti, as there was no provision of VAT collection in these cities.	As discussed during the PMC meeting, these indicatosr has been treated as non-applicable for these two cities and the weights have been redistributed among other indicators within the same category.
11	Indicator on coverage of basic services to slum households does not concern cities with no slums (notified/ non-notified.	As discussed during the PMC meeting, this indicators has been treated as non-applicable for these cities and the weights have been redistributed among other indicators within the same category.

1. Introduction

The Ministry of Housing and Urban Affairs (MoHUA) is implementing several flagship urban missions such as the Smart Cities Mission (SCM), Atal Mission for Urban Rejuvenation and Transformation (AMRUT), Heritage City Development and Augmentation Yojana (HRIDAY), Housing for All (HFA). Theses mission along with other transformative initiatives of the Government including National Water Mission, Power for All, National Health Mission are aimed at making Indian cities more 'liveable.' The overarching goal of these initiatives is to move from an input-based approach to a 'citizen centric-outcome based' assessment of urban liveability.

To develop a common minimum framework for cities to assess their existing status and chart their pathway towards providing a better quality of life to their citizens, the MoHUA developed a set of 'Liveability Standards' relevant to cities to generate a Liveability Index and ranking of cities. These standards were launched in June, 2017. The MoHUA has planned to conduct an 'Annual Assessment of Liveability Standards in Cities – an ambitious national project that will involve yearly submission of data by cities across the various indicators, compilation and analysis, development of indices and ranking of cities. The Liveability Index is envisioned as a 360° tool for tracking, planning and transforming Indian cities. The Liveability Index is aimed at the following objectives:

- Providing strong evidence-based approach for future interventions and investments to deliver liveability outcomes
- Catalysing actions to improve the overall quality of the city's liveability and achieve broader development outcomes including the Sustainable Development Goals
- Assessing the implementation of government policies and schemes governing characteristics of cities that can contribute to creating liveable communities



Tracking
liveability
Urban Planning
and Management
City level self-assessment
Citizen driven accountability systems
Use cases and pathways for reform
Unearth blind spots and incentivise action
Institutionalisation of outcome based planning and governance

Cities move to a single, unified data driven decision making paradigm...

The first round of the assessment commenced in January 2018 covering 116 major cities including smart cities, capital cities and cities with population of above one million each. Implementation of the liveability assessment commenced in January 2018 with a national level orientation workshop for the urban local bodies. The workshop aimed at orienting the states and urban local bodies on the overall framework, indicators, data sources, methodology and key milestones and timelines involved in the liveability assessment. Subsequently, a series of State/ Union Territory level orientation workshops were carried out in 33 states/UTs for a detailed discussion on the framework. Online data collection commenced from 9th March through an online data collection platform that supported both online and offline data submission modes. On the date of closure of the online data entry portal i.e., 16th April, 2018 112 cities submitted their data. Subsequently, comprehensive checks on the submitted data was undertaken that involved checking for outliers, logical inconsistencies etc. post which round-1 of data reconciliation was conducted. This draft report is based on round-1 of reconciled data as on 28th April, 2018.

2. City Profile

This chapter presents the city profile -Geographic and Demographic, Social (Education Health, Safety and Security, Heritage), Economic profile, and Physical (Water, sanitation and Waste Management, Electricity, Open space and roads).

		Total number of households in the city with access to community toilets in the city	...
	Solid Waste Management	**Daily average quantity of municipal solid waste collected in the city (Tonnes/day)**	...
		Total number of households covered through door-to-door collection of solid waste	...
	Waste Water	**Daily Average Quantum of Waste Water Generated in the City (MLD)**	103
		Daily average quantum of waste water treated by STPs in the city (MLD)	72
	Electricity	**Total number of authorized electrical connections in the city**	294882
		Total electricity supplied to the city (kWh)	2321520000
	Public and Open Spaces	**Total area covered by green spaces in the city (m^2)**	
	Roads and Transport	**Total Length of Road Network in the City (Km)**	1579.74
		Total length of arterial and sub-arterial road network in the city (Km)	1175.17
		Total length of footpath (wider than 1.2 metres) in the city along the street network (Km)	43.42

3. Liveability Framework and Indicators

The Liveability Framework comprises a total of 79 indicators (57 Core Indicators and 22 Supporting Indicators). A core indicator carries 70% weightage and a supporting indicator carries 30% weightage. These indicators are grouped under 15 thematic categories which in turn are part of four pillars of comprehensive development of cities i.e., institutional, social, economic and physical. Based on the performance of cities against the various core and supporting indicators, various 'Category Sub-Indexes' and a composite 'City Liveability Index' will be developed for each city.

3.1 Scoring and Computing Category Indices of Liveability

The set of 79 indicators, associated categories and pillars are presented in the table below:

Table 1 List of Pillars, Catego

ries and Indicators

Pillars of Comprehensive Development	Category	Indicators
Institutional	1. Governance	1.1 Percentage of citizen services available online
		1.2 Percentage of services integrated through Command Centre
		1.3 Percentage of citizens using online services
		1.4 Average delay in grievance redressal
		1.5 Tax collected as percentage of tax billed
		1.6 Extent of cost recovery (O&M) in water supply services
		1.7 Capital spending as percentage of total expenditure
		1.8 Percentage of population covered under Ward Committees/Area *Sabhas*
Social	**2. Identity and Culture**	2.1 Restoration and reuse of historic buildings
		2.2 Percentage of ecologically important areas covered through projects for restoration
		2.3 Hotel occupancy
		2.4 Percentage of budget allocated towards cultural/sports activities
		2.5 Number of cultural/sports events hosted by city
	3. Education	3.1 Percentage of school-aged population enrolled in schools
		3.2 Percentage of female school-aged population enrolled in schools

Pillars of Comprehensive Development	Category	Indicators
		3.3 Primary education student-teacher ratio
		3.4 Percentage of schools with access to digital education
		3.5 Percentage of students completing primary education
		3.6 Percentage of students completing secondary education
	4. Health	4.1 Number of in-patient hospital beds per 10,000 population
		4.2 Healthcare professionals per 10,000 population
		4.3 Average response time in case of health emergencies
		4.4 Period prevalence of water borne diseases
		4.5 Period prevalence of vector borne diseases
	5. Safety and Security	5.1 Number of CCTV Cameras
		5.2 Number of recorded crimes per lakh population
		5.3 Extent of crimes recorded against women, children and elderly per year
		5.4 Transport-related fatality per lakh population
Economic	**6. Economy and Employment**	6.1 Increase in VAT/GST collection
		6.2 Increase in collection of Professional Tax
		6.3 Increase in issuance of Construction permits
		6.4 Unemployment rate
		6.5 Percentage of vendors registered and provided formal spaces
Physical	**7. Housing and Inclusiveness**	7.1 Percentage of Slum/EWS households covered through formal/affordable housing
		7.2 Percentage of slum areas covered through basic

Pillars of Comprehensive Development	Category	Indicators
		services
	8. Public Open Spaces	8.1 Per capita availability of green spaces
		8.2 Per capita availability of public and recreational places
	9. Mixed Land Use and Compactness	9.1 Share of mixed land use area in overall city land use
		9.2 Net Density
	10. Power Supply	10.1 Percentage of city population with authorized electrical services
		10.2 Percentage of electrical connections covered through smart meters
		10.3 Average number of electrical interruptions per year
		10.4 Average length of electrical interruptions per year
		10.5 Percentage of total energy derived from renewable sources
		10.6 Energy consumption per unit - water supply and sewerage
		10.7 Energy consumption per unit - street lighting
		10.8 Percentage of new and redeveloped buildings following green building norms
		10.9 Total energy consumption per capita
	11. Transportation and Mobility	11.1 Geographical coverage of public transport
		11.2 Availability of public transport
		11.3 Mode share of public transport
		11.4 Percentage of road network with dedicated bicycle tracks
		11.5 Percentage of interchanges with bicycle parking

Pillars of Comprehensive Development	Category	Indicators
		facilities
		11.6 Mode share of non-motorized transport
		11.7 Availability of Passenger Information System
		11.8 Extent of signal synchronization
		11.9 Availability of paid parking spaces
		11.10 Percentage coverage of footpaths – wider than 1.2 m
		11.11 Percentage of traffic intersections with pedestrian crossing facilities
		11.12 Extent to which universal accessibility is incorporated in public rights-of-way
	12. Assured Water Supply	12.1 Household level coverage of direct water supply connections
		12.2 Per capita supply of water
		12.3 Quality of water supplied
		12.4 Level of non-revenue water – NRW
		12.5 Percentage of water connections covered through meters
		12.6 Percentage of plots with rainwater harvesting facility
	13. Waste Water Management	13.1 Coverage of toilets
		13.2 Coverage of sewerage network and/or septage
		13.3 Collection efficiency of sewerage network
		13.4 Extent of reuse and recycling of waste water
		13.5 Coverage of storm water drains
	14. Solid Waste	14.1 Household level coverage of municipal solid waste

Pillars of Comprehensive Development	Category	Indicators
	Management	collection
		14.2 Efficiency of collection of municipal solid waste
		14.3 Extent of municipal solid waste recovered through reuse
	15. Reduced Pollution	15.1 Concentration of SO2- air pollution
		15.2 Concentration of NO2- air pollution
		15.3 Concentration of PM10 - air pollution
		15.4 Level of noise pollution
		15.5 Quality of water in public surface water bodies

3.2 Scoring and Computing Category Indices of Liveability

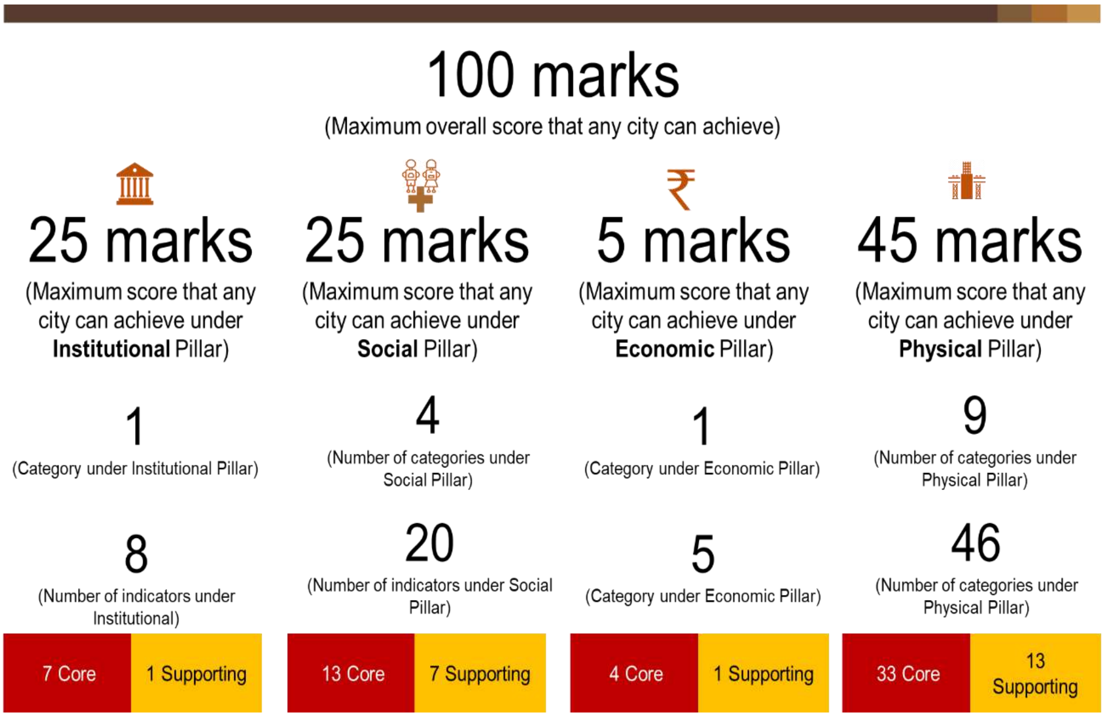
The performance achieved by cities against 79 indicators, will be assessed against given benchmarks. Where no international/national norms are available, city with the best performance in its group (population range) will be treated as a benchmark. The groups are given in the table below.

Table 2 Details on Population Range

Category	Population range
Category 1	Population ≥ 4 million
Category 2	1 million ≤ Population < 4 million
Category 3	0.5 million ≤ Population < 1 million
Category 4	Population < 0.5 million

3.3 Scoring Approach and Methodology

A city can earn a maximum score of 100 points for 79 indicators across four pillars. The pillar weights are as follows: Institutional (25 points), Social (25 points), Economy and Employment (5 points) and Physical (45 points). Based on the number and nature of indicators i.e., core vs. secondary, indicator wise maximum marks were computed.



100 marks

(Maximum overall score that any city can achieve)

25 marks	25 marks	5 marks	45 marks
(Maximum score that any city can achieve under **Institutional** Pillar)	(Maximum score that any city can achieve under **Social** Pillar)	(Maximum score that any city can achieve under **Economic** Pillar)	(Maximum score that any city can achieve under **Physical** Pillar)
1 (Category under Institutional Pillar)	4 (Number of categories under Social Pillar)	1 (Category under Economic Pillar)	9 (Number of categories under Physical Pillar)
8 (Number of indicators under Institutional)	20 (Number of indicators under Social Pillar)	5 (Category under Economic Pillar)	46 (Number of categories under Physical Pillar)
7 Core 1 Supporting	13 Core 7 Supporting	4 Core 1 Supporting	33 Core 13 Supporting

Dimensional Index Methodology (DIM) has been used to compute scores for each indicator with reference to "maximum within the comparison group" or "absolute benchmarks". For indicators where benchmarks are available, cities getting the benchmark score (or above) are given the maximum mark, and the marks awarded to other cities are calculated proportionately. For indicators where benchmarks are not available, the best performing cities in each population group are given the maximum mark, and the marks awarded to other cities (within the population group) are calculated proportionately. For indicators where benchmarks do not exist, the city data has been tested for outliers before scoring.

3.4 Scoring Normalisation:

To construct aggregate scores across cities as well as to make the scores across indicators comparable, indicator values were normalised using a min-max approach. The following formula was used to normalise the indicator values-

$$\frac{indicator\ value\ for\ the\ city - indicator\ value\ for\ the\ worst\ performing\ city}{benchmark - \ indicator\ value\ for\ the\ worst\ performing\ city}$$

This approach would restrict the normalised indicator value between 0 and 1. Cities that met or exceeded the benchmark received a normalised indicator value of 1. Worst performing cities are given a normalised indicator value of 0. After normalisation, the normalised value is weighted according to the category and the indicator being core or supporting.

To illustrate, consider the indicator 12.3 Quality of Water Supplied in the Category 12 for Assured Water Supply. If in City A 50% of the water samples collected qualify the potable water standards specified by the CPHEEO, and only 10% of the samples from worst performing city qualify the standards. Then, the normalised value for the indicator for city A would be 0.44 [(0.5-0.1)/(1-0.1)].

The weight for indicator 12.3 is 1.03, so the final weighted score for City A would come out to 0.45 [1.03*0.44].

4. Data Collection and Verification

4.1 Submission of Data by the cities

The Liveability Assessment is based on secondary data submitted by the urban local bodies and other concerned government agencies (collectively called as data owners). The 79 indicators were broken down into a set of easy to understand and relatable 553 questions mapped to data owners. Submission of the data was enabled through an online data entry portal on the smartnet platform of the Ministry. The portal also allowed the ULBs to download the liveability assessment questionnaire and upload filled in questionnaire. To familiarise and assist cities in identifying, mapping and collation of data points, a city level nodal person was available during the entire period of data submission process.

4.2 Mapping of Data Owners for the City

For the assessment of liveability indices broadly 12 data owners such as Central/state Pollution control board, Development authority, DISCOM/Electricity Board, State Disaster Management Authority, State Education Department, State Health department, State Renewable energy and development agency, State sales and commercial taxes department, town and country planning department, Traffic and police department, Transport authority, and Urban local body were identified to respond to the questions on the portal. However, during state workshop and subsequent city level discussions, more data owners were mapped to respond to different categories and sub categories. The following table provides the details of city level data owners mapped under the 12 data owner.

Table 3:Details of Data Owners

Designated data owners	Subcategories	Data owners at city level
Urban Local Body	For Accounts Related Questions	Account Department, Aurangabad Municipal corporation
Urban Local Body	For Park and Recreation Related Questions	Garden Department, Aurangabad Municipal corporation
Urban Local Body	For Water Supply and Drainage related questions	Water Supply Department, Aurangabad Municipal corporation
Urban Local Body	For Heritage sites related data	Town Planning Department, Aurangabad Municipal corporation
Urban Local Body	For Ecological sites related data	Aurangabad Municipal corporation
Urban Local Body	For Housing related data	Housing Section, Aurangabad Municipal Corporation
Urban Local Body	For Building plan related data	Town Planning Department, Aurangabad Municipal Corporation
Urban Local Body	For Roads related data	Town Planning Department, Aurangabad Municipal Corporation

Designated data owners	Subcategories	Data owners at city level
Urban Local Body	For Solid waste management related data	Solid Waste Management Department, Aurangabad Municipal Corporation
Urban Local Body	For IT services related data	IT Department, Aurangabad Municipal Corporation
Urban Local Body	For Vendor committee related data	Vendor Committee, Aurangabad Municipal Corporation
Urban Local Body	Any other departments involved in providing data for questions mentioned under Urban Local Body	
Central / state Pollution control Board	Water Quality, Air Quality, Noise Quality	Maharashtra Pollution Control Board
Development Authority	Building Infrastructure	Town Planning Department, Aurangabad Municipal Corporation
	Construction planning	Town Planning Department, Aurangabad Municipal Corporation
	Green Building	Town Planning Department, Aurangabad Municipal Corporation
	Rain water harvesting	Town Planning Department, Aurangabad Municipal Corporation
	Universal Design Principle	Town Planning Department, Aurangabad Municipal Corporation
DISCOM/Electricity Board	Electrical Connection/ Grievance Redressal/ Power supply	Maharashtra State Electricity Development Corporation DISCOM, Aurangabad
State Disaster management authority		Disaster management Department, Aunganbad
State Education Department		District Education Department Education Department, AMC
State Health Department	Health care professionals	Health Department, AMC
	Citizen Services	Health Department, AMC
	Disease Prevalence	Health Department, AMC

Designated data owners	Subcategories	Data owners at city level
	Health Infrastructure	Health Department, AMC
State Renewable Energy Development Agency		Maharashtra Renewable Energy Development Agency
State Sales / Commercial Taxes Department		Sales Taxes department, Aurangabad
Town and Country Planning Department	Land Use	Town Planning Department, Aurangabad Municipal Corporation
Traffic and Police Department		Commissioner of Police Office, Aurangabad
Transport Authorities	Buses	Road and Transport Office
	Registered Vehicles	Maharashtra State Transport department
	Sub urban rail transport	NA
	Mono Rail Authority	NA
	Tramways	NA
	Marine Transport Authority	NA

4.3 List of secondary documents available as supportive

City has provided supporting documents/evidences against the responses given by city on the online portal. In support of their responses on the portal, city submitted 136 number of documents. Documents submitted includes reports, official orders, copy of data maintained in official register, signed copy of questionnaire, and signed letters/submissions from concern departments. Verification includes mapping of documents against responses given by city, checking the type/category of documents, and validation of data provided.

The following table presents the data owner wise number of documents:

Table 4: Data owner wise number of secondary documents submitted by city

Data Owners	Number of Documents
Sales and Commercial Taxes	**1**
State Education Department	**8**
DISCOM/Electricity Department	**7**

Traffic and Police Department	**0**
Development Authority	**0**
Pollution Control Board	**9**
State Renewable Energy Department	**0**
Town and Country Planning	**1**
State Health Department	**5**
Transport Authority	**7**
Disaster Management	**1**
Urban Local Body	**97**
Total	**136***

4.4 Data Verification

A three-stage data quality check comprising verification of data against secondary documents furnished by data owners, logical inconsistency checks including outliers, and physical audit for select indicators (Refer the exhibit below) is being undertaken. The objective of the data quality check is to ensure that data from the source documents are accurate and verifiable. Sources of data included reports, administrative data, survey results and other statistical records, log books among other.

Physical audit of eight indicators – one indicator from the Institutional pillar, one from the Social pillar, one from the Economy pillar and five from the Physical pillar is also being carried out by the field team to ascertain the degree of reliability of data reported by the cities. The list of these eight indicators is presented below:

1.2 | Percentage of services integrated through Command Centre

2.3 | Hotel occupancy

3.4 | Percentage of schools with access to digital education

5.1| Number of streets, public places, junctions covered through surveillance systems

6.5 | Percentage of vendors registered and provided formal spaces

11.7 | Availability of Passenger Information System

11.11 | Percentage of traffic intersections with pedestrian crossing facilities

11.12 | Extent to which universal accessibility is incorporated in public rights-of-way

For a set of five indicators namely, unemployment rate, mode share of public transport, mode share of non-motorised transport, quality of water supplied and level of noise pollution, existing datasets were found to be not available consistently across all cities and/or were inadequate. To help cities that do not have data on these five indicators, dipstick assessments are being carried to fill data gaps.

6.4 | Unemployment Rate

11.3 | Mode share of public transport

11.5 | Mode share of Non Motorized Transport

12.3 | Quality of Water Supplied

15.4 | Level of Noise Pollution

4.5 Physical Audit

The following map presents the indicators audited at city level.

5. City Score on 15 categories of Assessment

Liveability Assessment covered 15 categories and 78 indicators. The below table presents the scores for all 15 indicators namely governance, identity & culture, education, health, safety and security, economy & employment, housing & inclusiveness, public open spaces, mixed land use & compactness, power supply, transport & mobility, assured water supply, waste water management, solid waste management and reduced pollution.

Table 5: Category wise scores

Categories	**Scores in Percentage**
Governance	26.53%
Identity & Culture	19%
Education	93%
Health	93%
Safety & Security	38%
Economy & Employment	7%
Housing & Inclusiveness	0%
Public Open Spaces	0%
Mixed Land Use & Compactness	0%
Power Supply	35%
Transport & Mobility	38%
Assured Water Supply	21%
Waste Water Management	22%
Solid Waste Management	0%
Reduced Pollution	59%

The rank of the city is based on the performance and scores in each of the category. The final city rank is submitted separately.

Executive Summary

Assessment of liveability indices is an initiative by the Ministry of Housing and Urban Affairs to improve quality of life of citizens and achieve sustainable development goals by encouraging cities to adopt "outcome based" approach for urban planning. Assessment process aimed to provide opportunity to cities to review the development components holistically by involving 79 measurable indicators categorized under governance, health, education, safety, economy, power supply, transportation and mobility, identity, culture, housing, waste management and pollution.

This report highlights the assessment process, key milestones, and the final outcome of the data submitted. Implementation of liveability assessment commenced formally on 19th January 2018. A national level workshop was organized on 13th February 2018 to explain the importance and process of liveability assessment and get feedback on methodology from the city authorities.

This was followed by the next stage of Questionnaire development. The questionnaire was arranged under 12 categories representing 12 data owners namely urban local body, Central and state pollution control board, development authority, DISCOM/Electricity board, State disaster management authority, state education department, state health department, state renewable energy development agency, state sales and commercial taxes department, town and country planning department, traffic and police department and transport authorities.

An online data entry portal was developed to facilitate data submission by the cities. Each city had a unique log in to access the portal and submit the data. Both online and off-line options (download the questionnaire in an excel) to submit the data were available for cities. An email help desk was set up for the cities to raise any queries and seek clarification when responding to the questions.

A team for each state comprising of State Coordinator and City Coordinator (one per city) was deployed that facilitated the process and supported the cities. A total of 6 regional coordinators/ consultants, 29 State Coordinators, and 99 city coordinators were deployed across 116 cities. Training for state coordinators was held from 26th to 28th February 2018 at Chennai to make coordinators understand overall liveability assessment, indicators, data sources, protocols and roles and responsibilities.

City Reconnaissance Meetings were initiated by the state and city coordinators. The discussion began with discussions to finalize the state workshop schedule, mapping of data owners, and assist cities in data collection. The City Coordinators were based in the cities for over 6 weeks and during this time, they liase with ULB and other data owners to explain the liveability framework, online portal, and facilitate the online submission.

A total of 33 state workshops were conducted at the state level. The objective of the workshop was to orient the city stakeholders on liveability assessment, indicators, components of data collection, timelines, expectations of support and support extended by MoHUA. The state level workshops brought various city level departments on a single platform to understand and discuss the methodology and components of city liveability assessment.

Nodal agency at state level supported by the City and State Coordinator and city level (Municipality corporation/smart city limited) coordinated with city specific data owners/departments for data gathering, collation, and submission. Nodal persons in each department were appointed for timely data collection and submission. Of 116, 112 cities submitted data as per the timeline on 16th April 2018.

Post submission, the city and state coordinators supported by the central team followed up extensively with the cities to support secondary documents as evidence to substantiate their submissions. Secondary documents such as reports, official orders, copy of office register, signed copy of liveability assessment questionnaire furnished by cities against the submitted data. Documents are verified to map the documents for the reponses provided by city and to check the type data provided by city. The document check outcomes were shared with the cities as a part of data quality check.

For checking consistency of data, logical check of data, verifying data from other public sources were undertaken. Quality check was done to ensure data validity and provide opportunity to cities to review the data provided by them and correct in case of wrong data entry.

For 8 selected indicators namely, percentage of services integrated through command and control center, hotel occupancy rate, percentage of schools with access to digital education, number of CCTV cameras per unit road length, percentage of vendors registered and provided formal spaces, availability of passenger information system, percentage of traffic intersection with pedestrian crossing facility, and extent to which universal accessibility is incorporated in public rights of way. Physical audit was conducted in 110 cities by physical auditors appointed and trained by the consortium. In consultation with ULB nodal person, locations and indicators for physical audit was selected in each city. A mobile based application was developed to capture the physical audit related data.

Primary data collection was done for five indicators such as unemployment rates, mode share of public transport, mode share of non-motorized transport, quality of water supplied, and level of noise pollution. Protocols for water and noise test were prepared in consultation with experts. Water quality test involved physical, chemical and bacteriological test of water as per the CPCB norms. For testing quality of water at consumer end, the auditors worked closely with the ULB and Water department. Samples were collected from consumer end and submitted to the lab suggested by city. For noise pollution, in about 20 cities the state pollution board or city level

environment department took the responsibility for providing noise pollution data as per the protocols. In rest of the cities, mobile based application was used to measure noise pollution.

During implementation, MoHUA facilitated the process by conducting video conferences with cities to address any queries, reiterate the importance, and ensure that cities adequately engages in the process and submit their responses in time and respond to requests for clarifications.

In addition to secondary data collection, physical audit and primary data collection, citizen survey was conducted to understand their perception and level of satisfaction on various services such as health, education, water supply, electricity, waste management etc. provided by urban local bodies. Over 60000 citizens participated in the survey across India.

The final scores and ranks have been generated based on the scoring methodology that has been discussed extensively and minor modifications made that are summarized as below:

#	**Challenges**	**Proposed Solutions**
1	Only 23 cities of 111 cities have City Mobility Plan (CMP) or any and hence able to provide data for Mode Share of Public Transport and Non-Motorised Transport. To address the data gap, as advised by the MoHUA, the consortia undertook a sample dipstick across all cities covering a sample of 150 Households. Understandably, the dipstick findings will not match the rigor of a CMP.	We recommend the following: 1) Cities which have provided CMP Data will be evaluated on 100% of the maximum score 2) For the cities where the dipstick data is used, the city receives a 50% discount on the overall score Alternatively, another approach is to assign 0 score to all 88 cities that don't have a CMP
2	Variance was observed on data reported by cities on road network and data presented in the smart city proposals during the verifications.	We recommend taking the data reported by the cities in the Smart City Proposals.
3	There is no secondary source/ organization that provides unemployment data at city level. As a result, most cities do not have the data. Fully cognizance of the challenges of generating this data in a short span of time, it was agreed to collect this data through a dipstick survey on lines of NSSO questions. The	The indicator on unemployment will be excluded from scores. For final ranking, the cities will be scored on 78 indicators.

#	Challenges	Proposed Solutions
	data generated needs further scrutiny and triangulation with some inputs from experts. This may not be possible in the short window.	
4	Many cities did not have data on noise pollution and it was decided that data will be collected using a mobile app for all the 111 cities. However, many cities have expressed reservations with the approach especially with respect to the reliability of using this data. Further, some cities have relied on the SPCB to collect the data as per the approach proposed by the consortia. Thus, noise pollution data is currently from two sources: 1. SPCB- 20 cities 2. Noise-based app- 91 cities	The data collected through the primary survey will be used for scoring the cities. Currently, there is no differential scoring for the data from the SPCB and the data collected through the mobile app. However, a certain higher weightage can be provided to those cities which used the state apparatus to collect noise pollution data.
5	For the indicator on quality of water supplied, the methodology document states that samples should be drawn both at the treatment plant outlet as well as the consumer end. However, the data provided by the cities were predominantly from the distribution point. Hence for consumer end results with MoHUA intervention, consortia coordinated with cities to collect the data at the consumer end. The cities facilitated the testing. The outcome of the process is as below: 1. Sample given- 102 cities 2. Report received- 86 cities 3. Report awaited- 16 cities 4. Tests not completed due to lack of cooperation and other reasons – 9	The maximum score for this indicator will be distributed equally (50%) for results based on samples from the treatment plant and consumer end. Cities that did not complete tests or provide the results will be given a score 0 for against consumer end tests.
6	City level population is not projected annually by most of the cities. So, estimates for 2017 population are not available with the cities.	As recommended by MoHUA, 2011 census population is being used for the ranking purpose.
7	The age category specific data for 9 cities is not available at a city level	The age category specific population data has been taken at a district level for these cities.

#	Challenges	Proposed Solutions
8	Indicators on non-motorised transports like- Dedicated bicycle tracks, bicycle parking facilities and mode share of non-motorised transport are not relevant for hilly terrains.	As discussed during the PMC meeting, these indicators have been treated as non-applicable for the hilly cities and the weights have been redistributed among other indicators within the same category.
9	The indicator on increase in professional tax is not relevant to cities which do not levy the professional tax.	As discussed during the PMC meeting, this indicator has been non-applicable to the cities belonging to states where professional tax is not levied, and the weights have been redistributed among other indicators within the same category.
10	The indicator on increase in VAT collection is not applicable to Port Blair and Kavaratti, as there was no provision of VAT collection in these cities.	As discussed during the PMC meeting, these indicatosr has been treated as non-applicable for these two cities and the weights have been redistributed among other indicators within the same category.
11	Indicator on coverage of basic services to slum households does not concern cities with no slums (notified/ non-notified.	As discussed during the PMC meeting, this indicators has been treated as non-applicable for these cities and the weights have been redistributed among other indicators within the same category.

1. Introduction

The Ministry of Housing and Urban Affairs (MoHUA) is implementing several flagship urban missions such as the Smart Cities Mission (SCM), Atal Mission for Urban Rejuvenation and Transformation (AMRUT), Heritage City Development and Augmentation Yojana (HRIDAY), Housing for All (HFA). Theses mission along with other transformative initiatives of the Government including National Water Mission, Power for All, National Health Mission are aimed at making Indian cities more 'liveable.' The overarching goal of these initiatives is to move from an input-based approach to a 'citizen centric-outcome based' assessment of urban liveability.

To develop a common minimum framework for cities to assess their existing status and chart their pathway towards providing a better quality of life to their citizens, the MoHUA developed a set of 'Liveability Standards' relevant to cities to generate a Liveability Index and ranking of cities. These standards were launched in June, 2017. The MoHUA has planned to conduct an 'Annual Assessment of Liveability Standards in Cities – an ambitious national project that will involve yearly submission of data by cities across the various indicators, compilation and analysis, development of indices and ranking of cities. The Liveability Index is envisioned as a 360° tool for tracking, planning and transforming Indian cities. The Liveability Index is aimed at the following objectives:

- Providing strong evidence-based approach for future interventions and investments to deliver liveability outcomes
- Catalysing actions to improve the overall quality of the city's liveability and achieve broader development outcomes including the Sustainable Development Goals
- Assessing the implementation of government policies and schemes governing characteristics of cities that can contribute to creating liveable communities

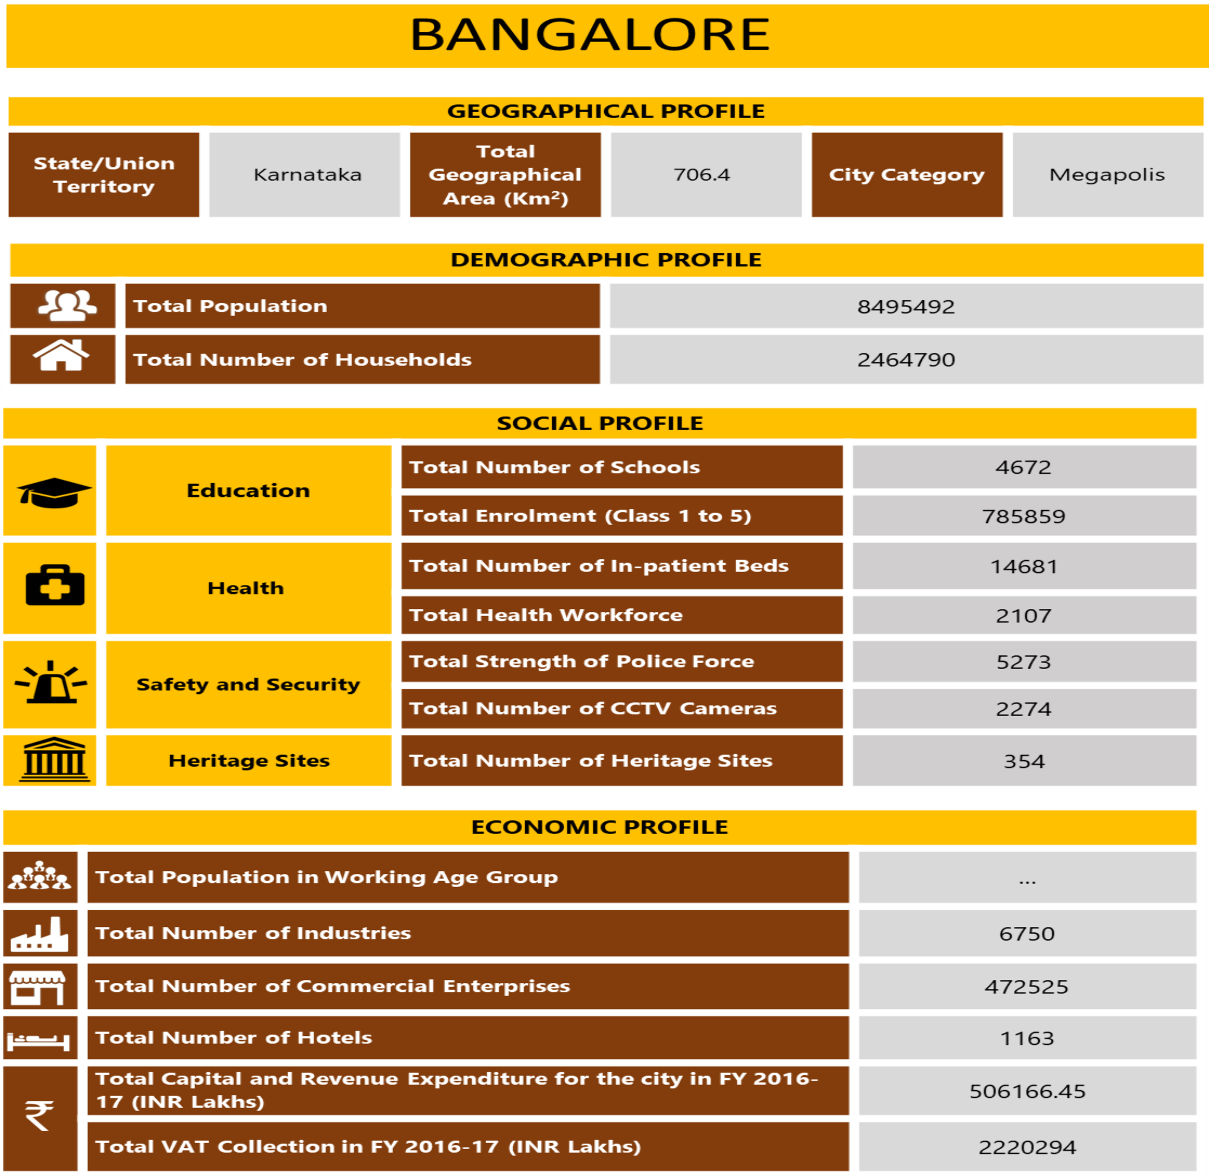
Institutionalisation of outcome based planning and governance
Cities move to a single, unified data driven decision making paradigm...

The first round of the assessment commenced in January 2018 covering 116 major cities including smart cities, capital cities and cities with population of above one million each. Implementation of the liveability assessment commenced in January 2018 with a national level orientation workshop for the urban local bodies. The workshop aimed at orienting the states and urban local bodies on the overall framework, indicators, data sources, methodology and key milestones and timelines involved in the liveability assessment. Subsequently, a series of State/ Union Territory level orientation workshops were carried out in 33 states/UTs for a detailed discussion on the framework. Online data collection commenced from 9th March through an online data collection platform that supported both online and offline data submission modes. On the date of closure of the online data entry portal i.e., 16th April, 2018 112 cities submitted their data. Subsequently, comprehensive checks on the submitted data was undertaken that involved checking for outliers, logical inconsistencies etc. post which round-1 of data reconciliation was conducted. This draft report is based on round-1 of reconciled data as on 28th April, 2018.

2. City Profile

This chapter presents the city profile -Geographic and Demographic, Social (Education Health, Safety and Security, Heritage), Economic profile, and Physical (Water, sanitation and Waste Management, Electricity, Open space and roads).



BANGALORE

GEOGRAPHICAL PROFILE

State/Union Territory	Karnataka	**Total Geographical Area (Km^2)**	706.4	**City Category**	Megapolis

DEMOGRAPHIC PROFILE

Total Population	8495492
Total Number of Households	2464790

SOCIAL PROFILE

Education	**Total Number of Schools**	4672
	Total Enrolment (Class 1 to 5)	785859
Health	**Total Number of In-patient Beds**	14681
	Total Health Workforce	2107
Safety and Security	**Total Strength of Police Force**	5273
	Total Number of CCTV Cameras	2274
Heritage Sites	**Total Number of Heritage Sites**	354

ECONOMIC PROFILE

Total Population in Working Age Group	...
Total Number of Industries	6750
Total Number of Commercial Enterprises	472525
Total Number of Hotels	1163
Total Capital and Revenue Expenditure for the city in FY 2016-17 (INR Lakhs)	506166.45
Total VAT Collection in FY 2016-17 (INR Lakhs)	2220294

PHYSICAL PROFILE

Water	Average Quantity of Water Supplied (MLD)	1366.4
	Total Number of Water Connections	903136
Sanitation Facilities	Total number of households with access to individual toilets in the city	951612
	Total number of households in the city with access to community toilets in the city	...
Solid Waste Management	Daily average quantity of municipal solid waste collected in the city (Tonnes/day)	5383.8
	Total number of households covered through door-to-door collection of solid waste	2426700
Waste Water	Daily Average Quantum of Waste Water Generated in the City (MLD)	1440
	Daily average quantum of waste water treated by STPs in the city (MLD)	721
Electricity	Total number of authorized electrical connections in the city	4940166
	Total electricity supplied to the city (kWh)	13133.16
Public and Open Spaces	Total area covered by green spaces in the city (m^2)	100020000
Roads and Transport	Total Length of Road Network in the City (Km)	13500
	Total length of arterial and sub-arterial road network in the city (Km)	1400
	Total length of footpath (wider than 1.2 metres) in the city along the street network (Km)	895

3. Liveability Framework and Indicators

The Liveability Framework comprises a total of 79 indicators (57 Core Indicators and 22 Supporting Indicators). A core indicator carries 70% weightage and a supporting indicator carries 30% weightage. These indicators are grouped under 15 thematic categories which in turn are part of four pillars of comprehensive development of cities i.e., institutional, social, economic and physical. Based on the performance of cities against the various core and supporting indicators, various 'Category Sub-Indexes' and a composite 'City Liveability Index' will be developed for each city.

3.1 Scoring and Computing Category Indices of Liveability

The set of 79 indicators, associated categories and pillars are presented in the table below:

Table 1 List of Pillars, Categories and Indicators

Pillars of Comprehensive Development	Category	Indicators
Institutional	1. Governance	1.1 Percentage of citizen services available online
		1.2 Percentage of services integrated through Command Centre
		1.3 Percentage of citizens using online services
		1.4 Average delay in grievance redressal
		1.5 Tax collected as percentage of tax billed
		1.6 Extent of cost recovery (O&M) in water supply services
		1.7 Capital spending as percentage of total expenditure
		1.8 Percentage of population covered under Ward Committees/Area *Sabhas*
Social	**2. Identity and Culture**	2.1 Restoration and reuse of historic buildings
		2.2 Percentage of ecologically important areas covered through projects for restoration
		2.3 Hotel occupancy
		2.4 Percentage of budget allocated towards

Pillars of Comprehensive Development	Category	Indicators
		cultural/sports activities
		2.5 Number of cultural/sports events hosted by city
	3. Education	3.1 Percentage of school-aged population enrolled in schools
		3.2 Percentage of female school-aged population enrolled in schools
		3.3 Primary education student-teacher ratio
		3.4 Percentage of schools with access to digital education
		3.5 Percentage of students completing primary education
		3.6 Percentage of students completing secondary education
	4. Health	4.1 Number of in-patient hospital beds per 10,000 population
		4.2 Healthcare professionals per 10,000 population
		4.3 Average response time in case of health emergencies
		4.4 Period prevalence of water borne diseases
		4.5 Period prevalence of vector borne diseases
	5. Safety and Security	5.1 Number of CCTV Cameras
		5.2 Number of recorded crimes per lakh population
		5.3 Extent of crimes recorded against women, children and elderly per year
		5.4 Transport-related fatality per lakh population
Economic	**6. Economy and Employment**	6.1 Increase in VAT/GST collection
		6.2 Increase in collection of Professional Tax

Pillars of Comprehensive Development	Category	Indicators
		6.3 Increase in issuance of Construction permits
		6.4 Unemployment rate
		6.5 Percentage of vendors registered and provided formal spaces
Physical	**7. Housing and Inclusiveness**	7.1 Percentage of Slum/EWS households covered through formal/affordable housing
		7.2 Percentage of slum areas covered through basic services
	8. Public Open Spaces	8.1 Per capita availability of green spaces
		8.2 Per capita availability of public and recreational places
	9. Mixed Land Use and Compactness	9.1 Share of mixed land use area in overall city land use
		9.2 Net Density
	10. Power Supply	10.1 Percentage of city population with authorized electrical services
		10.2 Percentage of electrical connections covered through smart meters
		10.3 Average number of electrical interruptions per year
		10.4 Average length of electrical interruptions per year
		10.5 Percentage of total energy derived from renewable sources
		10.6 Energy consumption per unit - water supply and sewerage
		10.7 Energy consumption per unit - street lighting
		10.8 Percentage of new and redeveloped buildings following green building norms
		10.9 Total energy consumption per capita

Pillars of Comprehensive Development	Category	Indicators
	11. Transportation and Mobility	11.1 Geographical coverage of public transport
		11.2 Availability of public transport
		11.3 Mode share of public transport
		11.4 Percentage of road network with dedicated bicycle tracks
		11.5 Percentage of interchanges with bicycle parking facilities
		11.6 Mode share of non-motorized transport
		11.7 Availability of Passenger Information System
		11.8 Extent of signal synchronization
		11.9 Availability of paid parking spaces
		11.10 Percentage coverage of footpaths – wider than 1.2 m
		11.11 Percentage of traffic intersections with pedestrian crossing facilities
		11.12 Extent to which universal accessibility is incorporated in public rights-of-way
	12. Assured Water Supply	12.1 Household level coverage of direct water supply connections
		12.2 Per capita supply of water
		12.3 Quality of water supplied
		12.4 Level of non-revenue water – NRW
		12.5 Percentage of water connections covered through meters
		12.6 Percentage of plots with rainwater harvesting facility
	13. Waste Water	13.1 Coverage of toilets

Pillars of Comprehensive Development	Category	Indicators
	Management	13.2 Coverage of sewerage network and/or septage
		13.3 Collection efficiency of sewerage network
		13.4 Extent of reuse and recycling of waste water
		13.5 Coverage of storm water drains
	14. Solid Waste Management	14.1 Household level coverage of municipal solid waste collection
		14.2 Efficiency of collection of municipal solid waste
		14.3 Extent of municipal solid waste recovered through reuse
	15. Reduced Pollution	15.1 Concentration of SO2- air pollution
		15.2 Concentration of NO2- air pollution
		15.3 Concentration of PM10 - air pollution
		15.4 Level of noise pollution
		15.5 Quality of water in public surface water bodies

3.2 Scoring and Computing Category Indices of Liveability

The performance achieved by cities against 79 indicators, will be assessed against given benchmarks. Where no international/national norms are available, city with the best performance in its group (population range) will be treated as a benchmark. The groups are given in the table below.

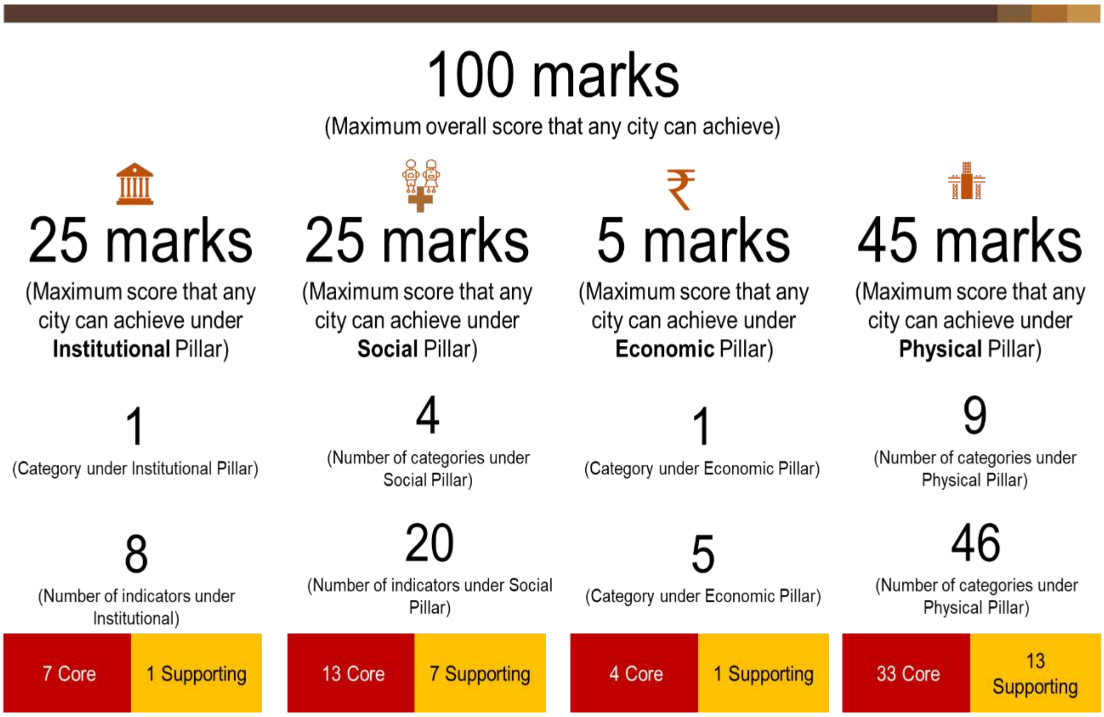
Table 2 Details on Population Range

Category	Population range
Category 1	Population ≥ 4 million
Category 2	1 million ≤ Population < 4 million

Category 3	0.5 million ≤ Population < 1 million
Category 4	Population < 0.5 million

3.3 Scoring Approach and Methodology

A city can earn a maximum score of 100 points for 79 indicators across four pillars. The pillar weights are as follows: Institutional (25 points), Social (25 points), Economy and Employment (5 points) and Physical (45 points). Based on the number and nature of indicators i.e., core vs. secondary, indicator wise maximum marks were computed.



100 marks
(Maximum overall score that any city can achieve)
25 marks
(Maximum score that any city can achieve under **Institutional** Pillar)
1
(Category under Institutional Pillar)
8
(Number of indicators under Institutional)
7 Core
1 Supporting
25 marks
(Maximum score that any city can achieve under **Social** Pillar)
4
(Number of categories under Social Pillar)
20
(Number of indicators under Social Pillar)
13 Core
7 Supporting
5 marks
(Maximum score that any city can achieve under **Economic** Pillar)
1
(Category under Economic Pillar)
5
(Category under Economic Pillar)
4 Core
1 Supporting
45 marks
(Maximum score that any city can achieve under **Physical** Pillar)
9
(Number of categories under Physical Pillar)
46
(Number of categories under Physical Pillar)
33 Core
13 Supporting

Dimensional Index Methodology (DIM) has been used to compute scores for each indicator with reference to "maximum within the comparison group" or "absolute benchmarks". For indicators where benchmarks are available, cities getting the benchmark score (or above) are given the maximum mark, and the marks awarded to other cities are calculated proportionately. For indicators where benchmarks are not available, the best performing cities in each population group are given the maximum mark, and the marks awarded to other cities (within the population group) are calculated proportionately. For indicators where benchmarks do not exist, the city data has been tested for outliers before scoring..

3.4 Scoring Normalisation:

To construct aggregate scores across cities as well as to make the scores across indicators comparable, indicator values were normalised using a min-max approach. The following formula was used to normalise the indicator values-

$$\frac{indicator\ value\ for\ the\ city - indicator\ value\ for\ the\ worst\ performing\ city}{benchmark - \ indicator\ value\ for\ the\ worst\ performing\ city}$$

This approach would restrict the normalised indicator value between 0 and 1. Cities that met or exceeded the benchmark received a normalised indicator value of 1. Worst performing cities are given a normalised indicator value of 0. After normalisation, the normalised value is weighted according to the category and the indicator being core or supporting.

To illustrate, consider the indicator 12.3 Quality of Water Supplied in the Category 12 for Assured Water Supply. If in City A 50% of the water samples collected qualify the potable water standards specified by the CPHEEO, and only 10% of the samples from worst performing city qualify the standards. Then, the normalised value for the indicator for city A would be 0.44 [(0.5-0.1)/(1-0.1)].

The weight for indicator 12.3 is 1.03, so the final weighted score for City A would come out to 0.45 [1.03*0.44].

4. Data Collection and Verification

4.1 Submission of Data by the cities

The Liveability Assessment is based on secondary data submitted by the urban local bodies and other concerned government agencies (collectively called as data owners). The 79 indicators were broken down into a set of easy to understand and relatable 553 questions mapped to data owners. Submission of the data was enabled through an online data entry portal on the smartnet platform of the Ministry. The portal also allowed the ULBs to download the liveability assessment questionnaire and upload filled in questionnaire. To familiarise and assist cities in identifying, mapping and collation of data points, a city level nodal person was available during the entire period of data submission process.

4.2 Mapping of Data Owners for the City

For the assessment of liveability indices broadly 12 data owners such as Central/state Pollution control board, Development authority, DISCOM/Electricity Board, State Disaster Management Authority, State Education Department, State Health department, State Renewable energy and development agency, State sales and commercial taxes department, town and country planning department, Traffic and police department, Transport authority, and Urban local body were identified to respond to the questions on the portal. However, during state workshop and subsequent city level discussions, more data owners were mapped to respond to different categories and sub categories. The following table provides the details of city level data owners mapped under the 12 data owner.

Table 3:Details of Data Owners

Designated data owners	Subcategories	Data owners at city level
Urban Local Body	For Accounts Related Questions	Accounts Department, Bruhath Bengaluru Mahanagara Palike (BBMP)
Urban Local Body	For Park and Recreation Related Questions	Town Planning Department, Bruhath Bengaluru Mahanagara Palike (BBMP)
Urban Local Body	For Water Supply and Drainage related questions	Engineering Department, Bruhath Bengaluru Mahanagara Palike (BBMP)
Urban Local Body	For Heritage sites related data	Town Planning Department, Bruhath Bengaluru Mahanagara Palike (BBMP)
Urban Local Body	For Ecological sites related data	Bruhath Bengaluru Mahanagara Palike (BBMP)
Urban Local Body	For Housing related data	Bruhath Bengaluru Mahanagara Palike (BBMP)
Urban Local Body	For Building plan related data	Planning Department, Bruhath Bengaluru Mahanagara Palike (BBMP)
Urban Local Body	For Roads related data	Engineering Department, Bruhath Bengaluru Mahanagara Palike (BBMP)
Urban Local Body	For Solid waste management related data	Solid waste management, Bruhath Bengaluru Mahanagara Palike (BBMP)
Urban Local Body	For IT services related data	IT Department, Bruhath Bengaluru Mahanagara Palike (BBMP)
Urban Local Body	For Vendor committee	Bruhath Bengaluru Mahanagara Palike

Designated data owners	Subcategories	Data owners at city level
	related data	(BBMP)
Urban Local Body	Any other departments involved in providing data for questions mentioned under Urban Local Body	Commercial Tax Department (Professional Tax related queries), Education Department (Population of age group between 6-14), Revenue Department, Bangalore Development Authority, Health Department, Pollution Department, Bangalore Water Supply & Sewerage Board, Police Department (BWSSB), Transport & Railway Department, Karnataka Slum Development Board (KSDB), Bangalore Electricity Supply Company Limited (BESCOM).
Central / state Pollution control Board	Water Quality, Air Quality, Noise Quality	Pollution Control Board
Development Authority	Building Infrastructure	Bangalore Development Authority (BDA) Bruhath Bengaluru Mahanagara Palike (BBMP)
	Construction planning	Town Planning Department, Bruhath Bengaluru Mahanagara Palike (BBMP)
	Green Building	Town Planning Department, Bruhath Bengaluru Mahanagara Palike (BBMP)
	Rain water harvesting	Town Planning Department, Bruhath Bengaluru Mahanagara Palike (BBMP)
	Universal Design Principle	Development Authority
DISCOM/Electricity Board	Electrical Connection/ Grievance Redressal/ Power supply	Bangalore Electricity Supply Company Limited (BESCOM)
State Disaster management authority		Revenue Department (Disaster management & Services)
State Education Department		Deputy Director of Public Instructions, Bangalore
State Health Department	Health care professionals	District Health & Family Welfare Department, Bangalore
	Citizen Services	District Health & Family Welfare Department
	Disease Prevalence	District Health & Family Welfare Department

Designated data owners	Subcategories	Data owners at city level
	Health Infrastructure	District Health & Family Welfare Department
State Renewable Energy Development Agency	Renewable Energy	Bangalore Electricity Supply Company Limited (BESCOM)
State Sales / Commercial Taxes Department		Commercial Taxes Department
Town and Country Planning Department	Land Use	Bengaluru Development Authority
Traffic and Police Department		Police Commissioner's Office, Bengaluru
Transport Authorities	Buses	Regional Transport Officer Office
	Registered Vehicles	Regional Transport Officer Office
	Sub urban rail transport	Not Applicable
	Mono Rail Authority	Not Applicable
	Tramways	Not Applicable
	Marine Transport Authority	Not Applicable

4.3 List of secondary documents available as supportive

City has provided supporting documents/evidences against the responses given by city on the online portal. In support of their responses on the portal, city submitted 31 number of documents. Documents submitted includes reports, official orders, copy of data maintained in official register, signed copy of questionnaire, and signed letters/submissions from concern departments. Verification includes mapping of documents against responses given by city, checking the type/category of documents, and validation of data provided.

The following table presents the data owner wise number of documents:

Table 4: Data owner wise number of secondary documents submitted by city

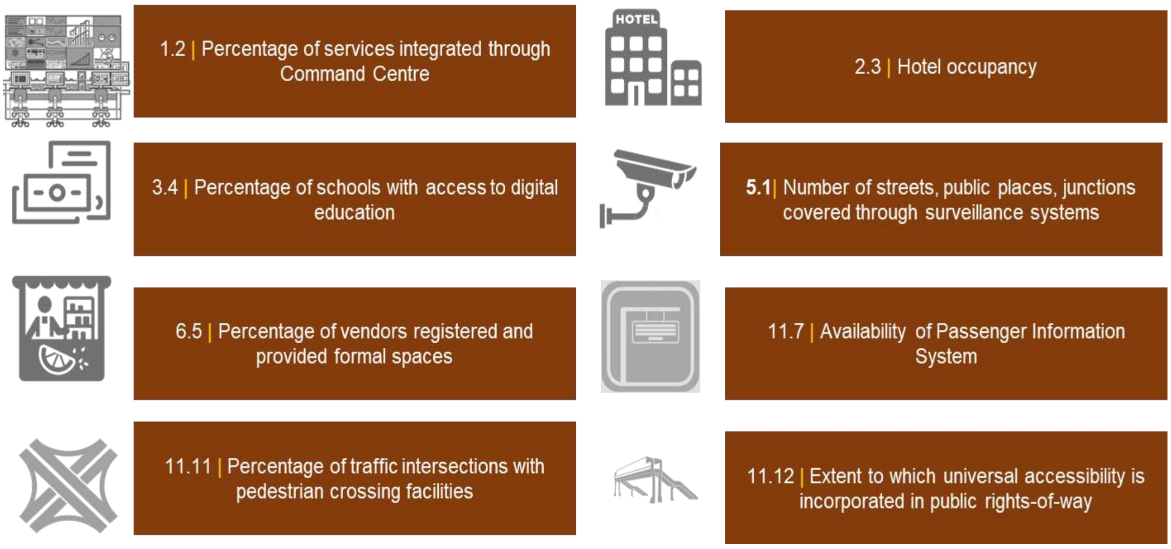
Data Owners	Number of Documents
Sales and Commercial Taxes	**2**
State Education Department	**1**
DISCOM/Electricity Department	**1**
Traffic and Police Department	**1**
Development Authority	**1**
Pollution Control Board	**0**
State Renewable Energy Department	**2**

Town and Country Planning	**1**
State Health Department	**1**
Transport Authority	**5**
Disaster Management	**1**
Urban Local Body	**15**
Total	**31**

4.4 Data Verification

A three-stage data quality check comprising verification of data against secondary documents furnished by data owners, logical inconsistency checks including outliers, and physical audit for select indicators (Refer the exhibit below) is being undertaken. The objective of the data quality check is to ensure that data from the source documents are accurate and verifiable. Sources of data included reports, administrative data, survey results and other statistical records, log books among other.

Physical audit of eight indicators – one indicator from the Institutional pillar, one from the Social pillar, one from the Economy pillar and five from the Physical pillar is also being carried out by the field team to ascertain the degree of reliability of data reported by the cities. The list of these eight indicators is presented below:



1.2 | Percentage of services integrated through Command Centre

2.3 | Hotel occupancy

3.4 | Percentage of schools with access to digital education

5.1| Number of streets, public places, junctions covered through surveillance systems

6.5 | Percentage of vendors registered and provided formal spaces

11.7 | Availability of Passenger Information System

11.11 | Percentage of traffic intersections with pedestrian crossing facilities

11.12 | Extent to which universal accessibility is incorporated in public rights-of-way

For a set of five indicators namely, unemployment rate, mode share of public transport, mode share of non-motorised transport, quality of water supplied and level of noise pollution, existing datasets were found to be not available consistently across all cities and/or were inadequate. To help cities that do not have data on these five indicators, dipstick assessments are being carried to fill data gaps.

6.4 | Unemployment Rate

11.3 | Mode share of public transport

11.5 | Mode share of Non Motorized Transport

12.3 | Quality of Water Supplied

15.4 | Level of Noise Pollution

4.5 Physical Audit

The following map presents the indicators audited at city level.

5. City Score on 15 categories of Assessment

Liveability Assessment covered 15 categories and 78 indicators. The below table presents the scores for all 15 indicators namely governance, identity & culture, education, health, safety and security, economy & employment, housing & inclusiveness, public open spaces, mixed land use & compactness, power supply, transport & mobility, assured water supply, waste water management, solid waste management and reduced pollution.

Table 5: Category wise scores

Categories	Scores in Percentage
Governance	77.59%
Identity & Culture	23%
Education	91%
Health	66%
Safety & Security	40%
Economy & Employment	46%
Housing & Inclusiveness	2%
Public Open Spaces	49%
Mixed Land Use & Compactness	27%
Power Supply	22%
Transport & Mobility	43%
Assured Water Supply	87%
Waste Water Management	62%
Solid Waste Management	74%
Reduced Pollution	67%

The rank of the city is based on the performance and scores in each of the category. The final city rank is submitted separately.

Executive Summary

Assessment of liveability indices is an initiative by the Ministry of Housing and Urban Affairs to improve quality of life of citizens and achieve sustainable development goals by encouraging cities to adopt "outcome based" approach for urban planning. Assessment process aimed to provide opportunity to cities to review the development components holistically by involving 79 measurable indicators categorized under governance, health, education, safety, economy, power supply, transportation and mobility, identity, culture, housing, waste management and pollution.

This report highlights the assessment process, key milestones, and the final outcome of the data submitted. Implementation of liveability assessment commenced formally on 19th January 2018. A national level workshop was organized on 13th February 2018 to explain the importance and process of liveability assessment and get feedback on methodology from the city authorities.

This was followed by the next stage of Questionnaire development. The questionnaire was arranged under 12 categories representing 12 data owners namely urban local body, Central and state pollution control board, development authority, DISCOM/Electricity board, State disaster management authority, state education department, state health department, state renewable energy development agency, state sales and commercial taxes department, town and country planning department, traffic and police department and transport authorities.

An online data entry portal was developed to facilitate data submission by the cities. Each city had a unique log in to access the portal and submit the data. Both online and off-line options (download the questionnaire in an excel) to submit the data were available for cities. An email help desk was set up for the cities to raise any queries and seek clarification when responding to the questions.

A team for each state comprising of State Coordinator and City Coordinator (one per city) was deployed that facilitated the process and supported the cities. A total of 6 regional coordinators/ consultants, 29 State Coordinators, and 99 city coordinators were deployed across 116 cities. Training for state coordinators was held from 26th to 28th February 2018 at Chennai to make coordinators understand overall liveability assessment, indicators, data sources, protocols and roles and responsibilities.

City Reconnaissance Meetings were initiated by the state and city coordinators. The discussion began with discussions to finalize the state workshop schedule, mapping of data owners, and assist cities in data collection. The City Coordinators were based in the cities for over 6 weeks and during this time, they liase with ULB and other data owners to explain the liveability framework, online portal, and facilitate the online submission.

A total of 33 state workshops were conducted at the state level. The objective of the workshop was to orient the city stakeholders on liveability assessment, indicators, components of data collection, timelines, expectations of support and support extended by MoHUA. The state level workshops brought various city level departments on a single platform to understand and discuss the methodology and components of city liveability assessment.

Nodal agency at state level supported by the City and State Coordinator and city level (Municipality corporation/smart city limited) coordinated with city specific data owners/departments for data gathering, collation, and submission. Nodal persons in each department were appointed for timely data collection and submission. Of 116, 112 cities submitted data as per the timeline on 16th April 2018.

Post submission, the city and state coordinators supported by the central team followed up extensively with the cities to support secondary documents as evidence to substantiate their submissions. Secondary documents such as reports, official orders, copy of office register, signed copy of liveability assessment questionnaire furnished by cities against the submitted data. Documents are verified to map the documents for the reponses provided by city and to check the type data provided by city. The document check outcomes were shared with the cities as a part of data quality check.

For checking consistency of data, logical check of data, verifying data from other public sources were undertaken. Quality check was done to ensure data validity and provide opportunity to cities to review the data provided by them and correct in case of wrong data entry.

For 8 selected indicators namely, percentage of services integrated through command and control center, hotel occupancy rate, percentage of schools with access to digital education, number of CCTV cameras per unit road length, percentage of vendors registered and provided formal spaces, availability of passenger information system, percentage of traffic intersection with pedestrian crossing facility, and extent to which universal accessibility is incorporated in public rights of way. Physical audit was conducted in 110 cities by physical auditors appointed and trained by the consortium. In consultation with ULB nodal person, locations and indicators for physical audit was selected in each city. A mobile based application was developed to capture the physical audit related data.

Primary data collection was done for five indicators such as unemployment rates, mode share of public transport, mode share of non-motorized transport, quality of water supplied, and level of noise pollution. Protocols for water and noise test were prepared in consultation with experts. Water quality test involved physical, chemical and bacteriological test of water as per the CPCB norms. For testing quality of water at consumer end, the auditors worked closely with the ULB and Water department. Samples were collected from consumer end and submitted to the lab suggested by city. For noise pollution, in about 20 cities the state pollution board or city level

environment department took the responsibility for providing noise pollution data as per the protocols. In rest of the cities, mobile based application was used to measure noise pollution.

During implementation, MoHUA facilitated the process by conducting video conferences with cities to address any queries, reiterate the importance, and ensure that cities adequately engages in the process and submit their responses in time and respond to requests for clarifications.

In addition to secondary data collection, physical audit and primary data collection, citizen survey was conducted to understand their perception and level of satisfaction on various services such as health, education, water supply, electricity, waste management etc. provided by urban local bodies. Over 60000 citizens participated in the survey across India.

The final scores and ranks have been generated based on the scoring methodology that has been discussed extensively and minor modifications made that are summarized as below:

#	**Challenges**	**Proposed Solutions**
1	Only 23 cities of 111 cities have City Mobility Plan (CMP) or any and hence able to provide data for Mode Share of Public Transport and Non-Motorised Transport. To address the data gap, as advised by the MoHUA, the consortia undertook a sample dipstick across all cities covering a sample of 150 Households. Understandably, the dipstick findings will not match the rigor of a CMP.	We recommend the following: 1) Cities which have provided CMP Data will be evaluated on 100% of the maximum score 2) For the cities where the dipstick data is used, the city receives a 50% discount on the overall score Alternatively, another approach is to assign 0 score to all 88 cities that don't have a CMP
2	Variance was observed on data reported by cities on road network and data presented in the smart city proposals during the verifications.	We recommend taking the data reported by the cities in the Smart City Proposals.
3	There is no secondary source/ organization that provides unemployment data at city level. As a result, most cities do not have the data. Fully cognizance of the challenges of generating this data in a short span of time, it was agreed to collect this data through a dipstick survey on lines of NSSO questions. The data generated needs further scrutiny and triangulation with	The indicator on unemployment will be excluded from scores. For final ranking, the cities will be scored on 78 indicators.

#	**Challenges**	**Proposed Solutions**
	some inputs from experts. This may not be possible in the short window.	
4	Many cities did not have data on noise pollution and it was decided that data will be collected using a mobile app for all the 111 cities. However, many cities have expressed reservations with the approach especially with respect to the reliability of using this data. Further, some cities have relied on the SPCB to collect the data as per the approach proposed by the consortia. Thus, noise pollution data is currently from two sources: 1. SPCB- 20 cities 2. Noise-based app- 91 cities	The data collected through the primary survey will be used for scoring the cities. Currently, there is no differential scoring for the data from the SPCB and the data collected through the mobile app. However, a certain higher weightage can be provided to those cities which used the state apparatus to collect noise pollution data.
5	For the indicator on quality of water supplied, the methodology document states that samples should be drawn both at the treatment plant outlet as well as the consumer end. However, the data provided by the cities were predominantly from the distribution point. Hence for consumer end results with MoHUA intervention, consortia coordinated with cities to collect the data at the consumer end. The cities facilitated the testing. The outcome of the process is as below: 1. Sample given- 102 cities 2. Report received- 86 cities 3. Report awaited- 16 cities 4. Tests not completed due to lack of cooperation and other reasons – 9	The maximum score for this indicator will be distributed equally (50%) for results based on samples from the treatment plant and consumer end. Cities that did not complete tests or provide the results will be given a score 0 for against consumer end tests.
6	City level population is not projected annually by most of the cities. So, estimates for 2017 population are not available with the cities.	As recommended by MoHUA, 2011 census population is being used for the ranking purpose.
7	The age category specific data for 9 cities is not available at a city level	The age category specific population data has been taken at a district level for these cities.

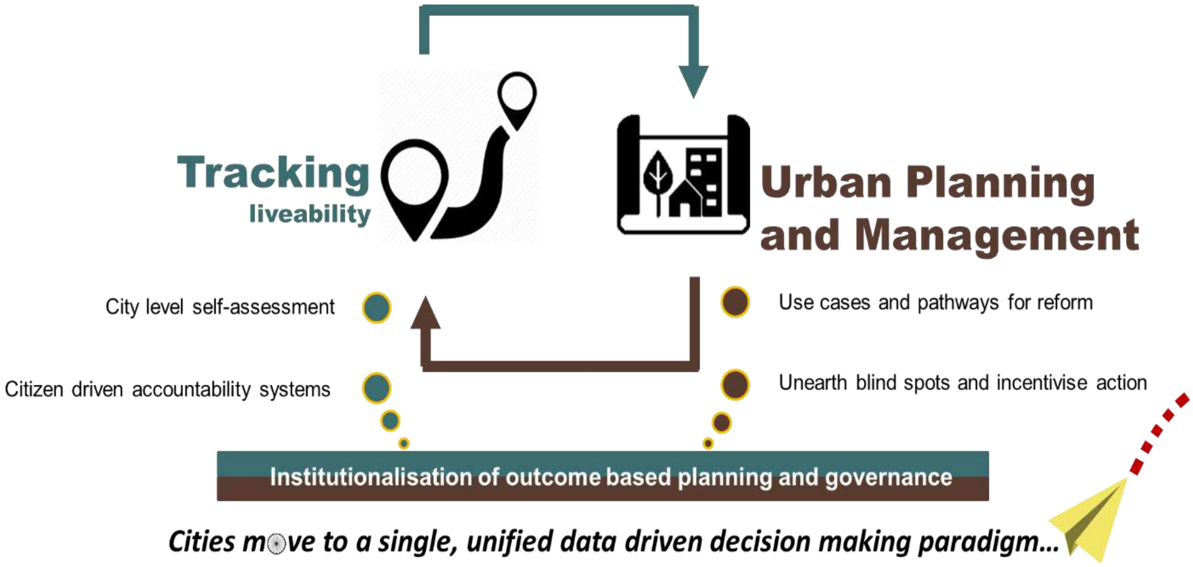
#	Challenges	Proposed Solutions
8	Indicators on non-motorised transports like- Dedicated bicycle tracks, bicycle parking facilities and mode share of non-motorised transport are not relevant for hilly terrains.	As discussed during the PMC meeting, these indicators have been treated as non-applicable for the hilly cities and the weights have been redistributed among other indicators within the same category.
9	The indicator on increase in professional tax is not relevant to cities which do not levy the professional tax.	As discussed during the PMC meeting, this indicator has been non-applicable to the cities belonging to states where professional tax is not levied, and the weights have been redistributed among other indicators within the same category.
10	The indicator on increase in VAT collection is not applicable to Port Blair and Kavaratti, as there was no provision of VAT collection in these cities.	As discussed during the PMC meeting, these indicatosr has been treated as non-applicable for these two cities and the weights have been redistributed among other indicators within the same category.
11	Indicator on coverage of basic services to slum households does not concern cities with no slums (notified/ non-notified.	As discussed during the PMC meeting, this indicators has been treated as non-applicable for these cities and the weights have been redistributed among other indicators within the same category.

1. Introduction

The Ministry of Housing and Urban Affairs (MoHUA) is implementing several flagship urban missions such as the Smart Cities Mission (SCM), Atal Mission for Urban Rejuvenation and Transformation (AMRUT), Heritage City Development and Augmentation Yojana (HRIDAY), Housing for All (HFA). Theses mission along with other transformative initiatives of the Government including National Water Mission, Power for All, National Health Mission are aimed at making Indian cities more 'liveable.' The overarching goal of these initiatives is to move from an input-based approach to a 'citizen centric-outcome based' assessment of urban liveability.

To develop a common minimum framework for cities to assess their existing status and chart their pathway towards providing a better quality of life to their citizens, the MoHUA developed a set of 'Liveability Standards' relevant to cities to generate a Liveability Index and ranking of cities. These standards were launched in June, 2017. The MoHUA has planned to conduct an 'Annual Assessment of Liveability Standards in Cities – an ambitious national project that will involve yearly submission of data by cities across the various indicators, compilation and analysis, development of indices and ranking of cities. The Liveability Index is envisioned as a 360° tool for tracking, planning and transforming Indian cities. The Liveability Index is aimed at the following objectives:

- Providing strong evidence-based approach for future interventions and investments to deliver liveability outcomes
- Catalysing actions to improve the overall quality of the city's liveability and achieve broader development outcomes including the Sustainable Development Goals
- Assessing the implementation of government policies and schemes governing characteristics of cities that can contribute to creating liveable communities



Tracking
liveability
Urban Planning
and Management
City level self-assessment
Citizen driven accountability systems
Use cases and pathways for reform
Unearth blind spots and incentivise action
Institutionalisation of outcome based planning and governance

Cities move to a single, unified data driven decision making paradigm...

The first round of the assessment commenced in January 2018 covering 116 major cities including smart cities, capital cities and cities with population of above one million each. Implementation of the liveability assessment commenced in January 2018 with a national level orientation workshop for the urban local bodies. The workshop aimed at orienting the states and urban local bodies on the overall framework, indicators, data sources, methodology and key milestones and timelines involved in the liveability assessment. Subsequently, a series of State/ Union Territory level orientation workshops were carried out in 33 states/UTs for a detailed discussion on the framework. Online data collection commenced from 9th March through an online data collection platform that supported both online and offline data submission modes. On the date of closure of the online data entry portal i.e., 16th April, 2018 112 cities submitted their data. Subsequently, comprehensive checks on the submitted data was undertaken that involved checking for outliers, logical inconsistencies etc. post which round-1 of data reconciliation was conducted. This draft report is based on round-1 of reconciled data as on 28th April, 2018.

2. City Profile

This chapter presents the city profile -Geographic and Demographic, Social (Education Health, Safety and Security, Heritage), Economic profile, and Physical (Water, sanitation and Waste Management, Electricity, Open space and roads).

BAREILLY

GEOGRAPHICAL PROFILE

State/Union Territory	Uttar Pradesh	**Total Geographical Area (Km^2)**	106.43	**City Category**	Large City

DEMOGRAPHIC PROFILE

Total Population	904797
Total Number of Households	144034

SOCIAL PROFILE

Education	**Total Number of Schools**	547
	Total Enrolment (Class 1 to 5)	...
Health	**Total Number of In-patient Beds**	11283
	Total Health Workforce	2952
Safety and Security	**Total Strength of Police Force**	762
	Total Number of CCTV Cameras	71
Heritage Sites	**Total Number of Heritage Sites**	1

ECONOMIC PROFILE

Total Population in Working Age Group	509
Total Number of Industries	605
Total Number of Commercial Enterprises	10788
Total Number of Hotels	68
Total Capital and Revenue Expenditure for the city in FY 2016-17 (INR Lakhs)	20692.18
Total VAT Collection in FY 2016-17 (INR Lakhs)	58390.45

PHYSICAL PROFILE		
Water	**Average Quantity of Water Supplied (MLD)**	146
	Total Number of Water Connection	97430
Sanitation Facilities	**Total number of households with access to individual toilets in the city**	102268
	Total number of households in the city with access to community toilets in the city	207
Solid Waste Management	**Daily average quantity of municipal solid waste collected in the city (Tonnes/day)**	3936.8
	Total number of households covered through door-to-door collection of solid waste	
Waste Water	**Daily Average Quantum of Waste Water Generated in the City (MLD)**	146
	Daily average quantum of waste water treated by STPs in the city (MLD)	
Electricity	**Total number of authorized electrical connections in the city**	178341
	Total electricity supplied to the city (kWh)	15960000
Public and Open Spaces	**Total area covered by green spaces in the city (m^2)**	446319.36
Roads and Transport	**Total Length of Road Network in the City (Km)**	1162.93
	Total length of arterial and sub-arterial road network in the city (Km)	1162.93
	Total length of footpath (wider than 1.2 metres) in the city along the street network (Km)	7.95

3. Liveability Framework and Indicators

The Liveability Framework comprises a total of 79 indicators (57 Core Indicators and 22 Supporting Indicators). A core indicator carries 70% weightage and a supporting indicator carries 30% weightage. These indicators are grouped under 15 thematic categories which in turn are part of four pillars of comprehensive development of cities i.e., institutional, social, economic and physical. Based on the performance of cities against the various core and supporting indicators, various 'Category Sub-Indexes' and a composite 'City Liveability Index' will be developed for each city.

3.1 Scoring and Computing Category Indices of Liveability

The set of 79 indicators, associated categories and pillars are presented in the table below:

Table 1 List of Pillars, Categories and Indicators

Pillars of Comprehensive Development	Category	Indicators
Institutional	1. Governance	1.1 Percentage of citizen services available online
		1.2 Percentage of services integrated through Command Centre
		1.3 Percentage of citizens using online services
		1.4 Average delay in grievance redressal
		1.5 Tax collected as percentage of tax billed
		1.6 Extent of cost recovery (O&M) in water supply services
		1.7 Capital spending as percentage of total expenditure
		1.8 Percentage of population covered under Ward Committees/Area *Sabhas*
Social	**2. Identity and Culture**	2.1 Restoration and reuse of historic buildings
		2.2 Percentage of ecologically important areas covered through projects for restoration
		2.3 Hotel occupancy
		2.4 Percentage of budget allocated towards cultural/sports activities
		2.5 Number of cultural/sports events hosted by city
	3. Education	3.1 Percentage of school-aged population enrolled in schools
		3.2 Percentage of female school-aged population enrolled in schools
		3.3 Primary education student-teacher ratio
		3.4 Percentage of schools with access to digital education
		3.5 Percentage of students completing primary education
		3.6 Percentage of students completing secondary education
	4. Health	4.1 Number of in-patient hospital beds per

Pillars of Comprehensive Development	Category	Indicators
		10,000 population
		4.2 Healthcare professionals per 10,000 population
		4.3 Average response time in case of health emergencies
		4.4 Period prevalence of water borne diseases
		4.5 Period prevalence of vector borne diseases
	5. Safety and Security	5.1 Number of CCTV Cameras
		5.2 Number of recorded crimes per lakh population
		5.3 Extent of crimes recorded against women, children and elderly per year
		5.4 Transport-related fatality per lakh population
Economic	**6. Economy and Employment**	6.1 Increase in VAT/GST collection
		6.2 Increase in collection of Professional Tax
		6.3 Increase in issuance of Construction permits
		6.4 Unemployment rate
		6.5 Percentage of vendors registered and provided formal spaces
Physical	**7. Housing and Inclusiveness**	7.1 Percentage of Slum/EWS households covered through formal/affordable housing
		7.2 Percentage of slum areas covered through basic services
	8. Public Open Spaces	8.1 Per capita availability of green spaces
		8.2 Per capita availability of public and recreational places
	9. Mixed Land Use and Compactness	9.1 Share of mixed land use area in overall city land use
		9.2 Net Density
	10. Power Supply	10.1 Percentage of city population with authorized electrical services
		10.2 Percentage of electrical connections covered through smart meters
		10.3 Average number of electrical interruptions per year

Pillars of Comprehensive Development	Category	Indicators
		10.4 Average length of electrical interruptions per year
		10.5 Percentage of total energy derived from renewable sources
		10.6 Energy consumption per unit - water supply and sewerage
		10.7 Energy consumption per unit - street lighting
		10.8 Percentage of new and redeveloped buildings following green building norms
		10.9 Total energy consumption per capita
	11. Transportation and Mobility	11.1 Geographical coverage of public transport
		11.2 Availability of public transport
		11.3 Mode share of public transport
		11.4 Percentage of road network with dedicated bicycle tracks
		11.5 Percentage of interchanges with bicycle parking facilities
		11.6 Mode share of non-motorized transport
		11.7 Availability of Passenger Information System
		11.8 Extent of signal synchronization
		11.9 Availability of paid parking spaces
		11.10 Percentage coverage of footpaths – wider than 1.2 m
		11.11 Percentage of traffic intersections with pedestrian crossing facilities
		11.12 Extent to which universal accessibility is incorporated in public rights-of-way
	12. Assured Water Supply	12.1 Household level coverage of direct water supply connections
		12.2 Per capita supply of water
		12.3 Quality of water supplied
		12.4 Level of non-revenue water – NRW
		12.5 Percentage of water connections covered through meters

Pillars of Comprehensive Development	Category	Indicators
		12.6 Percentage of plots with rainwater harvesting facility
	13. Waste Water Management	13.1 Coverage of toilets
		13.2 Coverage of sewerage network and/or septage
		13.3 Collection efficiency of sewerage network
		13.4 Extent of reuse and recycling of waste water
		13.5 Coverage of storm water drains
	14. Solid Waste Management	14.1 Household level coverage of municipal solid waste collection
		14.2 Efficiency of collection of municipal solid waste
		14.3 Extent of municipal solid waste recovered through reuse
	15. Reduced Pollution	15.1 Concentration of SO2- air pollution
		15.2 Concentration of NO2- air pollution
		15.3 Concentration of PM10 - air pollution
		15.4 Level of noise pollution
		15.5 Quality of water in public surface water bodies

3.2 Scoring and Computing Category Indices of Liveability

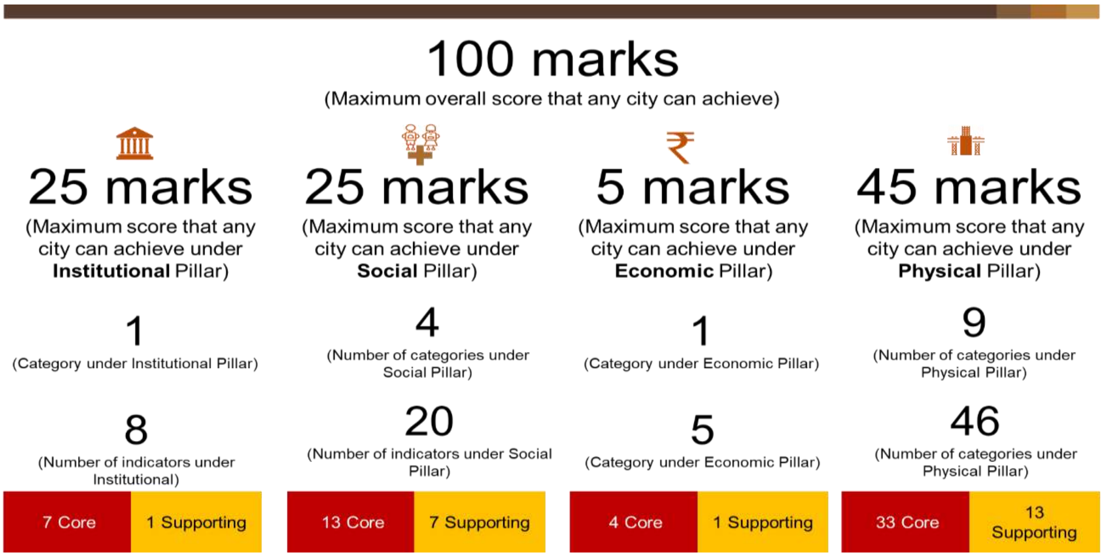
The performance achieved by cities against 79 indicators, will be assessed against given benchmarks. Where no international/national norms are available, city with the best performance in its group (population range) will be treated as a benchmark. The groups are given in the table below.

Table 2 Details on Population Range

Category	Population range
Category 1	Population ≥ 4 million
Category 2	1 million ≤ Population < 4 million
Category 3	0.5 million ≤ Population < 1 million
Category 4	Population < 0.5 million

3.3 Scoring Approach and Methodology

A city can earn a maximum score of 100 points for 79 indicators across four pillars. The pillar weights are as follows: Institutional (25 points), Social (25 points), Economy and Employment (5 points) and Physical (45 points). Based on the number and nature of indicators i.e., core vs. secondary, indicator wise maximum marks were computed.



100 marks
(Maximum overall score that any city can achieve)
25 marks
(Maximum score that any city can achieve under Institutional Pillar)
1
(Category under Institutional Pillar)
8
(Number of indicators under Institutional)
7 Core
1 Supporting
25 marks
(Maximum score that any city can achieve under Social Pillar)
4
(Number of categories under Social Pillar)
20
(Number of indicators under Social Pillar)
13 Core
7 Supporting
5 marks
(Maximum score that any city can achieve under Economic Pillar)
1
(Category under Economic Pillar)
5
(Category under Economic Pillar)
4 Core
1 Supporting
45 marks
(Maximum score that any city can achieve under Physical Pillar)
9
(Number of categories under Physical Pillar)
46
(Number of categories under Physical Pillar)
33 Core
13 Supporting

Dimensional Index Methodology (DIM) has been used to compute scores for each indicator with reference to "maximum within the comparison group" or "absolute benchmarks". For indicators where benchmarks are available, cities getting the benchmark score (or above) are given the maximum mark, and the marks awarded to other cities are calculated proportionately. For indicators where benchmarks are not available, the best performing cities in each population group are given the maximum mark, and the marks awarded to other cities (within the population group) are calculated proportionately. For indicators where benchmarks do not exist, the city data has been tested for outliers before scoring.

3.4 Scoring Normalisation:

To construct aggregate scores across cities as well as to make the scores across indicators comparable, indicator values were normalised using a min-max approach. The following formula was used to normalise the indicator values-

$$\frac{indicator\ value\ for\ the\ city - indicator\ value\ for\ the\ worst\ performing\ city}{benchmark - \ indicator\ value\ for\ the\ worst\ performing\ city}$$

This approach would restrict the normalised indicator value between 0 and 1. Cities that met or exceeded the benchmark received a normalised indicator value of 1. Worst performing cities are given a normalised indicator value of 0. After normalisation, the normalised value is weighted according to the category and the indicator being core or supporting.

To illustrate, consider the indicator 12.3 Quality of Water Supplied in the Category 12 for Assured Water Supply. If in City A 50% of the water samples collected qualify the potable water standards specified by the CPHEEO, and only 10% of the samples from worst performing city qualify the standards. Then, the normalised value for the indicator for city A would be 0.44 [(0.5-0.1)/(1-0.1)].

The weight for indicator 12.3 is 1.03, so the final weighted score for City A would come out to 0.45 [1.03*0.44].

4. Data Collection and Verification

4.1 Submission of Data by the cities

The Liveability Assessment is based on secondary data submitted by the urban local bodies and other concerned government agencies (collectively called as data owners). The 79 indicators were broken down into a set of easy to understand and relatable 553 questions mapped to data owners. Submission of the data was enabled through an online data entry portal on the smartnet platform of the Ministry. The portal also allowed the ULBs to download the liveability assessment questionnaire and upload filled in questionnaire. To familiarise and assist cities in identifying, mapping and collation of data points, a city level nodal person was available during the entire period of data submission process.

4.2 Mapping of Data Owners for the City

For the assessment of liveability indices broadly 12 data owners such as Central/state Pollution control board, Development authority, DISCOM/Electricity Board, State Disaster Management Authority, State Education Department, State Health department, State Renewable energy and development agency, State sales and commercial taxes department, town and country planning department, Traffic and police department, Transport authority, and Urban local body were identified to respond to the questions on the portal. However, during state workshop and subsequent city level discussions, more data owners were mapped to respond to different categories and sub categories. The following table provides the details of city level data owners mapped under the 12 data owner.

Table 3: Details of Data Owners

Designated data owners	Subcategories	Data owners at city level
Urban Local Body	For Accounts Related Questions	Accounts Department Nagar Nigam Bareilly
Urban Local Body	For Park and Recreation Related Questions	Udhyan Vibhag Nagar Nigam Bareilly
Urban Local Body	For Water Supply and Drainage related questions	Jal Nigam/ Jalkal Vibhag Nagar Nigam Bareilly
Urban Local Body	For Heritage sites related data	Archeological survey of India
Urban Local Body	For Ecological sites related data	Forrest department
Urban Local Body	For Housing related data	Bareilly Development Authority /

Designated data owners	Subcategories	Data owners at city level
		Nirmaan Vibhag Nagar Nigam Bareilly
Urban Local Body	For Building plan related data	Bareilly Development Authority
Urban Local Body	For Roads related data	Public Works Department / Nirmaan Vibhag Nagar Nigam Bareilly
Urban Local Body	For Solid waste management related data	Health Department Nagar Nigam Bareilly
Urban Local Body	For IT services related data	Computer department of ulb
Urban Local Body	For Vendor committee related data	District Urban Development Agency Bareilly
Urban Local Body	Any other departments involved in providing data for questions mentioned under Urban Local Body	Public Works Department, Bareilly Development Authority, District Urban Development Agency Bareilly, Employment Office Bareilly, Uttar Pradesh State Transport Bareilly
Central / state Pollution control Board	Water Quality, Air Quality, Noise Quality	Uttar Pradesh Pollution Control Board Bareilly
Development Authority	Building Infrastructure	Bareilly Development Authority
	Construction planning	Bareilly Development Authority
	Green Building	Bareilly Development Authority
	Rain water harvesting	Bareilly Development Authority
	Universal Design Principle	Bareilly Development Authority
DISCOM/Electricity Board	Electrical Connection/ Grievance Redressal/ Power supply	Uttar Pradesh Electricity Board Bareilly
State Disaster management authority		Central\state disaster management authority
State Education Department		Basic Education Department Bareilly
State Health Department	Health care professionals	District Hospital Bareilly
	Citizen Services	District Hospital Bareilly
	Disease Prevalence	District Hospital Bareilly
	Health Infrastructure	District Hospital Bareilly
State Renewable Energy Development Agency		UP NEDA Bareilly
State Sales / Commercial Taxes Department		Commercial tax department Bareilly
Town and Country	Land Use	Town and Country Planning

Designated data owners	Subcategories	Data owners at city level
Planning Department		Department Bareilly
Traffic and Police Department		Police Department (civil, Traffic ,GRP)
Transport Authorities	Buses	Uttar Pradesh State Transport Bareilly
	Registered Vehicles	Regional Transport Office Bareilly
	Sub urban rail transport	NA
	Mono Rail Authority	NA
	Tramways	NA
	Marine Transport Authority	NA

4.3 List of secondary documents available as supportive

City has provided supporting documents/evidences against the responses given by city on the online portal. In support of their responses on the portal, city submitted 45 number of documents. Documents submitted includes reports, official orders, copy of data maintained in official register, signed copy of questionnaire, and signed letters/submissions from concern departments. Verification includes mapping of documents against responses given by city, checking the type/category of documents, and validation of data provided.

The following table presents the data owner wise number of documents:

Table 4: Data owner wise number of secondary documents submitted by city

Data Owners	Number of Documents
Sales and Commercial Taxes	1
State Education Department	1
DISCOM/Electricity Department	1
Traffic and Police Department	2
Development Authority	0
Pollution Control Board	4
State Renewable Energy Department	1
Town and Country Planning	1
State Health Department	11
Transport Authority	2
Disaster Management	2
Urban Local Body	19
Total	45

4.4 Data Verification

A three-stage data quality check comprising verification of data against secondary documents furnished by data owners, logical inconsistency checks including outliers, and physical audit for select indicators (Refer the exhibit below) is being undertaken. The objective of the data quality check is to ensure that data from the source documents are accurate and verifiable. Sources of data included reports, administrative data, survey results and other statistical records, log books among other.

Physical audit of eight indicators – one indicator from the Institutional pillar, one from the Social pillar, one from the Economy pillar and five from the Physical pillar is also being carried out by the field team to ascertain the degree of reliability of data reported by the cities. The list of these eight indicators is presented below:

1.2 | Percentage of services integrated through Command Centre

2.3 | Hotel occupancy

3.4 | Percentage of schools with access to digital education

5.1| Number of streets, public places, junctions covered through surveillance systems

6.5 | Percentage of vendors registered and provided formal spaces

11.7 | Availability of Passenger Information System

11.11 | Percentage of traffic intersections with pedestrian crossing facilities

11.12 | Extent to which universal accessibility is incorporated in public rights-of-way

For a set of five indicators namely, unemployment rate, mode share of public transport, mode share of non-motorised transport, quality of water supplied and level of noise pollution, existing datasets were found to be not available consistently across all cities and/or were inadequate. To help cities that do not have data on these five indicators, dipstick assessments are being carried to fill data gaps.

6.4 | Unemployment Rate

11.3 | Mode share of public transport

11.5 | Mode share of Non Motorized Transport

12.3 | Quality of Water Supplied

15.4 | Level of Noise Pollution

4.5 Physical Audit

The following map presents the indicators audited at city level.

5. City Score on 15 categories of Assessment

Liveability Assessment covered 15 categories and 78 indicators. The below table presents the scores for all 15 indicators namely governance, identity & culture, education, health, safety and security, economy & employment, housing & inclusiveness, public open spaces, mixed land use & compactness, power supply, transport & mobility, assured water supply, waste water management, solid waste management and reduced pollution.

Table 5: Category wise scores

Categories	Scores in Percentage
Governance	52.68%
Identity & Culture	0%
Education	53%

Health	94%
Safety & Security	55%
Economy & Employment	20%
Housing & Inclusiveness	46%
Public Open Spaces	3%
Mixed Land Use & Compactness	0%
Power Supply	60%
Transport & Mobility	24%
Assured Water Supply	70%
Waste Water Management	41%
Solid Waste Management	63%
Reduced Pollution	76%

The rank of the city is based on the performance and scores in each of the category. The final city rank is submitted separately.

Executive Summary

Assessment of liveability indices is an initiative by the Ministry of Housing and Urban Affairs to improve quality of life of citizens and achieve sustainable development goals by encouraging cities to adopt "outcome based" approach for urban planning. Assessment process aimed to provide opportunity to cities to review the development components holistically by involving 79 measurable indicators categorized under governance, health, education, safety, economy, power supply, transportation and mobility, identity, culture, housing, waste management and pollution.

This report highlights the assessment process, key milestones, and the final outcome of the data submitted. Implementation of liveability assessment commenced formally on 19th January 2018. A national level workshop was organized on 13th February 2018 to explain the importance and process of liveability assessment and get feedback on methodology from the city authorities.

This was followed by the next stage of Questionnaire development. The questionnaire was arranged under 12 categories representing 12 data owners namely urban local body, Central and state pollution control board, development authority, DISCOM/Electricity board, State disaster management authority, state education department, state health department, state renewable energy development agency, state sales and commercial taxes department, town and country planning department, traffic and police department and transport authorities.

An online data entry portal was developed to facilitate data submission by the cities. Each city had a unique log in to access the portal and submit the data. Both online and off-line options (download the questionnaire in an excel) to submit the data were available for cities. An email help desk was set up for the cities to raise any queries and seek clarification when responding to the questions.

A team for each state comprising of State Coordinator and City Coordinator (one per city) was deployed that facilitated the process and supported the cities. A total of 6 regional coordinators/ consultants, 29 State Coordinators, and 99 city coordinators were deployed across 116 cities. Training for state coordinators was held from 26th to 28th February 2018 at Chennai to make coordinators understand overall liveability assessment, indicators, data sources, protocols and roles and responsibilities.

City Reconnaissance Meetings were initiated by the state and city coordinators. The discussion began with discussions to finalize the state workshop schedule, mapping of data owners, and assist cities in data collection. The City Coordinators were based in the cities for over 6 weeks and during this time, they liase with ULB and other data owners to explain the liveability framework, online portal, and facilitate the online submission.

A total of 33 state workshops were conducted at the state level. The objective of the workshop was to orient the city stakeholders on liveability assessment, indicators, components of data collection, timelines, expectations of support and support extended by MoHUA. The state level workshops brought various city level departments on a single platform to understand and discuss the methodology and components of city liveability assessment.

Nodal agency at state level supported by the City and State Coordinator and city level (Municipality corporation/smart city limited) coordinated with city specific data owners/departments for data gathering, collation, and submission. Nodal persons in each department were appointed for timely data collection and submission. Of 116, 112 cities submitted data as per the timeline on 16th April 2018.

Post submission, the city and state coordinators supported by the central team followed up extensively with the cities to support secondary documents as evidence to substantiate their submissions. Secondary documents such as reports, official orders, copy of office register, signed copy of liveability assessment questionnaire furnished by cities against the submitted data. Documents are verified to map the documents for the reponses provided by city and to check the type data provided by city. The document check outcomes were shared with the cities as a part of data quality check.

For checking consistency of data, logical check of data, verifying data from other public sources were undertaken. Quality check was done to ensure data validity and provide opportunity to cities to review the data provided by them and correct in case of wrong data entry.

For 8 selected indicators namely, percentage of services integrated through command and control center, hotel occupancy rate, percentage of schools with access to digital education, number of CCTV cameras per unit road length, percentage of vendors registered and provided formal spaces, availability of passenger information system, percentage of traffic intersection with pedestrian crossing facility, and extent to which universal accessibility is incorporated in public rights of way. Physical audit was conducted in 110 cities by physical auditors appointed and trained by the consortium. In consultation with ULB nodal person, locations and indicators for physical audit was selected in each city. A mobile based application was developed to capture the physical audit related data.

Primary data collection was done for five indicators such as unemployment rates, mode share of public transport, mode share of non-motorized transport, quality of water supplied, and level of noise pollution. Protocols for water and noise test were prepared in consultation with experts. Water quality test involved physical, chemical and bacteriological test of water as per the CPCB norms. For testing quality of water at consumer end, the auditors worked closely with the ULB and Water department. Samples were collected from consumer end and submitted to the lab suggested by city. For noise pollution, in about 20 cities the state pollution board or city level

environment department took the responsibility for providing noise pollution data as per the protocols. In rest of the cities, mobile based application was used to measure noise pollution.

During implementation, MoHUA facilitated the process by conducting video conferences with cities to address any queries, reiterate the importance, and ensure that cities adequately engages in the process and submit their responses in time and respond to requests for clarifications.

In addition to secondary data collection, physical audit and primary data collection, citizen survey was conducted to understand their perception and level of satisfaction on various services such as health, education, water supply, electricity, waste management etc. provided by urban local bodies. Over 60000 citizens participated in the survey across India.

The final scores and ranks have been generated based on the scoring methodology that has been discussed extensively and minor modifications made that are summarized as below:

#	**Challenges**	**Proposed Solutions**
1	Only 23 cities of 111 cities have City Mobility Plan (CMP) or any and hence able to provide data for Mode Share of Public Transport and Non-Motorised Transport. To address the data gap, as advised by the MoHUA, the consortia undertook a sample dipstick across all cities covering a sample of 150 Households. Understandably, the dipstick findings will not match the rigor of a CMP.	We recommend the following: 1) Cities which have provided CMP Data will be evaluated on 100% of the maximum score 2) For the cities where the dipstick data is used, the city receives a 50% discount on the overall score Alternatively, another approach is to assign 0 score to all 88 cities that don't have a CMP
2	Variance was observed on data reported by cities on road network and data presented in the smart city proposals during the verifications.	We recommend taking the data reported by the cities in the Smart City Proposals.
3	There is no secondary source/ organization that provides unemployment data at city level. As a result, most cities do not have the data. Fully cognizance of the challenges of generating this data in a short span of time, it was agreed to collect this data through a dipstick survey on lines of NSSO questions. The	The indicator on unemployment will be excluded from scores. For final ranking, the cities will be scored on 78 indicators.

#	Challenges	Proposed Solutions
	data generated needs further scrutiny and triangulation with some inputs from experts. This may not be possible in the short window.	
4	Many cities did not have data on noise pollution and it was decided that data will be collected using a mobile app for all the 111 cities. However, many cities have expressed reservations with the approach especially with respect to the reliability of using this data. Further, some cities have relied on the SPCB to collect the data as per the approach proposed by the consortia. Thus, noise pollution data is currently from two sources: 1. SPCB- 20 cities 2. Noise-based app- 91 cities	The data collected through the primary survey will be used for scoring the cities. Currently, there is no differential scoring for the data from the SPCB and the data collected through the mobile app. However, a certain higher weightage can be provided to those cities which used the state apparatus to collect noise pollution data.
5	For the indicator on quality of water supplied, the methodology document states that samples should be drawn both at the treatment plant outlet as well as the consumer end. However, the data provided by the cities were predominantly from the distribution point. Hence for consumer end results with MoHUA intervention, consortia coordinated with cities to collect the data at the consumer end. The cities facilitated the testing. The outcome of the process is as below: 1. Sample given- 102 cities 2. Report received- 86 cities 3. Report awaited- 16 cities 4. Tests not completed due to lack of cooperation and other reasons – 9	The maximum score for this indicator will be distributed equally (50%) for results based on samples from the treatment plant and consumer end. Cities that did not complete tests or provide the results will be given a score 0 for against consumer end tests.
6	City level population is not projected annually by most of the cities. So, estimates for 2017 population are not available with the cities.	As recommended by MoHUA, 2011 census population is being used for the ranking purpose.
7	The age category specific data for 9 cities is not available at a city level	The age category specific population data has been taken at a district level for these cities.

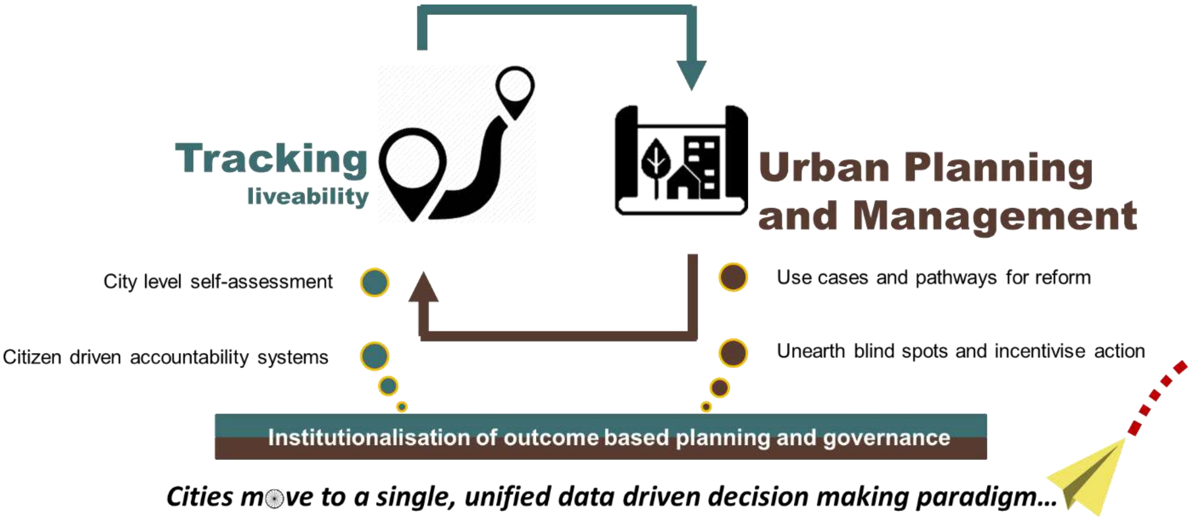
#	Challenges	Proposed Solutions
8	Indicators on non-motorised transports like- Dedicated bicycle tracks, bicycle parking facilities and mode share of non-motorised transport are not relevant for hilly terrains.	As discussed during the PMC meeting, these indicators have been treated as non-applicable for the hilly cities and the weights have been redistributed among other indicators within the same category.
9	The indicator on increase in professional tax is not relevant to cities which do not levy the professional tax.	As discussed during the PMC meeting, this indicator has been non-applicable to the cities belonging to states where professional tax is not levied, and the weights have been redistributed among other indicators within the same category.
10	The indicator on increase in VAT collection is not applicable to Port Blair and Kavaratti, as there was no provision of VAT collection in these cities.	As discussed during the PMC meeting, these indicatosr has been treated as non-applicable for these two cities and the weights have been redistributed among other indicators within the same category.
11	Indicator on coverage of basic services to slum households does not concern cities with no slums (notified/ non-notified.	As discussed during the PMC meeting, this indicators has been treated as non-applicable for these cities and the weights have been redistributed among other indicators within the same category.

1. Introduction

The Ministry of Housing and Urban Affairs (MoHUA) is implementing several flagship urban missions such as the Smart Cities Mission (SCM), Atal Mission for Urban Rejuvenation and Transformation (AMRUT), Heritage City Development and Augmentation Yojana (HRIDAY), Housing for All (HFA). Theses mission along with other transformative initiatives of the Government including National Water Mission, Power for All, National Health Mission are aimed at making Indian cities more 'liveable.' The overarching goal of these initiatives is to move from an input-based approach to a 'citizen centric-outcome based' assessment of urban liveability.

To develop a common minimum framework for cities to assess their existing status and chart their pathway towards providing a better quality of life to their citizens, the MoHUA developed a set of 'Liveability Standards' relevant to cities to generate a Liveability Index and ranking of cities. These standards were launched in June, 2017. The MoHUA has planned to conduct an 'Annual Assessment of Liveability Standards in Cities – an ambitious national project that will involve yearly submission of data by cities across the various indicators, compilation and analysis, development of indices and ranking of cities. The Liveability Index is envisioned as a 360° tool for tracking, planning and transforming Indian cities. The Liveability Index is aimed at the following objectives:

- Providing strong evidence-based approach for future interventions and investments to deliver liveability outcomes
- Catalysing actions to improve the overall quality of the city's liveability and achieve broader development outcomes including the Sustainable Development Goals
- Assessing the implementation of government policies and schemes governing characteristics of cities that can contribute to creating liveable communities



Tracking
liveability
Urban Planning
and Management
City level self-assessment
Citizen driven accountability systems
Use cases and pathways for reform
Unearth blind spots and incentivise action
Institutionalisation of outcome based planning and governance
Cities move to a single, unified data driven decision making paradigm...

The first round of the assessment commenced in January 2018 covering 116 major cities including smart cities, capital cities and cities with population of above one million each. Implementation of the liveability assessment commenced in January 2018 with a national level orientation workshop for the urban local bodies. The workshop aimed at orienting the states and urban local bodies on the overall framework, indicators, data sources, methodology and key milestones and timelines involved in the liveability assessment. Subsequently, a series of State/ Union Territory level orientation workshops were carried out in 33 states/UTs for a detailed discussion on the framework. Online data collection commenced from 9th March through an online data collection platform that supported both online and offline data submission modes. On the date of closure of the online data entry portal i.e., 16th April, 2018 112 cities submitted their data. Subsequently, comprehensive checks on the submitted data was undertaken that involved checking for outliers, logical inconsistencies etc. post which round-1 of data reconciliation was conducted. This draft report is based on round-1 of reconciled data as on 28th April, 2018.

2. City Profile

This chapter presents the city profile -Geographic and Demographic, Social (Education Health, Safety and Security, Heritage), Economic profile, and Physical (Water, sanitation and Waste Management, Electricity, Open space and roads).

BELAGAVI

GEOGRAPHICAL PROFILE

State/Union Territory	Karnataka	**Total Geographical Area (Km^2)**	94.08	**City Category**	Small City

DEMOGRAPHIC PROFILE

Total Population	490045
Total Number of Households	137022

SOCIAL PROFILE

Education	**Total Number of Schools**	403
	Total Enrolment (Class 1 to 5)	45021
Health	**Total Number of In-patients Beds**	5510
	Total Health Workforce	2623
Safety and Security	**Total Strength of Police Force**	1311
	Total Number of CCTV Cameras	155
Heritage Sites	**Total Number of Heritage Sites**	5

ECONOMIC PROFILE

Total Population in Working Age Group	54669
Total Number of Industries	665
Total Number of Commercial Enterprises	16603
Total Number of Hotels	214
Total Capital and Revenue Expenditure for the city in FY 2016-17 (INR Lakhs)	15765.61
Total VAT Collection in FY 2016-17 (INR Lakhs)	42219.83

PHYSICAL PROFILE

	Water	**Average Quantity of Water Supplied (MLD)**	75.5
		Total Number of Water Connections	63768
	Sanitation Facilities	**Total number of households with access to individual toilets in the city**	114437
		Total number of households in the city with access to community toilets in the city	810
	Solid Waste Management	**Daily average quantity of municipal solid waste collected in the city (Tonnes/day)**	240
		Total number of households covered through door-to-door collection of solid waste	118065
	Waste Water	**Daily Average Quantum of Waste Water Generated in the City (MLD)**	60.4
		Daily average quantum of waste water treated by STPs in the city (MLD)	...
	Electricity	**Total number of authorized electrical connections in the city**	170970
		Total electricity supplied to the city (kWh)	41210
	Public and Open Spaces	**Total area covered by green spaces in the city (m^2)**	495132
	Roads and Transport	**Total Length of Road Network in the City (Km)**	804
		Total length of arterial and sub-arterial road network in the city (Km)	157.52
		Total length of footpath (wider than 1.2 metres) in the city along the street network (Km)	27.31

3. Liveability Framework and Indicators

The Liveability Framework comprises a total of 79 indicators (57 Core Indicators and 22 Supporting Indicators). A core indicator carries 70% weightage and a supporting indicator carries 30% weightage. These indicators are grouped under 15 thematic categories which in turn are part of four pillars of comprehensive development of cities i.e., institutional, social, economic and physical. Based on the performance of cities against the various core and supporting indicators, various 'Category Sub-Indexes' and a composite 'City Liveability Index' will be developed for each city.

3.1 Scoring and Computing Category Indices of Liveability

The set of 79 indicators, associated categories and pillars are presented in the table below:

Table 1 List of Pillars, Categories and Indicators

Pillars of Comprehensive Development	Category	Indicators
Institutional	1. Governance	1.1 Percentage of citizen services available online
		1.2 Percentage of services integrated through Command Centre
		1.3 Percentage of citizens using online services
		1.4 Average delay in grievance redressal
		1.5 Tax collected as percentage of tax billed
		1.6 Extent of cost recovery (O&M) in water supply services
		1.7 Capital spending as percentage of total expenditure
		1.8 Percentage of population covered under Ward Committees/Area *Sabhas*
Social	**2. Identity and Culture**	2.1 Restoration and reuse of historic buildings
		2.2 Percentage of ecologically important areas covered through projects for restoration
		2.3 Hotel occupancy

Pillars of Comprehensive Development	Category	Indicators
		2.4 Percentage of budget allocated towards cultural/sports activities
		2.5 Number of cultural/sports events hosted by city
	3. Education	3.1 Percentage of school-aged population enrolled in schools
		3.2 Percentage of female school-aged population enrolled in schools
		3.3 Primary education student-teacher ratio
		3.4 Percentage of schools with access to digital education
		3.5 Percentage of students completing primary education
		3.6 Percentage of students completing secondary education
	4. Health	4.1 Number of in-patient hospital beds per 10,000 population
		4.2 Healthcare professionals per 10,000 population
		4.3 Average response time in case of health emergencies
		4.4 Period prevalence of water borne diseases
		4.5 Period prevalence of vector borne diseases
	5. Safety and Security	5.1 Number of CCTV Cameras
		5.2 Number of recorded crimes per lakh population
		5.3 Extent of crimes recorded against women, children and elderly per year
		5.4 Transport-related fatality per lakh population
Economic	**6. Economy and Employment**	6.1 Increase in VAT/GST collection
		6.2 Increase in collection of Professional Tax

Pillars of Comprehensive Development	Category	Indicators
		6.3 Increase in issuance of Construction permits
		6.4 Unemployment rate
		6.5 Percentage of vendors registered and provided formal spaces
Physical	**7. Housing and Inclusiveness**	7.1 Percentage of Slum/EWS households covered through formal/affordable housing
		7.2 Percentage of slum areas covered through basic services
	8. Public Open Spaces	8.1 Per capita availability of green spaces
		8.2 Per capita availability of public and recreational places
	9. Mixed Land Use and Compactness	9.1 Share of mixed land use area in overall city land use
		9.2 Net Density
	10. Power Supply	10.1 Percentage of city population with authorized electrical services
		10.2 Percentage of electrical connections covered through smart meters
		10.3 Average number of electrical interruptions per year
		10.4 Average length of electrical interruptions per year
		10.5 Percentage of total energy derived from renewable sources
		10.6 Energy consumption per unit - water supply and sewerage
		10.7 Energy consumption per unit - street lighting
		10.8 Percentage of new and redeveloped buildings following green building norms
		10.9 Total energy consumption per capita

Pillars of Comprehensive Development	Category	Indicators
	11. Transportation and Mobility	11.1 Geographical coverage of public transport
		11.2 Availability of public transport
		11.3 Mode share of public transport
		11.4 Percentage of road network with dedicated bicycle tracks
		11.5 Percentage of interchanges with bicycle parking facilities
		11.6 Mode share of non-motorized transport
		11.7 Availability of Passenger Information System
		11.8 Extent of signal synchronization
		11.9 Availability of paid parking spaces
		11.10 Percentage coverage of footpaths – wider than 1.2 m
		11.11 Percentage of traffic intersections with pedestrian crossing facilities
		11.12 Extent to which universal accessibility is incorporated in public rights-of-way
	12. Assured Water Supply	12.1 Household level coverage of direct water supply connections
		12.2 Per capita supply of water
		12.3 Quality of water supplied
		12.4 Level of non-revenue water – NRW
		12.5 Percentage of water connections covered through meters
		12.6 Percentage of plots with rainwater harvesting facility
	13. Waste Water	13.1 Coverage of toilets

Pillars of Comprehensive Development	Category	Indicators
	Management	13.2 Coverage of sewerage network and/or septage
		13.3 Collection efficiency of sewerage network
		13.4 Extent of reuse and recycling of waste water
		13.5 Coverage of storm water drains
	14. Solid Waste Management	14.1 Household level coverage of municipal solid waste collection
		14.2 Efficiency of collection of municipal solid waste
		14.3 Extent of municipal solid waste recovered through reuse
	15. Reduced Pollution	15.1 Concentration of SO2- air pollution
		15.2 Concentration of NO2- air pollution
		15.3 Concentration of PM10 - air pollution
		15.4 Level of noise pollution
		15.5 Quality of water in public surface water bodies

3.2 Scoring and Computing Category Indices of Liveability

The performance achieved by cities against 79 indicators, will be assessed against given benchmarks. Where no international/national norms are available, city with the best performance in its group (population range) will be treated as a benchmark. The groups are given in the table below.

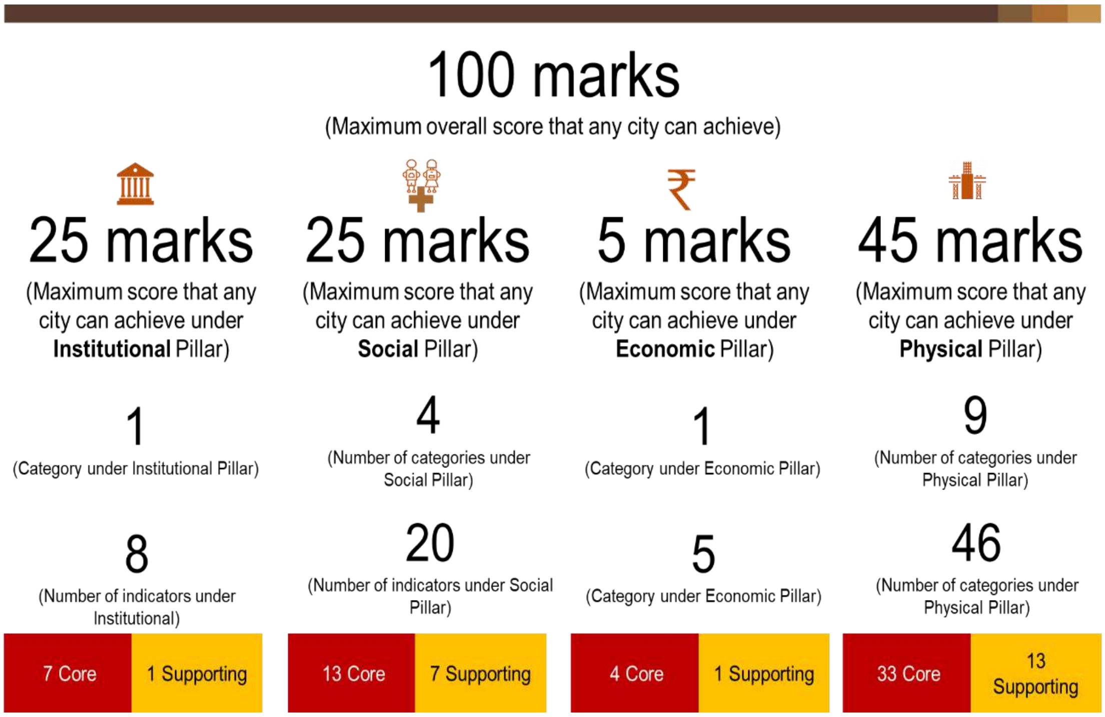
Table 2 Details on Population Range

Category	Population range
Category 1	Population ≥ 4 million
Category 2	1 million ≤ Population < 4 million

Category 3	0.5 million ≤ Population < 1 million
Category 4	Population < 0.5 million

3.3 Scoring Approach and Methodology

A city can earn a maximum score of 100 points for 79 indicators across four pillars. The pillar weights are as follows: Institutional (25 points), Social (25 points), Economy and Employment (5 points) and Physical (45 points). Based on the number and nature of indicators i.e., core vs. secondary, indicator wise maximum marks were computed.



100 marks
(Maximum overall score that any city can achieve)
25 marks
(Maximum score that any city can achieve under Institutional Pillar)
25 marks
(Maximum score that any city can achieve under Social Pillar)
5 marks
(Maximum score that any city can achieve under Economic Pillar)
45 marks
(Maximum score that any city can achieve under Physical Pillar)
1
(Category under Institutional Pillar)
4
(Number of categories under Social Pillar)
1
(Category under Economic Pillar)
9
(Number of categories under Physical Pillar)
8
(Number of indicators under Institutional)
20
(Number of indicators under Social Pillar)
5
(Category under Economic Pillar)
46
(Number of categories under Physical Pillar)
7 Core
1 Supporting
13 Core
7 Supporting
4 Core
1 Supporting
33 Core
13 Supporting

Dimensional Index Methodology (DIM) has been used to compute scores for each indicator with reference to "maximum within the comparison group" or "absolute benchmarks". For indicators where benchmarks are available, cities getting the benchmark score (or above) are given the maximum mark, and the marks awarded to other cities are calculated proportionately. For indicators where benchmarks are not available, the best performing cities in each population group are given the maximum mark, and the marks awarded to other cities (within the population group) are calculated proportionately. For indicators where benchmarks do not exist, the city data has been tested for outliers before scoring.

3.4 Scoring Normalisation:

To construct aggregate scores across cities as well as to make the scores across indicators comparable, indicator values were normalised using a min-max approach. The following formula was used to normalise the indicator values-

$$\frac{indicator\ value\ for\ the\ city - indicator\ value\ for\ the\ worst\ performing\ city}{benchmark - \ indicator\ value\ for\ the\ worst\ performing\ city}$$

This approach would restrict the normalised indicator value between 0 and 1. Cities that met or exceeded the benchmark received a normalised indicator value of 1. Worst performing cities are given a normalised indicator value of 0. After normalisation, the normalised value is weighted according to the category and the indicator being core or supporting.

To illustrate, consider the indicator 12.3 Quality of Water Supplied in the Category 12 for Assured Water Supply. If in City A 50% of the water samples collected qualify the potable water standards specified by the CPHEEO, and only 10% of the samples from worst performing city qualify the standards. Then, the normalised value for the indicator for city A would be 0.44 [(0.5-0.1)/(1-0.1)].

The weight for indicator 12.3 is 1.03, so the final weighted score for City A would come out to 0.45 [1.03*0.44].

4. Data Collection and Verification

4.1 Submission of Data by the cities

The Liveability Assessment is based on secondary data submitted by the urban local bodies and other concerned government agencies (collectively called as data owners). The 79 indicators were broken down into a set of easy to understand and relatable 553 questions mapped to data owners. Submission of the data was enabled through an online data entry portal on the smartnet platform of the Ministry. The portal also allowed the ULBs to download the liveability assessment questionnaire and upload filled in questionnaire. To familiarise and assist cities in identifying, mapping and collation of data points, a city level nodal person was available during the entire period of data submission process.

4.2 Mapping of Data Owners for the City

For the assessment of liveability indices broadly 12 data owners such as Central/state Pollution control board, Development authority, DISCOM/Electricity Board, State Disaster Management Authority, State Education Department, State Health department, State Renewable energy and development agency, State sales and commercial taxes department, town and country planning

department, Traffic and police department, Transport authority, and Urban local body were identified to respond to the questions on the portal. However, during state workshop and subsequent city level discussions, more data owners were mapped to respond to different categories and sub categories. The following table provides the details of city level data owners mapped under the 12 data owner.

Table 3:Details of Data Owners

Designated data owners	Subcategories	Data owners at city level
Urban Local Body	For Accounts Related Questions	Accounts Department Belagavi City Copn.
Urban Local Body	For Park and Recreation Related Questions	Town Planning Department Belagavi City Copn.
Urban Local Body	For Water Supply and Drainage related questions	Engineering Department Belagavi City Copn.
Urban Local Body	For Heritage sites related data	Town Planning Department Belagavi City Copn.
Urban Local Body	For Ecological sites related data	Department of forest, ecology and environment
Urban Local Body	For Housing related data	Rajiv housing Yojana. Belagavi City Copn. Slum Board Dept.
Urban Local Body	For Building plan related data	Town Planning Department Belagavi City Copn. (Belagavi Urban Dev. Authority)
Urban Local Body	For Roads related data	Engineering Department Belagavi City Copn. & Publc Works Department
Urban Local Body	For Solid waste management related data	Health & Sanitation section, Belagavi City Copn
Urban Local Body	For IT services related data	IT Department
Urban Local Body	For Vendor committee related data	Urban Poverty Alleviation Cell Vender Reg. Cell . Belagavi City Copn., National Urban Livelihood Mission
Urban Local Body	Any other departments involved in providing data for questions mentioned under Urban Local Body	Commercial Tax Department (Professional Tax related queries), Education Department (Population of age group between 6-14), Revenue Department, PMAY, District Employment Exchange, Belagavi Development Authority, (CMP related),

Designated data owners	Subcategories	Data owners at city level
		Health Department, State Pollution Control Board Health & Family Welfare Dept. Police Department (Crime & Accident information) Road Transport Dept. (Vehicles and road information)
Central / state Pollution control Board	Water Quality, Air Quality, Noise Quality	State / District Pollution control board, Belagavi Water Supply and Drainage Board Department of Health, Hygiene & Sanitation
Development Authority	Building Infrastructure	Belagavi Urban Development Authority & Engineering section BCC, Smart City Limited
	Construction planning	Development Authority and Town Planning Department, Belagavi City Corporation.
	Green Building	Town Planning Department,
	Rain water harvesting	Town Planning Department, Belagavi City Corporation.
	Universal Design Principle	Belagavi Urban Development Authority / Belagavi City Corporation
DISCOM/Electricity Board	Electrical Connection/ Grievance Redressal/ Power supply	Hubballi Electricity Supply Company Limited
State Disaster management authority		Disaster Management Cell, Deputy Commissioner Office
State Education Department		
State Health Department	Health care professionals	District Health Office
	Citizen Services	District Health Office
	Disease Prevalence	District Health Office
	Health Infrastructure	District Health Office
State Renewable Energy Development Agency	Renewable Energy	Hubballi Electricity Supply Company Limited
State Sales / Commercial Taxes Department		Joint Commissioner, Commercial Tax Office
Town and Country	Land Use	Belagavi Urban Development Authority/

Designated data owners	Subcategories	Data owners at city level
Planning Department		Town planning
Traffic and Police Department		Police Commissioner's Office Belagavi
Transport Authorities	Buses	Regional Transport Officer Office
	Registered Vehicles	Regional Transport Officer Office
	Sub urban rail transport	NA
	Mono Rail Authority	NA
	Tramways	NA
	Marine Transport Authority	NA

4.3 List of secondary documents available as supportive

City has provided supporting documents/evidences against the responses given by city on the online portal. In support of their responses on the portal, city submitted 81 number of documents. Documents submitted includes reports, official orders, copy of data maintained in official register, signed copy of questionnaire, and signed letters/submissions from concern departments. Verification includes mapping of documents against responses given by city, checking the type/category of documents, and validation of data provided.

The following table presents the data owner wise number of documents:

Table 4: Data owner wise number of secondary documents submitted by city

Data Owners	Number of Documents
Sales and Commercial Taxes	**0**
State Education Department	**4**
DISCOM/Electricity Department	**5**
Traffic and Police Department	**18**
Development Authority	**0**
Pollution Control Board	**8**
State Renewable Energy Department	**0**
Town and Country Planning	**4**
State Health Department	**0**
Transport Authority	**3**
Disaster Management	**1**
Urban Local Body	**38**
Total	**81**

4.4 Data Verification

A three-stage data quality check comprising verification of data against secondary documents furnished by data owners, logical inconsistency checks including outliers, and physical audit for select indicators (Refer the exhibit below) is being undertaken. The objective of the data quality check is to ensure that data from the source documents are accurate and verifiable. Sources of data included reports, administrative data, survey results and other statistical records, log books among other.

Physical audit of eight indicators – one indicator from the Institutional pillar, one from the Social pillar, one from the Economy pillar and five from the Physical pillar is also being carried out by the field team to ascertain the degree of reliability of data reported by the cities. The list of these eight indicators is presented below:

1.2 | Percentage of services integrated through Command Centre

2.3 | Hotel occupancy

3.4 | Percentage of schools with access to digital education

5.1| Number of streets, public places, junctions covered through surveillance systems

6.5 | Percentage of vendors registered and provided formal spaces

11.7 | Availability of Passenger Information System

11.11 | Percentage of traffic intersections with pedestrian crossing facilities

11.12 | Extent to which universal accessibility is incorporated in public rights-of-way

For a set of five indicators namely, unemployment rate, mode share of public transport, mode share of non-motorised transport, quality of water supplied and level of noise pollution, existing datasets were found to be not available consistently across all cities and/or were inadequate. To help cities that do not have data on these five indicators, dipstick assessments are being carried to fill data gaps.

6.4 | Unemployment Rate

11.3 | Mode share of public transport

11.5 | Mode share of Non Motorized Transport

12.3 | Quality of Water Supplied

15.4 | Level of Noise Pollution

4.4 Physical Audit

The following map presents the indicators audited at city level.

5. City Score on 15 categories of Assessment

Liveability Assessment covered 15 categories and 78 indicators. The below table presents the scores for all 15 indicators namely governance, identity & culture, education, health, safety and security, economy & employment, housing & inclusiveness, public open spaces, mixed land use & compactness, power supply, transport & mobility, assured water supply, waste water management, solid waste management and reduced pollution.

Table 5: Category wise scores

Categories	Scores in Percentage
Governance	42.30%
Identity & Culture	26%
Education	91%
Health	64%
Safety & Security	56%
Economy & Employment	10%
Housing & Inclusiveness	0%

Public Open Spaces	0%
Mixed Land Use & Compactness	0%
Power Supply	46%
Transport & Mobility	18%
Assured Water Supply	41%
Waste Water Management	61%
Solid Waste Management	33%
Reduced Pollution	57%

The rank of the city is based on the performance and scores in each of the category. The final city rank is submitted separately.

Executive Summary

Assessment of liveability indices is an initiative by the Ministry of Housing and Urban Affairs to improve quality of life of citizens and achieve sustainable development goals by encouraging cities to adopt "outcome based" approach for urban planning. Assessment process aimed to provide opportunity to cities to review the development components holistically by involving 79 measurable indicators categorized under governance, health, education, safety, economy, power supply, transportation and mobility, identity, culture, housing, waste management and pollution.

This report highlights the assessment process, key milestones, and the final outcome of the data submitted. Implementation of liveability assessment commenced formally on 19th January 2018. A national level workshop was organized on 13th February 2018 to explain the importance and process of liveability assessment and get feedback on methodology from the city authorities.

This was followed by the next stage of Questionnaire development. The questionnaire was arranged under 12 categories representing 12 data owners namely urban local body, Central and state pollution control board, development authority, DISCOM/Electricity board, State disaster management authority, state education department, state health department, state renewable energy development agency, state sales and commercial taxes department, town and country planning department, traffic and police department and transport authorities.

An online data entry portal was developed to facilitate data submission by the cities. Each city had a unique log in to access the portal and submit the data. Both online and off-line options (download the questionnaire in an excel) to submit the data were available for cities. An email help desk was set up for the cities to raise any queries and seek clarification when responding to the questions.

A team for each state comprising of State Coordinator and City Coordinator (one per city) was deployed that facilitated the process and supported the cities. A total of 6 regional coordinators/ consultants, 29 State Coordinators, and 99 city coordinators were deployed across 116 cities. Training for state coordinators was held from 26th to 28th February 2018 at Chennai to make coordinators understand overall liveability assessment, indicators, data sources, protocols and roles and responsibilities.

City Reconnaissance Meetings were initiated by the state and city coordinators. The discussion began with discussions to finalize the state workshop schedule, mapping of data owners, and assist cities in data collection. The City Coordinators were based in the cities for over 6 weeks and during this time, they liase with ULB and other data owners to explain the liveability framework, online portal, and facilitate the online submission.

A total of 33 state workshops were conducted at the state level. The objective of the workshop was to orient the city stakeholders on liveability assessment, indicators, components of data collection, timelines, expectations of support and support extended by MoHUA. The state level workshops brought various city level departments on a single platform to understand and discuss the methodology and components of city liveability assessment.

Nodal agency at state level supported by the City and State Coordinator and city level (Municipality corporation/smart city limited) coordinated with city specific data owners/departments for data gathering, collation, and submission. Nodal persons in each department were appointed for timely data collection and submission. Of 116, 112 cities submitted data as per the timeline on 16th April 2018.

Post submission, the city and state coordinators supported by the central team followed up extensively with the cities to support secondary documents as evidence to substantiate their submissions. Secondary documents such as reports, official orders, copy of office register, signed copy of liveability assessment questionnaire furnished by cities against the submitted data. Documents are verified to map the documents for the reponses provided by city and to check the type data provided by city. The document check outcomes were shared with the cities as a part of data quality check.

For checking consistency of data, logical check of data, verifying data from other public sources were undertaken. Quality check was done to ensure data validity and provide opportunity to cities to review the data provided by them and correct in case of wrong data entry.

For 8 selected indicators namely, percentage of services integrated through command and control center, hotel occupancy rate, percentage of schools with access to digital education, number of CCTV cameras per unit road length, percentage of vendors registered and provided formal spaces, availability of passenger information system, percentage of traffic intersection with pedestrian crossing facility, and extent to which universal accessibility is incorporated in public rights of way. Physical audit was conducted in 110 cities by physical auditors appointed and trained by the consortium. In consultation with ULB nodal person, locations and indicators for physical audit was selected in each city. A mobile based application was developed to capture the physical audit related data.

Primary data collection was done for five indicators such as unemployment rates, mode share of public transport, mode share of non-motorized transport, quality of water supplied, and level of noise pollution. Protocols for water and noise test were prepared in consultation with experts. Water quality test involved physical, chemical and bacteriological test of water as per the CPCB norms. For testing quality of water at consumer end, the auditors worked closely with the ULB and Water department. Samples were collected from consumer end and submitted to the lab suggested by city. For noise pollution, in about 20 cities the state pollution board or city level

environment department took the responsibility for providing noise pollution data as per the protocols. In rest of the cities, mobile based application was used to measure noise pollution.

During implementation, MoHUA facilitated the process by conducting video conferences with cities to address any queries, reiterate the importance, and ensure that cities adequately engages in the process and submit their responses in time and respond to requests for clarifications.

In addition to secondary data collection, physical audit and primary data collection, citizen survey was conducted to understand their perception and level of satisfaction on various services such as health, education, water supply, electricity, waste management etc. provided by urban local bodies. Over 60000 citizens participated in the survey across India.

The final scores and ranks have been generated based on the scoring methodology that has been discussed extensively and minor modifications made that are summarized as below:

#	**Challenges**	**Proposed Solutions**
1	Only 23 cities of 111 cities have City Mobility Plan (CMP) or any and hence able to provide data for Mode Share of Public Transport and Non-Motorised Transport. To address the data gap, as advised by the MoHUA, the consortia undertook a sample dipstick across all cities covering a sample of 150 Households. Understandably, the dipstick findings will not match the rigor of a CMP.	We recommend the following: 1) Cities which have provided CMP Data will be evaluated on 100% of the maximum score 2) For the cities where the dipstick data is used, the city receives a 50% discount on the overall score Alternatively, another approach is to assign 0 score to all 88 cities that don't have a CMP
2	Variance was observed on data reported by cities on road network and data presented in the smart city proposals during the verifications.	We recommend taking the data reported by the cities in the Smart City Proposals.
3	There is no secondary source/ organization that provides unemployment data at city level. As a result, most cities do not have the data. Fully cognizance of the challenges of generating this data in a short span of time, it was agreed to collect this data through a dipstick survey on lines of NSSO questions. The	The indicator on unemployment will be excluded from scores. For final ranking, the cities will be scored on 78 indicators.

#	Challenges	Proposed Solutions
	data generated needs further scrutiny and triangulation with some inputs from experts. This may not be possible in the short window.	
4	Many cities did not have data on noise pollution and it was decided that data will be collected using a mobile app for all the 111 cities. However, many cities have expressed reservations with the approach especially with respect to the reliability of using this data. Further, some cities have relied on the SPCB to collect the data as per the approach proposed by the consortia. Thus, noise pollution data is currently from two sources: 1. SPCB- 20 cities 2. Noise-based app- 91 cities	The data collected through the primary survey will be used for scoring the cities. Currently, there is no differential scoring for the data from the SPCB and the data collected through the mobile app. However, a certain higher weightage can be provided to those cities which used the state apparatus to collect noise pollution data.
5	For the indicator on quality of water supplied, the methodology document states that samples should be drawn both at the treatment plant outlet as well as the consumer end. However, the data provided by the cities were predominantly from the distribution point. Hence for consumer end results with MoHUA intervention, consortia coordinated with cities to collect the data at the consumer end. The cities facilitated the testing. The outcome of the process is as below: 1. Sample given- 102 cities 2. Report received- 86 cities 3. Report awaited- 16 cities 4. Tests not completed due to lack of cooperation and other reasons – 9	The maximum score for this indicator will be distributed equally (50%) for results based on samples from the treatment plant and consumer end. Cities that did not complete tests or provide the results will be given a score 0 for against consumer end tests.
6	City level population is not projected annually by most of the cities. So, estimates for 2017 population are not available with the cities.	As recommended by MoHUA, 2011 census population is being used for the ranking purpose.
7	The age category specific data for 9 cities is not available at a city level	The age category specific population data has been taken at a district level for these cities.

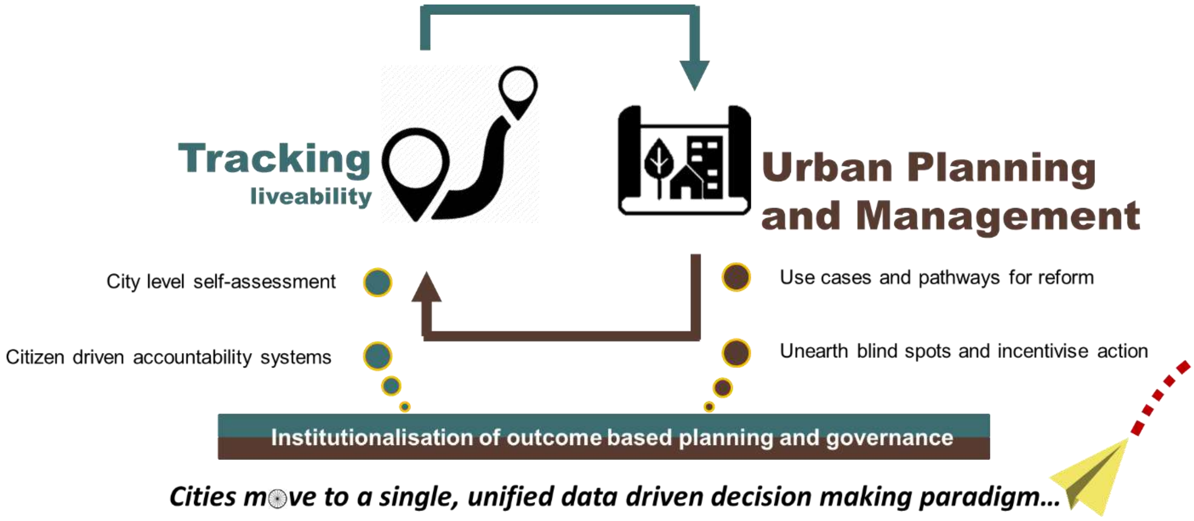
#	Challenges	Proposed Solutions
8	Indicators on non-motorised transports like- Dedicated bicycle tracks, bicycle parking facilities and mode share of non-motorised transport are not relevant for hilly terrains.	As discussed during the PMC meeting, these indicators have been treated as non-applicable for the hilly cities and the weights have been redistributed among other indicators within the same category.
9	The indicator on increase in professional tax is not relevant to cities which do not levy the professional tax.	As discussed during the PMC meeting, this indicator has been non-applicable to the cities belonging to states where professional tax is not levied, and the weights have been redistributed among other indicators within the same category.
10	The indicator on increase in VAT collection is not applicable to Port Blair and Kavaratti, as there was no provision of VAT collection in these cities.	As discussed during the PMC meeting, these indicatosr has been treated as non-applicable for these two cities and the weights have been redistributed among other indicators within the same category.
11	Indicator on coverage of basic services to slum households does not concern cities with no slums (notified/ non-notified.	As discussed during the PMC meeting, this indicators has been treated as non-applicable for these cities and the weights have been redistributed among other indicators within the same category.

1. Introduction

The Ministry of Housing and Urban Affairs (MoHUA) is implementing several flagship urban missions such as the Smart Cities Mission (SCM), Atal Mission for Urban Rejuvenation and Transformation (AMRUT), Heritage City Development and Augmentation Yojana (HRIDAY), Housing for All (HFA). Theses mission along with other transformative initiatives of the Government including National Water Mission, Power for All, National Health Mission are aimed at making Indian cities more 'liveable.' The overarching goal of these initiatives is to move from an input-based approach to a 'citizen centric-outcome based' assessment of urban liveability.

To develop a common minimum framework for cities to assess their existing status and chart their pathway towards providing a better quality of life to their citizens, the MoHUA developed a set of 'Liveability Standards' relevant to cities to generate a Liveability Index and ranking of cities. These standards were launched in June, 2017. The MoHUA has planned to conduct an 'Annual Assessment of Liveability Standards in Cities – an ambitious national project that will involve yearly submission of data by cities across the various indicators, compilation and analysis, development of indices and ranking of cities. The Liveability Index is envisioned as a 360° tool for tracking, planning and transforming Indian cities. The Liveability Index is aimed at the following objectives:

- Providing strong evidence-based approach for future interventions and investments to deliver liveability outcomes
- Catalysing actions to improve the overall quality of the city's liveability and achieve broader development outcomes including the Sustainable Development Goals
- Assessing the implementation of government policies and schemes governing characteristics of cities that can contribute to creating liveable communities

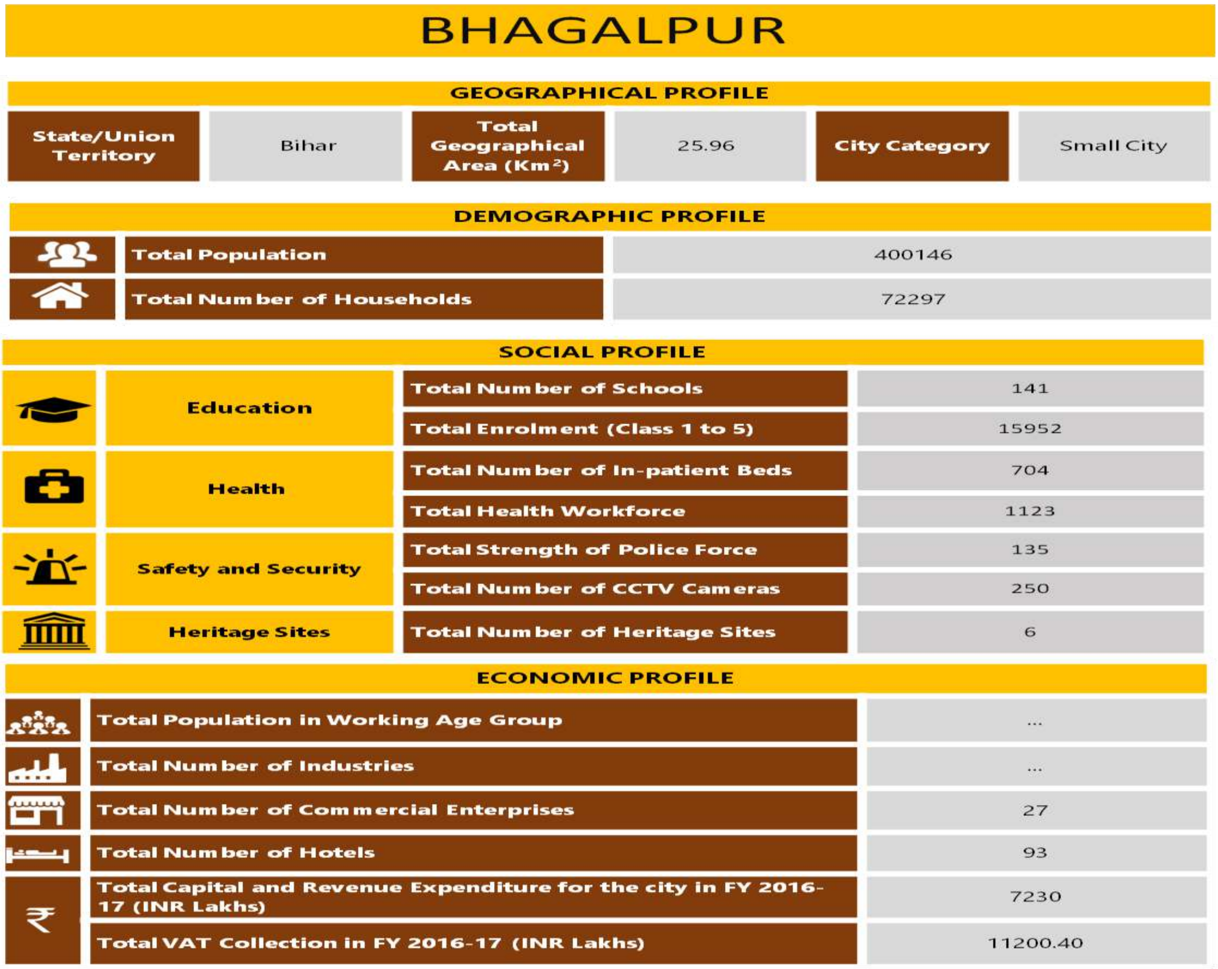


Tracking
liveability
Urban Planning
and Management
City level self-assessment
Citizen driven accountability systems
Use cases and pathways for reform
Unearth blind spots and incentivise action
Institutionalisation of outcome based planning and governance
Cities move to a single, unified data driven decision making paradigm...

The first round of the assessment commenced in January 2018 covering 116 major cities including smart cities, capital cities and cities with population of above one million each. Implementation of the liveability assessment commenced in January 2018 with a national level orientation workshop for the urban local bodies. The workshop aimed at orienting the states and urban local bodies on the overall framework, indicators, data sources, methodology and key milestones and timelines involved in the liveability assessment. Subsequently, a series of State/ Union Territory level orientation workshops were carried out in 33 states/UTs for a detailed discussion on the framework. Online data collection commenced from 9th March through an online data collection platform that supported both online and offline data submission modes. On the date of closure of the online data entry portal i.e., 16th April, 2018 112 cities submitted their data. Subsequently, comprehensive checks on the submitted data was undertaken that involved checking for outliers, logical inconsistencies etc. post which round-1 of data reconciliation was conducted. This draft report is based on round-1 of reconciled data as on 28th April, 2018.

2. City Profile

This chapter presents the city profile -Geographic and Demographic, Social (Education Health, Safety and Security, Heritage), Economic profile, and Physical (Water, sanitation and Waste Management, Electricity, Open space and roads).



BHAGALPUR

GEOGRAPHICAL PROFILE

State/Union Territory	Bihar	Total Geographical Area (Km^2)	25.96	City Category	Small City

DEMOGRAPHIC PROFILE

Total Population	400146
Total Number of Households	72297

SOCIAL PROFILE

Education	Total Number of Schools	141
	Total Enrolment (Class 1 to 5)	15952
Health	Total Number of In-patient Beds	704
	Total Health Workforce	1123
Safety and Security	Total Strength of Police Force	135
	Total Number of CCTV Cameras	250
Heritage Sites	Total Number of Heritage Sites	6

ECONOMIC PROFILE

Total Population in Working Age Group	...
Total Number of Industries	...
Total Number of Commercial Enterprises	27
Total Number of Hotels	93
Total Capital and Revenue Expenditure for the city in FY 2016-17 (INR Lakhs)	7230
Total VAT Collection in FY 2016-17 (INR Lakhs)	11200.40

PHYSICAL PROFILE

	Water	**Average Quantity of Water Supplied (MLD)**	16
		Total Number of Water Connection	42355
	Sanitation Facilities	**Total number of households with access to individual toilets in the city**	4213
		Total number of households in the city with access to community toilets in the city	8
	Solid Waste Management	**Daily average quantity of municipal solid waste collected in the city (Tonnes/day)**	255
		Total number of households covered through door-to-door collection of solid waste	72297
	Waste Water	**Daily Average Quantum of Waste Water Generated in the City (MLD)**	...
		Daily average quantum of waste water treated by STPs in the city (MLD)	...
	Electricity	**Total number of authorized electrical connections in the city**	73567
		Total electricity supplied to the city (kWh)	371953
	Public and Open Spaces	**Total area covered by green spaces in the city (m^2)**	...
	Roads and Transport	**Total Length of Road Network in the City (Km)**	25.96
		Total length of arterial and sub-arterial road network in the city (Km)	25.96
		Total length of footpath (wider than 1.2 metres) in the city along the street network (Km)	...

3. Liveability Framework and Indicators

The Liveability Framework comprises a total of 79 indicators (57 Core Indicators and 22 Supporting Indicators). A core indicator carries 70% weightage and a supporting indicator carries 30% weightage. These indicators are grouped under 15 thematic categories which in turn are part of four pillars of comprehensive development of cities i.e., institutional, social, economic and physical. Based on the performance of cities against the various core and supporting indicators, various 'Category Sub-Indexes' and a composite 'City Liveability Index' will be developed for each city.

3.1 Scoring and Computing Category Indices of Liveability

The set of 79 indicators, associated categories and pillars are presented in the table below:

Table 1 List of Pillars, Categories and Indicators

Pillars of Comprehensive Development	Category	Indicators
Institutional	1. Governance	1.1 Percentage of citizen services available online
		1.2 Percentage of services integrated through Command Centre
		1.3 Percentage of citizens using online services
		1.4 Average delay in grievance redressal
		1.5 Tax collected as percentage of tax billed
		1.6 Extent of cost recovery (O&M) in water supply services
		1.7 Capital spending as percentage of total expenditure
		1.8 Percentage of population covered under Ward Committees/Area *Sabhas*
Social	**2. Identity and Culture**	2.1 Restoration and reuse of historic buildings
		2.2 Percentage of ecologically important areas covered through projects for restoration
		2.3 Hotel occupancy
		2.4 Percentage of budget allocated towards cultural/sports

Pillars of Comprehensive Development	Category	Indicators
		activities
		2.5 Number of cultural/sports events hosted by city
	3. Education	3.1 Percentage of school-aged population enrolled in schools
		3.2 Percentage of female school-aged population enrolled in schools
		3.3 Primary education student-teacher ratio
		3.4 Percentage of schools with access to digital education
		3.5 Percentage of students completing primary education
		3.6 Percentage of students completing secondary education
	4. Health	4.1 Number of in-patient hospital beds per 10,000 population
		4.2 Healthcare professionals per 10,000 population
		4.3 Average response time in case of health emergencies
		4.4 Period prevalence of water borne diseases
		4.5 Period prevalence of vector borne diseases
	5. Safety and Security	5.1 Number of CCTV Cameras
		5.2 Number of recorded crimes per lakh population
		5.3 Extent of crimes recorded against women, children and elderly per year
		5.4 Transport-related fatality per lakh population
Economic	**6. Economy and Employment**	6.1 Increase in VAT/GST collection
		6.2 Increase in collection of Professional Tax
		6.3 Increase in issuance of Construction permits
		6.4 Unemployment rate

Pillars of Comprehensive Development	Category	Indicators
		6.5 Percentage of vendors registered and provided formal spaces
Physical	**7. Housing and Inclusiveness**	7.1 Percentage of Slum/EWS households covered through formal/affordable housing
		7.2 Percentage of slum areas covered through basic services
	8. Public Open Spaces	8.1 Per capita availability of green spaces
		8.2 Per capita availability of public and recreational places
	9. Mixed Land Use and Compactness	9.1 Share of mixed land use area in overall city land use
		9.2 Net Density
	10. Power Supply	10.1 Percentage of city population with authorized electrical services
		10.2 Percentage of electrical connections covered through smart meters
		10.3 Average number of electrical interruptions per year
		10.4 Average length of electrical interruptions per year
		10.5 Percentage of total energy derived from renewable sources
		10.6 Energy consumption per unit - water supply and sewerage
		10.7 Energy consumption per unit - street lighting
		10.8 Percentage of new and redeveloped buildings following green building norms
		10.9 Total energy consumption per capita
	11. Transportation	11.1 Geographical coverage of public transport
		11.2 Availability of public transport

Pillars of Comprehensive Development	Category	Indicators
	and Mobility	11.3 Mode share of public transport
		11.4 Percentage of road network with dedicated bicycle tracks
		11.5 Percentage of interchanges with bicycle parking facilities
		11.6 Mode share of non-motorized transport
		11.7 Availability of Passenger Information System
		11.8 Extent of signal synchronization
		11.9 Availability of paid parking spaces
		11.10 Percentage coverage of footpaths – wider than 1.2 m
		11.11 Percentage of traffic intersections with pedestrian crossing facilities
		11.12 Extent to which universal accessibility is incorporated in public rights-of-way
	12. Assured Water Supply	12.1 Household level coverage of direct water supply connections
		12.2 Per capita supply of water
		12.3 Quality of water supplied
		12.4 Level of non-revenue water – NRW
		12.5 Percentage of water connections covered through meters
		12.6 Percentage of plots with rainwater harvesting facility
	13. Waste Water Management	13.1 Coverage of toilets
		13.2 Coverage of sewerage network and/or septage
		13.3 Collection efficiency of sewerage network
		13.4 Extent of reuse and recycling of waste water

Pillars of Comprehensive Development	Category	Indicators
		13.5 Coverage of storm water drains
	14. Solid Waste Management	14.1 Household level coverage of municipal solid waste collection
		14.2 Efficiency of collection of municipal solid waste
		14.3 Extent of municipal solid waste recovered through reuse
	15. Reduced Pollution	15.1 Concentration of SO2- air pollution
		15.2 Concentration of NO2- air pollution
		15.3 Concentration of PM10 - air pollution
		15.4 Level of noise pollution
		15.5 Quality of water in public surface water bodies

3.2 Scoring and Computing Category Indices of Liveability

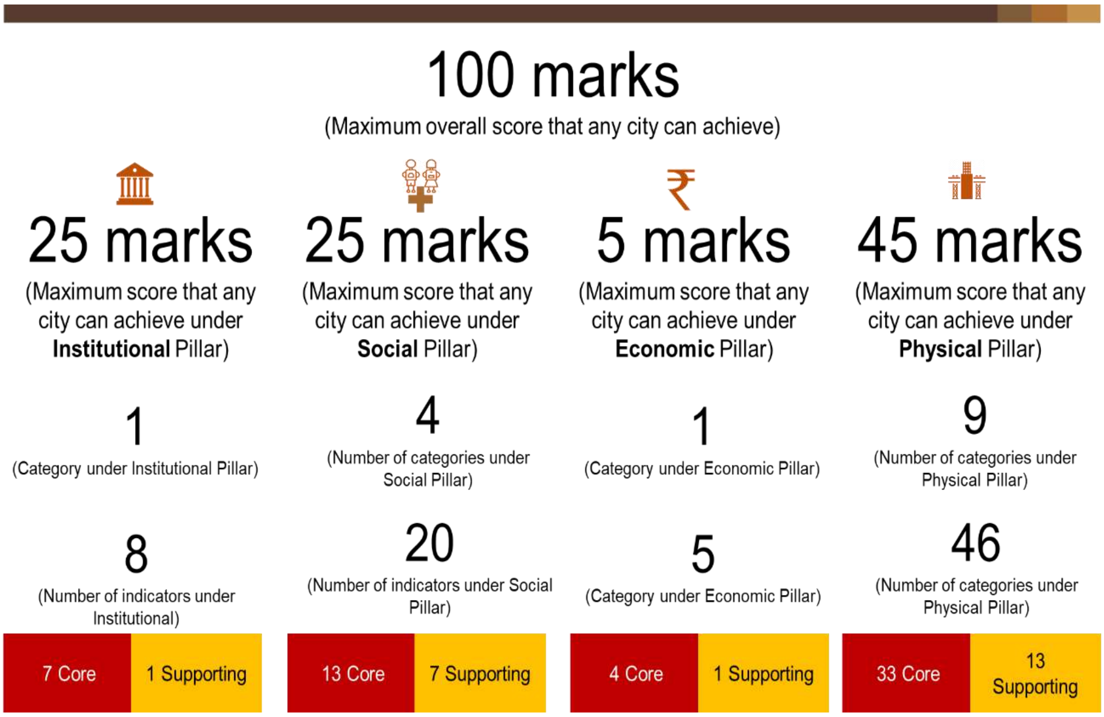
The performance achieved by cities against 79 indicators, will be assessed against given benchmarks. Where no international/national norms are available, city with the best performance in its group (population range) will be treated as a benchmark. The groups are given in the table below.

Table 2 Details on Population Range

Category	Population range
Category 1	Population ≥ 4 million
Category 2	1 million ≤ Population < 4 million
Category 3	0.5 million ≤ Population < 1 million
Category 4	Population < 0.5 million

3.3 Scoring Approach and Methodology

A city can earn a maximum score of 100 points for 79 indicators across four pillars. The pillar weights are as follows: Institutional (25 points), Social (25 points), Economy and Employment (5 points) and Physical (45 points). Based on the number and nature of indicators i.e., core vs. secondary, indicator wise maximum marks were computed.



100 marks
(Maximum overall score that any city can achieve)
25 marks
(Maximum score that any city can achieve under Institutional Pillar)
25 marks
(Maximum score that any city can achieve under Social Pillar)
5 marks
(Maximum score that any city can achieve under Economic Pillar)
45 marks
(Maximum score that any city can achieve under Physical Pillar)
1
(Category under Institutional Pillar)
4
(Number of categories under Social Pillar)
1
(Category under Economic Pillar)
9
(Number of categories under Physical Pillar)
8
(Number of indicators under Institutional)
20
(Number of indicators under Social Pillar)
5
(Category under Economic Pillar)
46
(Number of categories under Physical Pillar)
7 Core
1 Supporting
13 Core
7 Supporting
4 Core
1 Supporting
33 Core
13 Supporting

Dimensional Index Methodology (DIM) has been used to compute scores for each indicator with reference to “maximum within the comparison group” or “absolute benchmarks”. For indicators where benchmarks are available, cities getting the benchmark score (or above) are given the maximum mark, and the marks awarded to other cities are calculated proportionately. For indicators where benchmarks are not available, the best performing cities in each population group are given the maximum mark, and the marks awarded to other cities (within the population group) are calculated proportionately. For indicators where benchmarks do not exist, the city data has been tested for outliers before scoring.

3.4 Scoring Normalisation:

To construct aggregate scores across cities as well as to make the scores across indicators comparable, indicator values were normalised using a min-max approach. The following formula was used to normalise the indicator values-

$$\frac{indicator\ value\ for\ the\ city - indicator\ value\ for\ the\ worst\ performing\ city}{benchmark - \ indicator\ value\ for\ the\ worst\ performing\ city}$$

This approach would restrict the normalised indicator value between 0 and 1. Cities that met or exceeded the benchmark received a normalised indicator value of 1. Worst performing cities are given a normalised indicator value of 0. After normalisation, the normalised value is weighted according to the category and the indicator being core or supporting.

To illustrate, consider the indicator 12.3 Quality of Water Supplied in the Category 12 for Assured Water Supply. If in City A 50% of the water samples collected qualify the potable water standards specified by the CPHEEO, and only 10% of the samples from worst performing city qualify the standards. Then, the normalised value for the indicator for city A would be 0.44 [(0.5-0.1)/(1-0.1)].

The weight for indicator 12.3 is 1.03, so the final weighted score for City A would come out to 0.45 [1.03*0.44].

4. Data Collection and Verification

4.1 Submission of Data by the cities

The Liveability Assessment is based on secondary data submitted by the urban local bodies and other concerned government agencies (collectively called as data owners). The 79 indicators were broken down into a set of easy to understand and relatable 553 questions mapped to data owners. Submission of the data was enabled through an online data entry portal on the smartnet platform of the Ministry. The portal also allowed the ULBs to download the liveability assessment questionnaire and upload filled in questionnaire. To familiarise and assist cities in identifying, mapping and collation of data points, a city level nodal person was available during the entire period of data submission process.

4.2 Mapping of Data Owners for the City

For the assessment of liveability indices broadly 12 data owners such as Central/state Pollution control board, Development authority, DISCOM/Electricity Board, State Disaster Management Authority, State Education Department, State Health department, State Renewable energy and development agency, State sales and commercial taxes department, town and country planning department, Traffic and police department, Transport authority, and Urban local body were identified to respond to the questions on the portal. However, during state workshop and subsequent city level discussions, more data owners were mapped to respond to different categories and sub categories. The following table provides the details of city level data owners mapped under the 12 data owner.

Table 3:Details of Data Owners

Designated data owners	Subcategories	Data owners at city level
Urban Local Body	For Accounts Related Questions	Account Department, Bhagalpur Municipal Corporation
Urban Local Body	For Park and Recreation Related Questions	Engineering Department, Bhagalpur Municipal Corporation
Urban Local Body	For Water Supply and Drainage related questions	Engineering Department, Bhagalpur Municipal Corporation
Urban Local Body	For Heritage sites related data	Bhagalpur Municipal Corporation
Urban Local Body	For Ecological sites related data	Bhagalpur Municipal Corporation
Urban Local Body	For Housing related data	Social development SectionBhagalpur Municipal Corporation
Urban Local Body	For Building plan related data	Engineering Department, Bhagalpur Municipal Corporation
Urban Local Body	For Roads related data	Engineering Department, Bhagalpur Municipal Corporation
Urban Local Body	For Solid waste management related data	Bhagalpur Municipal Corporation
Urban Local Body	For IT services related data	IT section, Bhagalpur Municipal Corporation
Urban Local Body	For Vendor committee related data	Social Development Section, Bhagalpur Municipal Corporation
Urban Local Body	Any other departments involved in providing data for questions mentioned under Urban Local Body	
Central / state Pollution control Board	Water Quality, Air Quality, Noise Quality	State Pollution Control Board, Bihar

Designated data owners	Subcategories	Data owners at city level
Development Authority	Building Infrastructure	Engineering Department, Bhagalpur Municipal Corporation
	Construction planning	Engineering Department, Bhagalpur Municipal Corporation
	Green Building	Engineering Department, Bhagalpur Municipal Corporation
	Rain water harvesting	Engineering Department, Bhagalpur Municipal Corporation
	Universal Design Principle	Engineering Department, Bhagalpur Municipal Corporation
DISCOM/Electricity Board	Electrical Connection/ Grievance Redressal/ Power supply	Bihar Power Distribution Corporation Limited
State Disaster management authority		District Collectorate Office
State Education Department		District Education Department
State Health Department	Health care professionals	Civil Surgeon Office
	Citizen Services	Civil Surgeon Office
	Disease Prevalence	Civil Surgeon Office
	Health Infrastructure	Civil Surgeon Office
State Renewable Energy Development Agency		Bihar Renewable Energy Development Authority
State Sales / Commercial Taxes Department		State Commercial and Tax department
Town and Country Planning Department	Land Use	Bhagalpur Municipal Corporation
Traffic and Police Department		Office of Senior Superintendent of Police
Transport Authorities	Buses	District Transport office
	Registered Vehicles	District Transport office
	Sub urban rail transport	
	Mono Rail Authority	
	Tramways	
	Marine Transport Authority	

4.3 List of secondary documents available as supportive

City has provided supporting documents/evidences against the responses given by city on the online portal. In support of their responses on the portal, city submitted 26 number of documents. Documents submitted includes reports, official orders, copy of data maintained in official register, signed copy of questionnaire, and signed letters/submissions from concern departments. Verification includes mapping of documents against responses given by city, checking the type/category of documents, and validation of data provided.

The following table presents the data owner wise number of documents:

Table 4: Data owner wise number of secondary documents submitted by city

Data Owners	Number of Documents
Sales and Commercial Taxes	**0**
State Education Department	**5**
DISCOM/Electricity Department	**2**
Traffic and Police Department	**2**
Development Authority	**0**
Pollution Control Board	**1**
State Renewable Energy Department	**0**
Town and Country Planning	**0**
State Health Department	**4**
Transport Authority	**2**
Disaster Management	**1**
Urban Local Body	**9**
Total	**26**

4.4 Data Verification

A three-stage data quality check comprising verification of data against secondary documents furnished by data owners, logical inconsistency checks including outliers, and physical audit for select indicators (Refer the exhibit below) is being undertaken. The objective of the data quality check is to ensure that data from the source documents are accurate and verifiable. Sources of data included reports, administrative data, survey results and other statistical records, log books among other.

Physical audit of eight indicators – one indicator from the Institutional pillar, one from the Social pillar, one from the Economy pillar and five from the Physical pillar is also being carried out by the

field team to ascertain the degree of reliability of data reported by the cities. The list of these eight indicators is presented below:

1.2 | Percentage of services integrated through Command Centre

2.3 | Hotel occupancy

3.4 | Percentage of schools with access to digital education

5.1| Number of streets, public places, junctions covered through surveillance systems

6.5 | Percentage of vendors registered and provided formal spaces

11.7 | Availability of Passenger Information System

11.11 | Percentage of traffic intersections with pedestrian crossing facilities

11.12 | Extent to which universal accessibility is incorporated in public rights-of-way

For a set of five indicators namely, unemployment rate, mode share of public transport, mode share of non-motorised transport, quality of water supplied and level of noise pollution, existing datasets were found to be not available consistently across all cities and/or were inadequate. To help cities that do not have data on these five indicators, dipstick assessments are being carried to fill data gaps.

6.4 | Unemployment Rate

11.3 | Mode share of public transport

11.5 | Mode share of Non Motorized Transport

12.3 | Quality of Water Supplied

15.4 | Level of Noise Pollution

4.5 Physical Audit

The following map presents the indicators audited at city level.

5. City Score on 15 categories of Assessment

Liveability Assessment covered 15 categories and 78 indicators. The below table presents the scores for all 15 indicators namely governance, identity & culture, education, health, safety and security, economy & employment, housing & inclusiveness, public open spaces, mixed land use & compactness, power supply, transport & mobility, assured water supply, waste water management, solid waste management and reduced pollution.

Table 5: Category wise scores

Categories	Scores in Percentage
Governance	49.82%
Identity & Culture	0%
Education	44%
Health	91%
Safety & Security	48%

Economy & Employment	13%
Housing & Inclusiveness	3%
Public Open Spaces	0%
Mixed Land Use & Compactness	0%
Power Supply	18%
Transport & Mobility	22%
Assured Water Supply	17%
Waste Water Management	2%
Solid Waste Management	67%
Reduced Pollution	21%

The rank of the city is based on the performance and scores in each of the category. The final city rank is submitted separately.

Executive Summary

Assessment of liveability indices is an initiative by the Ministry of Housing and Urban Affairs to improve quality of life of citizens and achieve sustainable development goals by encouraging cities to adopt "outcome based" approach for urban planning. Assessment process aimed to provide opportunity to cities to review the development components holistically by involving 79 measurable indicators categorized under governance, health, education, safety, economy, power supply, transportation and mobility, identity, culture, housing, waste management and pollution.

This report highlights the assessment process, key milestones, and the final outcome of the data submitted. Implementation of liveability assessment commenced formally on 19th January 2018. A national level workshop was organized on 13th February 2018 to explain the importance and process of liveability assessment and get feedback on methodology from the city authorities.

This was followed by the next stage of Questionnaire development. The questionnaire was arranged under 12 categories representing 12 data owners namely urban local body, Central and state pollution control board, development authority, DISCOM/Electricity board, State disaster management authority, state education department, state health department, state renewable energy development agency, state sales and commercial taxes department, town and country planning department, traffic and police department and transport authorities.

An online data entry portal was developed to facilitate data submission by the cities. Each city had a unique log in to access the portal and submit the data. Both online and off-line options (download the questionnaire in an excel) to submit the data were available for cities. An email help desk was set up for the cities to raise any queries and seek clarification when responding to the questions.

A team for each state comprising of State Coordinator and City Coordinator (one per city) was deployed that facilitated the process and supported the cities. A total of 6 regional coordinators/ consultants, 29 State Coordinators, and 99 city coordinators were deployed across 116 cities. Training for state coordinators was held from 26th to 28th February 2018 at Chennai to make coordinators understand overall liveability assessment, indicators, data sources, protocols and roles and responsibilities.

City Reconnaissance Meetings were initiated by the state and city coordinators. The discussion began with discussions to finalize the state workshop schedule, mapping of data owners, and assist cities in data collection. The City Coordinators were based in the cities for over 6 weeks and during this time, they liase with ULB and other data owners to explain the liveability framework, online portal, and facilitate the online submission.

A total of 33 state workshops were conducted at the state level. The objective of the workshop was to orient the city stakeholders on liveability assessment, indicators, components of data collection, timelines, expectations of support and support extended by MoHUA. The state level workshops brought various city level departments on a single platform to understand and discuss the methodology and components of city liveability assessment.

Nodal agency at state level supported by the City and State Coordinator and city level (Municipality corporation/smart city limited) coordinated with city specific data owners/departments for data gathering, collation, and submission. Nodal persons in each department were appointed for timely data collection and submission. Of 116, 112 cities submitted data as per the timeline on 16th April 2018.

Post submission, the city and state coordinators supported by the central team followed up extensively with the cities to support secondary documents as evidence to substantiate their submissions. Secondary documents such as reports, official orders, copy of office register, signed copy of liveability assessment questionnaire furnished by cities against the submitted data. Documents are verified to map the documents for the reponses provided by city and to check the type data provided by city. The document check outcomes were shared with the cities as a part of data quality check.

For checking consistency of data, logical check of data, verifying data from other public sources were undertaken. Quality check was done to ensure data validity and provide opportunity to cities to review the data provided by them and correct in case of wrong data entry.

For 8 selected indicators namely, percentage of services integrated through command and control center, hotel occupancy rate, percentage of schools with access to digital education, number of CCTV cameras per unit road length, percentage of vendors registered and provided formal spaces, availability of passenger information system, percentage of traffic intersection with pedestrian crossing facility, and extent to which universal accessibility is incorporated in public rights of way. Physical audit was conducted in 110 cities by physical auditors appointed and trained by the consortium. In consultation with ULB nodal person, locations and indicators for physical audit was selected in each city. A mobile based application was developed to capture the physical audit related data.

Primary data collection was done for five indicators such as unemployment rates, mode share of public transport, mode share of non-motorized transport, quality of water supplied, and level of noise pollution. Protocols for water and noise test were prepared in consultation with experts. Water quality test involved physical, chemical and bacteriological test of water as per the CPCB norms. For testing quality of water at consumer end, the auditors worked closely with the ULB and Water department. Samples were collected from consumer end and submitted to the lab suggested by city. For noise pollution, in about 20 cities the state pollution board or city level

environment department took the responsibility for providing noise pollution data as per the protocols. In rest of the cities, mobile based application was used to measure noise pollution.

During implementation, MoHUA facilitated the process by conducting video conferences with cities to address any queries, reiterate the importance, and ensure that cities adequately engages in the process and submit their responses in time and respond to requests for clarifications.

In addition to secondary data collection, physical audit and primary data collection, citizen survey was conducted to understand their perception and level of satisfaction on various services such as health, education, water supply, electricity, waste management etc. provided by urban local bodies. Over 60000 citizens participated in the survey across India.

The final scores and ranks have been generated based on the scoring methodology that has been discussed extensively and minor modifications made that are summarized as below:

#	**Challenges**	**Proposed Solutions**
1	Only 23 cities of 111 cities have City Mobility Plan (CMP) or any and hence able to provide data for Mode Share of Public Transport and Non-Motorised Transport. To address the data gap, as advised by the MoHUA, the consortia undertook a sample dipstick across all cities covering a sample of 150 Households. Understandably, the dipstick findings will not match the rigor of a CMP.	We recommend the following: 1) Cities which have provided CMP Data will be evaluated on 100% of the maximum score 2) For the cities where the dipstick data is used, the city receives a 50% discount on the overall score Alternatively, another approach is to assign 0 score to all 88 cities that don't have a CMP
2	Variance was observed on data reported by cities on road network and data presented in the smart city proposals during the verifications.	We recommend taking the data reported by the cities in the Smart City Proposals.
3	There is no secondary source/ organization that provides unemployment data at city level. As a result, most cities do not have the data. Fully cognizance of the challenges of generating this data in a short span of time, it was agreed to collect this data through a dipstick survey on lines of NSSO questions. The	The indicator on unemployment will be excluded from scores. For final ranking, the cities will be scored on 78 indicators.

#	Challenges	Proposed Solutions
	data generated needs further scrutiny and triangulation with some inputs from experts. This may not be possible in the short window.	
4	Many cities did not have data on noise pollution and it was decided that data will be collected using a mobile app for all the 111 cities. However, many cities have expressed reservations with the approach especially with respect to the reliability of using this data. Further, some cities have relied on the SPCB to collect the data as per the approach proposed by the consortia. Thus, noise pollution data is currently from two sources: 1. SPCB- 20 cities 2. Noise-based app- 91 cities	The data collected through the primary survey will be used for scoring the cities. Currently, there is no differential scoring for the data from the SPCB and the data collected through the mobile app. However, a certain higher weightage can be provided to those cities which used the state apparatus to collect noise pollution data.
5	For the indicator on quality of water supplied, the methodology document states that samples should be drawn both at the treatment plant outlet as well as the consumer end. However, the data provided by the cities were predominantly from the distribution point. Hence for consumer end results with MoHUA intervention, consortia coordinated with cities to collect the data at the consumer end. The cities facilitated the testing. The outcome of the process is as below: 1. Sample given- 102 cities 2. Report received- 86 cities 3. Report awaited- 16 cities 4. Tests not completed due to lack of cooperation and other reasons – 9	The maximum score for this indicator will be distributed equally (50%) for results based on samples from the treatment plant and consumer end. Cities that did not complete tests or provide the results will be given a score 0 for against consumer end tests.
6	City level population is not projected annually by most of the cities. So, estimates for 2017 population are not available with the cities.	As recommended by MoHUA, 2011 census population is being used for the ranking purpose.
7	The age category specific data for 9 cities is not available at a city level	The age category specific population data has been taken at a district level for these cities.

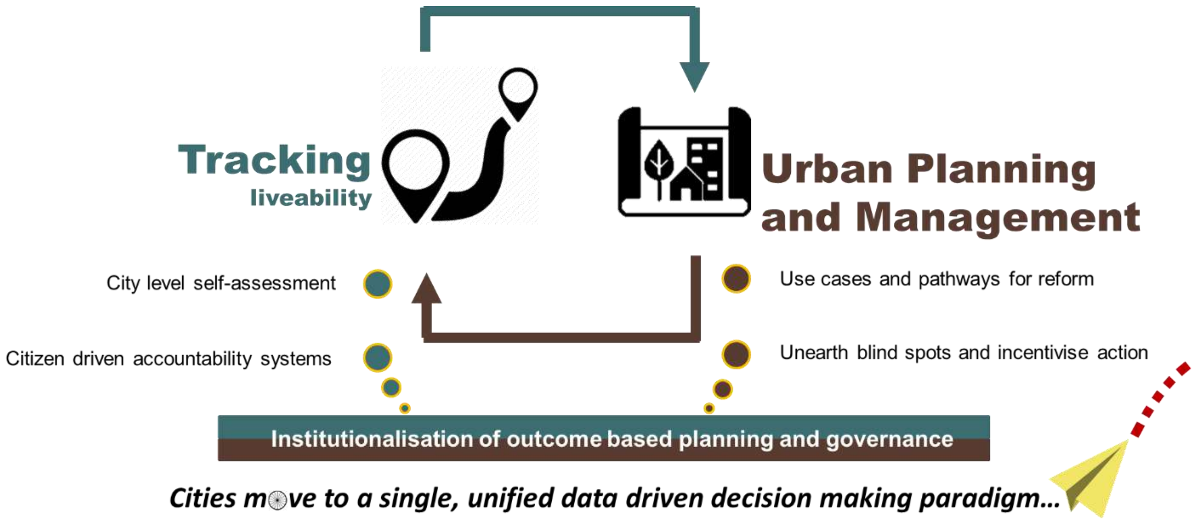
#	Challenges	Proposed Solutions
8	Indicators on non-motorised transports like- Dedicated bicycle tracks, bicycle parking facilities and mode share of non-motorised transport are not relevant for hilly terrains.	As discussed during the PMC meeting, these indicators have been treated as non-applicable for the hilly cities and the weights have been redistributed among other indicators within the same category.
9	The indicator on increase in professional tax is not relevant to cities which do not levy the professional tax.	As discussed during the PMC meeting, this indicator has been non-applicable to the cities belonging to states where professional tax is not levied, and the weights have been redistributed among other indicators within the same category.
10	The indicator on increase in VAT collection is not applicable to Port Blair and Kavaratti, as there was no provision of VAT collection in these cities.	As discussed during the PMC meeting, these indicatosr has been treated as non-applicable for these two cities and the weights have been redistributed among other indicators within the same category.
11	Indicator on coverage of basic services to slum households does not concern cities with no slums (notified/ non-notified.	As discussed during the PMC meeting, this indicators has been treated as non-applicable for these cities and the weights have been redistributed among other indicators within the same category.

1. Introduction

The Ministry of Housing and Urban Affairs (MoHUA) is implementing several flagship urban missions such as the Smart Cities Mission (SCM), Atal Mission for Urban Rejuvenation and Transformation (AMRUT), Heritage City Development and Augmentation Yojana (HRIDAY), Housing for All (HFA). Theses mission along with other transformative initiatives of the Government including National Water Mission, Power for All, National Health Mission are aimed at making Indian cities more 'liveable.' The overarching goal of these initiatives is to move from an input-based approach to a 'citizen centric-outcome based' assessment of urban liveability.

To develop a common minimum framework for cities to assess their existing status and chart their pathway towards providing a better quality of life to their citizens, the MoHUA developed a set of 'Liveability Standards' relevant to cities to generate a Liveability Index and ranking of cities. These standards were launched in June, 2017. The MoHUA has planned to conduct an 'Annual Assessment of Liveability Standards in Cities – an ambitious national project that will involve yearly submission of data by cities across the various indicators, compilation and analysis, development of indices and ranking of cities. The Liveability Index is envisioned as a 360° tool for tracking, planning and transforming Indian cities. The Liveability Index is aimed at the following objectives:

- Providing strong evidence-based approach for future interventions and investments to deliver liveability outcomes
- Catalysing actions to improve the overall quality of the city's liveability and achieve broader development outcomes including the Sustainable Development Goals
- Assessing the implementation of government policies and schemes governing characteristics of cities that can contribute to creating liveable communities

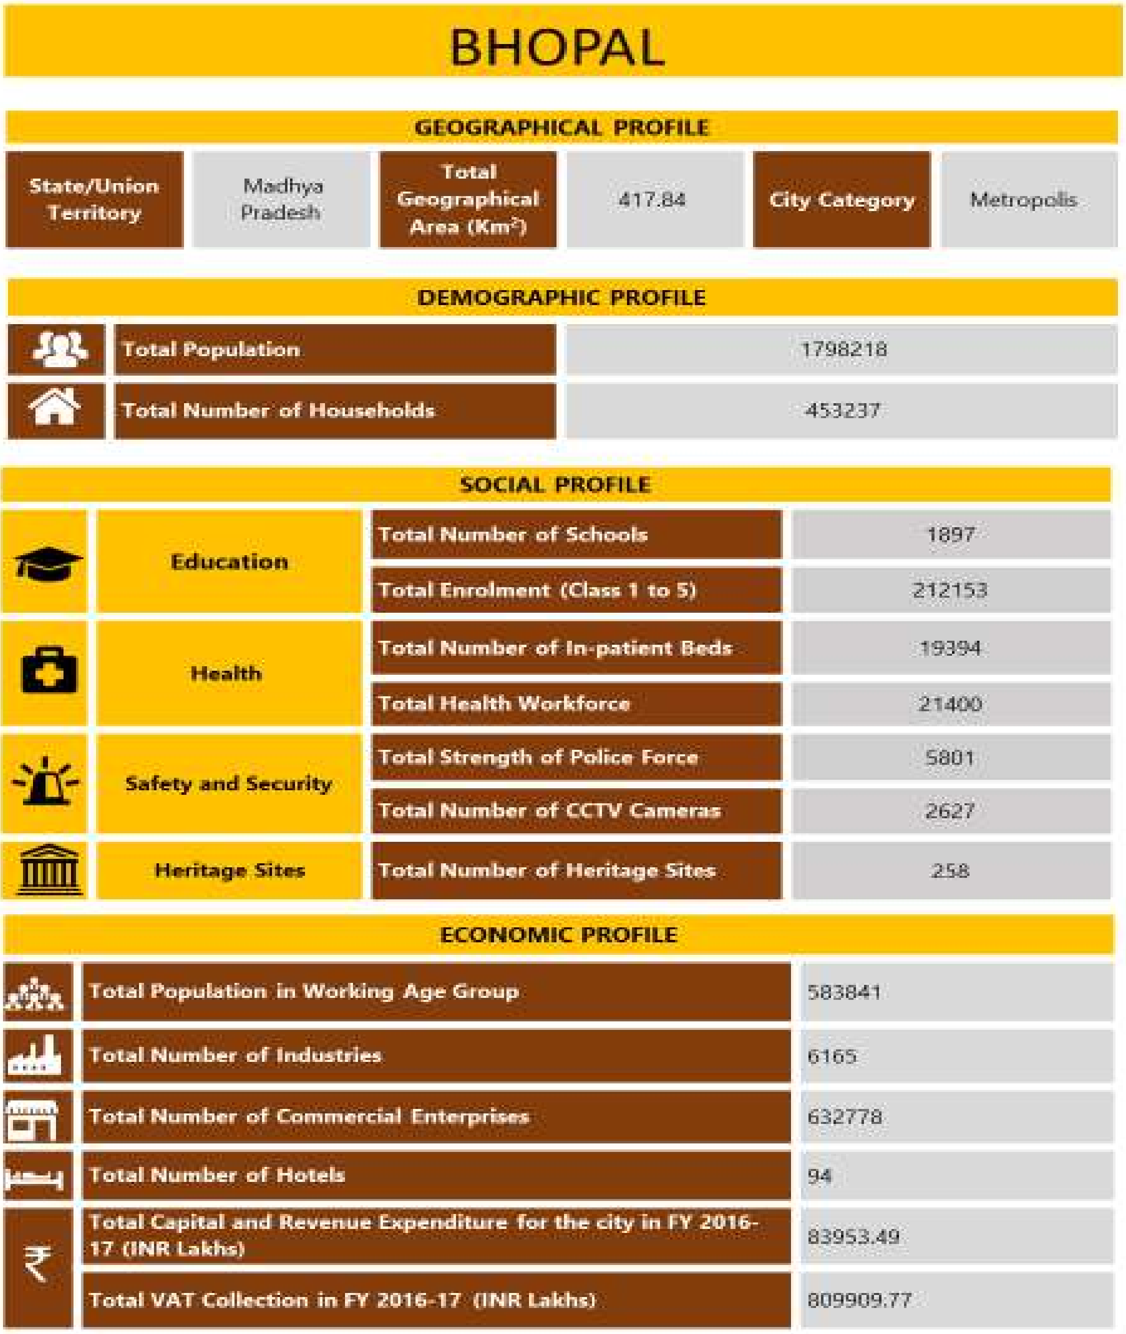


Tracking
liveability
Urban Planning
and Management
City level self-assessment
Citizen driven accountability systems
Use cases and pathways for reform
Unearth blind spots and incentivise action
Institutionalisation of outcome based planning and governance
Cities move to a single, unified data driven decision making paradigm...

The first round of the assessment commenced in January 2018 covering 116 major cities including smart cities, capital cities and cities with population of above one million each. Implementation of the liveability assessment commenced in January 2018 with a national level orientation workshop for the urban local bodies. The workshop aimed at orienting the states and urban local bodies on the overall framework, indicators, data sources, methodology and key milestones and timelines involved in the liveability assessment. Subsequently, a series of State/ Union Territory level orientation workshops were carried out in 33 states/UTs for a detailed discussion on the framework. Online data collection commenced from 9th March through an online data collection platform that supported both online and offline data submission modes. On the date of closure of the online data entry portal i.e., 16th April, 2018 112 cities submitted their data. Subsequently, comprehensive checks on the submitted data was undertaken that involved checking for outliers, logical inconsistencies etc. post which round-1 of data reconciliation was conducted. This draft report is based on round-1 of reconciled data as on 28th April, 2018.

2. City Profile

This chapter presents the city profile -Geographic and Demographic, Social (Education Health, Safety and Security, Heritage), Economic profile, and Physical (Water, sanitation and Waste Management, Electricity, Open space and roads).



BHOPAL

GEOGRAPHICAL PROFILE

State/Union Territory	Madhya Pradesh	**Total Geographical Area (Km^2)**	417.84	**City Category**	Metropolis

DEMOGRAPHIC PROFILE

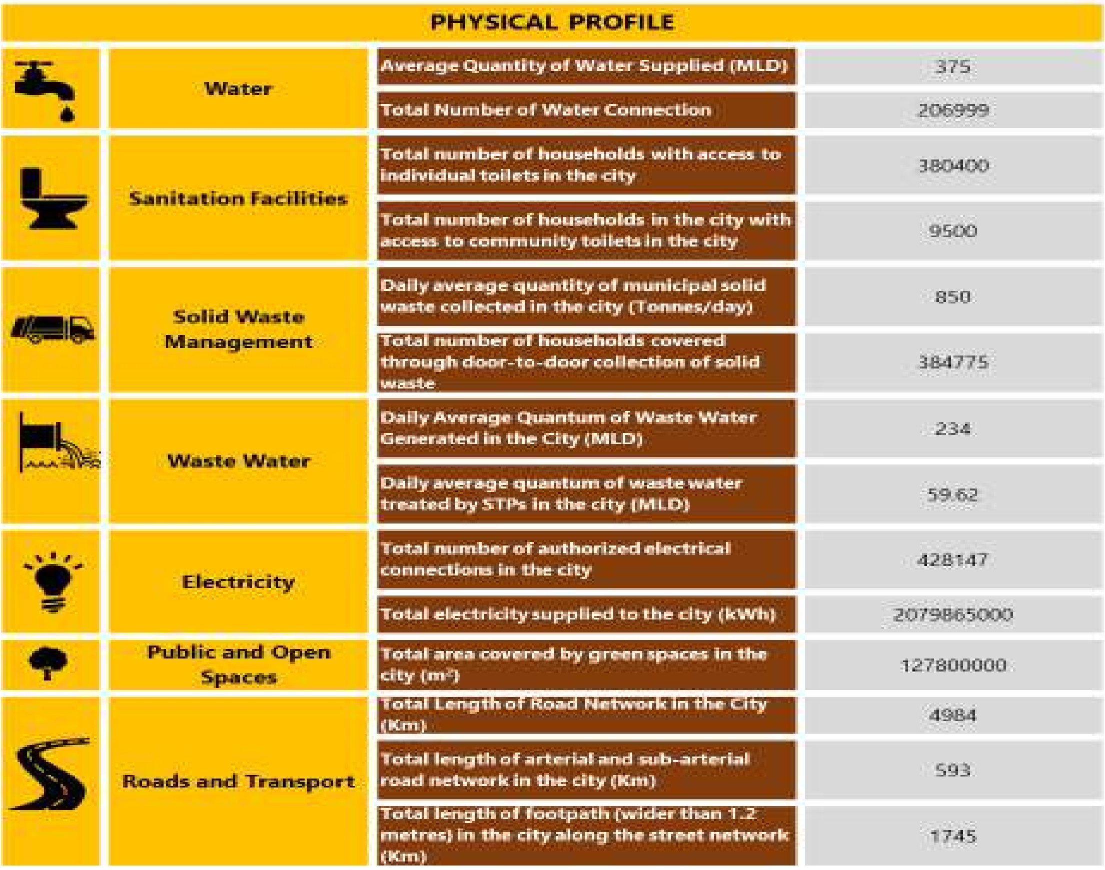
Total Population	1798218
Total Number of Households	453237

SOCIAL PROFILE

Education	**Total Number of Schools**	1897
	Total Enrolment (Class 1 to 5)	212153
Health	**Total Number of In-patient Beds**	19394
	Total Health Workforce	21400
Safety and Security	**Total Strength of Police Force**	5801
	Total Number of CCTV Cameras	2627
Heritage Sites	**Total Number of Heritage Sites**	258

ECONOMIC PROFILE

Total Population in Working Age Group	583841
Total Number of Industries	6165
Total Number of Commercial Enterprises	632778
Total Number of Hotels	94
Total Capital and Revenue Expenditure for the city in FY 2016-17 (INR Lakhs)	83953.49
Total VAT Collection in FY 2016-17 (INR Lakhs)	809909.77



PHYSICAL PROFILE		
Water	Average Quantity of Water Supplied (MLD)	375
	Total Number of Water Connection	206999
Sanitation Facilities	Total number of households with access to individual toilets in the city	380400
	Total number of households in the city with access to community toilets in the city	9500
Solid Waste Management	Daily average quantity of municipal solid waste collected in the city (Tonnes/day)	850
	Total number of households covered through door-to-door collection of solid waste	384775
Waste Water	Daily Average Quantum of Waste Water Generated in the City (MLD)	234
	Daily average quantum of waste water treated by STPs in the city (MLD)	59.62
Electricity	Total number of authorized electrical connections in the city	428147
	Total electricity supplied to the city (kWh)	2079865000
Public and Open Spaces	Total area covered by green spaces in the city (m^2)	127800000
Roads and Transport	Total Length of Road Network in the City (Km)	4984
	Total length of arterial and sub-arterial road network in the city (Km)	593
	Total length of footpath (wider than 1.2 metres) in the city along the street network (Km)	1745

3. Liveability Framework and Indicators

The Liveability Framework comprises a total of 79 indicators (57 Core Indicators and 22 Supporting Indicators). A core indicator carries 70% weightage and a supporting indicator carries 30% weightage. These indicators are grouped under 15 thematic categories which in turn are part of four pillars of comprehensive development of cities i.e., institutional, social, economic and physical. Based on the performance of cities against the various core and supporting indicators, various 'Category Sub-Indexes' and a composite 'City Liveability Index' will be developed for each city.

3.1 Scoring and Computing Category Indices of Liveability

The set of 79 indicators, associated categories and pillars are presented in the table below:

Table 1 List of Pillars, Categories and Indicators

Pillars of Comprehensive Development	Category	Indicators
Institutional	1. Governance	1.1 Percentage of citizen services available online
		1.2 Percentage of services integrated through Command Centre
		1.3 Percentage of citizens using online services
		1.4 Average delay in grievance redressal
		1.5 Tax collected as percentage of tax billed
		1.6 Extent of cost recovery (O&M) in water supply services
		1.7 Capital spending as percentage of total expenditure
		1.8 Percentage of population covered under Ward Committees/Area *Sabhas*
Social	**2. Identity and Culture**	2.1 Restoration and reuse of historic buildings
		2.2 Percentage of ecologically important areas covered through projects for restoration
		2.3 Hotel occupancy
		2.4 Percentage of budget allocated towards cultural/sports activities
		2.5 Number of cultural/sports events hosted by city
	3. Education	3.1 Percentage of school-aged population enrolled in schools
		3.2 Percentage of female school-aged population enrolled in schools
		3.3 Primary education student-teacher ratio
		3.4 Percentage of schools with access to digital education
		3.5 Percentage of students completing primary education
		3.6 Percentage of students completing secondary education
	4. Health	4.1 Number of in-patient hospital beds per 10,000 population

Pillars of Comprehensive Development	Category	Indicators
		4.2 Healthcare professionals per 10,000 population
		4.3 Average response time in case of health emergencies
		4.4 Period prevalence of water borne diseases
		4.5 Period prevalence of vector borne diseases
	5. Safety and Security	5.1 Number of CCTV Cameras
		5.2 Number of recorded crimes per lakh population
		5.3 Extent of crimes recorded against women, children and elderly per year
		5.4 Transport-related fatality per lakh population
Economic	**6. Economy and Employment**	6.1 Increase in VAT/GST collection
		6.2 Increase in collection of Professional Tax
		6.3 Increase in issuance of Construction permits
		6.4 Unemployment rate
		6.5 Percentage of vendors registered and provided formal spaces
Physical	**7. Housing and Inclusiveness**	7.1 Percentage of Slum/EWS households covered through formal/affordable housing
		7.2 Percentage of slum areas covered through basic services
	8. Public Open Spaces	8.1 Per capita availability of green spaces
		8.2 Per capita availability of public and recreational places
	9. Mixed Land Use and Compactness	9.1 Share of mixed land use area in overall city land use
		9.2 Net Density
	10. Power Supply	10.1 Percentage of city population with authorized electrical services
		10.2 Percentage of electrical connections covered through smart meters
		10.3 Average number of electrical interruptions per year
		10.4 Average length of electrical interruptions per year
		10.5 Percentage of total energy derived from renewable sources
		10.6 Energy consumption per unit - water supply and sewerage
		10.7 Energy consumption per unit - street lighting
		10.8 Percentage of new and redeveloped buildings

Pillars of Comprehensive Development	Category	Indicators
		following green building norms
		10.9 Total energy consumption per capita
	11. Transportation and Mobility	11.1 Geographical coverage of public transport
		11.2 Availability of public transport
		11.3 Mode share of public transport
		11.4 Percentage of road network with dedicated bicycle tracks
		11.5 Percentage of interchanges with bicycle parking facilities
		11.6 Mode share of non-motorized transport
		11.7 Availability of Passenger Information System
		11.8 Extent of signal synchronization
		11.9 Availability of paid parking spaces
		11.10 Percentage coverage of footpaths – wider than 1.2 m
		11.11 Percentage of traffic intersections with pedestrian crossing facilities
		11.12 Extent to which universal accessibility is incorporated in public rights-of-way
	12. Assured Water Supply	12.1 Household level coverage of direct water supply connections
		12.2 Per capita supply of water
		12.3 Quality of water supplied
		12.4 Level of non-revenue water – NRW
		12.5 Percentage of water connections covered through meters
		12.6 Percentage of plots with rainwater harvesting facility
	13. Waste Water Management	13.1 Coverage of toilets
		13.2 Coverage of sewerage network and/or septage
		13.3 Collection efficiency of sewerage network
		13.4 Extent of reuse and recycling of waste water
		13.5 Coverage of storm water drains
	14. Solid Waste Management	14.1 Household level coverage of municipal solid waste collection
		14.2 Efficiency of collection of municipal solid waste
		14.3 Extent of municipal solid waste recovered through

Pillars of Comprehensive Development	Category	Indicators
		reuse
	15. Reduced Pollution	15.1 Concentration of SO2- air pollution
		15.2 Concentration of NO2- air pollution
		15.3 Concentration of PM10 - air pollution
		15.4 Level of noise pollution
		15.5 Quality of water in public surface water bodies

3.2 Scoring and Computing Category Indices of Liveability

The performance achieved by cities against 79 indicators, will be assessed against given benchmarks. Where no international/national norms are available, city with the best performance in its group (population range) will be treated as a benchmark. The groups are given in the table below.

Table 2 Details on Population Range

Category	Population range
Category 1	Population ≥ 4 million
Category 2	1 million ≤ Population < 4 million
Category 3	0.5 million ≤ Population < 1 million
Category 4	Population < 0.5 million

3.3 Scoring Approach and Methodology

A city can earn a maximum score of 100 points for 79 indicators across four pillars. The pillar weights are as follows: Institutional (25 points), Social (25 points), Economy and Employment (5 points) and Physical (45 points). Based on the number and nature of indicators i.e., core vs. secondary, indicator wise maximum marks were computed.

100 marks

(Maximum overall score that any city can achieve)

25 marks	25 marks	5 marks	45 marks
(Maximum score that any city can achieve under **Institutional** Pillar)	(Maximum score that any city can achieve under **Social** Pillar)	(Maximum score that any city can achieve under **Economic** Pillar)	(Maximum score that any city can achieve under **Physical** Pillar)
1	4	1	9
(Category under Institutional Pillar)	(Number of categories under Social Pillar)	(Category under Economic Pillar)	(Number of categories under Physical Pillar)
8	20	5	46
(Number of indicators under Institutional)	(Number of indicators under Social Pillar)	(Category under Economic Pillar)	(Number of categories under Physical Pillar)
7 Core 1 Supporting	13 Core 7 Supporting	4 Core 1 Supporting	33 Core 13 Supporting

Dimensional Index Methodology (DIM) has been used to compute scores for each indicator with reference to “maximum within the comparison group” or “absolute benchmarks”. For indicators where benchmarks are available, cities getting the benchmark score (or above) are given the maximum mark, and the marks awarded to other cities are calculated proportionately. For indicators where benchmarks are not available, the best performing cities in each population group are given the maximum mark, and the marks awarded to other cities (within the population group) are calculated proportionately. For indicators where benchmarks do not exist, the city data has been tested for outliers before scoring.

3.4 Scoring Normalisation:

To construct aggregate scores across cities as well as to make the scores across indicators comparable, indicator values were normalised using a min-max approach. The following formula was used to normalise the indicator values-

$$\frac{indicator\ value\ for\ the\ city - indicator\ value\ for\ the\ worst\ performing\ city}{benchmark - \ indicator\ value\ for\ the\ worst\ performing\ city}$$

This approach would restrict the normalised indicator value between 0 and 1. Cities that met or exceeded the benchmark received a normalised indicator value of 1. Worst performing cities are given a normalised indicator value of 0. After normalisation, the normalised value is weighted according to the category and the indicator being core or supporting.

To illustrate, consider the indicator 12.3 Quality of Water Supplied in the Category 12 for Assured Water Supply. If in City A 50% of the water samples collected qualify the potable water standards specified by the CPHEEO, and only 10% of the samples from worst performing city qualify the standards. Then, the normalised value for the indicator for city A would be 0.44 [(0.5-0.1)/(1-0.1)].

The weight for indicator 12.3 is 1.03, so the final weighted score for City A would come out to 0.45 [1.03*0.44].

4. Data Collection and Verification

4.1 Submission of Data by the cities

The Liveability Assessment is based on secondary data submitted by the urban local bodies and other concerned government agencies (collectively called as data owners). The 79 indicators were broken down into a set of easy to understand and relatable 553 questions mapped to data owners. Submission of the data was enabled through an online data entry portal on the smartnet platform of the Ministry. The portal also allowed the ULBs to download the liveability assessment questionnaire and upload filled in questionnaire. To familiarise and assist cities in identifying, mapping and collation of data points, a city level nodal person was available during the entire period of data submission process.

4.2 Mapping of Data Owners for the City

For the assessment of liveability indices broadly 12 data owners such as Central/state Pollution control board, Development authority, DISCOM/Electricity Board, State Disaster Management Authority, State Education Department, State Health department, State Renewable energy and development agency, State sales and commercial taxes department, town and country planning department, Traffic and police department, Transport authority, and Urban local body were identified to respond to the questions on the portal. However, during state workshop and subsequent city level discussions, more data owners were mapped to respond to different categories and sub categories. The following table provides the details of city level data owners mapped under the 12 data owner.

Table 3:Details of Data Owners

Designated data owners	Sub categories	Data owners at city level
	Accounts	Accounting Department, Bhopal Municipal Corporation
	Park and Recreation	Garden Department, Bhopal Municipal Corporation
	Water Supply and Drainage	Engineering Department, Bhopal Municipal Corporation

Designated data owners	Sub categories	Data owners at city level
Urban Local Body	Heritage sites	Bhopal Municipal Corporation
	Ecological sites	Bhopal Municipal Corporation
	Housing	Housing section, Bhopal Municipal Corporation
	Building plan	Building Permission Section, Bhopal Municipal Corporation
	Roads	Bhopal Municipal Corporation
	Solid waste management	Solid waste management, Bhopal Municipal Corporation
	IT services	IT Section, Bhopal Municipal Corporation
	Vendor committee	Bhopal Municipal Corporation
	Any other departments involved in providing data for questions mentioned under Urban Local Body	
Central / state Pollution control Board	Water Quality, Air Quality, Noise Quality	Madhya Pradesh Pollution Control Board
Development Authority	Building Infrastructure	Building Permission Section, Bhopal Municipal Corporation Bhopal Development Authority
	Construction planning	Building Permission Section, Bhopal Municipal Corporation Bhopal Development Authority
	Green Building	Bhopal Development Authority
	Rain water harvesting	Bhopal Development Authority
	Universal Design Principle	Bhopal Development Authority
DISCOM/Electricity Board	Electrical Connection/ Grievance Redressal/ Power supply	Madhya Pradesh Madhya Kshetra Vidyut Vitaran Company limited
State Disaster management authority		District Disaster management Office
State Education Department		District Education Department
State Health Department	Health care professionals	Directorate of Health Services, Bhopal
	Citizen Services	Health Department
	Disease Prevalence	Health Department
	Health Infrastructure	Health Department
State Renewable Energy		Madhya Pradesh New and Renewable Energy Department

Designated data owners	Sub categories	Data owners at city level
Development Agency		
State Sales / Commercial Taxes Department		Department of Commercial Taxes
Town and Country Planning Department	Land Use	Town and country planning
Traffic and Police Department		Traffic and Police Department, Bhopal
Transport Authorities	Buses	Regional Transport Office
	Registered Vehicles	Madhya Pradesh Transport Department
	Sub urban rail transport	NA
	Mono Rail Authority	NA
	Tramways	NA
	Marine Transport Authority	NA

4.3 List of secondary documents available as supportive

City has provided supporting documents/evidences against the responses given by city on the online portal. In support of their responses on the portal, city submitted 68 number of documents. Documents submitted includes reports, official orders, copy of data maintained in official register, signed copy of questionnaire, and signed letters/submissions from concern departments. Verification includes mapping of documents against responses given by city, checking the type/category of documents, and validation of data provided.

The following table presents the data owner wise number of documents:

Table 4: Data owner wise number of secondary documents submitted by city

Data Owners	Number of Documents
Sales and Commercial Taxes	3
State Education Department	11
DISCOM/Electricity Department	3
Traffic and Police Department	8
Development Authority	0
Pollution Control Board	6
State Renewable Energy Department	3
Town and Country Planning	1
State Health Department	3

Transport Authority	1
Disaster Management	1
Urban Local Body	28
Total	68

4.4 Data Verification

A three-stage data quality check comprising verification of data against secondary documents furnished by data owners, logical inconsistency checks including outliers, and physical audit for select indicators (Refer the exhibit below) is being undertaken. The objective of the data quality check is to ensure that data from the source documents are accurate and verifiable. Sources of data included reports, administrative data, survey results and other statistical records, log books among other.

Physical audit of eight indicators – one indicator from the Institutional pillar, one from the Social pillar, one from the Economy pillar and five from the Physical pillar is also being carried out by the field team to ascertain the degree of reliability of data reported by the cities. The list of these eight indicators is presented below:

1.2 | Percentage of services integrated through Command Centre

2.3 | Hotel occupancy

3.4 | Percentage of schools with access to digital education

5.1| Number of streets, public places, junctions covered through surveillance systems

6.5 | Percentage of vendors registered and provided formal spaces

11.7 | Availability of Passenger Information System

11.11 | Percentage of traffic intersections with pedestrian crossing facilities

11.12 | Extent to which universal accessibility is incorporated in public rights-of-way

For a set of five indicators namely, unemployment rate, mode share of public transport, mode share of non-motorised transport, quality of water supplied and level of noise pollution, existing datasets were found to be not available consistently across all cities and/or were inadequate. To help cities that do not have data on these five indicators, dipstick assessments are being carried to fill data gaps.

6.4 | Unemployment Rate

11.3 | Mode share of public transport

11.5 | Mode share of Non Motorized Transport

12.3 | Quality of Water Supplied

15.4 | Level of Noise Pollution

4.5 Physical Audit

The following map presents the indicators audited at city level.

7. LA - Street Vendors
8. LA - Universal Design Principles

5. City Score on 15 categories of Assessment

Liveability Assessment covered 15 categories and 78 indicators. The below table presents the scores for all 15 indicators namely governance, identity & culture, education, health, safety and security, economy & employment, housing & inclusiveness, public open spaces, mixed land use & compactness, power supply, transport & mobility, assured water supply, waste water management, solid waste management and reduced pollution.

Table 5: Category wise scores

Categories	Scores in Percentage
Governance	64.80%
Identity & Culture	57%
Education	85%
Health	86%
Safety & Security	64%
Economy & Employment	14%
Housing & Inclusiveness	4%
Public Open Spaces	100%
Mixed Land Use & Compactness	2%
Power Supply	48%
Transport & Mobility	55%
Assured Water Supply	80%
Waste Water Management	64%
Solid Waste Management	82%
Reduced Pollution	40%

The rank of the city is based on the performance and scores in each of the category. The final city rank is submitted separately.

Executive Summary

Assessment of liveability indices is an initiative by the Ministry of Housing and Urban Affairs to improve quality of life of citizens and achieve sustainable development goals by encouraging cities to adopt "outcome based" approach for urban planning. Assessment process aimed to provide opportunity to cities to review the development components holistically by involving 79 measurable indicators categorized under governance, health, education, safety, economy, power supply, transportation and mobility, identity, culture, housing, waste management and pollution.

This report highlights the assessment process, key milestones, and the final outcome of the data submitted. Implementation of liveability assessment commenced formally on 19th January 2018. A national level workshop was organized on 13th February 2018 to explain the importance and process of liveability assessment and get feedback on methodology from the city authorities.

This was followed by the next stage of Questionnaire development. The questionnaire was arranged under 12 categories representing 12 data owners namely urban local body, Central and state pollution control board, development authority, DISCOM/Electricity board, State disaster management authority, state education department, state health department, state renewable energy development agency, state sales and commercial taxes department, town and country planning department, traffic and police department and transport authorities.

An online data entry portal was developed to facilitate data submission by the cities. Each city had a unique log in to access the portal and submit the data. Both online and off-line options (download the questionnaire in an excel) to submit the data were available for cities. An email help desk was set up for the cities to raise any queries and seek clarification when responding to the questions.

A team for each state comprising of State Coordinator and City Coordinator (one per city) was deployed that facilitated the process and supported the cities. A total of 6 regional coordinators/ consultants, 29 State Coordinators, and 99 city coordinators were deployed across 116 cities. Training for state coordinators was held from 26th to 28th February 2018 at Chennai to make coordinators understand overall liveability assessment, indicators, data sources, protocols and roles and responsibilities.

City Reconnaissance Meetings were initiated by the state and city coordinators. The discussion began with discussions to finalize the state workshop schedule, mapping of data owners, and assist cities in data collection. The City Coordinators were based in the cities for over 6 weeks and during this time, they liase with ULB and other data owners to explain the liveability framework, online portal, and facilitate the online submission.

A total of 33 state workshops were conducted at the state level. The objective of the workshop was to orient the city stakeholders on liveability assessment, indicators, components of data collection, timelines, expectations of support and support extended by MoHUA. The state level workshops brought various city level departments on a single platform to understand and discuss the methodology and components of city liveability assessment.

Nodal agency at state level supported by the City and State Coordinator and city level (Municipality corporation/smart city limited) coordinated with city specific data owners/departments for data gathering, collation, and submission. Nodal persons in each department were appointed for timely data collection and submission. Of 116, 112 cities submitted data as per the timeline on 16th April 2018.

Post submission, the city and state coordinators supported by the central team followed up extensively with the cities to support secondary documents as evidence to substantiate their submissions. Secondary documents such as reports, official orders, copy of office register, signed copy of liveability assessment questionnaire furnished by cities against the submitted data. Documents are verified to map the documents for the reponses provided by city and to check the type data provided by city. The document check outcomes were shared with the cities as a part of data quality check.

For checking consistency of data, logical check of data, verifying data from other public sources were undertaken. Quality check was done to ensure data validity and provide opportunity to cities to review the data provided by them and correct in case of wrong data entry.

For 8 selected indicators namely, percentage of services integrated through command and control center, hotel occupancy rate, percentage of schools with access to digital education, number of CCTV cameras per unit road length, percentage of vendors registered and provided formal spaces, availability of passenger information system, percentage of traffic intersection with pedestrian crossing facility, and extent to which universal accessibility is incorporated in public rights of way. Physical audit was conducted in 110 cities by physical auditors appointed and trained by the consortium. In consultation with ULB nodal person, locations and indicators for physical audit was selected in each city. A mobile based application was developed to capture the physical audit related data.

Primary data collection was done for five indicators such as unemployment rates, mode share of public transport, mode share of non-motorized transport, quality of water supplied, and level of noise pollution. Protocols for water and noise test were prepared in consultation with experts. Water quality test involved physical, chemical and bacteriological test of water as per the CPCB norms. For testing quality of water at consumer end, the auditors worked closely with the ULB and Water department. Samples were collected from consumer end and submitted to the lab suggested by city. For noise pollution, in about 20 cities the state pollution board or city level

environment department took the responsibility for providing noise pollution data as per the protocols. In rest of the cities, mobile based application was used to measure noise pollution.

During implementation, MoHUA facilitated the process by conducting video conferences with cities to address any queries, reiterate the importance, and ensure that cities adequately engages in the process and submit their responses in time and respond to requests for clarifications.

In addition to secondary data collection, physical audit and primary data collection, citizen survey was conducted to understand their perception and level of satisfaction on various services such as health, education, water supply, electricity, waste management etc. provided by urban local bodies. Over 60000 citizens participated in the survey across India.

The final scores and ranks have been generated based on the scoring methodology that has been discussed extensively and minor modifications made that are summarized as below:

#	Challenges	Proposed Solutions
1	Only 23 cities of 111 cities have City Mobility Plan (CMP) or any and hence able to provide data for Mode Share of Public Transport and Non-Motorised Transport. To address the data gap, as advised by the MoHUA, the consortia undertook a sample dipstick across all cities covering a sample of 150 Households. Understandably, the dipstick findings will not match the rigor of a CMP.	We recommend the following: 1) Cities which have provided CMP Data will be evaluated on 100% of the maximum score 2) For the cities where the dipstick data is used, the city receives a 50% discount on the overall score Alternatively, another approach is to assign 0 score to all 88 cities that don't have a CMP
2	Variance was observed on data reported by cities on road network and data presented in the smart city proposals during the verifications.	We recommend taking the data reported by the cities in the Smart City Proposals.
3	There is no secondary source/ organization that provides unemployment data at city level. As a result, most cities do not have the data. Fully cognizance of the challenges of generating this data in a short span of time, it was agreed to collect this data through a dipstick survey on lines of NSSO questions. The	The indicator on unemployment will be excluded from scores. For final ranking, the cities will be scored on 78 indicators.

#	Challenges	Proposed Solutions
	data generated needs further scrutiny and triangulation with some inputs from experts. This may not be possible in the short window.	
4	Many cities did not have data on noise pollution and it was decided that data will be collected using a mobile app for all the 111 cities. However, many cities have expressed reservations with the approach especially with respect to the reliability of using this data. Further, some cities have relied on the SPCB to collect the data as per the approach proposed by the consortia. Thus, noise pollution data is currently from two sources: 1. SPCB- 20 cities 2. Noise-based app- 91 cities	The data collected through the primary survey will be used for scoring the cities. Currently, there is no differential scoring for the data from the SPCB and the data collected through the mobile app. However, a certain higher weightage can be provided to those cities which used the state apparatus to collect noise pollution data.
5	For the indicator on quality of water supplied, the methodology document states that samples should be drawn both at the treatment plant outlet as well as the consumer end. However, the data provided by the cities were predominantly from the distribution point. Hence for consumer end results with MoHUA intervention, consortia coordinated with cities to collect the data at the consumer end. The cities facilitated the testing. The outcome of the process is as below: 1. Sample given- 102 cities 2. Report received- 86 cities 3. Report awaited- 16 cities 4. Tests not completed due to lack of cooperation and other reasons – 9	The maximum score for this indicator will be distributed equally (50%) for results based on samples from the treatment plant and consumer end. Cities that did not complete tests or provide the results will be given a score 0 for against consumer end tests.
6	City level population is not projected annually by most of the cities. So, estimates for 2017 population are not available with the cities.	As recommended by MoHUA, 2011 census population is being used for the ranking purpose.
7	The age category specific data for 9 cities is not available at a city level	The age category specific population data has been taken at a district level for these cities.

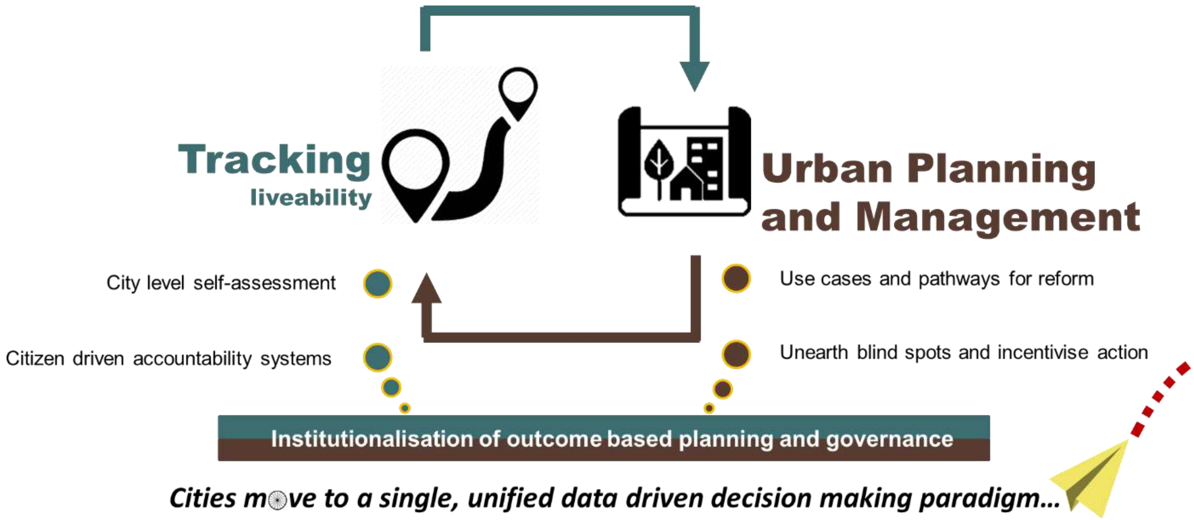
#	Challenges	Proposed Solutions
8	Indicators on non-motorised transports like- Dedicated bicycle tracks, bicycle parking facilities and mode share of non-motorised transport are not relevant for hilly terrains.	As discussed during the PMC meeting, these indicators have been treated as non-applicable for the hilly cities and the weights have been redistributed among other indicators within the same category.
9	The indicator on increase in professional tax is not relevant to cities which do not levy the professional tax.	As discussed during the PMC meeting, this indicator has been non-applicable to the cities belonging to states where professional tax is not levied, and the weights have been redistributed among other indicators within the same category.
10	The indicator on increase in VAT collection is not applicable to Port Blair and Kavaratti, as there was no provision of VAT collection in these cities.	As discussed during the PMC meeting, these indicatosr has been treated as non-applicable for these two cities and the weights have been redistributed among other indicators within the same category.
11	Indicator on coverage of basic services to slum households does not concern cities with no slums (notified/ non-notified.	As discussed during the PMC meeting, this indicators has been treated as non-applicable for these cities and the weights have been redistributed among other indicators within the same category.

1. Introduction

The Ministry of Housing and Urban Affairs (MoHUA) is implementing several flagship urban missions such as the Smart Cities Mission (SCM), Atal Mission for Urban Rejuvenation and Transformation (AMRUT), Heritage City Development and Augmentation Yojana (HRIDAY), Housing for All (HFA). Theses mission along with other transformative initiatives of the Government including National Water Mission, Power for All, National Health Mission are aimed at making Indian cities more 'liveable.' The overarching goal of these initiatives is to move from an input-based approach to a 'citizen centric-outcome based' assessment of urban liveability.

To develop a common minimum framework for cities to assess their existing status and chart their pathway towards providing a better quality of life to their citizens, the MoHUA developed a set of 'Liveability Standards' relevant to cities to generate a Liveability Index and ranking of cities. These standards were launched in June, 2017. The MoHUA has planned to conduct an 'Annual Assessment of Liveability Standards in Cities – an ambitious national project that will involve yearly submission of data by cities across the various indicators, compilation and analysis, development of indices and ranking of cities. The Liveability Index is envisioned as a 360° tool for tracking, planning and transforming Indian cities. The Liveability Index is aimed at the following objectives:

- Providing strong evidence-based approach for future interventions and investments to deliver liveability outcomes
- Catalysing actions to improve the overall quality of the city's liveability and achieve broader development outcomes including the Sustainable Development Goals
- Assessing the implementation of government policies and schemes governing characteristics of cities that can contribute to creating liveable communities



Tracking
liveability
Urban Planning and Management
City level self-assessment
Citizen driven accountability systems
Use cases and pathways for reform
Unearth blind spots and incentivise action
Institutionalisation of outcome based planning and governance

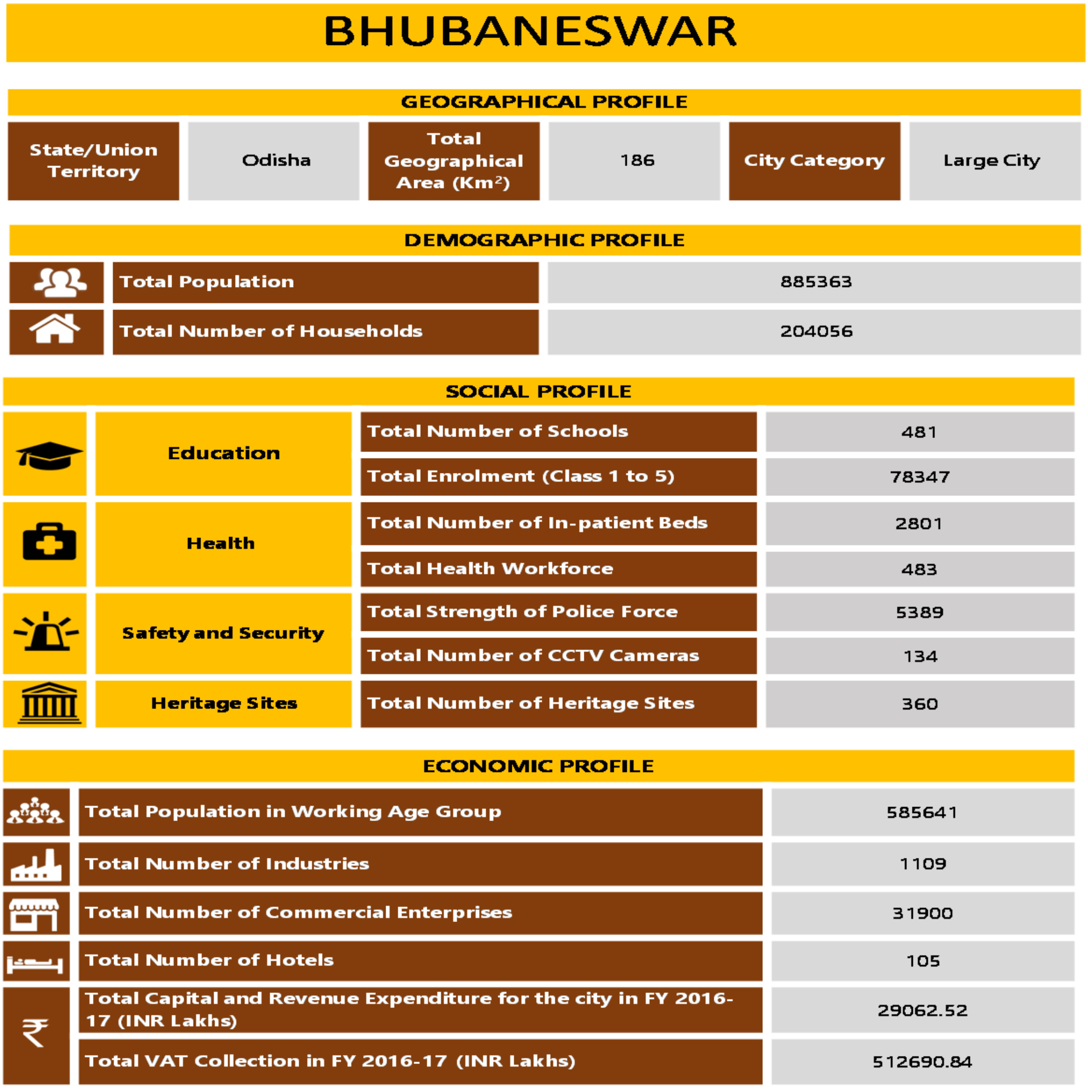
Cities move to a single, unified data driven decision making paradigm…

The first round of the assessment commenced in January 2018 covering 116 major cities including

smart cities, capital cities and cities with population of above one million each. Implementation of the liveability assessment commenced in January 2018 with a national level orientation workshop for the urban local bodies. The workshop aimed at orienting the states and urban local bodies on the overall framework, indicators, data sources, methodology and key milestones and timelines involved in the liveability assessment. Subsequently, a series of State/ Union Territory level orientation workshops were carried out in 33 states/UTs for a detailed discussion on the framework. Online data collection commenced from 9th March through an online data collection platform that supported both online and offline data submission modes. On the date of closure of the online data entry portal i.e., 16th April, 2018 112 cities submitted their data. Subsequently, comprehensive checks on the submitted data was undertaken that involved checking for outliers, logical inconsistencies etc. post which round-1 of data reconciliation was conducted. This draft report is based on round-1 of reconciled data as on 28th April, 2018.

2. City Profile

This chapter presents the city profile -Geographic and Demographic, Social (Education Health,



BHUBANESWAR

GEOGRAPHICAL PROFILE

State/Union Territory	Odisha	**Total Geographical Area (Km^2)**	186	**City Category**	Large City

DEMOGRAPHIC PROFILE

Total Population	885363
Total Number of Households	204056

SOCIAL PROFILE

Education	**Total Number of Schools**	481
	Total Enrolment (Class 1 to 5)	78347
Health	**Total Number of In-patient Beds**	2801
	Total Health Workforce	483
Safety and Security	**Total Strength of Police Force**	5389
	Total Number of CCTV Cameras	134
Heritage Sites	**Total Number of Heritage Sites**	360

ECONOMIC PROFILE

Total Population in Working Age Group	585641
Total Number of Industries	1109
Total Number of Commercial Enterprises	31900
Total Number of Hotels	105
Total Capital and Revenue Expenditure for the city in FY 2016-17 (INR Lakhs)	29062.52
Total VAT Collection in FY 2016-17 (INR Lakhs)	512690.84

Safety and Security, Heritage), Economic profile, and Physical (Water, sanitation and Waste Management, Electricity, Open space and roads).

PHYSICAL PROFILE

Water	Average Quantity of Water Supplied (MLD)	276.45
	Total Number of Water Connections	98907
Sanitation Facilities	Total number of households with access to individual toilets in the city	147512
	Total number of households in the city with access to community toilets in the city	14851
Solid Waste Management	Daily average quantity of municipal solid waste collected in the city (Tonnes/day)	520
	Total number of households covered through door-to-door collection of solid waste	104056
Waste Water	Daily Average Quantum of Waste Water Generated in the City (MLD)	212.27
	Daily average quantum of waste water treated by STPs in the city (MLD)	0.1
Electricity	Total number of authorized electrical connections in the city	195130
	Total electricity supplied to the city (kWh)	1708026000
Public and Open Spaces	Total area covered by green spaces in the city (m^2)	23904221
Roads and Transport	Total Length of Road Network in the City (Km)	1920
	Total length of arterial and sub-arterial road network in the city (Km)	142
	Total length of footpath (wider than 1.2 metres) in the city along the street network (Km)	43.08

3. Liveability Framework and Indicators

The Liveability Framework comprises a total of 79 indicators (57 Core Indicators and 22 Supporting Indicators). A core indicator carries 70% weightage and a supporting indicator carries 30% weightage. These indicators are grouped under 15 thematic categories which in turn are part of four pillars of comprehensive development of cities i.e., institutional, social, economic and physical. Based on the performance of cities against the various core and supporting indicators, various 'Category Sub-Indexes' and a composite 'City Liveability Index' will be developed for each city.

3.1 Scoring and Computing Category Indices of Liveability

The set of 79 indicators, associated categories and pillars are presented in the table below:

Table 1 List of Pillars, Categories and Indicators

Pillars of Comprehensive Development	Category	Indicators
Institutional	1. Governance	1.1 Percentage of citizen services available online
		1.2 Percentage of services integrated through Command Centre
		1.3 Percentage of citizens using online services
		1.4 Average delay in grievance redressal
		1.5 Tax collected as percentage of tax billed
		1.6 Extent of cost recovery (O&M) in water supply services
		1.7 Capital spending as percentage of total expenditure
		1.8 Percentage of population covered under Ward Committees/Area *Sabhas*
Social	**2. Identity and Culture**	2.1 Restoration and reuse of historic buildings
		2.2 Percentage of ecologically important areas covered through projects for restoration
		2.3 Hotel occupancy

Pillars of Comprehensive Development	Category	Indicators
		2.4 Percentage of budget allocated towards cultural/sports activities
		2.5 Number of cultural/sports events hosted by city
	3. Education	3.1 Percentage of school-aged population enrolled in schools
		3.2 Percentage of female school-aged population enrolled in schools
		3.3 Primary education student-teacher ratio
		3.4 Percentage of schools with access to digital education
		3.5 Percentage of students completing primary education
		3.6 Percentage of students completing secondary education
	4. Health	4.1 Number of in-patient hospital beds per 10,000 population
		4.2 Healthcare professionals per 10,000 population
		4.3 Average response time in case of health emergencies
		4.4 Period prevalence of water borne diseases
		4.5 Period prevalence of vector borne diseases
	5. Safety and Security	5.1 Number of CCTV Cameras
		5.2 Number of recorded crimes per lakh population
		5.3 Extent of crimes recorded against women, children and elderly per year
		5.4 Transport-related fatality per lakh population
Economic	**6. Economy and Employment**	6.1 Increase in VAT/GST collection
		6.2 Increase in collection of Professional Tax

Pillars of Comprehensive Development	Category	Indicators
		6.3 Increase in issuance of Construction permits
		6.4 Unemployment rate
		6.5 Percentage of vendors registered and provided formal spaces
Physical	**7. Housing and Inclusiveness**	7.1 Percentage of Slum/EWS households covered through formal/affordable housing
		7.2 Percentage of slum areas covered through basic services
	8. Public Open Spaces	8.1 Per capita availability of green spaces
		8.2 Per capita availability of public and recreational places
	9. Mixed Land Use and Compactness	9.1 Share of mixed land use area in overall city land use
		9.2 Net Density
	10. Power Supply	10.1 Percentage of city population with authorized electrical services
		10.2 Percentage of electrical connections covered through smart meters
		10.3 Average number of electrical interruptions per year
		10.4 Average length of electrical interruptions per year
		10.5 Percentage of total energy derived from renewable sources
		10.6 Energy consumption per unit - water supply and sewerage
		10.7 Energy consumption per unit - street lighting
		10.8 Percentage of new and redeveloped buildings following green building norms
		10.9 Total energy consumption per capita

Pillars of Comprehensive Development	Category	Indicators
	11. Transportation and Mobility	11.1 Geographical coverage of public transport
		11.2 Availability of public transport
		11.3 Mode share of public transport
		11.4 Percentage of road network with dedicated bicycle tracks
		11.5 Percentage of interchanges with bicycle parking facilities
		11.6 Mode share of non-motorized transport
		11.7 Availability of Passenger Information System
		11.8 Extent of signal synchronization
		11.9 Availability of paid parking spaces
		11.10 Percentage coverage of footpaths – wider than 1.2 m
		11.11 Percentage of traffic intersections with pedestrian crossing facilities
		11.12 Extent to which universal accessibility is incorporated in public rights-of-way
	12. Assured Water Supply	12.1 Household level coverage of direct water supply connections
		12.2 Per capita supply of water
		12.3 Quality of water supplied
		12.4 Level of non-revenue water – NRW
		12.5 Percentage of water connections covered through meters
		12.6 Percentage of plots with rainwater harvesting facility
	13. Waste Water	13.1 Coverage of toilets

Pillars of Comprehensive Development	Category	Indicators
	Management	13.2 Coverage of sewerage network and/or septage
		13.3 Collection efficiency of sewerage network
		13.4 Extent of reuse and recycling of waste water
		13.5 Coverage of storm water drains
	14. Solid Waste Management	14.1 Household level coverage of municipal solid waste collection
		14.2 Efficiency of collection of municipal solid waste
		14.3 Extent of municipal solid waste recovered through reuse
	15. Reduced Pollution	15.1 Concentration of SO2- air pollution
		15.2 Concentration of NO2- air pollution
		15.3 Concentration of PM10 - air pollution
		15.4 Level of noise pollution
		15.5 Quality of water in public surface water bodies

3.2 Scoring and Computing Category Indices of Liveability

The performance achieved by cities against 79 indicators, will be assessed against given benchmarks. Where no international/national norms are available, city with the best performance in its group (population range) will be treated as a benchmark. The groups are given in the table below.

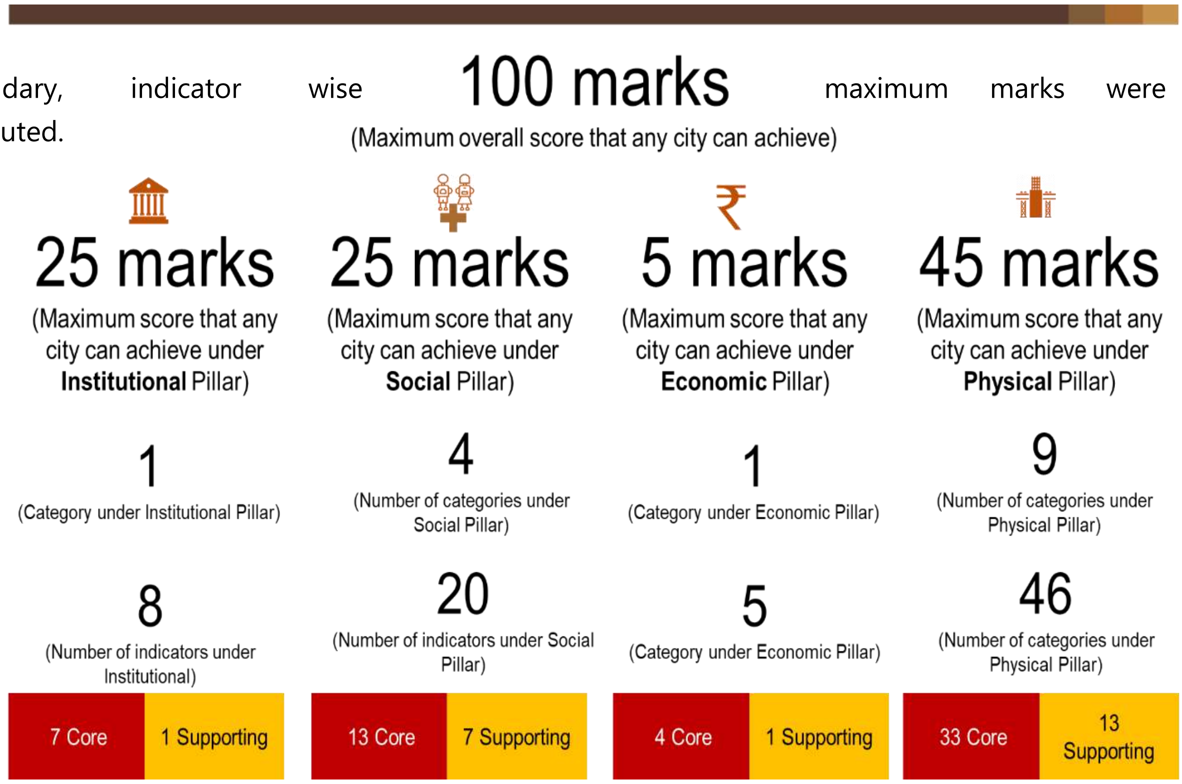
Table 2 Details on Population Range

Category	Population range
Category 1	Population ≥ 4 million
Category 2	1 million ≤ Population < 4 million

Category 3	0.5 million ≤ Population < 1 million
Category 4	Population < 0.5 million

3.3 Scoring Approach and Methodology

A city can earn a maximum score of 100 points for 79 indicators across four pillars. The pillar weights are as follows: Institutional (25 points), Social (25 points), Economy and Employment (5 points) and Physical (45 points). Based on the number and nature of indicators i.e., core vs. secondary, indicator wise maximum marks were computed.



100 marks
(Maximum overall score that any city can achieve)

25 marks	25 marks	5 marks	45 marks
(Maximum score that any city can achieve under **Institutional** Pillar)	(Maximum score that any city can achieve under **Social** Pillar)	(Maximum score that any city can achieve under **Economic** Pillar)	(Maximum score that any city can achieve under **Physical** Pillar)
1	4	1	9
(Category under Institutional Pillar)	(Number of categories under Social Pillar)	(Category under Economic Pillar)	(Number of categories under Physical Pillar)
8	20	5	46
(Number of indicators under Institutional)	(Number of indicators under Social Pillar)	(Category under Economic Pillar)	(Number of categories under Physical Pillar)
7 Core 1 Supporting	13 Core 7 Supporting	4 Core 1 Supporting	33 Core 13 Supporting

Dimensional Index Methodology (DIM) has been used to compute scores for each indicator with reference to “maximum within the comparison group” or “absolute benchmarks”. For indicators where benchmarks are available, cities getting the benchmark score (or above) are given the maximum mark, and the marks awarded to other cities are calculated proportionately. For indicators where benchmarks are not available, the best performing cities in each population group are given the maximum mark, and the marks awarded to other cities (within the population group) are calculated proportionately. For indicators where benchmarks do not exist, the city data has been tested for outliers before scoring.

3.4 Scoring Normalisation:

To construct aggregate scores across cities as well as to make the scores across indicators comparable, indicator values were normalised using a min-max approach. The following formula was used to normalise the indicator values-

$$\frac{indicator\ value\ for\ the\ city - indicator\ value\ for\ the\ worst\ performing\ city}{benchmark - \ indicator\ value\ for\ the\ worst\ performing\ city}$$

This approach would restrict the normalised indicator value between 0 and 1. Cities that met or exceeded the benchmark received a normalised indicator value of 1. Worst performing cities are given a normalised indicator value of 0. After normalisation, the normalised value is weighted according to the category and the indicator being core or supporting.

To illustrate, consider the indicator 12.3 Quality of Water Supplied in the Category 12 for Assured Water Supply. If in City A 50% of the water samples collected qualify the potable water standards specified by the CPHEEO, and only 10% of the samples from worst performing city qualify the standards. Then, the normalised value for the indicator for city A would be 0.44 [(0.5-0.1)/(1-0.1)].

The weight for indicator 12.3 is 1.03, so the final weighted score for City A would come out to 0.45 [1.03*0.44].

4. Data Collection and Verification

4.1 Submission of Data by the cities

The Liveability Assessment is based on secondary data submitted by the urban local bodies and other concerned government agencies (collectively called as data owners). The 79 indicators were broken down into a set of easy to understand and relatable 553 questions mapped to data owners. Submission of the data was enabled through an online data entry portal on the smartnet platform of the Ministry. The portal also allowed the ULBs to download the liveability assessment questionnaire and upload filled in questionnaire. To familiarise and assist cities in identifying, mapping and collation of data points, a city level nodal person was available during the entire period of data submission process.

4.2 Mapping of Data Owners for the City

For the assessment of liveability indices broadly 12 data owners such as Central/state Pollution control board, Development authority, DISCOM/Electricity Board, State Disaster Management Authority, State Education Department, State Health department, State Renewable energy and development agency, State sales and commercial taxes department, town and country planning department, Traffic and police department, Transport authority, and Urban local body were identified to respond to the questions on the portal. However, during state workshop and subsequent city level discussions, more data owners were mapped to respond to different categories and sub categories. The following table provides the details of city level data owners mapped under the 12 data owner.

Table 3:Details of Data Owners

Designated data owners	Subcategories	Data owners at city level
Urban Local Body	For Accounts Related Questions	Bhubaneswar Municipal Corporation
Urban Local Body	For Park and Recreation Related Questions	Bhubaneswar Development Authority Bhubaneswar Municipal Corporation
Urban Local Body	For Water Supply and Drainage related questions	Bhubaneswar Municipal Corporation Public Health Office
Urban Local Body	For Heritage sites related data	Bhubaneswar Development Authority
Urban Local Body	For Ecological sites related data	Forest Department Bhubaneswar Development Authority
Urban Local Body	For Housing related data	Bhubaneswar Municipal Corporation Bhubaneswar Development Authority
Urban Local Body	For Building plan related data	Bhubaneswar Municipal Corporation
Urban Local Body	For Roads related data	Bhubaneswar Municipal Corporation Road & Building Superintendent Engineer
Urban Local Body	For Solid waste management related data	Bhubaneswar Municipal Corporation

Designated data owners	Subcategories	Data owners at city level
Urban Local Body	For IT services related data	Bhubaneswar Municipal Corporation
Urban Local Body	For Vendor committee related data	Bhubaneswar Municipal Corporation
Urban Local Body	Any other departments involved in providing data for questions mentioned under Urban Local Body	
Central / state Pollution control Board	Water Quality, Air Quality, Noise Quality	Public Health Officer, Odisha State Pollution Control Board
Development Authority	Building Infrastructure	Bhubaneswar Municipal Corporation Bhubaneswar Development Authority
	Construction planning	Bhubaneswar Municipal Corporation Bhubaneswar Development Authority
	Green Building	Bhubaneswar Municipal Corporation Bhubaneswar Development Authority
	Rain water harvesting	Department of Water Resources
	Universal Design Principle	Bhubaneswar Municipal Corporation Bhubaneswar Development Authority
DISCOM/Electricity Board	Electrical Connection/ Grievance Redressal/ Power supply	Central Electricity Supply Corporation, Bhubaneswar Municipal Corporation
State Disaster management authority		Odisha State Disaster Management Authority
State Education Department		Odisha Primary Education Programme Authority
State Health Department	Health care professionals	National Urban Health Mission
	Citizen Services	National Urban Health Mission
	Disease Prevalence	National Urban Health Mission
	Health Infrastructure	National Urban Health Mission
State Renewable Energy Development Agency		Odisha Renewable Energy Development Agency
State Sales / Commercial Taxes Department		Commercial Tax Department
Town and Country	Land Use	Bhubaneswar Development Authority

Designated data owners	Subcategories	Data owners at city level
Planning Department		
Traffic and Police Department		Commission rate of Police , Railway (GRPF)
Transport Authorities	Buses	Dream Sahara Transport Service, Road Transport Office
	Registered Vehicles	Road Transport Office
	Sub urban rail transport	NA
	Mono Rail Authority	NA
	Tramways	NA
	Marine Transport Authority	NA

4.3 List of secondary documents available as supportive

City has provided supporting documents/evidences against the responses given by city on the online portal. In support of their responses on the portal, city submitted 55 number of documents. Documents submitted includes reports, official orders, copy of data maintained in official register, signed copy of questionnaire, and signed letters/submissions from concern departments. Verification includes mapping of documents against responses given by city, checking the type/category of documents, and validation of data provided.

The following table presents the data owner wise number of documents:

Table 4: Data owner wise number of secondary documents submitted by city

Data Owners	Number of Documents
Sales and Commercial Taxes	0
State Education Department	0
DISCOM/Electricity Department	2
Traffic and Police Department	11
Development Authority	0
Pollution Control Board	4
State Renewable Energy Department	0
Town and Country Planning	0
State Health Department	4
Transport Authority	2
Disaster Management	0
Urban Local Body	32
Total	55

4.4 Data Verification

A three-stage data quality check comprising verification of data against secondary documents furnished by data owners, logical inconsistency checks including outliers, and physical audit for select indicators (Refer the exhibit below) is being undertaken. The objective of the data quality check is to ensure that data from the source documents are accurate and verifiable. Sources of data included reports, administrative data, survey results and other statistical records, log books among other.

Physical audit of eight indicators – one indicator from the Institutional pillar, one from the Social pillar, one from the Economy pillar and five from the Physical pillar is also being carried out by the field team to ascertain the degree of reliability of data reported by the cities. The list of these eight indicators is presented below:

1.2 | Percentage of services integrated through Command Centre

2.3 | Hotel occupancy

3.4 | Percentage of schools with access to digital education

5.1 | Number of streets, public places, junctions covered through surveillance systems

6.5 | Percentage of vendors registered and provided formal spaces

11.7 | Availability of Passenger Information System

11.11 | Percentage of traffic intersections with pedestrian crossing facilities

11.12 | Extent to which universal accessibility is incorporated in public rights-of-way

For a set of five indicators namely, unemployment rate, mode share of public transport, mode share of non-motorised transport, quality of water supplied and level of noise pollution, existing datasets were found to be not available consistently across all cities and/or were inadequate. To help cities that do not have data on these five indicators, dipstick assessments are being carried to fill data gaps.

6.4 | Unemployment Rate

11.3 | Mode share of public transport

11.5 | Mode share of Non Motorized Transport

12.3 | Quality of Water Supplied

15.4 | Level of Noise Pollution

4.5 Physical Audit

The following map presents the indicators audited at city level.

5. City Score on 15 categories of Assessment

Liveability Assessment covered 15 categories and 78 indicators. The below table presents the scores for all 15 indicators namely governance, identity & culture, education, health, safety and security, economy & employment, housing & inclusiveness, public open spaces, mixed land use & compactness, power supply, transport & mobility, assured water supply, waste water management, solid waste management and reduced pollution.

Table 5: Category wise scores

Categories	Scores in Percentage

Governance	46.02%
Identity & Culture	41%
Education	86%
Health	86%
Safety & Security	64%
Economy & Employment	51%
Housing & Inclusiveness	2%
Public Open Spaces	66%
Mixed Land Use & Compactness	0%
Power Supply	52%
Transport & Mobility	48%
Assured Water Supply	70%
Waste Water Management	47%
Solid Waste Management	67%
Reduced Pollution	80%

The rank of the city is based on the performance and scores in each of the category. The final city rank is submitted separately.

Executive Summary

Assessment of liveability indices is an initiative by the Ministry of Housing and Urban Affairs to improve quality of life of citizens and achieve sustainable development goals by encouraging cities to adopt "outcome based" approach for urban planning. Assessment process aimed to provide opportunity to cities to review the development components holistically by involving 79 measurable indicators categorized under governance, health, education, safety, economy, power supply, transportation and mobility, identity, culture, housing, waste management and pollution.

This report highlights the assessment process, key milestones, and the final outcome of the data submitted. Implementation of liveability assessment commenced formally on 19th January 2018. A national level workshop was organized on 13th February 2018 to explain the importance and process of liveability assessment and get feedback on methodology from the city authorities.

This was followed by the next stage of Questionnaire development. The questionnaire was arranged under 12 categories representing 12 data owners namely urban local body, Central and state pollution control board, development authority, DISCOM/Electricity board, State disaster management authority, state education department, state health department, state renewable energy development agency, state sales and commercial taxes department, town and country planning department, traffic and police department and transport authorities.

An online data entry portal was developed to facilitate data submission by the cities. Each city had a unique log in to access the portal and submit the data. Both online and off-line options (download the questionnaire in an excel) to submit the data were available for cities. An email help desk was set up for the cities to raise any queries and seek clarification when responding to the questions.

A team for each state comprising of State Coordinator and City Coordinator (one per city) was deployed that facilitated the process and supported the cities. A total of 6 regional coordinators/ consultants, 29 State Coordinators, and 99 city coordinators were deployed across 116 cities. Training for state coordinators was held from 26th to 28th February 2018 at Chennai to make coordinators understand overall liveability assessment, indicators, data sources, protocols and roles and responsibilities.

City Reconnaissance Meetings were initiated by the state and city coordinators. The discussion began with discussions to finalize the state workshop schedule, mapping of data owners, and assist cities in data collection. The City Coordinators were based in the cities for over 6 weeks and during this time, they liase with ULB and other data owners to explain the liveability framework, online portal, and facilitate the online submission.

A total of 33 state workshops were conducted at the state level. The objective of the workshop was to orient the city stakeholders on liveability assessment, indicators, components of data collection, timelines, expectations of support and support extended by MoHUA. The state level workshops brought various city level departments on a single platform to understand and discuss the methodology and components of city liveability assessment.

Nodal agency at state level supported by the City and State Coordinator and city level (Municipality corporation/smart city limited) coordinated with city specific data owners/departments for data gathering, collation, and submission. Nodal persons in each department were appointed for timely data collection and submission. Of 116, 112 cities submitted data as per the timeline on 16th April 2018.

Post submission, the city and state coordinators supported by the central team followed up extensively with the cities to support secondary documents as evidence to substantiate their submissions. Secondary documents such as reports, official orders, copy of office register, signed copy of liveability assessment questionnaire furnished by cities against the submitted data. Documents are verified to map the documents for the reponses provided by city and to check the type data provided by city. The document check outcomes were shared with the cities as a part of data quality check.

For checking consistency of data, logical check of data, verifying data from other public sources were undertaken. Quality check was done to ensure data validity and provide opportunity to cities to review the data provided by them and correct in case of wrong data entry.

For 8 selected indicators namely, percentage of services integrated through command and control center, hotel occupancy rate, percentage of schools with access to digital education, number of CCTV cameras per unit road length, percentage of vendors registered and provided formal spaces, availability of passenger information system, percentage of traffic intersection with pedestrian crossing facility, and extent to which universal accessibility is incorporated in public rights of way. Physical audit was conducted in 110 cities by physical auditors appointed and trained by the consortium. In consultation with ULB nodal person, locations and indicators for physical audit was selected in each city. A mobile based application was developed to capture the physical audit related data.

Primary data collection was done for five indicators such as unemployment rates, mode share of public transport, mode share of non-motorized transport, quality of water supplied, and level of noise pollution. Protocols for water and noise test were prepared in consultation with experts. Water quality test involved physical, chemical and bacteriological test of water as per the CPCB norms. For testing quality of water at consumer end, the auditors worked closely with the ULB and Water department. Samples were collected from consumer end and submitted to the lab suggested by city. For noise pollution, in about 20 cities the state pollution board or city level

environment department took the responsibility for providing noise pollution data as per the protocols. In rest of the cities, mobile based application was used to measure noise pollution.

During implementation, MoHUA facilitated the process by conducting video conferences with cities to address any queries, reiterate the importance, and ensure that cities adequately engages in the process and submit their responses in time and respond to requests for clarifications.

In addition to secondary data collection, physical audit and primary data collection, citizen survey was conducted to understand their perception and level of satisfaction on various services such as health, education, water supply, electricity, waste management etc. provided by urban local bodies. Over 60000 citizens participated in the survey across India.

The final scores and ranks have been generated based on the scoring methodology that has been discussed extensively and minor modifications made that are summarized as below:

#	**Challenges**	**Proposed Solutions**
1	Only 23 cities of 111 cities have City Mobility Plan (CMP) or any and hence able to provide data for Mode Share of Public Transport and Non-Motorised Transport. To address the data gap, as advised by the MoHUA, the consortia undertook a sample dipstick across all cities covering a sample of 150 Households. Understandably, the dipstick findings will not match the rigor of a CMP.	We recommend the following: 1) Cities which have provided CMP Data will be evaluated on 100% of the maximum score 2) For the cities where the dipstick data is used, the city receives a 50% discount on the overall score Alternatively, another approach is to assign 0 score to all 88 cities that don't have a CMP
2	Variance was observed on data reported by cities on road network and data presented in the smart city proposals during the verifications.	We recommend taking the data reported by the cities in the Smart City Proposals.
3	There is no secondary source/ organization that provides unemployment data at city level. As a result, most cities do not have the data. Fully cognizance of the challenges of generating this data in a short span of time, it was agreed to collect this data through a dipstick survey on lines of NSSO questions. The	The indicator on unemployment will be excluded from scores. For final ranking, the cities will be scored on 78 indicators.

#	Challenges	Proposed Solutions
	data generated needs further scrutiny and triangulation with some inputs from experts. This may not be possible in the short window.	
4	Many cities did not have data on noise pollution and it was decided that data will be collected using a mobile app for all the 111 cities. However, many cities have expressed reservations with the approach especially with respect to the reliability of using this data. Further, some cities have relied on the SPCB to collect the data as per the approach proposed by the consortia. Thus, noise pollution data is currently from two sources: 1. SPCB- 20 cities 2. Noise-based app- 91 cities	The data collected through the primary survey will be used for scoring the cities. Currently, there is no differential scoring for the data from the SPCB and the data collected through the mobile app. However, a certain higher weightage can be provided to those cities which used the state apparatus to collect noise pollution data.
5	For the indicator on quality of water supplied, the methodology document states that samples should be drawn both at the treatment plant outlet as well as the consumer end. However, the data provided by the cities were predominantly from the distribution point. Hence for consumer end results with MoHUA intervention, consortia coordinated with cities to collect the data at the consumer end. The cities facilitated the testing. The outcome of the process is as below: 1. Sample given- 102 cities 2. Report received- 86 cities 3. Report awaited- 16 cities 4. Tests not completed due to lack of cooperation and other reasons – 9	The maximum score for this indicator will be distributed equally (50%) for results based on samples from the treatment plant and consumer end. Cities that did not complete tests or provide the results will be given a score 0 for against consumer end tests.
6	City level population is not projected annually by most of the cities. So, estimates for 2017 population are not available with the cities.	As recommended by MoHUA, 2011 census population is being used for the ranking purpose.
7	The age category specific data for 9 cities is not available at a city level	The age category specific population data has been taken at a district level for these cities.

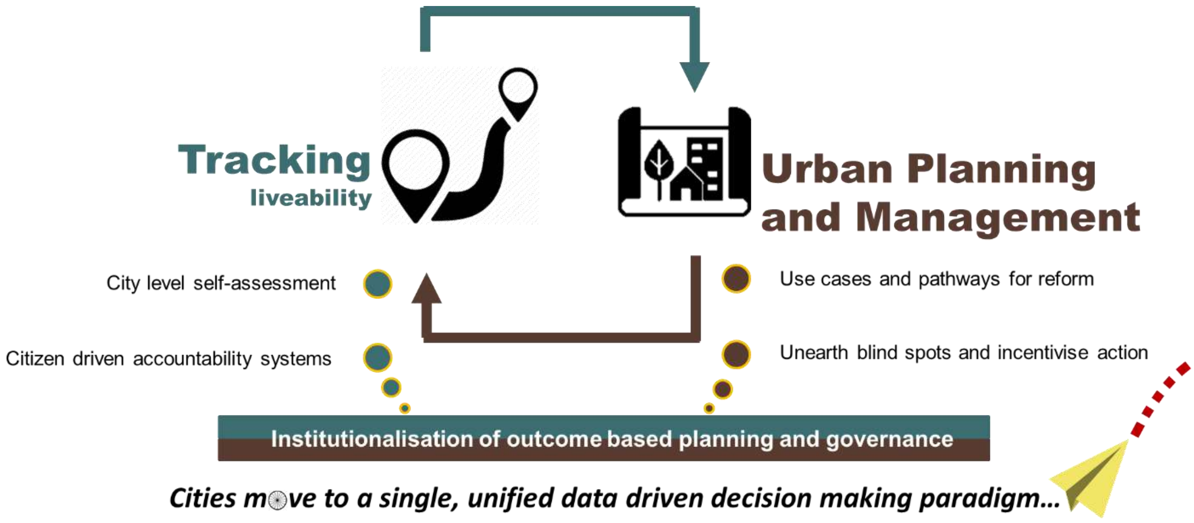
#	Challenges	Proposed Solutions
8	Indicators on non-motorised transports like- Dedicated bicycle tracks, bicycle parking facilities and mode share of non-motorised transport are not relevant for hilly terrains.	As discussed during the PMC meeting, these indicators have been treated as non-applicable for the hilly cities and the weights have been redistributed among other indicators within the same category.
9	The indicator on increase in professional tax is not relevant to cities which do not levy the professional tax.	As discussed during the PMC meeting, this indicator has been non-applicable to the cities belonging to states where professional tax is not levied, and the weights have been redistributed among other indicators within the same category.
10	The indicator on increase in VAT collection is not applicable to Port Blair and Kavaratti, as there was no provision of VAT collection in these cities.	As discussed during the PMC meeting, these indicatosr has been treated as non-applicable for these two cities and the weights have been redistributed among other indicators within the same category.
11	Indicator on coverage of basic services to slum households does not concern cities with no slums (notified/ non-notified.	As discussed during the PMC meeting, this indicators has been treated as non-applicable for these cities and the weights have been redistributed among other indicators within the same category.

1. Introduction

The Ministry of Housing and Urban Affairs (MoHUA) is implementing several flagship urban missions such as the Smart Cities Mission (SCM), Atal Mission for Urban Rejuvenation and Transformation (AMRUT), Heritage City Development and Augmentation Yojana (HRIDAY), Housing for All (HFA). Theses mission along with other transformative initiatives of the Government including National Water Mission, Power for All, National Health Mission are aimed at making Indian cities more 'liveable.' The overarching goal of these initiatives is to move from an input-based approach to a 'citizen centric-outcome based' assessment of urban liveability.

To develop a common minimum framework for cities to assess their existing status and chart their pathway towards providing a better quality of life to their citizens, the MoHUA developed a set of 'Liveability Standards' relevant to cities to generate a Liveability Index and ranking of cities. These standards were launched in June, 2017. The MoHUA has planned to conduct an 'Annual Assessment of Liveability Standards in Cities – an ambitious national project that will involve yearly submission of data by cities across the various indicators, compilation and analysis, development of indices and ranking of cities. The Liveability Index is envisioned as a 360° tool for tracking, planning and transforming Indian cities. The Liveability Index is aimed at the following objectives:

- Providing strong evidence-based approach for future interventions and investments to deliver liveability outcomes
- Catalysing actions to improve the overall quality of the city's liveability and achieve broader development outcomes including the Sustainable Development Goals
- Assessing the implementation of government policies and schemes governing characteristics of cities that can contribute to creating liveable communities

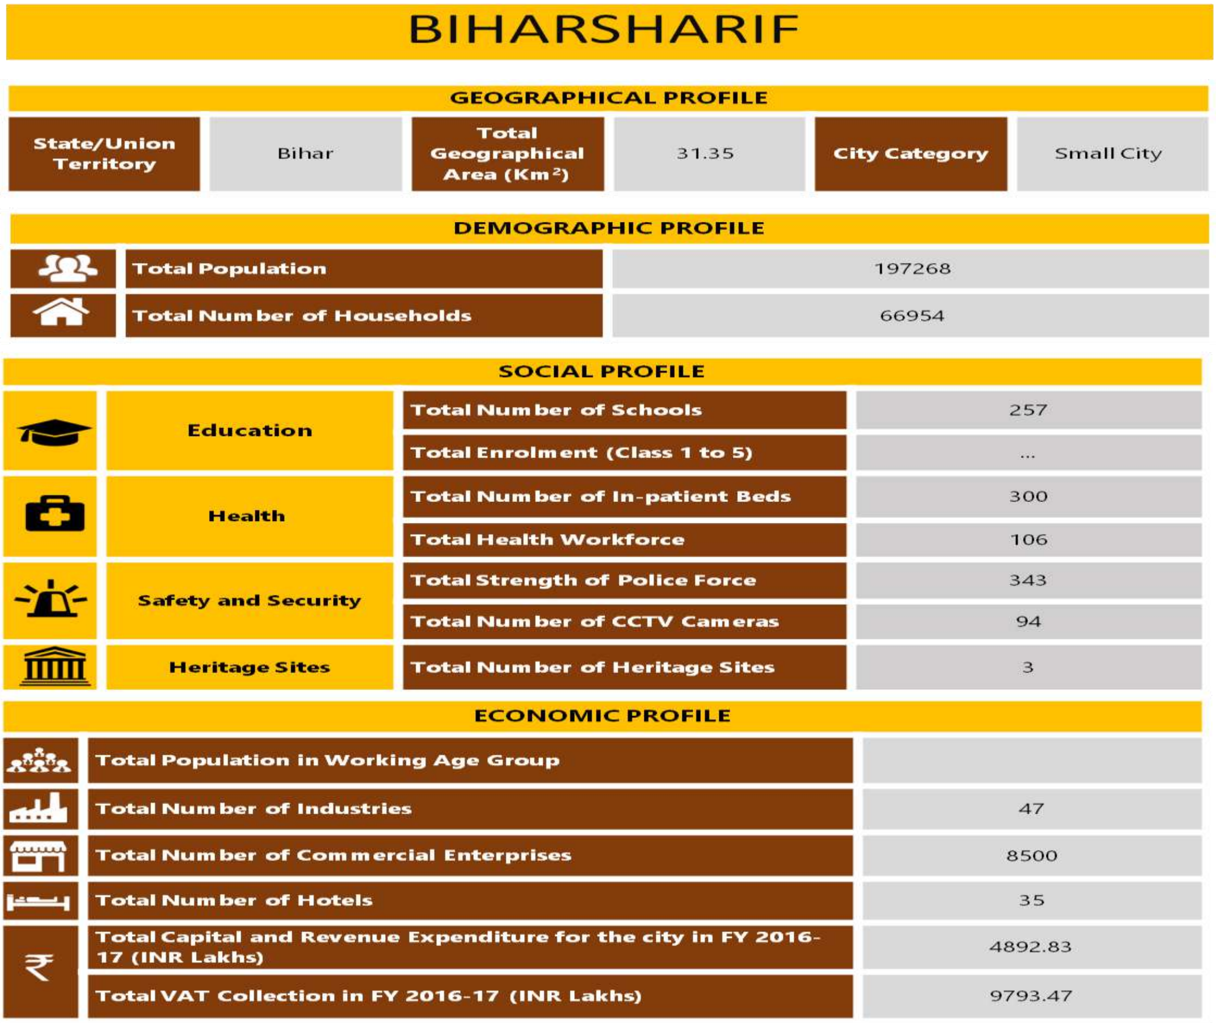


Tracking
liveability
Urban Planning
and Management
City level self-assessment
Citizen driven accountability systems
Use cases and pathways for reform
Unearth blind spots and incentivise action
Institutionalisation of outcome based planning and governance
Cities move to a single, unified data driven decision making paradigm…

The first round of the assessment commenced in January 2018 covering 116 major cities including smart cities, capital cities and cities with population of above one million each. Implementation of the liveability assessment commenced in January 2018 with a national level orientation workshop for the urban local bodies. The workshop aimed at orienting the states and urban local bodies on the overall framework, indicators, data sources, methodology and key milestones and timelines involved in the liveability assessment. Subsequently, a series of State/ Union Territory level orientation workshops were carried out in 33 states/UTs for a detailed discussion on the framework. Online data collection commenced from 9th March through an online data collection platform that supported both online and offline data submission modes. On the date of closure of the online data entry portal i.e., 16th April, 2018 112 cities submitted their data. Subsequently, comprehensive checks on the submitted data was undertaken that involved checking for outliers, logical inconsistencies etc. post which round-1 of data reconciliation was conducted. This draft report is based on round-1 of reconciled data as on 28th April, 2018.

2. City Profile

This chapter presents the city profile -Geographic and Demographic, Social (Education Health, Safety and Security, Heritage), Economic profile, and Physical (Water, sanitation and Waste Management, Electricity, Open space and roads).



BIHARSHARIF

GEOGRAPHICAL PROFILE

State/Union Territory	Bihar	Total Geographical Area (Km²)	31.35	City Category	Small City

DEMOGRAPHIC PROFILE

Total Population	197268
Total Number of Households	66954

SOCIAL PROFILE

Education	Total Number of Schools	257
	Total Enrolment (Class 1 to 5)	...
Health	Total Number of In-patient Beds	300
	Total Health Workforce	106
Safety and Security	Total Strength of Police Force	343
	Total Number of CCTV Cameras	94
Heritage Sites	Total Number of Heritage Sites	3

ECONOMIC PROFILE

Total Population in Working Age Group	
Total Number of Industries	47
Total Number of Commercial Enterprises	8500
Total Number of Hotels	35
Total Capital and Revenue Expenditure for the city in FY 2016-17 (INR Lakhs)	4892.83
Total VAT Collection in FY 2016-17 (INR Lakhs)	9793.47

PHYSICAL PROFILE

Water	Average Quantity of Water Supplied (MLD)	11.5
	Total Number of Water Connection	28050
Sanitation Facilities	Total number of households with access to individual toilets in the city	34000
	Total number of households in the city with access to community toilets in the city	400
Solid Waste Management	Daily average quantity of municipal solid waste collected in the city (Tonnes/day)	160
	Total number of households covered through door-to-door collection of solid waste	44465
Waste Water	Daily Average Quantum of Waste Water Generated in the City (MLD)	9.2
	Daily average quantum of waste water treated by STPs in the city (MLD)	...
Electricity	Total number of authorized electrical connections in the city	50938
	Total electricity supplied to the city (kWh)	174204000
Public and Open Spaces	Total area covered by green spaces in the city (m^2)	3000
Roads and Transport	Total Length of Road Network in the City (Km)	404
	Total length of arterial and sub-arterial road network in the city (Km)	404
	Total length of footpath (wider than 1.2 metres) in the city along the street network (Km)	...

3. Liveability Framework and Indicators

The Liveability Framework comprises a total of 79 indicators (57 Core Indicators and 22 Supporting Indicators). A core indicator carries 70% weightage and a supporting indicator carries 30% weightage. These indicators are grouped under 15 thematic categories which in turn are part of four pillars of comprehensive development of cities i.e., institutional, social, economic and physical. Based on the performance of cities against the various core and supporting indicators, various 'Category Sub-Indexes' and a composite 'City Liveability Index' will be developed for each city.

3.1 Scoring and Computing Category Indices of Liveability

The set of 79 indicators, associated categories and pillars are presented in the table below:

Table 1 List of Pillars, Categories and Indicators

Pillars of Comprehensive Development	Category	Indicators
Institutional	1. Governance	1.1 Percentage of citizen services available online
		1.2 Percentage of services integrated through Command Centre
		1.3 Percentage of citizens using online services
		1.4 Average delay in grievance redressal
		1.5 Tax collected as percentage of tax billed
		1.6 Extent of cost recovery (O&M) in water supply services
		1.7 Capital spending as percentage of total expenditure
		1.8 Percentage of population covered under Ward Committees/Area *Sabhas*
Social	**2. Identity and Culture**	2.1 Restoration and reuse of historic buildings
		2.2 Percentage of ecologically important areas covered through projects for restoration
		2.3 Hotel occupancy

Pillars of Comprehensive Development	Category	Indicators
		2.4 Percentage of budget allocated towards cultural/sports activities
		2.5 Number of cultural/sports events hosted by city
	3. Education	3.1 Percentage of school-aged population enrolled in schools
		3.2 Percentage of female school-aged population enrolled in schools
		3.3 Primary education student-teacher ratio
		3.4 Percentage of schools with access to digital education
		3.5 Percentage of students completing primary education
		3.6 Percentage of students completing secondary education
	4. Health	4.1 Number of in-patient hospital beds per 10,000 population
		4.2 Healthcare professionals per 10,000 population
		4.3 Average response time in case of health emergencies
		4.4 Period prevalence of water borne diseases
		4.5 Period prevalence of vector borne diseases
	5. Safety and Security	5.1 Number of CCTV Cameras
		5.2 Number of recorded crimes per lakh population
		5.3 Extent of crimes recorded against women, children and elderly per year
		5.4 Transport-related fatality per lakh population
Economic	**6. Economy and Employment**	6.1 Increase in VAT/GST collection
		6.2 Increase in collection of Professional Tax

Pillars of Comprehensive Development	Category	Indicators
		6.3 Increase in issuance of Construction permits
		6.4 Unemployment rate
		6.5 Percentage of vendors registered and provided formal spaces
Physical	**7. Housing and Inclusiveness**	7.1 Percentage of Slum/EWS households covered through formal/affordable housing
		7.2 Percentage of slum areas covered through basic services
	8. Public Open Spaces	8.1 Per capita availability of green spaces
		8.2 Per capita availability of public and recreational places
	9. Mixed Land Use and Compactness	9.1 Share of mixed land use area in overall city land use
		9.2 Net Density
	10. Power Supply	10.1 Percentage of city population with authorized electrical services
		10.2 Percentage of electrical connections covered through smart meters
		10.3 Average number of electrical interruptions per year
		10.4 Average length of electrical interruptions per year
		10.5 Percentage of total energy derived from renewable sources
		10.6 Energy consumption per unit - water supply and sewerage
		10.7 Energy consumption per unit - street lighting
		10.8 Percentage of new and redeveloped buildings following green building norms
		10.9 Total energy consumption per capita

Pillars of Comprehensive Development	Category	Indicators
	11. Transportation and Mobility	11.1 Geographical coverage of public transport
		11.2 Availability of public transport
		11.3 Mode share of public transport
		11.4 Percentage of road network with dedicated bicycle tracks
		11.5 Percentage of interchanges with bicycle parking facilities
		11.6 Mode share of non-motorized transport
		11.7 Availability of Passenger Information System
		11.8 Extent of signal synchronization
		11.9 Availability of paid parking spaces
		11.10 Percentage coverage of footpaths – wider than 1.2 m
		11.11 Percentage of traffic intersections with pedestrian crossing facilities
		11.12 Extent to which universal accessibility is incorporated in public rights-of-way
	12. Assured Water Supply	12.1 Household level coverage of direct water supply connections
		12.2 Per capita supply of water
		12.3 Quality of water supplied
		12.4 Level of non-revenue water – NRW
		12.5 Percentage of water connections covered through meters
		12.6 Percentage of plots with rainwater harvesting facility
	13. Waste Water	13.1 Coverage of toilets

Pillars of Comprehensive Development	Category	Indicators
	Management	13.2 Coverage of sewerage network and/or septage
		13.3 Collection efficiency of sewerage network
		13.4 Extent of reuse and recycling of waste water
		13.5 Coverage of storm water drains
	14. Solid Waste Management	14.1 Household level coverage of municipal solid waste collection
		14.2 Efficiency of collection of municipal solid waste
		14.3 Extent of municipal solid waste recovered through reuse
	15. Reduced Pollution	15.1 Concentration of SO2- air pollution
		15.2 Concentration of NO2- air pollution
		15.3 Concentration of PM10 - air pollution
		15.4 Level of noise pollution
		15.5 Quality of water in public surface water bodies

3.2 Scoring and Computing Category Indices of Liveability

The performance achieved by cities against 79 indicators, will be assessed against given benchmarks. Where no international/national norms are available, city with the best performance in its group (population range) will be treated as a benchmark. The groups are given in the table below.

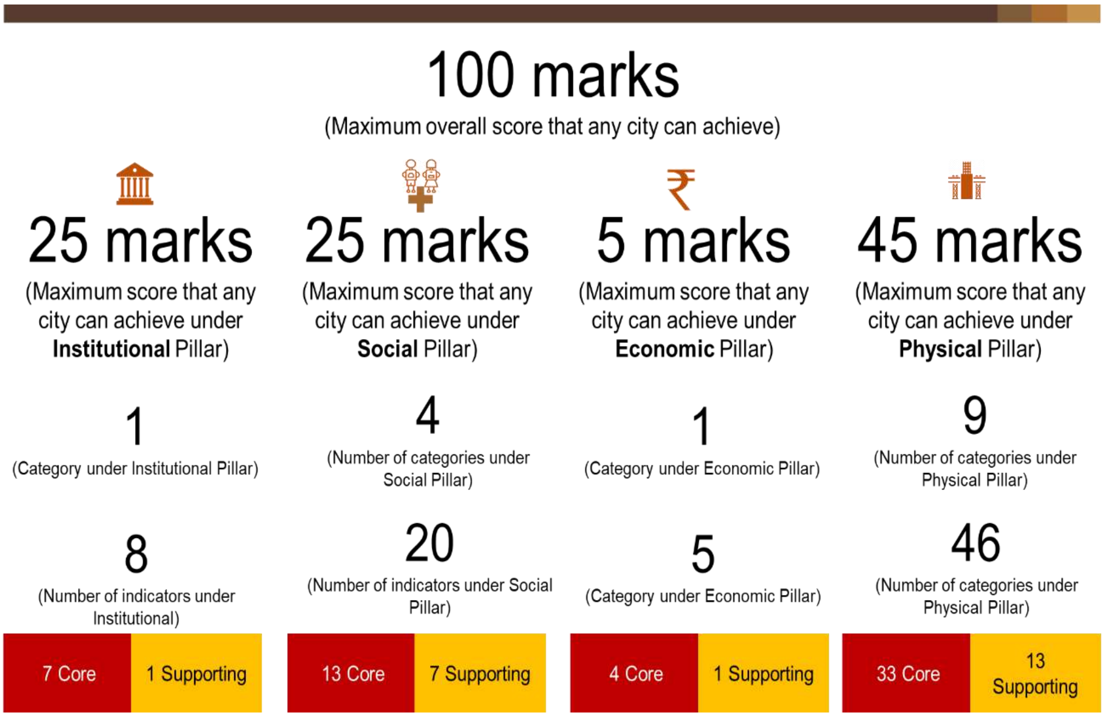
Table 2 Details on Population Range

Category	Population range
Category 1	Population ≥ 4 million
Category 2	1 million ≤ Population < 4 million

Category 3	0.5 million ≤ Population < 1 million
Category 4	Population < 0.5 million

3.3 Scoring Approach and Methodology

A city can earn a maximum score of 100 points for 79 indicators across four pillars. The pillar weights are as follows: Institutional (25 points), Social (25 points), Economy and Employment (5 points) and Physical (45 points). Based on the number and nature of indicators i.e., core vs. secondary, indicator wise maximum marks were computed.



100 marks

(Maximum overall score that any city can achieve)

25 marks

(Maximum score that any city can achieve under **Institutional** Pillar)

1

(Category under Institutional Pillar)

8

(Number of indicators under Institutional)

7 Core | 1 Supporting

25 marks

(Maximum score that any city can achieve under **Social** Pillar)

4

(Number of categories under Social Pillar)

20

(Number of indicators under Social Pillar)

13 Core | 7 Supporting

5 marks

(Maximum score that any city can achieve under **Economic** Pillar)

1

(Category under Economic Pillar)

5

(Category under Economic Pillar)

4 Core | 1 Supporting

45 marks

(Maximum score that any city can achieve under **Physical** Pillar)

9

(Number of categories under Physical Pillar)

46

(Number of categories under Physical Pillar)

33 Core | 13 Supporting

Dimensional Index Methodology (DIM) has been used to compute scores for each indicator with reference to "maximum within the comparison group" or "absolute benchmarks". For indicators where benchmarks are available, cities getting the benchmark score (or above) are given the maximum mark, and the marks awarded to other cities are calculated proportionately. For indicators where benchmarks are not available, the best performing cities in each population group are given the maximum mark, and the marks awarded to other cities (within the population group) are calculated proportionately. For indicators where benchmarks do not exist, the city data has been tested for outliers before scoring.

3.4 Scoring Normalisation:

To construct aggregate scores across cities as well as to make the scores across indicators comparable, indicator values were normalised using a min-max approach. The following formula was used to normalise the indicator values-

$$\frac{indicator\ value\ for\ the\ city - indicator\ value\ for\ the\ worst\ performing\ city}{benchmark - \ indicator\ value\ for\ the\ worst\ performing\ city}$$

This approach would restrict the normalised indicator value between 0 and 1. Cities that met or exceeded the benchmark received a normalised indicator value of 1. Worst performing cities are given a normalised indicator value of 0. After normalisation, the normalised value is weighted according to the category and the indicator being core or supporting.

To illustrate, consider the indicator 12.3 Quality of Water Supplied in the Category 12 for Assured Water Supply. If in City A 50% of the water samples collected qualify the potable water standards specified by the CPHEEO, and only 10% of the samples from worst performing city qualify the standards. Then, the normalised value for the indicator for city A would be 0.44 [(0.5-0.1)/(1-0.1)].

The weight for indicator 12.3 is 1.03, so the final weighted score for City A would come out to 0.45 [1.03*0.44].

4. Data Collection and Verification

4.1 Submission of Data by the cities

The Liveability Assessment is based on secondary data submitted by the urban local bodies and other concerned government agencies (collectively called as data owners). The 79 indicators were broken down into a set of easy to understand and relatable 553 questions mapped to data owners. Submission of the data was enabled through an online data entry portal on the smartnet platform of the Ministry. The portal also allowed the ULBs to download the liveability assessment questionnaire and upload filled in questionnaire. To familiarise and assist cities in identifying, mapping and collation of data points, a city level nodal person was available during the entire period of data submission process.

4.2 Mapping of Data Owners for the City

For the assessment of liveability indices broadly 12 data owners such as Central/state Pollution control board, Development authority, DISCOM/Electricity Board, State Disaster Management Authority, State Education Department, State Health department, State Renewable energy and

development agency, State sales and commercial taxes department, town and country planning department, Traffic and police department, Transport authority, and Urban local body were identified to respond to the questions on the portal. However, during state workshop and subsequent city level discussions, more data owners were mapped to respond to different categories and sub categories. The following table provides the details of city level data owners mapped under the 12 data owner.

Table 3:Details of Data Owners

Designated data owners	Subcategories	Data owners at city level
Urban Local Body	For Accounts Related Questions	Account Department, Bihar Sharif Municipal Corporation
Urban Local Body	For Park and Recreation Related Questions	Engineering Department, Bihar Sharif Municipal Corporation
Urban Local Body	For Water Supply and Drainage related questions	Engineering Department, Bihar Sharif Municipal Corporation
Urban Local Body	For Heritage sites related data	Bihar Sharif Municipal Corporation
Urban Local Body	For Ecological sites related data	Bihar Sharif Municipal Corporation
Urban Local Body	For Housing related data	Social development Section, Bihar Sharif Municipal Corporation
Urban Local Body	For Building plan related data	Engineering Department, Bihar Sharif Municipal Corporation
Urban Local Body	For Roads related data	Engineering Department, Bihar Sharif Municipal Corporation
Urban Local Body	For Solid waste management related data	Bihar Sharif Municipal Corporation
Urban Local Body	For IT services related data	IT section, Bihar Sharif Municipal Corporation
Urban Local Body	For Vendor committee related data	Social Development Section, Bihar Sharif Municipal Corporation
Urban Local Body	Any other departments involved in providing data for questions mentioned under Urban Local Body	
Central / state Pollution control Board	Water Quality, Air Quality, Noise Quality	State Pollution Control Board, Bihar
Development Authority	Building Infrastructure	Engineering Department, Bihar Sharif Municipal Corporation

Designated data owners	Subcategories	Data owners at city level
	Construction planning	Engineering Department, Bihar Sharif Municipal Corporation
	Green Building	Engineering Department, Bihar Sharif Municipal Corporation
	Rain water harvesting	Engineering Department, Bihar Sharif Municipal Corporation
	Universal Design Principle	Engineering Department, Bihar Sharif Municipal Corporation

	Tramways	
	Marine Transport Authority	

4.3 List of secondary documents available as supportive

City has provided supporting documents/evidences against the responses given by city on the online portal. In support of their responses on the portal, city submitted 9 number of documents. Documents submitted includes reports, official orders, copy of data maintained in official register, signed copy of questionnaire, and signed letters/submissions from concern departments. Verification includes mapping of documents against responses given by city, checking the type/category of documents, and validation of data provided.

The following table presents the data owner wise number of documents:

Table 4: Data owner wise number of secondary documents submitted by city

Data Owners	Number of Documents
Sales and Commercial Taxes	**1**
State Education Department	**1**
DISCOM/Electricity Department	**2**
Traffic and Police Department	**1**
Development Authority	**0**
Pollution Control Board	**0**
State Renewable Energy Department	**0**
Town and Country Planning	**0**
State Health Department	**1**
Transport Authority	**1**
Disaster Management	**1**
Urban Local Body	**1**
Total	**9***

* The count of documents is based on first round of submission.

4.4 Data Verification

A three-stage data quality check comprising verification of data against secondary documents furnished by data owners, logical inconsistency checks including outliers, and physical audit for select indicators (Refer the exhibit below) is being undertaken. The objective of the data quality check is to ensure that data from the source documents are accurate and verifiable. Sources of data included reports, administrative data, survey results and other statistical records, log books among other.

Physical audit of eight indicators – one indicator from the Institutional pillar, one from the Social pillar, one from the Economy pillar and five from the Physical pillar is also being carried out by the

field team to ascertain the degree of reliability of data reported by the cities. The list of these eight indicators is presented below:

- 1.2 | Percentage of services integrated through Command Centre
- 2.3 | Hotel occupancy
- 3.4 | Percentage of schools with access to digital education
- **5.1**| Number of streets, public places, junctions covered through surveillance systems
- 6.5 | Percentage of vendors registered and provided formal spaces
- 11.7 | Availability of Passenger Information System
- 11.11 | Percentage of traffic intersections with pedestrian crossing facilities
- 11.12 | Extent to which universal accessibility is incorporated in public rights-of-way

For a set of five indicators namely, unemployment rate, mode share of public transport, mode share of non-motorised transport, quality of water supplied and level of noise pollution, existing datasets were found to be not available consistently across all cities and/or were inadequate. To help cities that do not have data on these five indicators, dipstick assessments are being carried to fill data gaps.

- 6.4 | Unemployment Rate
- 11.3 | Mode share of public transport
- 11.5 | Mode share of Non Motorized Transport
- 12.3 | Quality of Water Supplied
- 15.4 | Level of Noise Pollution

4.5 Physical Audit

The following map presents the indicators audited at city level.

5. City Score on 15 categories of Assessment

Liveability Assessment covered 15 categories and 78 indicators. The below table presents the scores for all 15 indicators namely governance, identity & culture, education, health, safety and security, economy & employment, housing & inclusiveness, public open spaces, mixed land use & compactness, power supply, transport & mobility, assured water supply, waste water management, solid waste management and reduced pollution.

Table 5: Category wise scores

Categories	Scores in Percentage
Governance	30.38%
Identity & Culture	60%
Education	2%
Health	63%
Safety & Security	63%
Economy & Employment	18%
Housing & Inclusiveness	10%

Public Open Spaces	0%
Mixed Land Use & Compactness	0%
Power Supply	40%
Transport & Mobility	8%
Assured Water Supply	35%
Waste Water Management	34%
Solid Waste Management	64%
Reduced Pollution	7%

The rank of the city is based on the performance and scores in each of the category. The final city rank is submitted separately.

Executive Summary

Assessment of liveability indices is an initiative by the Ministry of Housing and Urban Affairs to improve quality of life of citizens and achieve sustainable development goals by encouraging cities to adopt "outcome based" approach for urban planning. Assessment process aimed to provide opportunity to cities to review the development components holistically by involving 79 measurable indicators categorized under governance, health, education, safety, economy, power supply, transportation and mobility, identity, culture, housing, waste management and pollution.

This report highlights the assessment process, key milestones, and the final outcome of the data submitted. Implementation of liveability assessment commenced formally on 19th January 2018. A national level workshop was organized on 13th February 2018 to explain the importance and process of liveability assessment and get feedback on methodology from the city authorities.

This was followed by the next stage of Questionnaire development. The questionnaire was arranged under 12 categories representing 12 data owners namely urban local body, Central and state pollution control board, development authority, DISCOM/Electricity board, State disaster management authority, state education department, state health department, state renewable energy development agency, state sales and commercial taxes department, town and country planning department, traffic and police department and transport authorities.

An online data entry portal was developed to facilitate data submission by the cities. Each city had a unique log in to access the portal and submit the data. Both online and off-line options (download the questionnaire in an excel) to submit the data were available for cities. An email help desk was set up for the cities to raise any queries and seek clarification when responding to the questions.

A team for each state comprising of State Coordinator and City Coordinator (one per city) was deployed that facilitated the process and supported the cities. A total of 6 regional coordinators/ consultants, 29 State Coordinators, and 99 city coordinators were deployed across 116 cities. Training for state coordinators was held from 26th to 28th February 2018 at Chennai to make coordinators understand overall liveability assessment, indicators, data sources, protocols and roles and responsibilities.

City Reconnaissance Meetings were initiated by the state and city coordinators. The discussion began with discussions to finalize the state workshop schedule, mapping of data owners, and assist cities in data collection. The City Coordinators were based in the cities for over 6 weeks and during this time, they liase with ULB and other data owners to explain the liveability framework, online portal, and facilitate the online submission.

A total of 33 state workshops were conducted at the state level. The objective of the workshop was to orient the city stakeholders on liveability assessment, indicators, components of data collection, timelines, expectations of support and support extended by MoHUA. The state level workshops brought various city level departments on a single platform to understand and discuss the methodology and components of city liveability assessment.

Nodal agency at state level supported by the City and State Coordinator and city level (Municipality corporation/smart city limited) coordinated with city specific data owners/departments for data gathering, collation, and submission. Nodal persons in each department were appointed for timely data collection and submission. Of 116, 112 cities submitted data as per the timeline on 16th April 2018.

Post submission, the city and state coordinators supported by the central team followed up extensively with the cities to support secondary documents as evidence to substantiate their submissions. Secondary documents such as reports, official orders, copy of office register, signed copy of liveability assessment questionnaire furnished by cities against the submitted data. Documents are verified to map the documents for the reponses provided by city and to check the type data provided by city. The document check outcomes were shared with the cities as a part of data quality check.

For checking consistency of data, logical check of data, verifying data from other public sources were undertaken. Quality check was done to ensure data validity and provide opportunity to cities to review the data provided by them and correct in case of wrong data entry.

For 8 selected indicators namely, percentage of services integrated through command and control center, hotel occupancy rate, percentage of schools with access to digital education, number of CCTV cameras per unit road length, percentage of vendors registered and provided formal spaces, availability of passenger information system, percentage of traffic intersection with pedestrian crossing facility, and extent to which universal accessibility is incorporated in public rights of way. Physical audit was conducted in 110 cities by physical auditors appointed and trained by the consortium. In consultation with ULB nodal person, locations and indicators for physical audit was selected in each city. A mobile based application was developed to capture the physical audit related data.

Primary data collection was done for five indicators such as unemployment rates, mode share of public transport, mode share of non-motorized transport, quality of water supplied, and level of noise pollution. Protocols for water and noise test were prepared in consultation with experts. Water quality test involved physical, chemical and bacteriological test of water as per the CPCB norms. For testing quality of water at consumer end, the auditors worked closely with the ULB and Water department. Samples were collected from consumer end and submitted to the lab suggested by city. For noise pollution, in about 20 cities the state pollution board or city level

environment department took the responsibility for providing noise pollution data as per the protocols. In rest of the cities, mobile based application was used to measure noise pollution.

During implementation, MoHUA facilitated the process by conducting video conferences with cities to address any queries, reiterate the importance, and ensure that cities adequately engages in the process and submit their responses in time and respond to requests for clarifications.

In addition to secondary data collection, physical audit and primary data collection, citizen survey was conducted to understand their perception and level of satisfaction on various services such as health, education, water supply, electricity, waste management etc. provided by urban local bodies. Over 60000 citizens participated in the survey across India.

The final scores and ranks have been generated based on the scoring methodology that has been discussed extensively and minor modifications made that are summarized as below:

#	**Challenges**	**Proposed Solutions**
1	Only 23 cities of 111 cities have City Mobility Plan (CMP) or any and hence able to provide data for Mode Share of Public Transport and Non-Motorised Transport. To address the data gap, as advised by the MoHUA, the consortia undertook a sample dipstick across all cities covering a sample of 150 Households. Understandably, the dipstick findings will not match the rigor of a CMP.	We recommend the following: 1) Cities which have provided CMP Data will be evaluated on 100% of the maximum score 2) For the cities where the dipstick data is used, the city receives a 50% discount on the overall score Alternatively, another approach is to assign 0 score to all 88 cities that don't have a CMP
2	Variance was observed on data reported by cities on road network and data presented in the smart city proposals during the verifications.	We recommend taking the data reported by the cities in the Smart City Proposals.
3	There is no secondary source/ organization that provides unemployment data at city level. As a result, most cities do not have the data. Fully cognizance of the challenges of generating this data in a short span of time, it was agreed to collect this data through a dipstick survey on lines of NSSO questions. The	The indicator on unemployment will be excluded from scores. For final ranking, the cities will be scored on 78 indicators.

#	Challenges	Proposed Solutions
	data generated needs further scrutiny and triangulation with some inputs from experts. This may not be possible in the short window.	
4	Many cities did not have data on noise pollution and it was decided that data will be collected using a mobile app for all the 111 cities. However, many cities have expressed reservations with the approach especially with respect to the reliability of using this data. Further, some cities have relied on the SPCB to collect the data as per the approach proposed by the consortia. Thus, noise pollution data is currently from two sources: 1. SPCB- 20 cities 2. Noise-based app- 91 cities	The data collected through the primary survey will be used for scoring the cities. Currently, there is no differential scoring for the data from the SPCB and the data collected through the mobile app. However, a certain higher weightage can be provided to those cities which used the state apparatus to collect noise pollution data.
5	For the indicator on quality of water supplied, the methodology document states that samples should be drawn both at the treatment plant outlet as well as the consumer end. However, the data provided by the cities were predominantly from the distribution point. Hence for consumer end results with MoHUA intervention, consortia coordinated with cities to collect the data at the consumer end. The cities facilitated the testing. The outcome of the process is as below: 1. Sample given- 102 cities 2. Report received- 86 cities 3. Report awaited- 16 cities 4. Tests not completed due to lack of cooperation and other reasons – 9	The maximum score for this indicator will be distributed equally (50%) for results based on samples from the treatment plant and consumer end. Cities that did not complete tests or provide the results will be given a score 0 for against consumer end tests.
6	City level population is not projected annually by most of the cities. So, estimates for 2017 population are not available with the cities.	As recommended by MoHUA, 2011 census population is being used for the ranking purpose.
7	The age category specific data for 9 cities is not available at a city level	The age category specific population data has been taken at a district level for these cities.

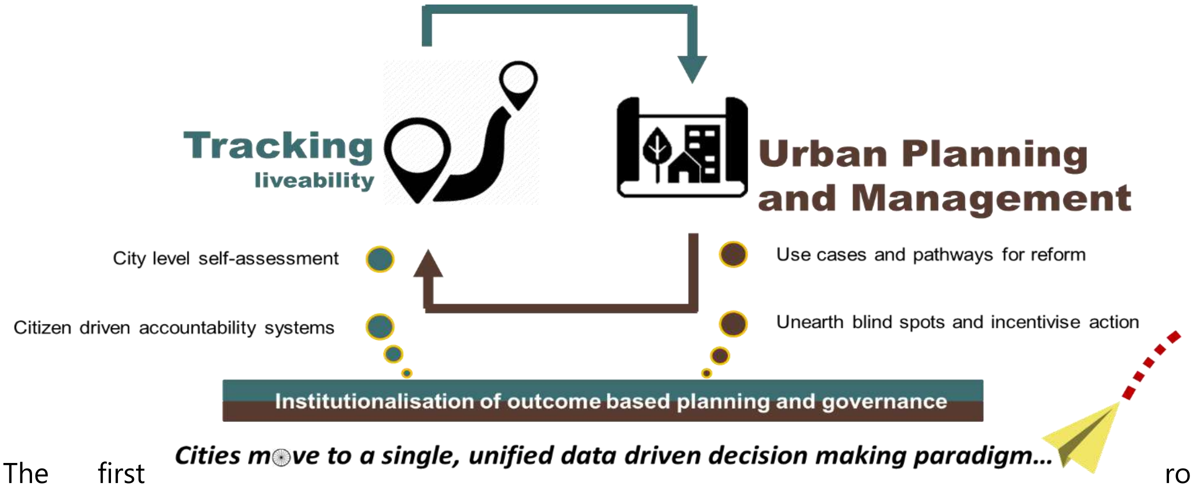
#	Challenges	Proposed Solutions
8	Indicators on non-motorised transports like- Dedicated bicycle tracks, bicycle parking facilities and mode share of non-motorised transport are not relevant for hilly terrains.	As discussed during the PMC meeting, these indicators have been treated as non-applicable for the hilly cities and the weights have been redistributed among other indicators within the same category.
9	The indicator on increase in professional tax is not relevant to cities which do not levy the professional tax.	As discussed during the PMC meeting, this indicator has been non-applicable to the cities belonging to states where professional tax is not levied, and the weights have been redistributed among other indicators within the same category.
10	The indicator on increase in VAT collection is not applicable to Port Blair and Kavaratti, as there was no provision of VAT collection in these cities.	As discussed during the PMC meeting, these indicatosr has been treated as non-applicable for these two cities and the weights have been redistributed among other indicators within the same category.
11	Indicator on coverage of basic services to slum households does not concern cities with no slums (notified/ non-notified.	As discussed during the PMC meeting, this indicators has been treated as non-applicable for these cities and the weights have been redistributed among other indicators within the same category.

1. Introduction

The Ministry of Housing and Urban Affairs (MoHUA) is implementing several flagship urban missions such as the Smart Cities Mission (SCM), Atal Mission for Urban Rejuvenation and Transformation (AMRUT), Heritage City Development and Augmentation Yojana (HRIDAY), Housing for All (HFA). Theses mission along with other transformative initiatives of the Government including National Water Mission, Power for All, National Health Mission are aimed at making Indian cities more 'liveable.' The overarching goal of these initiatives is to move from an input-based approach to a 'citizen centric-outcome based' assessment of urban liveability.

To develop a common minimum framework for cities to assess their existing status and chart their pathway towards providing a better quality of life to their citizens, the MoHUA developed a set of 'Liveability Standards' relevant to cities to generate a Liveability Index and ranking of cities. These standards were launched in June, 2017. The MoHUA has planned to conduct an 'Annual Assessment of Liveability Standards in Cities – an ambitious national project that will involve yearly submission of data by cities across the various indicators, compilation and analysis, development of indices and ranking of cities. The Liveability Index is envisioned as a 360° tool for tracking, planning and transforming Indian cities. The Liveability Index is aimed at the following objectives:

- Providing strong evidence-based approach for future interventions and investments to deliver liveability outcomes
- Catalysing actions to improve the overall quality of the city's liveability and achieve broader development outcomes including the Sustainable Development Goals
- Assessing the implementation of government policies and schemes governing characteristics of cities that can contribute to creating liveable communities

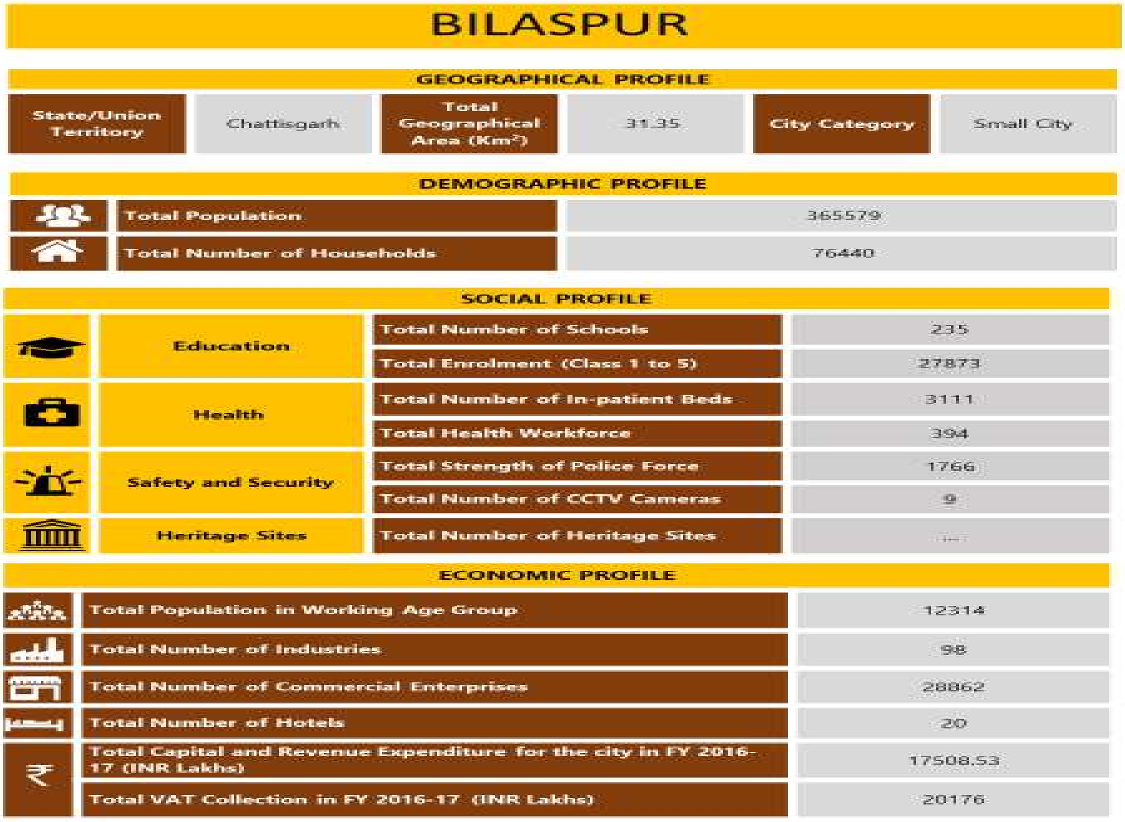


Tracking
liveability
Urban Planning
and Management
City level self-assessment
Citizen driven accountability systems
Use cases and pathways for reform
Unearth blind spots and incentivise action
Institutionalisation of outcome based planning and governance
Cities m⦿ve to a single, unified data driven decision making paradigm…

The first round of the assessment commenced in January 2018 covering 116 major cities including smart cities, capital cities and cities with population of above one million each. Implementation of the liveability assessment commenced in January 2018 with a national level orientation workshop for the urban local bodies. The workshop aimed at orienting the states and urban local bodies on the overall framework, indicators, data sources, methodology and key milestones and timelines involved in the liveability assessment. Subsequently, a series of State/ Union Territory level orientation workshops were carried out in 33 states/UTs for a detailed discussion on the framework. Online data collection commenced from 9th March through an online data collection platform that supported both online and offline data submission modes. On the date of closure of the online data entry portal i.e., 16th April, 2018 112 cities submitted their data. Subsequently, comprehensive checks on the submitted data was undertaken that involved checking for outliers, logical inconsistencies etc. post which round-1 of data reconciliation was conducted. This draft report is based on round-1 of reconciled data as on 28th April, 2018.

2. City Profile

This chapter presents the city profile -Geographic and Demographic, Social (Education Health, Safety and Security, Heritage), Economic profile, and Physical (Water, sanitation and Waste Management, Electricity, Open space and roads).



BILASPUR

GEOGRAPHICAL PROFILE

State/Union Territory	Chattisgarh	Total Geographical Area (Km²)	31.35	City Category	Small City

DEMOGRAPHIC PROFILE

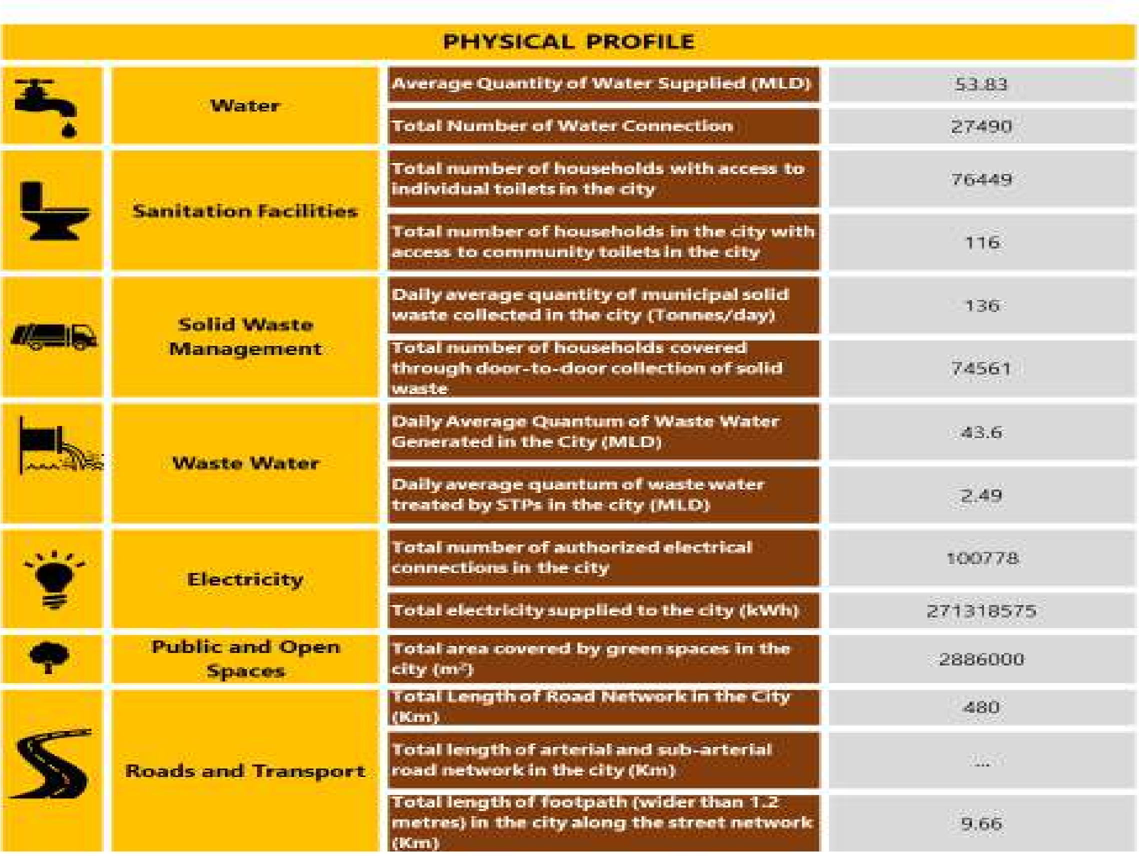
Total Population	365579
Total Number of Households	76440

SOCIAL PROFILE

Education	Total Number of Schools	235
	Total Enrolment (Class 1 to 5)	27873
Health	Total Number of In-patient Beds	3111
	Total Health Workforce	394
Safety and Security	Total Strength of Police Force	1766
	Total Number of CCTV Cameras	9
Heritage Sites	Total Number of Heritage Sites	----

ECONOMIC PROFILE

Total Population in Working Age Group	12314
Total Number of Industries	98
Total Number of Commercial Enterprises	28862
Total Number of Hotels	20
Total Capital and Revenue Expenditure for the city in FY 2016-17 (INR Lakhs)	17508.53
Total VAT Collection in FY 2016-17 (INR Lakhs)	20176



PHYSICAL PROFILE		
Water	Average Quantity of Water Supplied (MLD)	53.83
	Total Number of Water Connection	27490
Sanitation Facilities	Total number of households with access to individual toilets in the city	76449
	Total number of households in the city with access to community toilets in the city	116
Solid Waste Management	Daily average quantity of municipal solid waste collected in the city (Tonnes/day)	136
	Total number of households covered through door-to-door collection of solid waste	74561
Waste Water	Daily Average Quantum of Waste Water Generated in the City (MLD)	43.6
	Daily average quantum of waste water treated by STPs in the city (MLD)	2.49
Electricity	Total number of authorized electrical connections in the city	100778
	Total electricity supplied to the city (kWh)	271318575
Public and Open Spaces	Total area covered by green spaces in the city (m²)	2886000
Roads and Transport	Total Length of Road Network in the City (Km)	480
	Total length of arterial and sub-arterial road network in the city (Km)	...
	Total length of footpath (wider than 1.2 metres) in the city along the street network (Km)	9.66

3. Liveability Framework and Indicators

The Liveability Framework comprises a total of 79 indicators (57 Core Indicators and 22 Supporting Indicators). A core indicator carries 70% weightage and a supporting indicator carries 30% weightage. These indicators are grouped under 15 thematic categories which in turn are part of four pillars of comprehensive development of cities i.e., institutional, social, economic and physical. Based on the performance of cities against the various core and supporting indicators, various 'Category Sub-Indexes' and a composite 'City Liveability Index' will be developed for each city.

3.1 Scoring and Computing Category Indices of Liveability

The set of 79 indicators, associated categories and pillars are presented in the table below:

Table 1 List of Pillars, Categories and Indicators

Pillars of Comprehensive Development	Category	Indicators
Institutional	1. Governance	1.1 Percentage of citizen services available online
		1.2 Percentage of services integrated through Command Centre
		1.3 Percentage of citizens using online services
		1.4 Average delay in grievance redressal
		1.5 Tax collected as percentage of tax billed
		1.6 Extent of cost recovery (O&M) in water supply services
		1.7 Capital spending as percentage of total expenditure
		1.8 Percentage of population covered under Ward Committees/Area *Sabhas*
Social	**2. Identity and Culture**	2.1 Restoration and reuse of historic buildings
		2.2 Percentage of ecologically important areas covered through projects for restoration
		2.3 Hotel occupancy
		2.4 Percentage of budget allocated towards cultural/sports activities
		2.5 Number of cultural/sports events hosted by city
	3. Education	3.1 Percentage of school-aged population enrolled in schools
		3.2 Percentage of female school-aged population enrolled in schools
		3.3 Primary education student-teacher ratio
		3.4 Percentage of schools with access to digital education
		3.5 Percentage of students completing primary education
		3.6 Percentage of students completing secondary education
	4. Health	4.1 Number of in-patient hospital beds per 10,000 population
		4.2 Healthcare professionals per 10,000 population
		4.3 Average response time in case of health emergencies
		4.4 Period prevalence of water borne diseases
		4.5 Period prevalence of vector borne diseases

Pillars of Comprehensive Development	Category	Indicators
	5. Safety and Security	5.1 Number of CCTV Cameras
		5.2 Number of recorded crimes per lakh population
		5.3 Extent of crimes recorded against women, children and elderly per year
		5.4 Transport-related fatality per lakh population
Economic	**6. Economy and Employment**	6.1 Increase in VAT/GST collection
		6.2 Increase in collection of Professional Tax
		6.3 Increase in issuance of Construction permits
		6.4 Unemployment rate
		6.5 Percentage of vendors registered and provided formal spaces
Physical	**7. Housing and Inclusiveness**	7.1 Percentage of Slum/EWS households covered through formal/affordable housing
		7.2 Percentage of slum areas covered through basic services
	8. Public Open Spaces	8.1 Per capita availability of green spaces
		8.2 Per capita availability of public and recreational places
	9. Mixed Land Use and Compactness	9.1 Share of mixed land use area in overall city land use
		9.2 Net Density
	10. Power Supply	10.1 Percentage of city population with authorized electrical services
		10.2 Percentage of electrical connections covered through smart meters
		10.3 Average number of electrical interruptions per year
		10.4 Average length of electrical interruptions per year
		10.5 Percentage of total energy derived from renewable sources
		10.6 Energy consumption per unit - water supply and sewerage
		10.7 Energy consumption per unit - street lighting
		10.8 Percentage of new and redeveloped buildings following green building norms
		10.9 Total energy consumption per capita
	11. Transportation and Mobility	11.1 Geographical coverage of public transport
		11.2 Availability of public transport
		11.3 Mode share of public transport
		11.4 Percentage of road network with dedicated bicycle

Pillars of Comprehensive Development	Category	Indicators
		tracks
		11.5 Percentage of interchanges with bicycle parking facilities
		11.6 Mode share of non-motorized transport
		11.7 Availability of Passenger Information System
		11.8 Extent of signal synchronization
		11.9 Availability of paid parking spaces
		11.10 Percentage coverage of footpaths – wider than 1.2 m
		11.11 Percentage of traffic intersections with pedestrian crossing facilities
		11.12 Extent to which universal accessibility is incorporated in public rights-of-way
	12. Assured Water Supply	12.1 Household level coverage of direct water supply connections
		12.2 Per capita supply of water
		12.3 Quality of water supplied
		12.4 Level of non-revenue water – NRW
		12.5 Percentage of water connections covered through meters
		12.6 Percentage of plots with rainwater harvesting facility
	13. Waste Water Management	13.1 Coverage of toilets
		13.2 Coverage of sewerage network and/or septage
		13.3 Collection efficiency of sewerage network
		13.4 Extent of reuse and recycling of waste water
		13.5 Coverage of storm water drains
	14. Solid Waste Management	14.1 Household level coverage of municipal solid waste collection
		14.2 Efficiency of collection of municipal solid waste
		14.3 Extent of municipal solid waste recovered through reuse
	15. Reduced Pollution	15.1 Concentration of SO2- air pollution
		15.2 Concentration of NO2- air pollution
		15.3 Concentration of PM10 - air pollution
		15.4 Level of noise pollution
		15.5 Quality of water in public surface water bodies

3.2 Scoring and Computing Category Indices of Liveability

The performance achieved by cities against 79 indicators, will be assessed against given benchmarks. Where no international/national norms are available, city with the best performance in its group (population range) will be treated as a benchmark. The groups are given in the table below.

Table 2 Details on Population Range

Category	Population range
Category 1	Population ≥ 4 million
Category 2	1 million ≤ Population < 4 million
Category 3	0.5 million ≤ Population < 1 million
Category 4	Population < 0.5 million

3.3 Scoring Approach and Methodology

A city can earn a maximum score of 100 points for 79 indicators across four pillars. The pillar weights are as follows: Institutional (25 points), Social (25 points), Economy and Employment (5 points) and Physical (45 points). Based on the number and nature of indicators i.e., core vs. secondary, indicator wise maximum marks were computed.

100 marks

(Maximum overall score that any city can achieve)

25 marks	**25 marks**	**5 marks**	**45 marks**
(Maximum score that any city can achieve under **Institutional** Pillar)	(Maximum score that any city can achieve under **Social** Pillar)	(Maximum score that any city can achieve under **Economic** Pillar)	(Maximum score that any city can achieve under **Physical** Pillar)
1	4	1	9
(Category under Institutional Pillar)	(Number of categories under Social Pillar)	(Category under Economic Pillar)	(Number of categories under Physical Pillar)
8	20	5	46
(Number of indicators under Institutional)	(Number of indicators under Social Pillar)	(Category under Economic Pillar)	(Number of categories under Physical Pillar)
7 Core 1 Supporting	13 Core 7 Supporting	4 Core 1 Supporting	33 Core 13 Supporting

Dimensional Index Methodology (DIM) has been used to compute scores for each indicator with reference to "maximum within the comparison group" or "absolute benchmarks". For indicators where benchmarks are available, cities getting the benchmark score (or above) are given the maximum mark, and the marks awarded to other cities are calculated proportionately. For indicators where benchmarks are not available, the best performing cities in each population group are given the maximum mark, and the marks awarded to other cities (within the population group) are calculated proportionately. For indicators where benchmarks do not exist, the city data has been tested for outliers before scoring.

3.4 Scoring Normalisation:

To construct aggregate scores across cities as well as to make the scores across indicators comparable, indicator values were normalised using a min-max approach. The following formula was used to normalise the indicator values-

$$\frac{indicator\ value\ for\ the\ city - indicator\ value\ for\ the\ worst\ performing\ city}{benchmark - \ indicator\ value\ for\ the\ worst\ performing\ city}$$

This approach would restrict the normalised indicator value between 0 and 1. Cities that met or exceeded the benchmark received a normalised indicator value of 1. Worst performing cities are given a normalised indicator value of 0. After normalisation, the normalised value is weighted according to the category and the indicator being core or supporting.

To illustrate, consider the indicator 12.3 Quality of Water Supplied in the Category 12 for Assured Water Supply. If in City A 50% of the water samples collected qualify the potable water standards specified by the CPHEEO, and only 10% of the samples from worst performing city qualify the standards. Then, the normalised value for the indicator for city A would be 0.44 [(0.5-0.1)/(1-0.1)].

The weight for indicator 12.3 is 1.03, so the final weighted score for City A would come out to 0.45 [1.03*0.44].

4. Data Collection and Verification

4.1 Submission of Data by the cities

The Liveability Assessment is based on secondary data submitted by the urban local bodies and other concerned government agencies (collectively called as data owners). The 79 indicators were broken down into a set of easy to understand and relatable 553 questions mapped to data owners. Submission of the data was enabled through an online data entry portal on the smartnet platform of the Ministry. The portal also allowed the ULBs to download the liveability assessment questionnaire and upload filled in questionnaire. To familiarise and assist cities in identifying, mapping and collation of data points, a city level nodal person was available during the entire period of data submission process.

4.2 Mapping of Data Owners for the City

For the assessment of liveability indices broadly 12 data owners such as Central/state Pollution control board, Development authority, DISCOM/Electricity Board, State Disaster Management Authority, State Education Department, State Health department, State Renewable energy and development agency, State sales and commercial taxes department, town and country planning department, Traffic and police department, Transport authority, and Urban local body were identified to respond to the questions on the portal. However, during state workshop and subsequent city level discussions, more data owners were mapped to respond to different categories and sub categories. The following table provides the details of city level data owners mapped under the 12 data owner.

Table 3:Details of Data Owners

Designated data owners	Subcategories	Data owners at city level
Urban Local Body	For Accounts Related Questions	Accounts Department, BMC
Urban Local Body	For Park and Recreation Related Questions	AMRUT, BMC
Urban Local Body	For Water Supply and Drainage related questions	Water Supply Department, BMC
Urban Local Body	For Heritage sites related data	Indian National Trust for Art and Culture Heritage
Urban Local Body	For Ecological sites related data	NA
Urban Local Body	For Housing related data	Bilaspur Municipal Corporation
Urban Local Body	For Building plan related data	Bilaspur Development Authority
Urban Local Body	For Roads related data	Bilaspur Municipal Corporation
Urban Local Body	For Solid waste management related data	Solid waste management Department, Bilaspur Municipal Corporation
Urban Local Body	For IT services related data	IT Section, BMC
Urban Local Body	For Vendor committee related data	Bazzar Bibhag, BMC
Urban Local Body	Any other departments involved in providing data for questions mentioned	Employment Exchange, Census Department

Designated data owners	Subcategories	Data owners at city level
	under Urban Local Body	
For questions under Central / state Pollution control Board	Water Quality, Air Quality, Noise Quality	Chhattisgarh Pollution Control Board
Development Authority	Building Infrastructure	Bilaspur Development Authority Bilaspur Municipal Corporation
	Construction planning	Bilaspur Development Authority Bilaspur Municipal Corporation
	Green Building	Bilaspur Development Authority Bilaspur Municipal Corporation
	Rain water harvesting	Bilaspur Development Authority Bilaspur Municipal Corporation
	Universal Design Principle	Bilaspur Development Authority Bilaspur Municipal Corporation
DISCOM/Electricity Board	Electrical Connection/ Grievance Redressal/ Power supply	Chhattisgarh State Power Distribution Corporation Limited
State Disaster management authority		Bilaspur Smart city Limited
State Education Department		District Education Department
State Health Department	Health care professionals	Chhattisgarh Medical and Health organization
State Health Department	Citizen Services	Chhattisgarh Medical and Health organization
State Health Department	Disease Prevalence	Chhattisgarh Medical and Health organization
State Health Department	Health Infrastructure	Chhattisgarh Medical and Health organization
State Renewable Energy Development Agency		Chhattisgarh Renewable Energy Development Authority
State Sales / Commercial Taxes Department		State Sale Tax department
Town and Country Planning Department	Land Use	Town and country planning department, BMC
Traffic and Police		Police department, Bilaspur

Designated data owners	Subcategories	Data owners at city level
Department		
Transport Authorities	Buses	City Bus In charge, BMC
Transport Authorities	Registered Vehicles	Road and Transport organization, Bilaspur
Transport Authorities	Sub urban rail transport	
Transport Authorities	Mono Rail Authority	
Transport Authorities	Tramways	
Transport Authorities	Marine Transport Authority	

4.3 List of secondary documents available as supportive

City has provided supporting documents/evidences against the responses given by city on the online portal. In support of their responses on the portal, city submitted 112 number of documents. Documents submitted includes reports, official orders, copy of data maintained in official register, signed copy of questionnaire, and signed letters/submissions from concern departments. Verification includes mapping of documents against responses given by city, checking the type/category of documents, and validation of data provided.

The following table presents the data owner wise number of documents:

Table 4: Data owner wise number of secondary documents submitted by city

Data Owners	Number of Documents
Sales and Commercial Taxes	2
State Education Department	8
DISCOM/Electricity Department	11
Traffic and Police Department	9
Development Authority	1
Pollution Control Board	5
State Renewable Energy Department	3
Town and Country Planning	0
State Health Department	19
Transport Authority	1

Disaster Management	2
Urban Local Body	51
Total	112

4.4 Data Verification

A three-stage data quality check comprising verification of data against secondary documents furnished by data owners, logical inconsistency checks including outliers, and physical audit for select indicators (Refer the exhibit below) is being undertaken. The objective of the data quality check is to ensure that data from the source documents are accurate and verifiable. Sources of data included reports, administrative data, survey results and other statistical records, log books among other.

Physical audit of eight indicators – one indicator from the Institutional pillar, one from the Social pillar, one from the Economy pillar and five from the Physical pillar is also being carried out by the field team to ascertain the degree of reliability of data reported by the cities. The list of these eight indicators is presented below:

1.2 | Percentage of services integrated through Command Centre

2.3 | Hotel occupancy

3.4 | Percentage of schools with access to digital education

5.1| Number of streets, public places, junctions covered through surveillance systems

6.5 | Percentage of vendors registered and provided formal spaces

11.7 | Availability of Passenger Information System

11.11 | Percentage of traffic intersections with pedestrian crossing facilities

11.12 | Extent to which universal accessibility is incorporated in public rights-of-way

For a set of five indicators namely, unemployment rate, mode share of public transport, mode share of non-motorised transport, quality of water supplied and level of noise pollution, existing datasets were found to be not available consistently across all cities and/or were inadequate. To help cities that do not have data on these five indicators, dipstick assessments are being carried to fill data gaps.

6.4 | Unemployment Rate

11.3 | Mode share of public transport

11.5 | Mode share of Non Motorized Transport

12.3 | Quality of Water Supplied

15.4 | Level of Noise Pollution

4.5 Physical Audit

The following map presents the indicators audited at city level.

5. City Score on 15 categories of Assessment

Liveability Assessment covered 15 categories and 78 indicators. The below table presents the scores for all 15 indicators namely governance, identity & culture, education, health, safety and security, economy & employment, housing & inclusiveness, public open spaces, mixed land use &

compactness, power supply, transport & mobility, assured water supply, waste water management, solid waste management and reduced pollution.

Table 5: Category wise scores

Categories	Scores in Percentage
Governance	72.68%
Identity & Culture	41%
Education	72%
Health	93%
Safety & Security	69%
Economy & Employment	31%
Housing & Inclusiveness	37%
Public Open Spaces	34%
Mixed Land Use & Compactness	6%
Power Supply	53%
Transport & Mobility	27%
Assured Water Supply	69%
Waste Water Management	54%
Solid Waste Management	99%
Reduced Pollution	79%

The rank of the city is based on the performance and scores in each of the category. The final city rank is submitted separately.

Executive Summary

Assessment of liveability indices is an initiative by the Ministry of Housing and Urban Affairs to improve quality of life of citizens and achieve sustainable development goals by encouraging cities to adopt "outcome based" approach for urban planning. Assessment process aimed to provide opportunity to cities to review the development components holistically by involving 79 measurable indicators categorized under governance, health, education, safety, economy, power supply, transportation and mobility, identity, culture, housing, waste management and pollution.

This report highlights the assessment process, key milestones, and the final outcome of the data submitted. Implementation of liveability assessment commenced formally on 19th January 2018. A national level workshop was organized on 13th February 2018 to explain the importance and process of liveability assessment and get feedback on methodology from the city authorities.

This was followed by the next stage of Questionnaire development. The questionnaire was arranged under 12 categories representing 12 data owners namely urban local body, Central and state pollution control board, development authority, DISCOM/Electricity board, State disaster management authority, state education department, state health department, state renewable energy development agency, state sales and commercial taxes department, town and country planning department, traffic and police department and transport authorities.

An online data entry portal was developed to facilitate data submission by the cities. Each city had a unique log in to access the portal and submit the data. Both online and off-line options (download the questionnaire in an excel) to submit the data were available for cities. An email help desk was set up for the cities to raise any queries and seek clarification when responding to the questions.

A team for each state comprising of State Coordinator and City Coordinator (one per city) was deployed that facilitated the process and supported the cities. A total of 6 regional coordinators/ consultants, 29 State Coordinators, and 99 city coordinators were deployed across 116 cities. Training for state coordinators was held from 26th to 28th February 2018 at Chennai to make coordinators understand overall liveability assessment, indicators, data sources, protocols and roles and responsibilities.

City Reconnaissance Meetings were initiated by the state and city coordinators. The discussion began with discussions to finalize the state workshop schedule, mapping of data owners, and assist cities in data collection. The City Coordinators were based in the cities for over 6 weeks and during this time, they liase with ULB and other data owners to explain the liveability framework, online portal, and facilitate the online submission.

A total of 33 state workshops were conducted at the state level. The objective of the workshop was to orient the city stakeholders on liveability assessment, indicators, components of data collection, timelines, expectations of support and support extended by MoHUA. The state level workshops brought various city level departments on a single platform to understand and discuss the methodology and components of city liveability assessment.

Nodal agency at state level supported by the City and State Coordinator and city level (Municipality corporation/smart city limited) coordinated with city specific data owners/departments for data gathering, collation, and submission. Nodal persons in each department were appointed for timely data collection and submission. Of 116, 112 cities submitted data as per the timeline on 16th April 2018.

Post submission, the city and state coordinators supported by the central team followed up extensively with the cities to support secondary documents as evidence to substantiate their submissions. Secondary documents such as reports, official orders, copy of office register, signed copy of liveability assessment questionnaire furnished by cities against the submitted data. Documents are verified to map the documents for the reponses provided by city and to check the type data provided by city. The document check outcomes were shared with the cities as a part of data quality check.

For checking consistency of data, logical check of data, verifying data from other public sources were undertaken. Quality check was done to ensure data validity and provide opportunity to cities to review the data provided by them and correct in case of wrong data entry.

For 8 selected indicators namely, percentage of services integrated through command and control center, hotel occupancy rate, percentage of schools with access to digital education, number of CCTV cameras per unit road length, percentage of vendors registered and provided formal spaces, availability of passenger information system, percentage of traffic intersection with pedestrian crossing facility, and extent to which universal accessibility is incorporated in public rights of way. Physical audit was conducted in 110 cities by physical auditors appointed and trained by the consortium. In consultation with ULB nodal person, locations and indicators for physical audit was selected in each city. A mobile based application was developed to capture the physical audit related data.

Primary data collection was done for five indicators such as unemployment rates, mode share of public transport, mode share of non-motorized transport, quality of water supplied, and level of noise pollution. Protocols for water and noise test were prepared in consultation with experts. Water quality test involved physical, chemical and bacteriological test of water as per the CPCB norms. For testing quality of water at consumer end, the auditors worked closely with the ULB and Water department. Samples were collected from consumer end and submitted to the lab suggested by city. For noise pollution, in about 20 cities the state pollution board or city level environment department took the responsibility for providing noise pollution data as per the protocols. In rest of the cities, mobile based application was used to measure noise pollution.

During implementation, MoHUA facilitated the process by conducting video conferences with cities to address any queries, reiterate the importance, and ensure that cities adequately engages in the process and submit their responses in time and respond to requests for clarifications.

In addition to secondary data collection, physical audit and primary data collection, citizen survey was conducted to understand their perception and level of satisfaction on various services such as health, education, water supply, electricity, waste management etc. provided by urban local bodies. Over 60000 citizens participated in the survey across India.

The final scores and ranks have been generated based on the scoring methodology that has been discussed extensively and minor modifications made that are summarized as below:

#	Challenges	Proposed Solutions
1	Only 23 cities of 111 cities have City Mobility Plan (CMP) or any and hence able to provide data for Mode Share of Public Transport and Non-Motorised Transport. To address the data gap, as advised by the MoHUA, the consortia undertook a sample dipstick across all cities covering a sample of 150 Households. Understandably, the dipstick findings will not match the rigor of a CMP.	We recommend the following: 1) Cities which have provided CMP Data will be evaluated on 100% of the maximum score 2) For the cities where the dipstick data is used, the city receives a 50% discount on the overall score Alternatively, another approach is to assign 0 score to all 88 cities that don't have a CMP
2	Variance was observed on data reported by cities on road network and data presented in the smart city proposals during the verifications.	We recommend taking the data reported by the cities in the Smart City Proposals.
3	There is no secondary source/ organization that provides unemployment data at city level. As a result, most cities do not have the data. Fully cognizance of the challenges of generating this data in a short span of time, it was agreed to collect this data through a dipstick survey on lines of NSSO questions. The data generated needs further scrutiny and	The indicator on unemployment will be excluded from scores. For final ranking, the cities will be scored on 78 indicators.

#	Challenges	Proposed Solutions
	triangulation with some inputs from experts. This may not be possible in the short window.	
4	Many cities did not have data on noise pollution and it was decided that data will be collected using a mobile app for all the 111 cities. However, many cities have expressed reservations with the approach especially with respect to the reliability of using this data. Further, some cities have relied on the SPCB to collect the data as per the approach proposed by the consortia. Thus, noise pollution data is currently from two sources: 1. SPCB- 20 cities 2. Noise-based app- 91 cities	The data collected through the primary survey will be used for scoring the cities. Currently, there is no differential scoring for the data from the SPCB and the data collected through the mobile app. However, a certain higher weightage can be provided to those cities which used the state apparatus to collect noise pollution data.
5	For the indicator on quality of water supplied, the methodology document states that samples should be drawn both at the treatment plant outlet as well as the consumer end. However, the data provided by the cities were predominantly from the distribution point. Hence for consumer end results with MoHUA intervention, consortia coordinated with cities to collect the data at the consumer end. The cities facilitated the testing. The outcome of the process is as below: 1. Sample given- 102 cities 2. Report received- 86 cities 3. Report awaited- 16 cities 4. Tests not completed due to lack of cooperation and other reasons – 9	The maximum score for this indicator will be distributed equally (50%) for results based on samples from the treatment plant and consumer end. Cities that did not complete tests or provide the results will be given a score 0 for against consumer end tests.
6	City level population is not projected annually by most of the cities. So, estimates for 2017 population are not available with the cities.	As recommended by MoHUA, 2011 census population is being used for the ranking purpose.

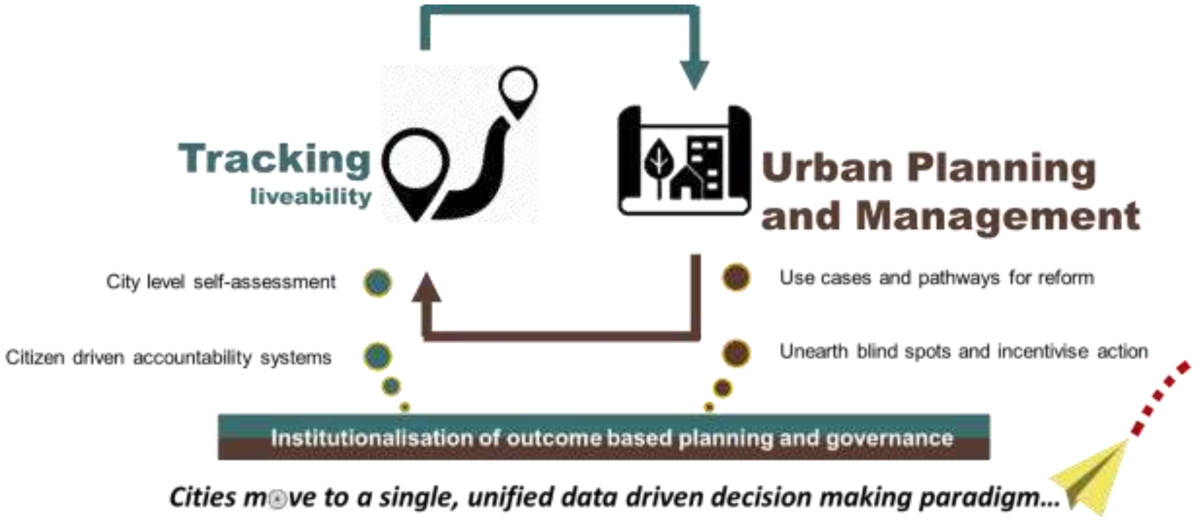
#	Challenges	Proposed Solutions
7	The age category specific data for 9 cities is not available at a city level	The age category specific population data has been taken at a district level for these cities.
8	Indicators on non-motorised transports like- Dedicated bicycle tracks, bicycle parking facilities and mode share of non-motorised transport are not relevant for hilly terrains.	As discussed during the PMC meeting, these indicators have been treated as non-applicable for the hilly cities and the weights have been redistributed among other indicators within the same category.
9	The indicator on increase in professional tax is not relevant to cities which do not levy the professional tax.	As discussed during the PMC meeting, this indicator has been non-applicable to the cities belonging to states where professional tax is not levied, and the weights have been redistributed among other indicators within the same category.
10	The indicator on increase in VAT collection is not applicable to Port Blair and Kavaratti, as there was no provision of VAT collection in these cities.	As discussed during the PMC meeting, these indicatosr has been treated as non-applicable for these two cities and the weights have been redistributed among other indicators within the same category.
11	Indicator on coverage of basic services to slum households does not concern cities with no slums (notified/ non-notified.	As discussed during the PMC meeting, this indicators has been treated as non-applicable for these cities and the weights have been redistributed among other indicators within the same category.

1. Introduction

The Ministry of Housing and Urban Affairs (MoHUA) is implementing several flagship urban missions such as the Smart Cities Mission (SCM), Atal Mission for Urban Rejuvenation and Transformation (AMRUT), Heritage City Development and Augmentation Yojana (HRIDAY), Housing for All (HFA). Theses mission along with other transformative initiatives of the Government including National Water Mission, Power for All, National Health Mission are aimed at making Indian cities more 'liveable.' The overarching goal of these initiatives is to move from an input-based approach to a 'citizen centric-outcome based' assessment of urban liveability.

To develop a common minimum framework for cities to assess their existing status and chart their pathway towards providing a better quality of life to their citizens, the MoHUA developed a set of 'Liveability Standards' relevant to cities to generate a Liveability Index and ranking of cities. These standards were launched in June, 2017. The MoHUA has planned to conduct an 'Annual Assessment of Liveability Standards in Cities – an ambitious national project that will involve yearly submission of data by cities across the various indicators, compilation and analysis, development of indices and ranking of cities. The Liveability Index is envisioned as a 360° tool for tracking, planning and transforming Indian cities. The Liveability Index is aimed at the following objectives:

- Providing strong evidence-based approach for future interventions and investments to deliver liveability outcomes
- Catalysing actions to improve the overall quality of the city's liveability and achieve broader development outcomes including the Sustainable Development Goals
- Assessing the implementation of government policies and schemes governing characteristics of cities that can contribute to creating liveable communities

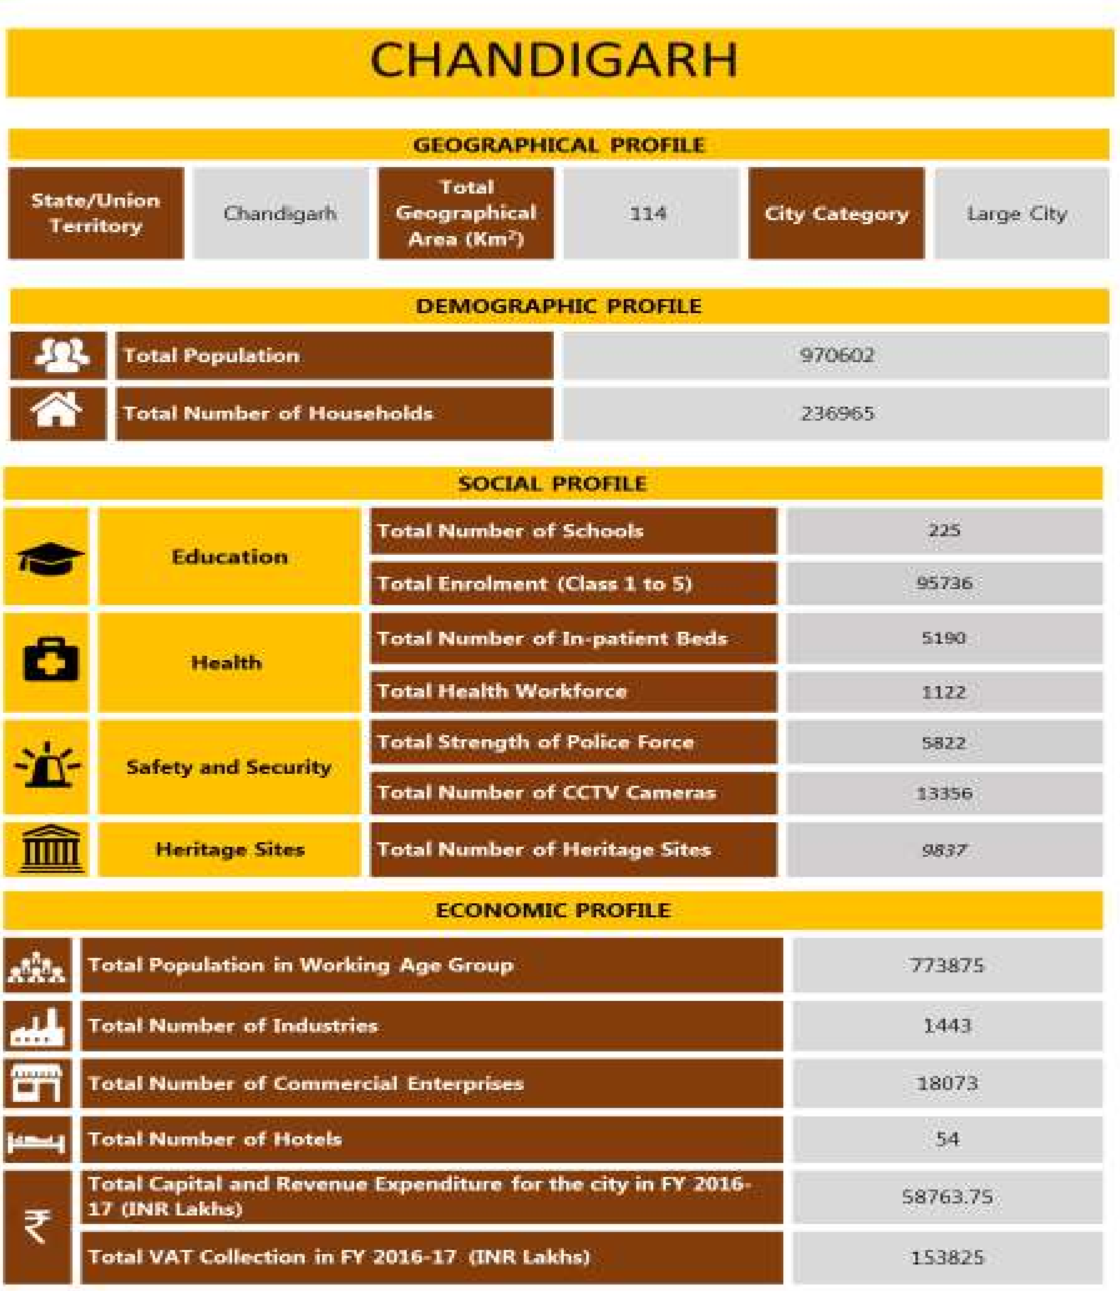


Tracking
liveability
Urban Planning and Management
City level self-assessment
Citizen driven accountability systems
Use cases and pathways for reform
Unearth blind spots and incentivise action
Institutionalisation of outcome based planning and governance
Cities move to a single, unified data driven decision making paradigm...

The first round of the assessment commenced in January 2018 covering 116 major cities including smart cities, capital cities and cities with population of above one million each. Implementation of the liveability assessment commenced in January 2018 with a national level orientation workshop for the urban local bodies. The workshop aimed at orienting the states and urban local bodies on the overall framework, indicators, data sources, methodology and key milestones and timelines involved in the liveability assessment. Subsequently, a series of State/ Union Territory level orientation workshops were carried out in 33 states/UTs for a detailed discussion on the framework. Online data collection commenced from 9th March through an online data collection platform that supported both online and offline data submission modes. On the date of closure of the online data entry portal i.e., 16th April, 2018 112 cities submitted their data. Subsequently, comprehensive checks on the submitted data was undertaken that involved checking for outliers, logical inconsistencies etc. post which round-1 of data reconciliation was conducted. This draft report is based on round-1 of reconciled data as on 28th April, 2018.

2. City Profile

This chapter presents the city profile -Geographic and Demographic, Social (Education Health, Safety and Security, Heritage), Economic profile, and Physical (Water, sanitation and Waste Management, Electricity, Open space and roads).



CHANDIGARH

GEOGRAPHICAL PROFILE

State/Union Territory	Chandigarh	Total Geographical Area (Km²)	114	City Category	Large City

DEMOGRAPHIC PROFILE

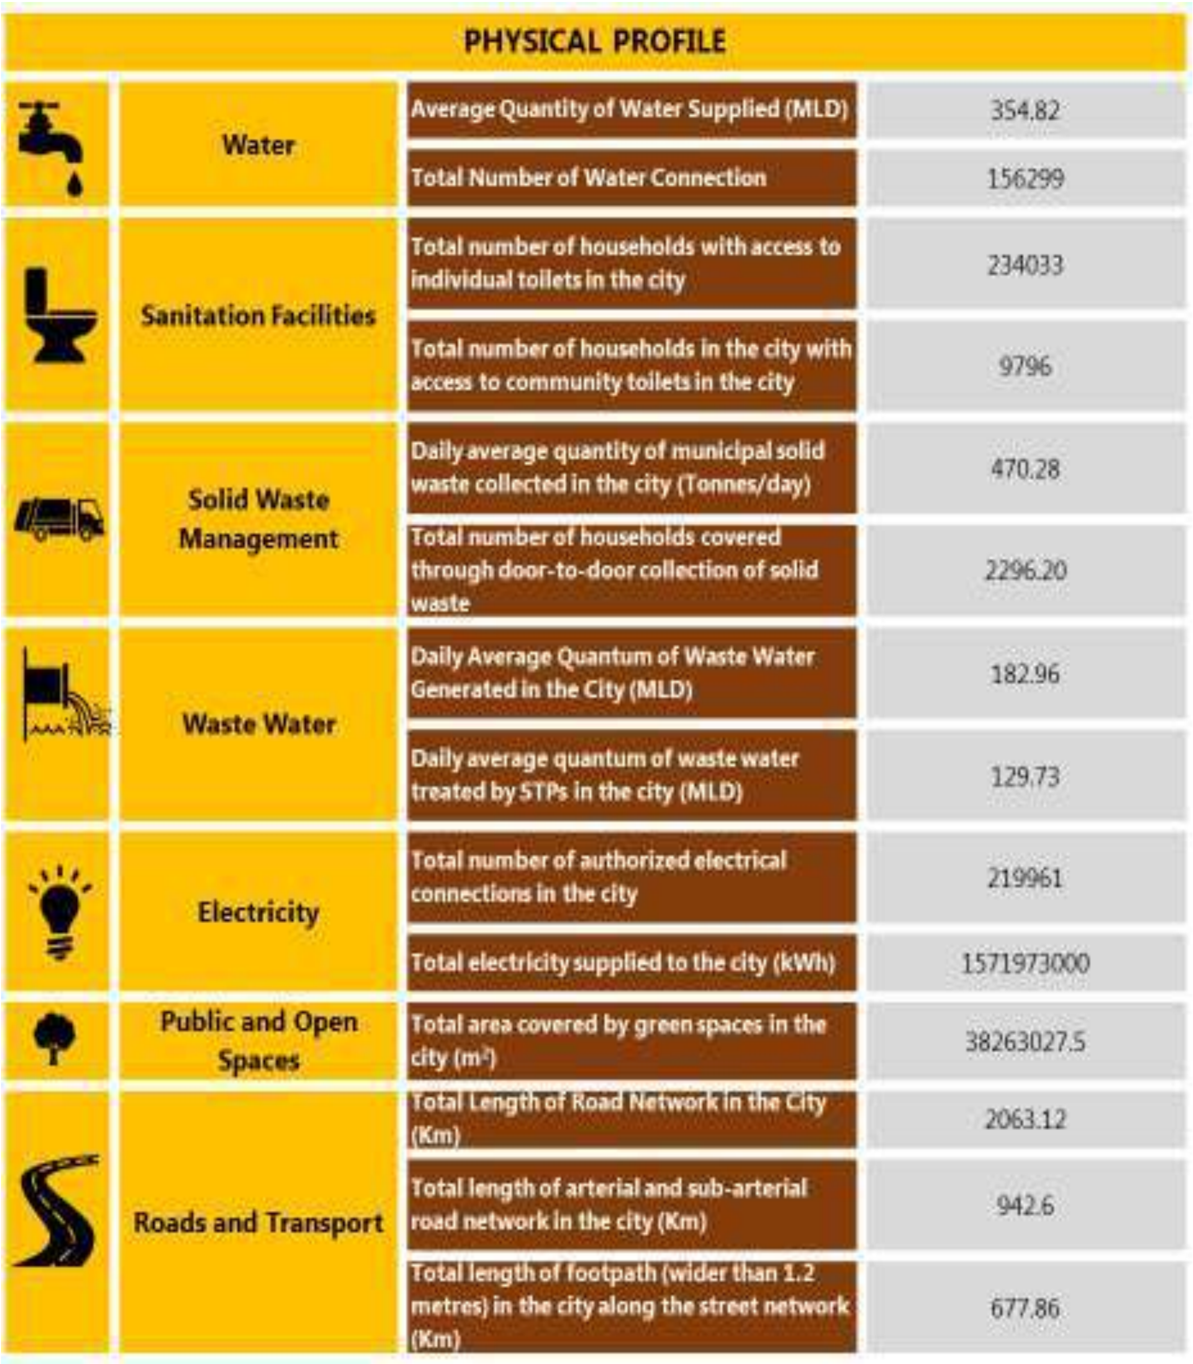
Total Population	970602
Total Number of Households	236965

SOCIAL PROFILE

Education	Total Number of Schools	225
	Total Enrolment (Class 1 to 5)	95736
Health	Total Number of In-patient Beds	5190
	Total Health Workforce	1122
Safety and Security	Total Strength of Police Force	5822
	Total Number of CCTV Cameras	13356
Heritage Sites	Total Number of Heritage Sites	9837

ECONOMIC PROFILE

Total Population in Working Age Group	773875
Total Number of Industries	1443
Total Number of Commercial Enterprises	18073
Total Number of Hotels	54
Total Capital and Revenue Expenditure for the city in FY 2016-17 (INR Lakhs)	58763.75
Total VAT Collection in FY 2016-17 (INR Lakhs)	153825



PHYSICAL PROFILE

Water	Average Quantity of Water Supplied (MLD)	354.82
	Total Number of Water Connection	156299
Sanitation Facilities	Total number of households with access to individual toilets in the city	234033
	Total number of households in the city with access to community toilets in the city	9796
Solid Waste Management	Daily average quantity of municipal solid waste collected in the city (Tonnes/day)	470.28
	Total number of households covered through door-to-door collection of solid waste	2296.20
Waste Water	Daily Average Quantum of Waste Water Generated in the City (MLD)	182.96
	Daily average quantum of waste water treated by STPs in the city (MLD)	129.73
Electricity	Total number of authorized electrical connections in the city	219961
	Total electricity supplied to the city (kWh)	1571973000
Public and Open Spaces	Total area covered by green spaces in the city (m^2)	38263027.5
Roads and Transport	Total Length of Road Network in the City (Km)	2063.12
	Total length of arterial and sub-arterial road network in the city (Km)	942.6
	Total length of footpath (wider than 1.2 metres) in the city along the street network (Km)	677.86

3. Liveability Framework and Indicators

The Liveability Framework comprises a total of 79 indicators (57 Core Indicators and 22 Supporting Indicators). A core indicator carries 70% weightage and a supporting indicator carries 30% weightage. These indicators are grouped under 15 thematic categories which in turn are part of four pillars of comprehensive development of cities i.e., institutional, social, economic and physical. Based on the performance of cities against the various core and supporting indicators, various 'Category Sub-Indexes' and a composite 'City Liveability Index' will be developed for each city.

3.1 Scoring and Computing Category Indices of Liveability

The set of 79 indicators, associated categories and pillars are presented in the table below:

Table 1 List of Pillars, Categories and Indicators

Pillars of Comprehensive Development	Category	Indicators
Institutional	1. Governance	1.1 Percentage of citizen services available online
		1.2 Percentage of services integrated through Command Centre
		1.3 Percentage of citizens using online services
		1.4 Average delay in grievance redressal
		1.5 Tax collected as percentage of tax billed
		1.6 Extent of cost recovery (O&M) in water supply services
		1.7 Capital spending as percentage of total expenditure
		1.8 Percentage of population covered under Ward Committees/Area *Sabhas*
Social	2. Identity and Culture	2.1 Restoration and reuse of historic buildings
		2.2 Percentage of ecologically important areas covered through projects for restoration
		2.3 Hotel occupancy
		2.4 Percentage of budget allocated towards cultural/sports activities
		2.5 Number of cultural/sports events hosted by city
	3. Education	3.1 Percentage of school-aged population enrolled in schools
		3.2 Percentage of female school-aged population enrolled in schools
		3.3 Primary education student-teacher ratio

Pillars of Comprehensive Development	Category	Indicators
		3.4 Percentage of schools with access to digital education
		3.5 Percentage of students completing primary education
		3.6 Percentage of students completing secondary education
	4. Health	4.1 Number of in-patient hospital beds per 10,000 population
		4.2 Healthcare professionals per 10,000 population
		4.3 Average response time in case of health emergencies
		4.4 Period prevalence of water borne diseases
		4.5 Period prevalence of vector borne diseases
	5. Safety and Security	5.1 Number of CCTV Cameras
		5.2 Number of recorded crimes per lakh population
		5.3 Extent of crimes recorded against women, children and elderly per year
		5.4 Transport-related fatality per lakh population
Economic	6. Economy and Employment	6.1 Increase in VAT/GST collection
		6.2 Increase in collection of Professional Tax
		6.3 Increase in issuance of Construction permits
		6.4 Unemployment rate
		6.5 Percentage of vendors registered and provided formal spaces
Physical	7. Housing and Inclusiveness	7.1 Percentage of Slum/EWS households covered through formal/affordable housing
		7.2 Percentage of slum areas covered through basic services
	8. Public Open Spaces	8.1 Per capita availability of green spaces
		8.2 Per capita availability of public and recreational places
	9. Mixed Land Use and Compactness	9.1 Share of mixed land use area in overall city land use
		9.2 Net Density
	10. Power Supply	10.1 Percentage of city population with authorized electrical services
		10.2 Percentage of electrical connections covered through smart meters
		10.3 Average number of electrical interruptions per year
		10.4 Average length of electrical interruptions per year
		10.5 Percentage of total energy derived from renewable sources

Pillars of Comprehensive Development	Category	Indicators
		10.6 Energy consumption per unit - water supply and sewerage
		10.7 Energy consumption per unit - street lighting
		10.8 Percentage of new and redeveloped buildings following green building norms
		10.9 Total energy consumption per capita
	11. Transportation and Mobility	11.1 Geographical coverage of public transport
		11.2 Availability of public transport
		11.3 Mode share of public transport
		11.4 Percentage of road network with dedicated bicycle tracks
		11.5 Percentage of interchanges with bicycle parking facilities
		11.6 Mode share of non-motorized transport
		11.7 Availability of Passenger Information System
		11.8 Extent of signal synchronization
		11.9 Availability of paid parking spaces
		11.10 Percentage coverage of footpaths – wider than 1.2 m
		11.11 Percentage of traffic intersections with pedestrian crossing facilities
		11.12 Extent to which universal accessibility is incorporated in public rights-of-way
	12. Assured Water Supply	12.1 Household level coverage of direct water supply connections
		12.2 Per capita supply of water
		12.3 Quality of water supplied
		12.4 Level of non-revenue water – NRW
		12.5 Percentage of water connections covered through meters
		12.6 Percentage of plots with rainwater harvesting facility
	13. Waste Water Management	13.1 Coverage of toilets
		13.2 Coverage of sewerage network and/or septage
		13.3 Collection efficiency of sewerage network
		13.4 Extent of reuse and recycling of waste water
		13.5 Coverage of storm water drains
	14. Solid Waste Management	14.1 Household level coverage of municipal solid waste collection

Pillars of Comprehensive Development	Category	Indicators
		14.2 Efficiency of collection of municipal solid waste
		14.3 Extent of municipal solid waste recovered through reuse
	15. Reduced Pollution	15.1 Concentration of SO2- air pollution
		15.2 Concentration of NO2- air pollution
		15.3 Concentration of PM10 - air pollution
		15.4 Level of noise pollution
		15.5 Quality of water in public surface water bodies

3.2 Scoring and Computing Category Indices of Liveability

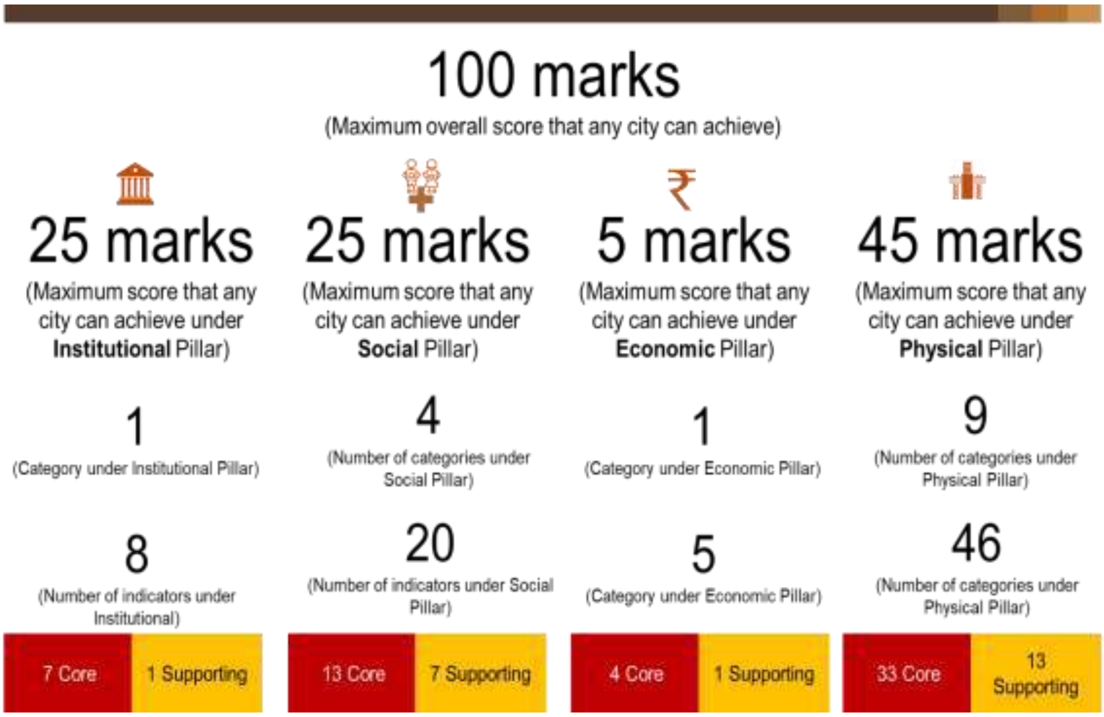
The performance achieved by cities against 79 indicators, will be assessed against given benchmarks. Where no international/national norms are available, city with the best performance in its group (population range) will be treated as a benchmark. The groups are given in the table below.

Table 2 Details on Population Range

Category	Population range
Category 1	Population ≥ 4 million
Category 2	1 million ≤ Population < 4 million
Category 3	0.5 million ≤ Population < 1 million
Category 4	Population < 0.5 million

3.3 Scoring Approach and Methodology

A city can earn a maximum score of 100 points for 79 indicators across four pillars. The pillar weights are as follows: Institutional (25 points), Social (25 points), Economy and Employment (5 points) and Physical (45 points). Based on the number and nature of indicators i.e., core vs. secondary, indicator wise maximum marks were computed.



100 marks
(Maximum overall score that any city can achieve)
25 marks
(Maximum score that any city can achieve under Institutional Pillar)
25 marks
(Maximum score that any city can achieve under Social Pillar)
5 marks
(Maximum score that any city can achieve under Economic Pillar)
45 marks
(Maximum score that any city can achieve under Physical Pillar)
1
(Category under Institutional Pillar)
4
(Number of categories under Social Pillar)
1
(Category under Economic Pillar)
9
(Number of categories under Physical Pillar)
8
(Number of indicators under Institutional)
20
(Number of indicators under Social Pillar)
5
(Category under Economic Pillar)

Dimensional Index Methodology (DIM) has been used to compute scores for each indicator with reference to "maximum within the comparison group" or "absolute benchmarks". For indicators where benchmarks are available, cities getting the benchmark score (or above) are given the maximum mark, and the marks awarded to other cities are calculated proportionately. For indicators where benchmarks are not available, the best performing cities in each population group are given the maximum mark, and the marks awarded to other cities (within the population group) are calculated proportionately. For indicators where benchmarks do not exist, the city data has been tested for outliers before scoring.

3.4 Scoring Normalisation:

To construct aggregate scores across cities as well as to make the scores across indicators comparable, indicator values were normalised using a min-max approach. The following formula was used to normalise the indicator values-

$$\frac{indicator\ value\ for\ the\ city - indicator\ value\ for\ the\ worst\ performing\ city}{benchmark -\ indicator\ value\ for\ the\ worst\ performing\ city}$$

This approach would restrict the normalised indicator value between 0 and 1. Cities that met or exceeded the benchmark received a normalised indicator value of 1. Worst performing cities are given a normalised indicator value of 0. After normalisation, the normalised value is weighted according to the category and the indicator being core or supporting.

To illustrate, consider the indicator 12.3 Quality of Water Supplied in the Category 12 for Assured Water Supply. If in City A 50% of the water samples collected qualify the potable water standards specified by the CPHEEO, and only 10% of the samples from worst performing city qualify the standards. Then, the normalised value for the indicator for city A would be 0.44 [(0.5-0.1)/(1-0.1)].

The weight for indicator 12.3 is 1.03, so the final weighted score for City A would come out to 0.45 [1.03*0.44].

4. Data Collection and Verification

4.1 Submission of Data by the cities

The Liveability Assessment is based on secondary data submitted by the urban local bodies and other concerned government agencies (collectively called as data owners). The 79 indicators were broken down into a set of easy to understand and relatable 553 questions mapped to data owners. Submission of the data was enabled through an online data entry portal on the smartnet platform of the Ministry. The portal also allowed the ULBs to download the liveability assessment questionnaire and upload filled in questionnaire. To familiarise and assist cities in identifying, mapping and collation of data points, a city level nodal person was available during the entire period of data submission process.

4.2 Mapping of Data Owners for the City

For the assessment of liveability indices broadly 12 data owners such as Central/state Pollution control board, Development authority, DISCOM/Electricity Board, State Disaster Management Authority, State Education Department, State Health department, State Renewable energy and development agency, State sales and commercial taxes department, town and country planning department, Traffic and police department, Transport authority, and Urban local body were identified to respond to the questions on the portal. However, during state workshop and subsequent city level discussions, more data owners were mapped to respond to different categories and sub categories. The following table provides the details of city level data owners mapped under the 12 data owner.

Table 3:Details of Data Owners

Designated data owners	Subcategories	Data owners at city level
Urban Local Body	For Accounts Related Questions	Accounts department(ULB)
Urban Local Body	For Park and Recreation Related Questions	Sports , Horticulture department , ULB
Urban Local Body	For Water Supply and Drainage related questions	Water Supply department
Urban Local Body	For Heritage sites related data	Town and country planning department
Urban Local Body	For Ecological sites related data	Town and country planning department
Urban Local Body	For Housing related data	Housing Board
Urban Local Body	For Building plan related data	Building branch (Estate office)
Urban Local Body	For Roads related data	Roads and building department(ULB)
Urban Local Body	For Solid waste management related data	Health and sanitation department(ULB)
Urban Local Body	For IT services related data	IT department(ULB)
Urban Local Body	For Vendor committee related data	Vender cell(ULB)
Urban Local Body	Any other departments involved in providing data for questions mentioned under Urban Local Body	Tourism department, Excise and taxes department, architecture department
Central / state Pollution control Board	Water Quality, Air Quality, Noise Quality	Chandigarh pollution control committee (CPCC)
Development Authority	Building Infrastructure	Building branch (Estate office)
	Construction planning	Building branch (Estate office)
	Green Building	Building branch (Estate office)
	Rain water harvesting	Building branch (Estate office)
	Universal Design Principle	Building branch (Estate office)
DISCOM/Electricity Board	Electrical Connection/ Grievance Redressal/ Power supply	Electricity Board
State Disaster management authority		State Disaster Management Authority
State Education Department		State Education Department
State Health Department	Health care professionals	State Health Department
	Citizen Services	State Health Department
	Disease Prevalence	State Health Department

Designated data owners	Subcategories	Data owners at city level
	Health Infrastructure	State Health Department
State Renewable Energy Development Agency		Chandigarh Renewable Energy and science & technology (CREST)
State Sales / Commercial Taxes Department		Sales / Commercial Taxes Department
Town and Country Planning Department	Land Use	Town and Country Planning Department (UT Secretariat)
Traffic and Police Department		Traffic and Police Department
Transport Authorities	Buses	State transport Authority(STA) and Chandigarh Transport Undertaking (CTU)
	Registered Vehicles	Registering and licensing authority(RLA) and State transport Authority(STA)
	Sub urban rail transport	Not Applicable
	Mono Rail Authority	Not Applicable
	Tramways	Not Applicable
	Marine Transport Authority	Not Applicable

4.3 List of secondary documents available as supportive

City has provided supporting documents/evidences against the responses given by city on the online portal. In support of their responses on the portal, city submitted 77 number of documents. Documents submitted includes reports, official orders, copy of data maintained in official register, signed copy of questionnaire, and signed letters/submissions from concern departments. Verification includes mapping of documents against responses given by city, checking the type/category of documents, and validation of data provided.

The following table presents the data owner wise number of documents:

Table 4: Data owner wise number of secondary documents submitted by city

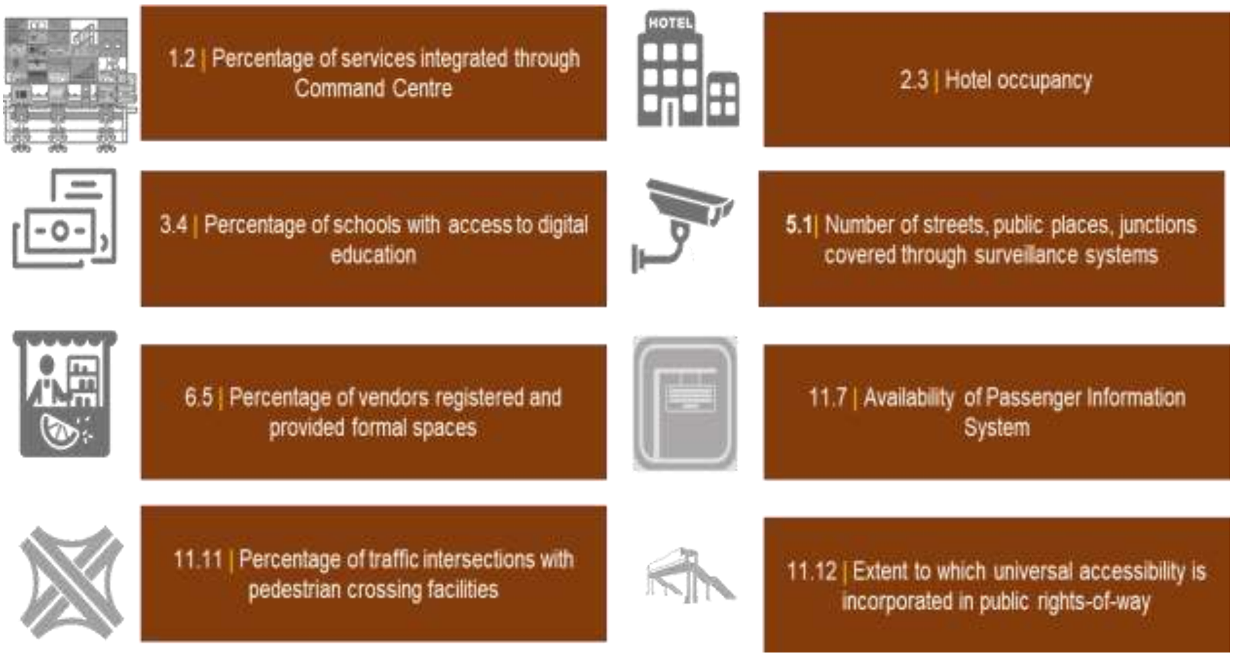
Data Owners	Number of Documents
Sales and Commercial Taxes	1
State Education Department	6
DISCOM/Electricity Department	5
Traffic and Police Department	17
Development Authority	1
Pollution Control Board	5

Data Owners	Number of Documents
State Renewable Energy Department	0
Town and Country Planning	0
State Health Department	6
Transport Authority	13
Disaster Management	1
Urban Local Body	22
Total	77

4.4 Data Verification

A three-stage data quality check comprising verification of data against secondary documents furnished by data owners, logical inconsistency checks including outliers, and physical audit for select indicators (Refer the exhibit below) is being undertaken. The objective of the data quality check is to ensure that data from the source documents are accurate and verifiable. Sources of data included reports, administrative data, survey results and other statistical records, log books among other.

Physical audit of eight indicators – one indicator from the Institutional pillar, one from the Social pillar, one from the Economy pillar and five from the Physical pillar is also being carried out by the field team to ascertain the degree of reliability of data reported by the cities. The list of these eight indicators is presented below:



1.2 | Percentage of services integrated through Command Centre

2.3 | Hotel occupancy

3.4 | Percentage of schools with access to digital education

5.1 | Number of streets, public places, junctions covered through surveillance systems

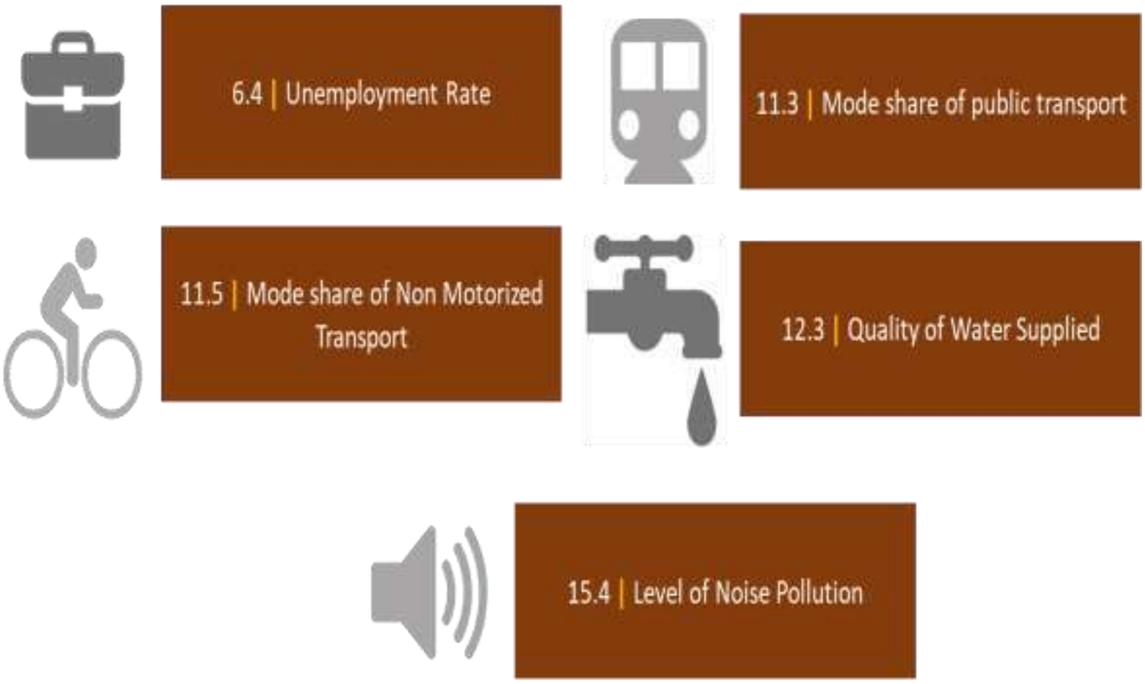
6.5 | Percentage of vendors registered and provided formal spaces

11.7 | Availability of Passenger Information System

11.11 | Percentage of traffic intersections with pedestrian crossing facilities

11.12 | Extent to which universal accessibility is incorporated in public rights-of-way

For a set of five indicators namely, unemployment rate, mode share of public transport, mode share of non-motorised transport, quality of water supplied and level of noise pollution, existing datasets were found to be not available consistently across all cities and/or were inadequate. To help cities that do not have data on these five indicators, dipstick assessments are being carried to fill data gaps.



6.4 | Unemployment Rate
11.3 | Mode share of public transport
11.5 | Mode share of Non Motorized Transport
12.3 | Quality of Water Supplied
15.4 | Level of Noise Pollution

4.5 Physical Audit

The following map presents the indicators audited at city level.

5. City Score on 15 categories of Assessment

Liveability Assessment covered 15 categories and 78 indicators. The below table presents the scores for all 15 indicators namely governance, identity & culture, education, health, safety and security, economy & employment, housing & inclusiveness, public open spaces, mixed land use & compactness, power supply, transport & mobility, assured water supply, waste water management, solid waste management and reduced pollution.

Table 5: Category wise scores

Categories	**Scores in Percentage**
Governance	57.30%
Identity & Culture	80%
Education	97%
Health	96%
Safety & Security	76%
Economy & Employment	18%
Housing & Inclusiveness	34%
Public Open Spaces	100%
Mixed Land Use & Compactness	1%
Power Supply	25%
Transport & Mobility	59%
Assured Water Supply	84%
Waste Water Management	89%
Solid Waste Management	66%
Reduced Pollution	88%

The rank of the city is based on the performance and scores in each of the category. The final city rank is submitted separately.

Executive Summary

Assessment of liveability indices is an initiative by the Ministry of Housing and Urban Affairs to improve quality of life of citizens and achieve sustainable development goals by encouraging cities to adopt "outcome based" approach for urban planning. Assessment process aimed to provide opportunity to cities to review the development components holistically by involving 79 measurable indicators categorized under governance, health, education, safety, economy, power supply, transportation and mobility, identity, culture, housing, waste management and pollution.

This report highlights the assessment process, key milestones, and the final outcome of the data submitted. Implementation of liveability assessment commenced formally on 19th January 2018. A national level workshop was organized on 13th February 2018 to explain the importance and process of liveability assessment and get feedback on methodology from the city authorities.

This was followed by the next stage of Questionnaire development. The questionnaire was arranged under 12 categories representing 12 data owners namely urban local body, Central and state pollution control board, development authority, DISCOM/Electricity board, State disaster management authority, state education department, state health department, state renewable energy development agency, state sales and commercial taxes department, town and country planning department, traffic and police department and transport authorities.

An online data entry portal was developed to facilitate data submission by the cities. Each city had a unique log in to access the portal and submit the data. Both online and off-line options (download the questionnaire in an excel) to submit the data were available for cities. An email help desk was set up for the cities to raise any queries and seek clarification when responding to the questions.

A team for each state comprising of State Coordinator and City Coordinator (one per city) was deployed that facilitated the process and supported the cities. A total of 6 regional coordinators/ consultants, 29 State Coordinators, and 99 city coordinators were deployed across 116 cities. Training for state coordinators was held from 26th to 28th February 2018 at Chennai to make coordinators understand overall liveability assessment, indicators, data sources, protocols and roles and responsibilities.

City Reconnaissance Meetings were initiated by the state and city coordinators. The discussion began with discussions to finalize the state workshop schedule, mapping of data owners, and assist cities in data collection. The City Coordinators were based in the cities for over 6 weeks and during this time, they liase with ULB and other data owners to explain the liveability framework, online portal, and facilitate the online submission.

A total of 33 state workshops were conducted at the state level. The objective of the workshop was to orient the city stakeholders on liveability assessment, indicators, components of data collection, timelines, expectations of support and support extended by MoHUA. The state level workshops brought various city level departments on a single platform to understand and discuss the methodology and components of city liveability assessment.

Nodal agency at state level supported by the City and State Coordinator and city level (Municipality corporation/smart city limited) coordinated with city specific data owners/departments for data gathering, collation, and submission. Nodal persons in each department were appointed for timely data collection and submission. Of 116, 112 cities submitted data as per the timeline on 16th April 2018.

Post submission, the city and state coordinators supported by the central team followed up extensively with the cities to support secondary documents as evidence to substantiate their submissions. Secondary documents such as reports, official orders, copy of office register, signed copy of liveability assessment questionnaire furnished by cities against the submitted data. Documents are verified to map the documents for the reponses provided by city and to check the type data provided by city. The document check outcomes were shared with the cities as a part of data quality check.

For checking consistency of data, logical check of data, verifying data from other public sources were undertaken. Quality check was done to ensure data validity and provide opportunity to cities to review the data provided by them and correct in case of wrong data entry.

For 8 selected indicators namely, percentage of services integrated through command and control center, hotel occupancy rate, percentage of schools with access to digital education, number of CCTV cameras per unit road length, percentage of vendors registered and provided formal spaces, availability of passenger information system, percentage of traffic intersection with pedestrian crossing facility, and extent to which universal accessibility is incorporated in public rights of way. Physical audit was conducted in 110 cities by physical auditors appointed and trained by the consortium. In consultation with ULB nodal person, locations and indicators for physical audit was selected in each city. A mobile based application was developed to capture the physical audit related data.

Primary data collection was done for five indicators such as unemployment rates, mode share of public transport, mode share of non-motorized transport, quality of water supplied, and level of noise pollution. Protocols for water and noise test were prepared in consultation with experts. Water quality test involved physical, chemical and bacteriological test of water as per the CPCB norms. For testing quality of water at consumer end, the auditors worked closely with the ULB and Water department. Samples were collected from consumer end and submitted to the lab suggested by city. For noise pollution, in about 20 cities the state pollution board or city level

environment department took the responsibility for providing noise pollution data as per the protocols. In rest of the cities, mobile based application was used to measure noise pollution.

During implementation, MoHUA facilitated the process by conducting video conferences with cities to address any queries, reiterate the importance, and ensure that cities adequately engages in the process and submit their responses in time and respond to requests for clarifications.

In addition to secondary data collection, physical audit and primary data collection, citizen survey was conducted to understand their perception and level of satisfaction on various services such as health, education, water supply, electricity, waste management etc. provided by urban local bodies. Over 60000 citizens participated in the survey across India.

The final scores and ranks have been generated based on the scoring methodology that has been discussed extensively and minor modifications made that are summarized as below:

#	**Challenges**	**Proposed Solutions**
1	Only 23 cities of 111 cities have City Mobility Plan (CMP) or any and hence able to provide data for Mode Share of Public Transport and Non-Motorised Transport. To address the data gap, as advised by the MoHUA, the consortia undertook a sample dipstick across all cities covering a sample of 150 Households. Understandably, the dipstick findings will not match the rigor of a CMP.	We recommend the following: 1) Cities which have provided CMP Data will be evaluated on 100% of the maximum score 2) For the cities where the dipstick data is used, the city receives a 50% discount on the overall score Alternatively, another approach is to assign 0 score to all 88 cities that don't have a CMP
2	Variance was observed on data reported by cities on road network and data presented in the smart city proposals during the verifications.	We recommend taking the data reported by the cities in the Smart City Proposals.
3	There is no secondary source/ organization that provides unemployment data at city level. As a result, most cities do not have the data. Fully cognizance of the challenges of generating this data in a short span of time, it was agreed to collect this data through a dipstick survey on lines of NSSO questions. The	The indicator on unemployment will be excluded from scores. For final ranking, the cities will be scored on 78 indicators.

#	Challenges	Proposed Solutions
	data generated needs further scrutiny and triangulation with some inputs from experts. This may not be possible in the short window.	
4	Many cities did not have data on noise pollution and it was decided that data will be collected using a mobile app for all the 111 cities. However, many cities have expressed reservations with the approach especially with respect to the reliability of using this data. Further, some cities have relied on the SPCB to collect the data as per the approach proposed by the consortia. Thus, noise pollution data is currently from two sources: 1. SPCB- 20 cities 2. Noise-based app- 91 cities	The data collected through the primary survey will be used for scoring the cities. Currently, there is no differential scoring for the data from the SPCB and the data collected through the mobile app. However, a certain higher weightage can be provided to those cities which used the state apparatus to collect noise pollution data.
5	For the indicator on quality of water supplied, the methodology document states that samples should be drawn both at the treatment plant outlet as well as the consumer end. However, the data provided by the cities were predominantly from the distribution point. Hence for consumer end results with MoHUA intervention, consortia coordinated with cities to collect the data at the consumer end. The cities facilitated the testing. The outcome of the process is as below: 1. Sample given- 102 cities 2. Report received- 86 cities 3. Report awaited- 16 cities 4. Tests not completed due to lack of cooperation and other reasons – 9	The maximum score for this indicator will be distributed equally (50%) for results based on samples from the treatment plant and consumer end. Cities that did not complete tests or provide the results will be given a score 0 for against consumer end tests.
6	City level population is not projected annually by most of the cities. So, estimates for 2017 population are not available with the cities.	As recommended by MoHUA, 2011 census population is being used for the ranking purpose.
7	The age category specific data for 9 cities is not available at a city level	The age category specific population data has been taken at a district level for these cities.

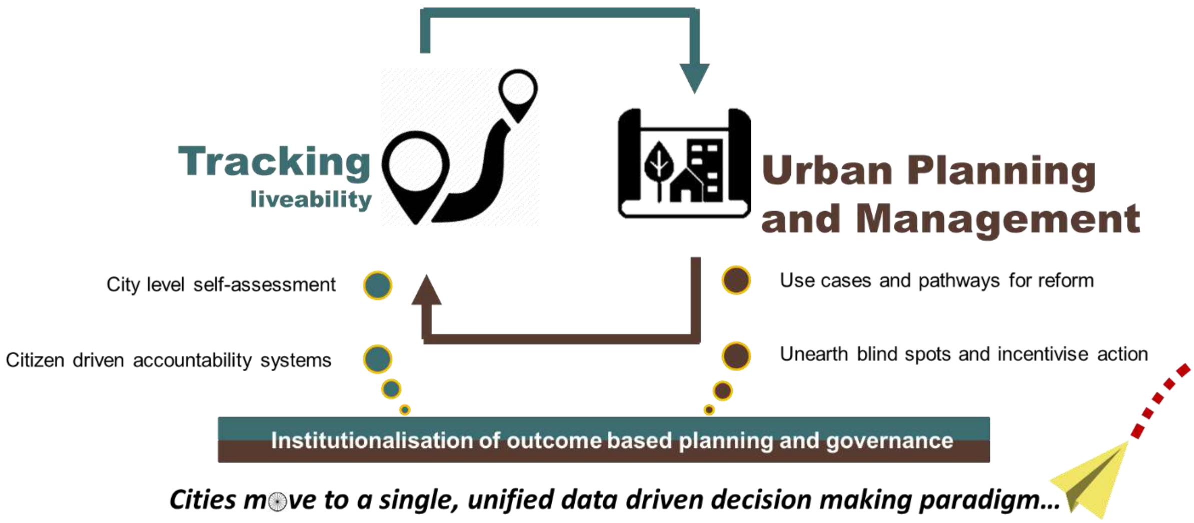
#	Challenges	Proposed Solutions
8	Indicators on non-motorised transports like- Dedicated bicycle tracks, bicycle parking facilities and mode share of non-motorised transport are not relevant for hilly terrains.	As discussed during the PMC meeting, these indicators have been treated as non-applicable for the hilly cities and the weights have been redistributed among other indicators within the same category.
9	The indicator on increase in professional tax is not relevant to cities which do not levy the professional tax.	As discussed during the PMC meeting, this indicator has been non-applicable to the cities belonging to states where professional tax is not levied, and the weights have been redistributed among other indicators within the same category.
10	The indicator on increase in VAT collection is not applicable to Port Blair and Kavaratti, as there was no provision of VAT collection in these cities.	As discussed during the PMC meeting, these indicatosr has been treated as non-applicable for these two cities and the weights have been redistributed among other indicators within the same category.
11	Indicator on coverage of basic services to slum households does not concern cities with no slums (notified/ non-notified.	As discussed during the PMC meeting, this indicators has been treated as non-applicable for these cities and the weights have been redistributed among other indicators within the same category.

1. Introduction

The Ministry of Housing and Urban Affairs (MoHUA) is implementing several flagship urban missions such as the Smart Cities Mission (SCM), Atal Mission for Urban Rejuvenation and Transformation (AMRUT), Heritage City Development and Augmentation Yojana (HRIDAY), Housing for All (HFA). Theses mission along with other transformative initiatives of the Government including National Water Mission, Power for All, National Health Mission are aimed at making Indian cities more 'liveable.' The overarching goal of these initiatives is to move from an input-based approach to a 'citizen centric-outcome based' assessment of urban liveability.

To develop a common minimum framework for cities to assess their existing status and chart their pathway towards providing a better quality of life to their citizens, the MoHUA developed a set of 'Liveability Standards' relevant to cities to generate a Liveability Index and ranking of cities. These standards were launched in June, 2017. The MoHUA has planned to conduct an 'Annual Assessment of Liveability Standards in Cities – an ambitious national project that will involve yearly submission of data by cities across the various indicators, compilation and analysis, development of indices and ranking of cities. The Liveability Index is envisioned as a 360° tool for tracking, planning and transforming Indian cities. The Liveability Index is aimed at the following objectives:

- Providing strong evidence-based approach for future interventions and investments to deliver liveability outcomes
- Catalysing actions to improve the overall quality of the city's liveability and achieve broader development outcomes including the Sustainable Development Goals
- Assessing the implementation of government policies and schemes governing characteristics of cities that can contribute to creating liveable communities



Tracking
liveability
Urban Planning
and Management
City level self-assessment
Citizen driven accountability systems
Use cases and pathways for reform
Unearth blind spots and incentivise action
Institutionalisation of outcome based planning and governance
Cities move to a single, unified data driven decision making paradigm...

The first round of the assessment commenced in January 2018 covering 116 major cities including smart cities, capital cities and cities with population of above one million each. Implementation of the liveability assessment commenced in January 2018 with a national level orientation workshop for the urban local bodies. The workshop aimed at orienting the states and urban local bodies on the overall framework, indicators, data sources, methodology and key milestones and timelines involved in the liveability assessment. Subsequently, a series of State/ Union Territory level orientation workshops were carried out in 33 states/UTs for a detailed discussion on the framework. Online data collection commenced from 9th March through an online data collection platform that supported both online and offline data submission modes. On the date of closure of the online data entry portal i.e., 16th April, 2018 112 cities submitted their data. Subsequently, comprehensive checks on the submitted data was undertaken that involved checking for outliers, logical inconsistencies etc. post which round-1 of data reconciliation was conducted. This draft report is based on round-1 of reconciled data as on 28th April, 2018.

2. City Profile

This chapter presents the city profile -Geographic and Demographic, Social (Education Health, Safety and Security, Heritage), Economic profile, and Physical (Water, sanitation and Waste Management, Electricity, Open space and roads).

CHENNAI

GEOGRAPHICAL PROFILE

State/Union Territory	Tamil Nadu	**Total Geographical Area (Km²)**	426	**City Category**	Megapolis

DEMOGRAPHIC PROFILE

Total Population	4646732
Total Number of Households	1211576

SOCIAL PROFILE

Education	**Total Number of Schools**	2207
	Total Enrolment (Class 1 to 5)	487622
Health	**Total Number of In-patients Beds**	32397
	Total Health Workforce	59562
Safety and Security	**Total Strength of Police Force**	22860
	Total Number of CCTV Cameras	51995
Heritage Sites	**Total Number of Heritage Sites**	41

ECONOMIC PROFILE

Total Population in Working Age Group	1906345
Total Number of Industries	24146
Total Number of Commercial Enterprises	119160
Total Number of Hotels	2827
Total Capital and Revenue Expenditure for the city in FY 2016-17 (INR Lakhs)	455677.72
Total VAT Collection in FY 2016-17 (INR Lakhs)	5056100

PHYSICAL PROFILE			
	Water	Average Quantity of Water Supplied (MLD)	1906345
		Total Number of Water Connections	24146
	Sanitation Facilities	Total number of households with access to individual toilets in the city	119160
		Total number of households in the city with access to community toilets in the city	2827
	Solid Waste Management	Daily average quantity of municipal solid waste collected in the city (Tonnes/day)	455677.72
		Total number of households covered through door-to-door collection of solid waste	5056100
	Waste Water	Daily Average Quantum of Waste Water Generated in the City (MLD)	1906345
		Daily average quantum of waste water treated by STPs in the city (MLD)	24146
	Electricity	Total number of authorized electrical connections in the city	119160
		Total electricity supplied to the city (kWh)	2827
	Public and Open Spaces	Total area covered by green spaces in the city (m^2)	455677.72
	Roads and Transport	Total Length of Road Network in the City (Km)	5056100
		Total length of arterial and sub-arterial road network in the city (Km)	1906345
		Total length of footpath (wider than 1.2 metres) in the city along the street network (Km)	24146

3. Liveability Framework and Indicators

The Liveability Framework comprises a total of 79 indicators (57 Core Indicators and 22 Supporting Indicators). A core indicator carries 70% weightage and a supporting indicator carries 30% weightage. These indicators are grouped under 15 thematic categories which in turn are part of four pillars of comprehensive development of cities i.e., institutional, social, economic and physical. Based on the performance of cities against the various core and supporting indicators, various 'Category Sub-Indexes' and a composite 'City Liveability Index' will be developed for each city.

3.1 Scoring and Computing Category Indices of Liveability

The set of 79 indicators, associated categories and pillars are presented in the table below:

Table 1 List of Pillars, Categories and Indicators

Pillars of Comprehensive Development	Category	Indicators
Institutional	1. Governance	1.1 Percentage of citizen services available online
		1.2 Percentage of services integrated through Command Centre
		1.3 Percentage of citizens using online services
		1.4 Average delay in grievance redressal
		1.5 Tax collected as percentage of tax billed
		1.6 Extent of cost recovery (O&M) in water supply services
		1.7 Capital spending as percentage of total expenditure
		1.8 Percentage of population covered under Ward Committees/Area *Sabhas*
Social	**2. Identity and Culture**	2.1 Restoration and reuse of historic buildings
		2.2 Percentage of ecologically important areas covered through projects for restoration
		2.3 Hotel occupancy
		2.4 Percentage of budget allocated towards cultural/sports activities
		2.5 Number of cultural/sports events hosted by city
	3. Education	3.1 Percentage of school-aged population enrolled in schools
		3.2 Percentage of female school-aged population

Pillars of Comprehensive Development	Category	Indicators
		enrolled in schools
		3.3 Primary education student-teacher ratio
		3.4 Percentage of schools with access to digital education
		3.5 Percentage of students completing primary education
		3.6 Percentage of students completing secondary education
	4. Health	4.1 Number of in-patient hospital beds per 10,000 population
		4.2 Healthcare professionals per 10,000 population
		4.3 Average response time in case of health emergencies
		4.4 Period prevalence of water borne diseases
		4.5 Period prevalence of vector borne diseases
	5. Safety and Security	5.1 Number of CCTV Cameras
		5.2 Number of recorded crimes per lakh population
		5.3 Extent of crimes recorded against women, children and elderly per year
		5.4 Transport-related fatality per lakh population
Economic	**6. Economy and Employment**	6.1 Increase in VAT/GST collection
		6.2 Increase in collection of Professional Tax
		6.3 Increase in issuance of Construction permits
		6.4 Unemployment rate
		6.5 Percentage of vendors registered and provided formal spaces
Physical	**7. Housing and Inclusiveness**	7.1 Percentage of Slum/EWS households covered through formal/affordable housing
		7.2 Percentage of slum areas covered through basic services
	8. Public Open Spaces	8.1 Per capita availability of green spaces
		8.2 Per capita availability of public and recreational places
	9. Mixed Land Use and Compactness	9.1 Share of mixed land use area in overall city land use
		9.2 Net Density
	10. Power Supply	10.1 Percentage of city population with authorized electrical services

Pillars of Comprehensive Development	Category	Indicators
		10.2 Percentage of electrical connections covered through smart meters
		10.3 Average number of electrical interruptions per year
		10.4 Average length of electrical interruptions per year
		10.5 Percentage of total energy derived from renewable sources
		10.6 Energy consumption per unit - water supply and sewerage
		10.7 Energy consumption per unit - street lighting
		10.8 Percentage of new and redeveloped buildings following green building norms
		10.9 Total energy consumption per capita
	11. Transportation and Mobility	11.1 Geographical coverage of public transport
		11.2 Availability of public transport
		11.3 Mode share of public transport
		11.4 Percentage of road network with dedicated bicycle tracks
		11.5 Percentage of interchanges with bicycle parking facilities
		11.6 Mode share of non-motorized transport
		11.7 Availability of Passenger Information System
		11.8 Extent of signal synchronization
		11.9 Availability of paid parking spaces
		11.10 Percentage coverage of footpaths – wider than 1.2 m
		11.11 Percentage of traffic intersections with pedestrian crossing facilities
		11.12 Extent to which universal accessibility is incorporated in public rights-of-way
	12. Assured Water Supply	12.1 Household level coverage of direct water supply connections
		12.2 Per capita supply of water
		12.3 Quality of water supplied
		12.4 Level of non-revenue water – NRW
		12.5 Percentage of water connections covered through meters
		12.6 Percentage of plots with rainwater harvesting

Pillars of Comprehensive Development	Category	Indicators
		facility
	13. Waste Water Management	13.1 Coverage of toilets
		13.2 Coverage of sewerage network and/or septage
		13.3 Collection efficiency of sewerage network
		13.4 Extent of reuse and recycling of waste water
		13.5 Coverage of storm water drains
	14. Solid Waste Management	14.1 Household level coverage of municipal solid waste collection
		14.2 Efficiency of collection of municipal solid waste
		14.3 Extent of municipal solid waste recovered through reuse
	15. Reduced Pollution	15.1 Concentration of SO2- air pollution
		15.2 Concentration of NO2- air pollution
		15.3 Concentration of PM10 - air pollution
		15.4 Level of noise pollution
		15.5 Quality of water in public surface water bodies

3.2 Scoring and Computing Category Indices of Liveability

The performance achieved by cities against 79 indicators, will be assessed against given benchmarks. Where no international/national norms are available, city with the best performance in its group (population range) will be treated as a benchmark. The groups are given in the table below.

Table 2 Details on Population Range

Category	Population range
Category 1	Population ≥ 4 million
Category 2	1 million ≤ Population < 4 million
Category 3	0.5 million ≤ Population < 1 million
Category 4	Population < 0.5 million

3.3 Scoring Approach and Methodology

A city can earn a maximum score of 100 points for 79 indicators across four pillars. The pillar weights are as follows: Institutional (25 points), Social (25 points), Economy and Employment (5 points) and Physical (45 points). Based on the number and nature of indicators i.e., core vs. secondary, indicator wise maximum marks were computed.

100 marks

(Maximum overall score that any city can achieve)

25 marks	25 marks	5 marks	45 marks
(Maximum score that any city can achieve under **Institutional** Pillar)	(Maximum score that any city can achieve under **Social** Pillar)	(Maximum score that any city can achieve under **Economic** Pillar)	(Maximum score that any city can achieve under **Physical** Pillar)
1	4	1	9
(Category under Institutional Pillar)	(Number of categories under Social Pillar)	(Category under Economic Pillar)	(Number of categories under Physical Pillar)
8	20	5	46
(Number of indicators under Institutional)	(Number of indicators under Social Pillar)	(Category under Economic Pillar)	(Number of categories under Physical Pillar)
7 Core 1 Supporting	13 Core 7 Supporting	4 Core 1 Supporting	33 Core 13 Supporting

Dimensional Index Methodology (DIM) has been used to compute scores for each indicator with reference to "maximum within the comparison group" or "absolute benchmarks". For indicators where benchmarks are available, cities getting the benchmark score (or above) are given the maximum mark, and the marks awarded to other cities are calculated proportionately. For indicators where benchmarks are not available, the best performing cities in each population group are given the maximum mark, and the marks awarded to other cities (within the population group) are calculated proportionately. For indicators where benchmarks do not exist, the city data has been tested for outliers before scoring.

3.4 Scoring Normalisation:

To construct aggregate scores across cities as well as to make the scores across indicators comparable, indicator values were normalised using a min-max approach. The following formula was used to normalise the indicator values-

$$\frac{indicator\ value\ for\ the\ city - indicator\ value\ for\ the\ worst\ performing\ city}{benchmark -\ indicator\ value\ for\ the\ worst\ performing\ city}$$

This approach would restrict the normalised indicator value between 0 and 1. Cities that met or exceeded the benchmark received a normalised indicator value of 1. Worst performing cities are given a normalised indicator value of 0. After normalisation, the normalised value is weighted according to the category and the indicator being core or supporting.

To illustrate, consider the indicator 12.3 Quality of Water Supplied in the Category 12 for Assured Water Supply. If in City A 50% of the water samples collected qualify the potable water standards specified by the CPHEEO, and only 10% of the samples from worst performing city qualify the standards. Then, the normalised value for the indicator for city A would be 0.44 [(0.5-0.1)/(1-0.1)].

The weight for indicator 12.3 is 1.03, so the final weighted score for City A would come out to 0.45 [1.03*0.44].

4. Data Collection and Verification

4.1 Submission of Data by the cities

The Liveability Assessment is based on secondary data submitted by the urban local bodies and other concerned government agencies (collectively called as data owners). The 79 indicators were broken down into a set of easy to understand and relatable 553 questions mapped to data owners. Submission of the data was enabled through an online data entry portal on the smartnet platform of the Ministry. The portal also allowed the ULBs to download the liveability assessment questionnaire and upload filled in questionnaire. To familiarise and assist cities in identifying, mapping and collation of data points, a city level nodal person was available during the entire period of data submission process.

4.2 Mapping of Data Owners for the City

For the assessment of liveability indices broadly 12 data owners such as Central/state Pollution control board, Development authority, DISCOM/Electricity Board, State Disaster Management Authority, State Education Department, State Health department, State Renewable energy and development agency, State sales and commercial taxes department, town and country planning department, Traffic and police department, Transport authority, and Urban local body were identified to respond to the questions on the portal. However, during state workshop and subsequent city level discussions, more data owners were mapped to respond to different categories and sub categories. The following table provides the details of city level data owners mapped under the 12 data owner.

Table 3:Details of Data Owners

Designated data owners	Subcategories	Data owners at city level
Urban Local Body	For Accounts Related Questions	Greater Chennai Corporation (GCC) – Accounts Department
Urban Local Body	For Park and Recreation Related Questions	GCC – Parks Department
Urban Local Body	For Water Supply and Drainage related questions	Chennai Metropolitan Water Supply and Sewerage Board (CMWSSB)
Urban Local Body	For Heritage sites related data	Archeological Survey Of India (ASI)
Urban Local Body	For Ecological sites related data	Forest Departments
Urban Local Body	For Housing related data	Tamilnadu Slum Clearance Board
Urban Local Body	For Building plan related data	Chennai Metropolitan Development Authority (CMDA)
Urban Local Body	For Roads related data	GCC – Bus Route Roads Department (BRR)
Urban Local Body	For Solid waste management related data	GCC – Solid Waste Management
Urban Local Body	For IT services related data	GCC – EDP Department
Urban Local Body	For Vendor committee related data	GCC – Revenue Department
Urban Local Body	Any other departments involved in providing data for questions	GCC – Departments of Education, Health, Works, Electrical Sports & Stadium, Storm Water Drain, Buildings

Designated data owners	Subcategories	Data owners at city level
	mentioned under Urban Local Body	
Central / state Pollution control Board	Water Quality, Air Quality, Noise Quality	Tamilnadu Pollution Control Board
Development Authority	Building Infrastructure	Chennai Metropolitan Development Authority (CMDA)
	Construction planning	Works Department
	Green Building	Chennai Metropolitan Development Authority (CMDA)
	Rain water harvesting	Chennai Metropolitan Development Authority (CMDA)
	Universal Design Principle	Building Department
DISCOM/Electricity Board	Electrical Connection/ Grievance Redressal/ Power supply	Tamilnadu Generation and Distribution corporation Limited (TANGEDCO)
State Disaster management authority		Tamilnadu State Disaster Management
State Education Department		Education Department
State Health Department	Health care professionals	Health Department
	Citizen Services	Health Department
	Disease Prevalence	Health Department
	Health Infrastructure	Health Department
State Renewable Energy Development Agency		Tamilnadu Generation and Distribution corporation Limited (TANGEDCO)
State Sales / Commercial Taxes Department		Department of Commercial tax
Town and Country Planning Department	Land Use	Chennai Metropolitan Development Authority (CMDA)
Traffic and Police Department		
Transport Authorities	Buses	Metropolitan Transport Authority (MTC)
	Registered Vehicles	Transport Corporation
	Sub urban rail transport	Southern Railways

Designated data owners	Subcategories	Data owners at city level
	Mono Rail Authority	Not Applicable
	Tramways	Not Applicable
	Marine Transport Authority	Not Applicable

4.3 List of secondary documents available as supportive

City has provided supporting documents/evidences against the responses given by city on the online portal. In support of their responses on the portal, city submitted 97 number of documents. Documents submitted includes reports, official orders, copy of data maintained in official register, signed copy of questionnaire, and signed letters/submissions from concern departments. Verification includes mapping of documents against responses given by city, checking the type/category of documents, and validation of data provided.

The following table presents the data owner wise number of documents:

Table 4: Data owner wise number of secondary documents submitted by city

Data Owners	Number of Documents
Sales and Commercial Taxes	2
State Education Department	3
DISCOM/Electricity Department	6
Traffic and Police Department	1
Development Authority	6
Pollution Control Board	4
State Renewable Energy Department	1
Town and Country Planning	3
State Health Department	10
Transport Authority	12
Disaster Management	1
Urban Local Body	48
Total	97*

* The count of documents is based on first round of submission.

4.4 Data Verification

A three-stage data quality check comprising verification of data against secondary documents furnished by data owners, logical inconsistency checks including outliers, and physical audit for select indicators (Refer the exhibit below) is being undertaken. The objective of the data quality check is to ensure that data from the source documents are accurate and verifiable. Sources of data included reports, administrative data, survey results and other statistical records, log books among other.

Physical audit of eight indicators – one indicator from the Institutional pillar, one from the Social pillar, one from the Economy pillar and five from the Physical pillar is also being carried out by the field team to ascertain the degree of reliability of data reported by the cities. The list of these eight indicators is presented below:

1.2 | Percentage of services integrated through Command Centre

2.3 | Hotel occupancy

3.4 | Percentage of schools with access to digital education

5.1 | Number of streets, public places, junctions covered through surveillance systems

6.5 | Percentage of vendors registered and provided formal spaces

11.7 | Availability of Passenger Information System

11.11 | Percentage of traffic intersections with pedestrian crossing facilities

11.12 | Extent to which universal accessibility is incorporated in public rights-of-way

For a set of five indicators namely, unemployment rate, mode share of public transport, mode share of non-motorised transport, quality of water supplied and level of noise pollution, existing datasets were found to be not available consistently across all cities and/or were inadequate. To help cities that do not have data on these five indicators, dipstick assessments are being carried to fill data gaps.

6.4 | Unemployment Rate

11.3 | Mode share of public transport

11.5 | Mode share of Non Motorized Transport

12.3 | Quality of Water Supplied

15.4 | Level of Noise Pollution

4.5 Physical Audit

The following map presents the indicators audited at city level.

5. City Score on 15 categories of Assessment

Liveability Assessment covered 15 categories and 78 indicators. The below table presents the scores for all 15 indicators namely governance, identity & culture, education, health, safety and security, economy & employment, housing & inclusiveness, public open spaces, mixed land use & compactness, power supply, transport & mobility, assured water supply, waste water management, solid waste management and reduced pollution.

Table 5: Category wise scores

Categories	Scores in Percentage
Governance	60.70%
Identity & Culture	55%
Education	93%
Health	97%
Safety & Security	63%
Economy & Employment	50%
Housing & Inclusiveness	3%

Public Open Spaces	48%
Mixed Land Use & Compactness	5%
Power Supply	34%
Transport & Mobility	55%
Assured Water Supply	82%
Waste Water Management	72%
Solid Waste Management	69%
Reduced Pollution	81%

The rank of the city is based on the performance and scores in each of the category. The final city rank is submitted separately.

Executive Summary

Assessment of liveability indices is an initiative by the Ministry of Housing and Urban Affairs to improve quality of life of citizens and achieve sustainable development goals by encouraging cities to adopt "outcome based" approach for urban planning. Assessment process aimed to provide opportunity to cities to review the development components holistically by involving 79 measurable indicators categorized under governance, health, education, safety, economy, power supply, transportation and mobility, identity, culture, housing, waste management and pollution.

This report highlights the assessment process, key milestones, and the final outcome of the data submitted. Implementation of liveability assessment commenced formally on 19th January 2018. A national level workshop was organized on 13th February 2018 to explain the importance and process of liveability assessment and get feedback on methodology from the city authorities.

This was followed by the next stage of Questionnaire development. The questionnaire was arranged under 12 categories representing 12 data owners namely urban local body, Central and state pollution control board, development authority, DISCOM/Electricity board, State disaster management authority, state education department, state health department, state renewable energy development agency, state sales and commercial taxes department, town and country planning department, traffic and police department and transport authorities.

An online data entry portal was developed to facilitate data submission by the cities. Each city had a unique log in to access the portal and submit the data. Both online and off-line options (download the questionnaire in an excel) to submit the data were available for cities. An email help desk was set up for the cities to raise any queries and seek clarification when responding to the questions.

A team for each state comprising of State Coordinator and City Coordinator (one per city) was deployed that facilitated the process and supported the cities. A total of 6 regional coordinators/ consultants, 29 State Coordinators, and 99 city coordinators were deployed across 116 cities. Training for state coordinators was held from 26th to 28th February 2018 at Chennai to make coordinators understand overall liveability assessment, indicators, data sources, protocols and roles and responsibilities.

City Reconnaissance Meetings were initiated by the state and city coordinators. The discussion began with discussions to finalize the state workshop schedule, mapping of data owners, and assist cities in data collection. The City Coordinators were based in the cities for over 6 weeks and during this time, they liase with ULB and other data owners to explain the liveability framework, online portal, and facilitate the online submission.

A total of 33 state workshops were conducted at the state level. The objective of the workshop was to orient the city stakeholders on liveability assessment, indicators, components of data collection, timelines, expectations of support and support extended by MoHUA. The state level workshops brought various city level departments on a single platform to understand and discuss the methodology and components of city liveability assessment.

Nodal agency at state level supported by the City and State Coordinator and city level (Municipality corporation/smart city limited) coordinated with city specific data owners/departments for data gathering, collation, and submission. Nodal persons in each department were appointed for timely data collection and submission. Of 116, 112 cities submitted data as per the timeline on 16th April 2018.

Post submission, the city and state coordinators supported by the central team followed up extensively with the cities to support secondary documents as evidence to substantiate their submissions. Secondary documents such as reports, official orders, copy of office register, signed copy of liveability assessment questionnaire furnished by cities against the submitted data. Documents are verified to map the documents for the reponses provided by city and to check the type data provided by city. The document check outcomes were shared with the cities as a part of data quality check.

For checking consistency of data, logical check of data, verifying data from other public sources were undertaken. Quality check was done to ensure data validity and provide opportunity to cities to review the data provided by them and correct in case of wrong data entry.

For 8 selected indicators namely, percentage of services integrated through command and control center, hotel occupancy rate, percentage of schools with access to digital education, number of CCTV cameras per unit road length, percentage of vendors registered and provided formal spaces, availability of passenger information system, percentage of traffic intersection with pedestrian crossing facility, and extent to which universal accessibility is incorporated in public rights of way. Physical audit was conducted in 110 cities by physical auditors appointed and trained by the consortium. In consultation with ULB nodal person, locations and indicators for physical audit was selected in each city. A mobile based application was developed to capture the physical audit related data.

Primary data collection was done for five indicators such as unemployment rates, mode share of public transport, mode share of non-motorized transport, quality of water supplied, and level of noise pollution. Protocols for water and noise test were prepared in consultation with experts. Water quality test involved physical, chemical and bacteriological test of water as per the CPCB norms. For testing quality of water at consumer end, the auditors worked closely with the ULB and Water department. Samples were collected from consumer end and submitted to the lab suggested by city. For noise pollution, in about 20 cities the state pollution board or city level

environment department took the responsibility for providing noise pollution data as per the protocols. In rest of the cities, mobile based application was used to measure noise pollution.

During implementation, MoHUA facilitated the process by conducting video conferences with cities to address any queries, reiterate the importance, and ensure that cities adequately engages in the process and submit their responses in time and respond to requests for clarifications.

In addition to secondary data collection, physical audit and primary data collection, citizen survey was conducted to understand their perception and level of satisfaction on various services such as health, education, water supply, electricity, waste management etc. provided by urban local bodies. Over 60000 citizens participated in the survey across India.

The final scores and ranks have been generated based on the scoring methodology that has been discussed extensively and minor modifications made that are summarized as below:

#	Challenges	Proposed Solutions
1	Only 23 cities of 111 cities have City Mobility Plan (CMP) or any and hence able to provide data for Mode Share of Public Transport and Non-Motorised Transport. To address the data gap, as advised by the MoHUA, the consortia undertook a sample dipstick across all cities covering a sample of 150 Households. Understandably, the dipstick findings will not match the rigor of a CMP.	We recommend the following: 1) Cities which have provided CMP Data will be evaluated on 100% of the maximum score 2) For the cities where the dipstick data is used, the city receives a 50% discount on the overall score Alternatively, another approach is to assign 0 score to all 88 cities that don't have a CMP
2	Variance was observed on data reported by cities on road network and data presented in the smart city proposals during the verifications.	We recommend taking the data reported by the cities in the Smart City Proposals.
3	There is no secondary source/ organization that provides unemployment data at city level. As a result, most cities do not have the data. Fully cognizance of the challenges of generating this data in a short span of time, it was agreed to collect this data through a dipstick survey on lines of NSSO questions. The	The indicator on unemployment will be excluded from scores. For final ranking, the cities will be scored on 78 indicators.

#	Challenges	Proposed Solutions
	data generated needs further scrutiny and triangulation with some inputs from experts. This may not be possible in the short window.	
4	Many cities did not have data on noise pollution and it was decided that data will be collected using a mobile app for all the 111 cities. However, many cities have expressed reservations with the approach especially with respect to the reliability of using this data. Further, some cities have relied on the SPCB to collect the data as per the approach proposed by the consortia. Thus, noise pollution data is currently from two sources: 1. SPCB- 20 cities 2. Noise-based app- 91 cities	The data collected through the primary survey will be used for scoring the cities. Currently, there is no differential scoring for the data from the SPCB and the data collected through the mobile app. However, a certain higher weightage can be provided to those cities which used the state apparatus to collect noise pollution data.
5	For the indicator on quality of water supplied, the methodology document states that samples should be drawn both at the treatment plant outlet as well as the consumer end. However, the data provided by the cities were predominantly from the distribution point. Hence for consumer end results with MoHUA intervention, consortia coordinated with cities to collect the data at the consumer end. The cities facilitated the testing. The outcome of the process is as below: 1. Sample given- 102 cities 2. Report received- 86 cities 3. Report awaited- 16 cities 4. Tests not completed due to lack of cooperation and other reasons – 9	The maximum score for this indicator will be distributed equally (50%) for results based on samples from the treatment plant and consumer end. Cities that did not complete tests or provide the results will be given a score 0 for against consumer end tests.
6	City level population is not projected annually by most of the cities. So, estimates for 2017 population are not available with the cities.	As recommended by MoHUA, 2011 census population is being used for the ranking purpose.
7	The age category specific data for 9 cities is not available at a city level	The age category specific population data has been taken at a district level for these cities.

#	Challenges	Proposed Solutions
8	Indicators on non-motorised transports like- Dedicated bicycle tracks, bicycle parking facilities and mode share of non-motorised transport are not relevant for hilly terrains.	As discussed during the PMC meeting, these indicators have been treated as non-applicable for the hilly cities and the weights have been redistributed among other indicators within the same category.
9	The indicator on increase in professional tax is not relevant to cities which do not levy the professional tax.	As discussed during the PMC meeting, this indicator has been non-applicable to the cities belonging to states where professional tax is not levied, and the weights have been redistributed among other indicators within the same category.
10	The indicator on increase in VAT collection is not applicable to Port Blair and Kavaratti, as there was no provision of VAT collection in these cities.	As discussed during the PMC meeting, these indicatosr has been treated as non-applicable for these two cities and the weights have been redistributed among other indicators within the same category.
11	Indicator on coverage of basic services to slum households does not concern cities with no slums (notified/ non-notified.	As discussed during the PMC meeting, this indicators has been treated as non-applicable for these cities and the weights have been redistributed among other indicators within the same category.

1. Introduction

The Ministry of Housing and Urban Affairs (MoHUA) is implementing several flagship urban missions such as the Smart Cities Mission (SCM), Atal Mission for Urban Rejuvenation and Transformation (AMRUT), Heritage City Development and Augmentation Yojana (HRIDAY), Housing for All (HFA). Theses mission along with other transformative initiatives of the Government including National Water Mission, Power for All, National Health Mission are aimed at making Indian cities more 'liveable.' The overarching goal of these initiatives is to move from an input-based approach to a 'citizen centric-outcome based' assessment of urban liveability.

To develop a common minimum framework for cities to assess their existing status and chart their pathway towards providing a better quality of life to their citizens, the MoHUA developed a set of 'Liveability Standards' relevant to cities to generate a Liveability Index and ranking of cities. These standards were launched in June, 2017. The MoHUA has planned to conduct an 'Annual Assessment of Liveability Standards in Cities – an ambitious national project that will involve yearly submission of data by cities across the various indicators, compilation and analysis, development of indices and ranking of cities. The Liveability Index is envisioned as a 360° tool for tracking, planning and transforming Indian cities. The Liveability Index is aimed at the following objectives:

- Providing strong evidence-based approach for future interventions and investments to deliver liveability outcomes
- Catalysing actions to improve the overall quality of the city's liveability and achieve broader development outcomes including the Sustainable Development Goals
- Assessing the implementation of government policies and schemes governing characteristics of cities that can contribute to creating liveable communities

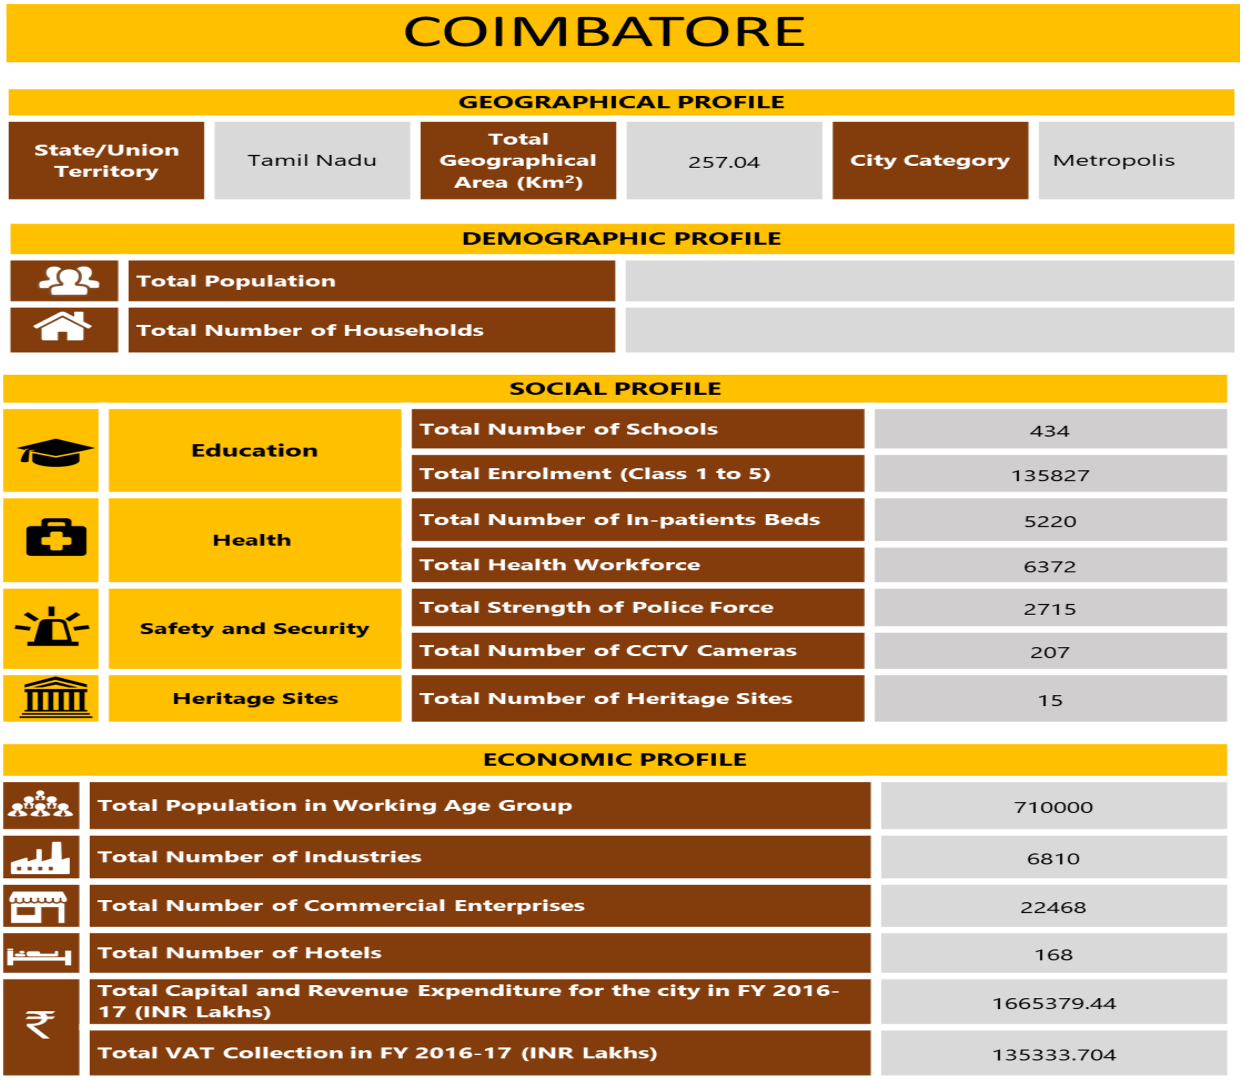
and Management
City level self-assessment
Citizen driven accountability systems
Use cases and pathways for reform
Unearth blind spots and incentivise action
Institutionalisation of outcome based planning and governance

Cities move to a single, unified data driven decision making paradigm...

The first round of the assessment commenced in January 2018 covering 116 major cities including smart cities, capital cities and cities with population of above one million each. Implementation of the liveability assessment commenced in January 2018 with a national level orientation workshop for the urban local bodies. The workshop aimed at orienting the states and urban local bodies on the overall framework, indicators, data sources, methodology and key milestones and timelines involved in the liveability assessment. Subsequently, a series of State/ Union Territory level orientation workshops were carried out in 33 states/UTs for a detailed discussion on the framework. Online data collection commenced from 9th March through an online data collection platform that supported both online and offline data submission modes. On the date of closure of the online data entry portal i.e., 16th April, 2018 112 cities submitted their data. Subsequently, comprehensive checks on the submitted data was undertaken that involved checking for outliers, logical inconsistencies etc. post which round-1 of data reconciliation was conducted. This draft report is based on round-1 of reconciled data as on 28th April, 2018.

2. City Profile

This chapter presents the city profile -Geographic and Demographic, Social (Education Health,



COIMBATORE

GEOGRAPHICAL PROFILE

State/Union Territory	Tamil Nadu	**Total Geographical Area (Km^2)**	257.04	**City Category**	Metropolis

DEMOGRAPHIC PROFILE

Total Population	
Total Number of Households	

SOCIAL PROFILE

Education	**Total Number of Schools**	434
	Total Enrolment (Class 1 to 5)	135827
Health	**Total Number of In-patients Beds**	5220
	Total Health Workforce	6372
Safety and Security	**Total Strength of Police Force**	2715
	Total Number of CCTV Cameras	207

ECONOMIC PROFILE

Total Population in Working Age Group	710000
Total Number of Industries	6810
Total Number of Commercial Enterprises	22468
Total Number of Hotels	168
Total Capital and Revenue Expenditure for the city in FY 2016-17 (INR Lakhs)	1665379.44
Total VAT Collection in FY 2016-17 (INR Lakhs)	135333.704

Safety and Security, Heritage), Economic profile, and Physical (Water, sanitation and Waste Management, Electricity, Open space and roads).

PHYSICAL PROFILE			
	Water	**Average Quantity of Water Supplied (MLD)**	220
		Total Number of Water Connections	277684
	Sanitation Facilities	**Total number of households with access to individual toilets in the city**	482222
		Total number of households in the city with access to community toilets in the city	6400
	Solid Waste Management	**Daily average quantity of municipal solid waste collected in the city (Tonnes/day)**	940
		Total number of households covered through door-to-door collection of solid waste	521605
	Waste Water	**Daily Average Quantum of Waste Water Generated in the City (MLD)**	190
		Daily average quantum of waste water treated by STPs in the city (MLD)	40
	Electricity	**Total number of authorized electrical connections in the city**	715466
		Total electricity supplied to the city (kWh)	1714109741
	Public and Open Spaces	**Total area covered by green spaces in the city (m^2)**	379819.54
	Roads and Transport	**Total Length of Road Network in the City (Km)**	2888.07
		Total length of arterial and sub-arterial road network in the city (Km)	40.2
		Total length of footpath (wider than 1.2 metres) in the city along the street network (Km)	40

3. Liveability Framework and Indicators

The Liveability Framework comprises a total of 79 indicators (57 Core Indicators and 22 Supporting Indicators). A core indicator carries 70% weightage and a supporting indicator carries 30% weightage. These indicators are grouped under 15 thematic categories which in turn are part of four pillars of comprehensive development of cities i.e., institutional, social, economic and physical. Based on the performance of cities against the various core and supporting indicators,

various 'Category Sub-Indexes' and a composite 'City Liveability Index' will be developed for each city.

3.1 Scoring and Computing Category Indices of Liveability

The set of 79 indicators, associated categories and pillars are presented in the table below:

Table 1 List of Pillars, Categories and Indicators

Pillars of Comprehensive Development	Category	Indicators
Institutional	1. Governance	1.1 Percentage of citizen services available online
		1.2 Percentage of services integrated through Command Centre
		1.3 Percentage of citizens using online services
		1.4 Average delay in grievance redressal
		1.5 Tax collected as percentage of tax billed
		1.6 Extent of cost recovery (O&M) in water supply services
		1.7 Capital spending as percentage of total expenditure
		1.8 Percentage of population covered under Ward Committees/Area *Sabhas*
Social	**2. Identity and Culture**	2.1 Restoration and reuse of historic buildings
		2.2 Percentage of ecologically important areas covered through projects for restoration
		2.3 Hotel occupancy
		2.4 Percentage of budget allocated towards cultural/sports activities
		2.5 Number of cultural/sports events hosted by city
	3. Education	3.1 Percentage of school-aged population enrolled in schools
		3.2 Percentage of female school-aged population enrolled in schools
		3.3 Primary education student-teacher ratio
		3.4 Percentage of schools with access to digital education
		3.5 Percentage of students completing primary education
		3.6 Percentage of students completing secondary education
	4. Health	4.1 Number of in-patient hospital beds per 10,000 population
		4.2 Healthcare professionals per 10,000 population

Pillars of Comprehensive Development	Category	Indicators
		4.3 Average response time in case of health emergencies
		4.4 Period prevalence of water borne diseases
		4.5 Period prevalence of vector borne diseases
	5. Safety and Security	5.1 Number of CCTV Cameras
		5.2 Number of recorded crimes per lakh population
		5.3 Extent of crimes recorded against women, children and elderly per year
		5.4 Transport-related fatality per lakh population
Economic	**6. Economy and Employment**	6.1 Increase in VAT/GST collection
		6.2 Increase in collection of Professional Tax
		6.3 Increase in issuance of Construction permits
		6.4 Unemployment rate
		6.5 Percentage of vendors registered and provided formal spaces
Physical	**7. Housing and Inclusiveness**	7.1 Percentage of Slum/EWS households covered through formal/affordable housing
		7.2 Percentage of slum areas covered through basic services
	8. Public Open Spaces	8.1 Per capita availability of green spaces
		8.2 Per capita availability of public and recreational places
	9. Mixed Land Use and Compactness	9.1 Share of mixed land use area in overall city land use
		9.2 Net Density
	10. Power Supply	10.1 Percentage of city population with authorized electrical services
		10.2 Percentage of electrical connections covered through smart meters
		10.3 Average number of electrical interruptions per year
		10.4 Average length of electrical interruptions per year
		10.5 Percentage of total energy derived from renewable sources
		10.6 Energy consumption per unit - water supply and sewerage
		10.7 Energy consumption per unit - street lighting
		10.8 Percentage of new and redeveloped buildings following green building norms
		10.9 Total energy consumption per capita
	11.	11.1 Geographical coverage of public transport

Pillars of Comprehensive Development	Category	Indicators
	Transportation and Mobility	11.2 Availability of public transport
		11.3 Mode share of public transport
		11.4 Percentage of road network with dedicated bicycle tracks
		11.5 Percentage of interchanges with bicycle parking facilities
		11.6 Mode share of non-motorized transport
		11.7 Availability of Passenger Information System
		11.8 Extent of signal synchronization
		11.9 Availability of paid parking spaces
		11.10 Percentage coverage of footpaths – wider than 1.2 m
		11.11 Percentage of traffic intersections with pedestrian crossing facilities
		11.12 Extent to which universal accessibility is incorporated in public rights-of-way
	12. Assured Water Supply	12.1 Household level coverage of direct water supply connections
		12.2 Per capita supply of water
		12.3 Quality of water supplied
		12.4 Level of non-revenue water – NRW
		12.5 Percentage of water connections covered through meters
		12.6 Percentage of plots with rainwater harvesting facility
	13. Waste Water Management	13.1 Coverage of toilets
		13.2 Coverage of sewerage network and/or septage
		13.3 Collection efficiency of sewerage network
		13.4 Extent of reuse and recycling of waste water
		13.5 Coverage of storm water drains
	14. Solid Waste Management	14.1 Household level coverage of municipal solid waste collection
		14.2 Efficiency of collection of municipal solid waste
		14.3 Extent of municipal solid waste recovered through reuse
	15. Reduced Pollution	15.1 Concentration of SO2- air pollution
		15.2 Concentration of NO2- air pollution
		15.3 Concentration of PM10 - air pollution
		15.4 Level of noise pollution
		15.5 Quality of water in public surface water bodies

3.2 Scoring and Computing Category Indices of Liveability

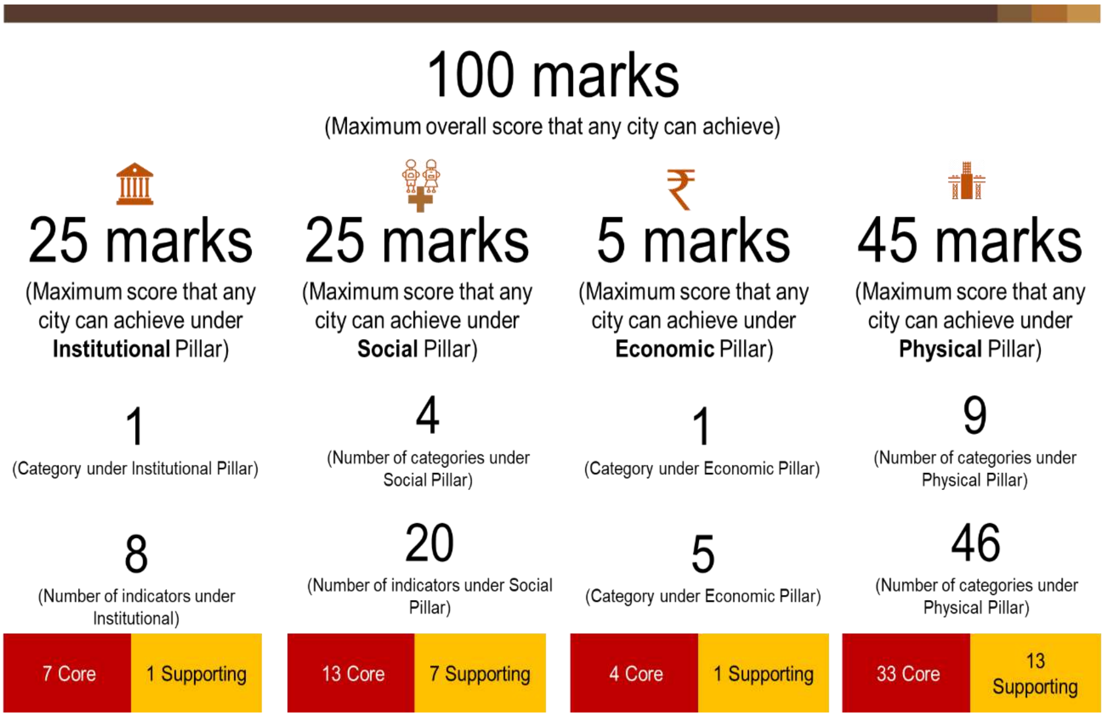
The performance achieved by cities against 79 indicators, will be assessed against given benchmarks. Where no international/national norms are available, city with the best performance in its group (population range) will be treated as a benchmark. The groups are given in the table below.

Table 2 Details on Population Range

Category	Population range
Category 1	Population ≥ 4 million
Category 2	1 million ≤ Population < 4 million
Category 3	0.5 million ≤ Population < 1 million
Category 4	Population < 0.5 million

3.3 Scoring Approach and Methodology

A city can earn a maximum score of 100 points for 79 indicators across four pillars. The pillar weights are as follows: Institutional (25 points), Social (25 points), Economy and Employment (5 points) and Physical (45 points). Based on the number and nature of indicators i.e., core vs. secondary, indicator wise maximum marks were computed.



100 marks
(Maximum overall score that any city can achieve)
25 marks
(Maximum score that any city can achieve under **Institutional** Pillar)
25 marks
(Maximum score that any city can achieve under **Social** Pillar)
5 marks
(Maximum score that any city can achieve under **Economic** Pillar)
45 marks
(Maximum score that any city can achieve under **Physical** Pillar)

Dimensional Index Methodology (DIM) has been used to compute scores for each indicator with reference to “maximum within the comparison group” or “absolute benchmarks”. For indicators where benchmarks are available, cities getting the benchmark score (or above) are given the maximum mark, and the marks awarded to other cities are calculated proportionately. For indicators where benchmarks are not available, the best performing cities in each population group are given the maximum mark, and the marks awarded to other cities (within the population group) are calculated proportionately. For indicators where benchmarks do not exist, the city data has been tested for outliers before scoring.

3.4 Scoring Normalisation:

To construct aggregate scores across cities as well as to make the scores across indicators comparable, indicator values were normalised using a min-max approach. The following formula was used to normalise the indicator values-

$$\frac{indicator\ value\ for\ the\ city - indicator\ value\ for\ the\ worst\ performing\ city}{benchmark - \ indicator\ value\ for\ the\ worst\ performing\ city}$$

This approach would restrict the normalised indicator value between 0 and 1. Cities that met or exceeded the benchmark received a normalised indicator value of 1. Worst performing cities are given a normalised indicator value of 0. After normalisation, the normalised value is weighted according to the category and the indicator being core or supporting.

To illustrate, consider the indicator 12.3 Quality of Water Supplied in the Category 12 for Assured Water Supply. If in City A 50% of the water samples collected qualify the potable water standards specified by the CPHEEO, and only 10% of the samples from worst performing city qualify the standards. Then, the normalised value for the indicator for city A would be 0.44 [(0.5-0.1)/(1-0.1)].

The weight for indicator 12.3 is 1.03, so the final weighted score for City A would come out to 0.45 [1.03*0.44].

4. Data Collection and Verification

4.1 Submission of Data by the cities

The Liveability Assessment is based on secondary data submitted by the urban local bodies and other concerned government agencies (collectively called as data owners). The 79 indicators were broken down into a set of easy to understand and relatable 553 questions mapped to data owners. Submission of the data was enabled through an online data entry portal on the smartnet platform of the Ministry. The portal also allowed the ULBs to download the liveability assessment questionnaire and upload filled in questionnaire. To familiarise and assist cities in identifying, mapping and collation of data points, a city level nodal person was available during the entire period of data submission process.

4.2 Mapping of Data Owners for the City

For the assessment of liveability indices broadly 12 data owners such as Central/state Pollution control board, Development authority, DISCOM/Electricity Board, State Disaster Management Authority, State Education Department, State Health department, State Renewable energy and development agency, State sales and commercial taxes department, town and country planning department, Traffic and police department, Transport authority, and Urban local body were identified to respond to the questions on the portal. However, during state workshop and subsequent city level discussions, more data owners were mapped to respond to different categories and sub categories. The following table provides the details of city level data owners mapped under the 12 data owner.

Table 3:Details of Data Owners

Designated data owners	Subcategories	Data owners at city level
Urban Local Body	For Accounts Related Questions	Accounts department
Urban Local Body	For Park and Recreation Related Questions	Engineering Section
Urban Local Body	For Water Supply and Drainage related questions	Engineering Section
Urban Local Body	For Heritage sites related data	Town planning
Urban Local Body	For Ecological sites related data	Town planning
Urban Local Body	For Housing related data	Town planning
Urban Local Body	For Building plan related data	Town planning
Urban Local Body	For Roads related data	Engineering Section
Urban Local Body	For Solid waste management related data	Health Department
Urban Local Body	For IT services related data	IT department
Urban Local Body	For Vendor committee related data	Town planning
Urban Local Body	Any other departments involved in providing data for questions mentioned under Urban Local Body	Revenue Section

Designated data owners	Subcategories	Data owners at city level
Central / state Pollution control Board	Water Quality, Air Quality, Noise Quality	Pollution Control Board,
Development Authority	Building Infrastructure	Town planning
	Construction planning	Town planning
	Green Building	Town planning
	Rain water harvesting	Town planning
	Universal Design Principle	Engineering Department
DISCOM/Electricity Board	Electrical Connection/ Grievance Redressal/ Power supply	Tamilnadu Electricity Board
State Disaster management authority		Revenue and Disaster Management Department
State Education Department		Education Department
State Health Department	Health care professionals	City Health Office
	Citizen Services	City Health Office
	Disease Prevalence	City Health Office
	Health Infrastructure	City Health Office
State Renewable Energy Development Agency		Tamilnadu Electricity Board
State Sales / Commercial Taxes Department		District Commercial Tax Department
Town and Country Planning Department	Land Use	Town Planning
Traffic and Police Department		Police Department
Transport Authorities	Buses	Tamilnadu State Transport Corporation
	Registered Vehicles	Regional Transport Office
	Sub urban rail transport	NA
	Mono Rail Authority	NA
	Tramways	NA
	Marine Transport Authority	NA

4.3 List of secondary documents available as supportive

City has provided supporting documents/evidences against the responses given by city on the online portal. In support of their responses on the portal, city submitted 157 number of documents. Documents submitted includes reports, official orders, copy of data maintained in official register, signed copy of questionnaire, and signed letters/submissions from concern departments. Verification includes mapping of documents against responses given by city, checking the type/category of documents, and validation of data provided.

The following table presents the data owner wise number of documents:

Table 4: Data owner wise number of secondary documents submitted by city

Data Owners	Number of Documents
Sales and Commercial Taxes	1
State Education Department	3
DISCOM/Electricity Department	8
Traffic and Police Department	3
Development Authority	12
Pollution Control Board	4
State Renewable Energy Department	1
Town and Country Planning	2
State Health Department	21
Transport Authority	11
Disaster Management	1
Urban Local Body	90
Total	157

4.4 Data Verification

A three-stage data quality check comprising verification of data against secondary documents furnished by data owners, logical inconsistency checks including outliers, and physical audit for select indicators (Refer the exhibit below) is being undertaken. The objective of the data quality check is to ensure that data from the source documents are accurate and verifiable. Sources of data included reports, administrative data, survey results and other statistical records, log books among other.

Physical audit of eight indicators – one indicator from the Institutional pillar, one from the Social pillar, one from the Economy pillar and five from the Physical pillar is also being carried out by the field team to ascertain the degree of reliability of data reported by the cities. The list of these eight indicators is presented below:

1.2 | Percentage of services integrated through Command Centre

2.3 | Hotel occupancy

3.4 | Percentage of schools with access to digital education

5.1| Number of streets, public places, junctions covered through surveillance systems

6.5 | Percentage of vendors registered and provided formal spaces

11.7 | Availability of Passenger Information System

11.11 | Percentage of traffic intersections with pedestrian crossing facilities

11.12 | Extent to which universal accessibility is incorporated in public rights-of-way

For a set of five indicators namely, unemployment rate, mode share of public transport, mode share of non-motorised transport, quality of water supplied and level of noise pollution, existing datasets were found to be not available consistently across all cities and/or were inadequate. To help cities that do not have data on these five indicators, dipstick assessments are being carried to fill data gaps.

6.4 | Unemployment Rate

11.3 | Mode share of public transport

11.5 | Mode share of Non Motorized Transport

12.3 | Quality of Water Supplied

15.4 | Level of Noise Pollution

4.5 Physical Audit

The following map presents the indicators audited at city level.

5. City Score on 15 categories of Assessment

Liveability Assessment covered 15 categories and 78 indicators. The below table presents the scores for all 15 indicators namely governance, identity & culture, education, health, safety and security, economy & employment, housing & inclusiveness, public open spaces, mixed land use & compactness, power supply, transport & mobility, assured water supply, waste water management, solid waste management and reduced pollution.

Table 5: Category wise scores

Categories	Scores in Percentage
Governance	53.30%
Identity & Culture	48%
Education	95%
Health	98%
Safety & Security	64%
Economy & Employment	14%
Housing & Inclusiveness	11%

Public Open Spaces	2%
Mixed Land Use & Compactness	16%
Power Supply	57%
Transport & Mobility	26%
Assured Water Supply	85%
Waste Water Management	68%
Solid Waste Management	92%
Reduced Pollution	73%

The rank of the city is based on the performance and scores in each of the category. The final city rank is submitted separately.

Executive Summary

Assessment of liveability indices is an initiative by the Ministry of Housing and Urban Affairs to improve quality of life of citizens and achieve sustainable development goals by encouraging cities to adopt "outcome based" approach for urban planning. Assessment process aimed to provide opportunity to cities to review the development components holistically by involving 79 measurable indicators categorized under governance, health, education, safety, economy, power supply, transportation and mobility, identity, culture, housing, waste management and pollution.

This report highlights the assessment process, key milestones, and the final outcome of the data submitted. Implementation of liveability assessment commenced formally on 19th January 2018. A national level workshop was organized on 13th February 2018 to explain the importance and process of liveability assessment and get feedback on methodology from the city authorities.

This was followed by the next stage of Questionnaire development. The questionnaire was arranged under 12 categories representing 12 data owners namely urban local body, Central and state pollution control board, development authority, DISCOM/Electricity board, State disaster management authority, state education department, state health department, state renewable energy development agency, state sales and commercial taxes department, town and country planning department, traffic and police department and transport authorities.

An online data entry portal was developed to facilitate data submission by the cities. Each city had a unique log in to access the portal and submit the data. Both online and off-line options (download the questionnaire in an excel) to submit the data were available for cities. An email help desk was set up for the cities to raise any queries and seek clarification when responding to the questions.

A team for each state comprising of State Coordinator and City Coordinator (one per city) was deployed that facilitated the process and supported the cities. A total of 6 regional coordinators/ consultants, 29 State Coordinators, and 99 city coordinators were deployed across 116 cities. Training for state coordinators was held from 26th to 28th February 2018 at Chennai to make coordinators understand overall liveability assessment, indicators, data sources, protocols and roles and responsibilities.

City Reconnaissance Meetings were initiated by the state and city coordinators. The discussion began with discussions to finalize the state workshop schedule, mapping of data owners, and assist cities in data collection. The City Coordinators were based in the cities for over 6 weeks and during this time, they liase with ULB and other data owners to explain the liveability framework, online portal, and facilitate the online submission.

A total of 33 state workshops were conducted at the state level. The objective of the workshop was to orient the city stakeholders on liveability assessment, indicators, components of data collection, timelines, expectations of support and support extended by MoHUA. The state level workshops brought various city level departments on a single platform to understand and discuss the methodology and components of city liveability assessment.

Nodal agency at state level supported by the City and State Coordinator and city level (Municipality corporation/smart city limited) coordinated with city specific data owners/departments for data gathering, collation, and submission. Nodal persons in each department were appointed for timely data collection and submission. Of 116, 112 cities submitted data as per the timeline on 16th April 2018.

Post submission, the city and state coordinators supported by the central team followed up extensively with the cities to support secondary documents as evidence to substantiate their submissions. Secondary documents such as reports, official orders, copy of office register, signed copy of liveability assessment questionnaire furnished by cities against the submitted data. Documents are verified to map the documents for the reponses provided by city and to check the type data provided by city. The document check outcomes were shared with the cities as a part of data quality check.

For checking consistency of data, logical check of data, verifying data from other public sources were undertaken. Quality check was done to ensure data validity and provide opportunity to cities to review the data provided by them and correct in case of wrong data entry.

For 8 selected indicators namely, percentage of services integrated through command and control center, hotel occupancy rate, percentage of schools with access to digital education, number of CCTV cameras per unit road length, percentage of vendors registered and provided formal spaces, availability of passenger information system, percentage of traffic intersection with pedestrian crossing facility, and extent to which universal accessibility is incorporated in public rights of way. Physical audit was conducted in 110 cities by physical auditors appointed and trained by the consortium. In consultation with ULB nodal person, locations and indicators for physical audit was selected in each city. A mobile based application was developed to capture the physical audit related data.

Primary data collection was done for five indicators such as unemployment rates, mode share of public transport, mode share of non-motorized transport, quality of water supplied, and level of noise pollution. Protocols for water and noise test were prepared in consultation with experts. Water quality test involved physical, chemical and bacteriological test of water as per the CPCB norms. For testing quality of water at consumer end, the auditors worked closely with the ULB and Water department. Samples were collected from consumer end and submitted to the lab suggested by city. For noise pollution, in about 20 cities the state pollution board or city level

environment department took the responsibility for providing noise pollution data as per the protocols. In rest of the cities, mobile based application was used to measure noise pollution.

During implementation, MoHUA facilitated the process by conducting video conferences with cities to address any queries, reiterate the importance, and ensure that cities adequately engages in the process and submit their responses in time and respond to requests for clarifications.

In addition to secondary data collection, physical audit and primary data collection, citizen survey was conducted to understand their perception and level of satisfaction on various services such as health, education, water supply, electricity, waste management etc. provided by urban local bodies. Over 60000 citizens participated in the survey across India.

The final scores and ranks have been generated based on the scoring methodology that has been discussed extensively and minor modifications made that are summarized as below:

#	**Challenges**	**Proposed Solutions**
1	Only 23 cities of 111 cities have City Mobility Plan (CMP) or any and hence able to provide data for Mode Share of Public Transport and Non-Motorised Transport. To address the data gap, as advised by the MoHUA, the consortia undertook a sample dipstick across all cities covering a sample of 150 Households. Understandably, the dipstick findings will not match the rigor of a CMP.	We recommend the following: 1) Cities which have provided CMP Data will be evaluated on 100% of the maximum score 2) For the cities where the dipstick data is used, the city receives a 50% discount on the overall score Alternatively, another approach is to assign 0 score to all 88 cities that don't have a CMP
2	Variance was observed on data reported by cities on road network and data presented in the smart city proposals during the verifications.	We recommend taking the data reported by the cities in the Smart City Proposals.
3	There is no secondary source/ organization that provides unemployment data at city level. As a result, most cities do not have the data. Fully cognizance of the challenges of generating this data in a short span of time, it was agreed to collect this data through a dipstick survey on lines of NSSO questions. The	The indicator on unemployment will be excluded from scores. For final ranking, the cities will be scored on 78 indicators.

#	Challenges	Proposed Solutions
	data generated needs further scrutiny and triangulation with some inputs from experts. This may not be possible in the short window.	
4	Many cities did not have data on noise pollution and it was decided that data will be collected using a mobile app for all the 111 cities. However, many cities have expressed reservations with the approach especially with respect to the reliability of using this data. Further, some cities have relied on the SPCB to collect the data as per the approach proposed by the consortia. Thus, noise pollution data is currently from two sources: 1. SPCB- 20 cities 2. Noise-based app- 91 cities	The data collected through the primary survey will be used for scoring the cities. Currently, there is no differential scoring for the data from the SPCB and the data collected through the mobile app. However, a certain higher weightage can be provided to those cities which used the state apparatus to collect noise pollution data.
5	For the indicator on quality of water supplied, the methodology document states that samples should be drawn both at the treatment plant outlet as well as the consumer end. However, the data provided by the cities were predominantly from the distribution point. Hence for consumer end results with MoHUA intervention, consortia coordinated with cities to collect the data at the consumer end. The cities facilitated the testing. The outcome of the process is as below: 1. Sample given- 102 cities 2. Report received- 86 cities 3. Report awaited- 16 cities 4. Tests not completed due to lack of cooperation and other reasons – 9	The maximum score for this indicator will be distributed equally (50%) for results based on samples from the treatment plant and consumer end. Cities that did not complete tests or provide the results will be given a score 0 for against consumer end tests.
6	City level population is not projected annually by most of the cities. So, estimates for 2017 population are not available with the cities.	As recommended by MoHUA, 2011 census population is being used for the ranking purpose.
7	The age category specific data for 9 cities is not available at a city level	The age category specific population data has been taken at a district level for these cities.

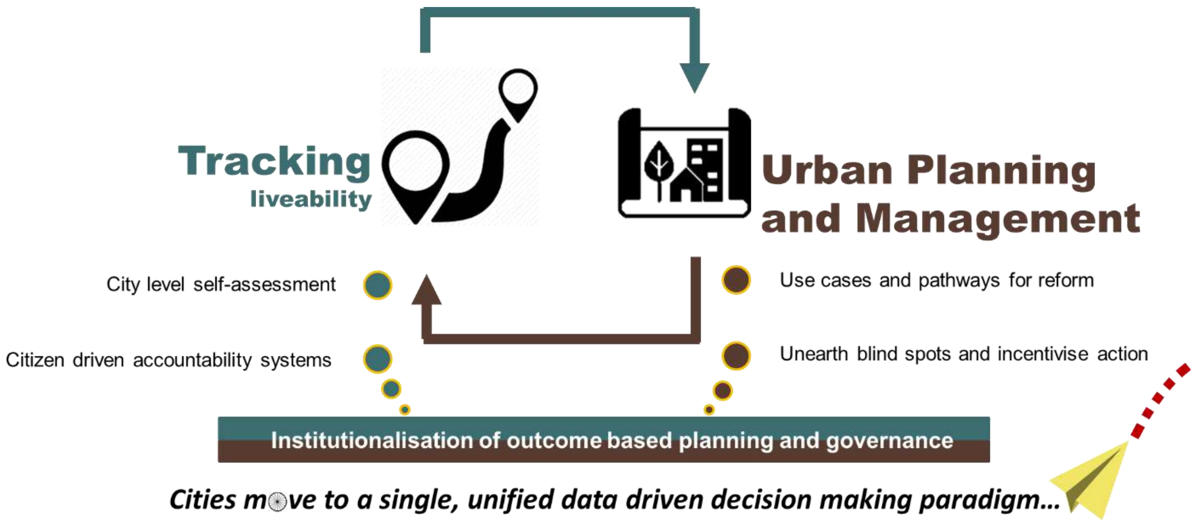
#	Challenges	Proposed Solutions
8	Indicators on non-motorised transports like- Dedicated bicycle tracks, bicycle parking facilities and mode share of non-motorised transport are not relevant for hilly terrains.	As discussed during the PMC meeting, these indicators have been treated as non-applicable for the hilly cities and the weights have been redistributed among other indicators within the same category.
9	The indicator on increase in professional tax is not relevant to cities which do not levy the professional tax.	As discussed during the PMC meeting, this indicator has been non-applicable to the cities belonging to states where professional tax is not levied, and the weights have been redistributed among other indicators within the same category.
10	The indicator on increase in VAT collection is not applicable to Port Blair and Kavaratti, as there was no provision of VAT collection in these cities.	As discussed during the PMC meeting, these indicatosr has been treated as non-applicable for these two cities and the weights have been redistributed among other indicators within the same category.
11	Indicator on coverage of basic services to slum households does not concern cities with no slums (notified/ non-notified.	As discussed during the PMC meeting, this indicators has been treated as non-applicable for these cities and the weights have been redistributed among other indicators within the same category.

1. Introduction

The Ministry of Housing and Urban Affairs (MoHUA) is implementing several flagship urban missions such as the Smart Cities Mission (SCM), Atal Mission for Urban Rejuvenation and Transformation (AMRUT), Heritage City Development and Augmentation Yojana (HRIDAY), Housing for All (HFA). Theses mission along with other transformative initiatives of the Government including National Water Mission, Power for All, National Health Mission are aimed at making Indian cities more 'liveable.' The overarching goal of these initiatives is to move from an input-based approach to a 'citizen centric-outcome based' assessment of urban liveability.

To develop a common minimum framework for cities to assess their existing status and chart their pathway towards providing a better quality of life to their citizens, the MoHUA developed a set of 'Liveability Standards' relevant to cities to generate a Liveability Index and ranking of cities. These standards were launched in June, 2017. The MoHUA has planned to conduct an 'Annual Assessment of Liveability Standards in Cities – an ambitious national project that will involve yearly submission of data by cities across the various indicators, compilation and analysis, development of indices and ranking of cities. The Liveability Index is envisioned as a 360° tool for tracking, planning and transforming Indian cities. The Liveability Index is aimed at the following objectives:

- Providing strong evidence-based approach for future interventions and investments to deliver liveability outcomes
- Catalysing actions to improve the overall quality of the city's liveability and achieve broader development outcomes including the Sustainable Development Goals
- Assessing the implementation of government policies and schemes governing characteristics of cities that can contribute to creating liveable communities



Tracking
liveability
Urban Planning
and Management
City level self-assessment
Citizen driven accountability systems
Use cases and pathways for reform
Unearth blind spots and incentivise action
Institutionalisation of outcome based planning and governance
Cities move to a single, unified data driven decision making paradigm...

The first round of the assessment commenced in January 2018 covering 116 major cities including smart cities, capital cities and cities with population of above one million each. Implementation of the liveability assessment commenced in January 2018 with a national level orientation workshop for the urban local bodies. The workshop aimed at orienting the states and urban local bodies on the overall framework, indicators, data sources, methodology and key milestones and timelines involved in the liveability assessment. Subsequently, a series of State/ Union Territory level orientation workshops were carried out in 33 states/UTs for a detailed discussion on the framework. Online data collection commenced from 9th March through an online data collection platform that supported both online and offline data submission modes. On the date of closure of the online data entry portal i.e., 16th April, 2018 112 cities submitted their data. Subsequently, comprehensive checks on the submitted data was undertaken that involved checking for outliers, logical inconsistencies etc. post which round-1 of data reconciliation was conducted. This draft report is based on round-1 of reconciled data as on 28th April, 2018.

2. City Profile

This chapter presents the city profile -Geographic and Demographic, Social (Education Health, Safety and Security, Heritage), Economic profile, and Physical (Water, sanitation and Waste Management, Electricity, Open space and roads).

DAHOD

GEOGRAPHICAL PROFILE

State/Union Territory	Gujrat	Total Geographical Area (Km²)	6.5	City Category	Small City

DEMOGRAPHIC PROFILE

Total Population	96000
Total Number of Households	25550

SOCIAL PROFILE

Education	Total Number of Schools	44
	Total Enrolment (Class 1 to 5)	3247
Health	Total Number of In-patient Beds	1323
	Total Health Workforce	1188
Safety and Security	Total Strength of Police Force	63
	Total Number of CCTV Cameras	19
Heritage Sites	Total Number of Heritage Sites	1

ECONOMIC PROFILE

Total Population in Working Age Group	...
Total Number of Industries	44
Total Number of Commercial Enterprises	8330
Total Number of Hotels	5
Total Capital and Revenue Expenditure for the city in FY 2016-17 (INR Lakhs)	3367.58
Total VAT Collection in FY 2016-17 (INR Lakhs)	4452.36

PHYSICAL PROFILE		
Water	Average Quantity of Water Supplied (MLD)	10
	Total Number of Water Connection	13569
Sanitation Facilities	Total number of households with access to individual toilets in the city	25550
	Total number of households in the city with access to community toilets in the city	6952
Solid Waste Management	Daily average quantity of municipal solid waste collected in the city (Tonnes/day)	35
	Total number of households covered through door-to-door collection of solid waste	25550
Waste Water	Daily Average Quantum of Waste Water Generated in the City (MLD)	...
	Daily average quantum of waste water treated by STPs in the city (MLD)	...
Electricity	Total number of authorized electrical connections in the city	38337
	Total electricity supplied to the city (kWh)	103566836
Public and Open Spaces	Total area covered by green spaces in the city (m^2)	57.32
Roads and Transport	Total Length of Road Network in the City (Km)	102
	Total length of arterial and sub-arterial road network in the city (Km)	14
	Total length of footpath (wider than 1.2 metres) in the city along the street network (Km)	1

3. Liveability Framework and Indicators

The Liveability Framework comprises a total of 79 indicators (57 Core Indicators and 22 Supporting Indicators). A core indicator carries 70% weightage and a supporting indicator carries 30% weightage. These indicators are grouped under 15 thematic categories which in turn are part of four pillars of comprehensive development of cities i.e., institutional, social, economic and physical. Based on the performance of cities against the various core and supporting indicators, various 'Category Sub-Indexes' and a composite 'City Liveability Index' will be developed for each city.

3.1 Scoring and Computing Category Indices of Liveability

The set of 79 indicators, associated categories and pillars are presented in the table below:

Table 1 List of Pillars, Categories and Indicators

Pillars of Comprehensive Development	Category	Indicators
Institutional	1. Governance	1.1 Percentage of citizen services available online
		1.2 Percentage of services integrated through Command Centre
		1.3 Percentage of citizens using online services
		1.4 Average delay in grievance redressal
		1.5 Tax collected as percentage of tax billed
		1.6 Extent of cost recovery (O&M) in water supply services
		1.7 Capital spending as percentage of total expenditure
		1.8 Percentage of population covered under Ward Committees/Area *Sabhas*
Social	**2. Identity and Culture**	2.1 Restoration and reuse of historic buildings
		2.2 Percentage of ecologically important areas covered through projects for restoration
		2.3 Hotel occupancy
		2.4 Percentage of budget allocated towards cultural/sports activities
		2.5 Number of cultural/sports events hosted by city
	3. Education	3.1 Percentage of school-aged population enrolled in schools
		3.2 Percentage of female school-aged population enrolled in schools
		3.3 Primary education student-teacher ratio
		3.4 Percentage of schools with access to digital education
		3.5 Percentage of students completing primary education
		3.6 Percentage of students completing secondary education
	4. Health	4.1 Number of in-patient hospital beds per 10,000 population
		4.2 Healthcare professionals per 10,000 population
		4.3 Average response time in case of health emergencies
		4.4 Period prevalence of water borne diseases

Pillars of Comprehensive Development	Category	Indicators
		4.5 Period prevalence of vector borne diseases
	5. Safety and Security	5.1 Number of CCTV Cameras
		5.2 Number of recorded crimes per lakh population
		5.3 Extent of crimes recorded against women, children and elderly per year
		5.4 Transport-related fatality per lakh population
Economic	**6. Economy and Employment**	6.1 Increase in VAT/GST collection
		6.2 Increase in collection of Professional Tax
		6.3 Increase in issuance of Construction permits
		6.4 Unemployment rate
		6.5 Percentage of vendors registered and provided formal spaces
Physical	**7. Housing and Inclusiveness**	7.1 Percentage of Slum/EWS households covered through formal/affordable housing
		7.2 Percentage of slum areas covered through basic services
	8. Public Open Spaces	8.1 Per capita availability of green spaces
		8.2 Per capita availability of public and recreational places
	9. Mixed Land Use and Compactness	9.1 Share of mixed land use area in overall city land use
		9.2 Net Density
	10. Power Supply	10.1 Percentage of city population with authorized electrical services
		10.2 Percentage of electrical connections covered through smart meters
		10.3 Average number of electrical interruptions per year
		10.4 Average length of electrical interruptions per year
		10.5 Percentage of total energy derived from renewable sources
		10.6 Energy consumption per unit - water supply and sewerage
		10.7 Energy consumption per unit - street lighting
		10.8 Percentage of new and redeveloped buildings following green building norms
		10.9 Total energy consumption per capita
	11. Transportation	11.1 Geographical coverage of public transport
		11.2 Availability of public transport

Pillars of Comprehensive Development	Category	Indicators
	and Mobility	11.3 Mode share of public transport
		11.4 Percentage of road network with dedicated bicycle tracks
		11.5 Percentage of interchanges with bicycle parking facilities
		11.6 Mode share of non-motorized transport
		11.7 Availability of Passenger Information System
		11.8 Extent of signal synchronization
		11.9 Availability of paid parking spaces
		11.10 Percentage coverage of footpaths – wider than 1.2 m
		11.11 Percentage of traffic intersections with pedestrian crossing facilities
		11.12 Extent to which universal accessibility is incorporated in public rights-of-way
	12. Assured Water Supply	12.1 Household level coverage of direct water supply connections
		12.2 Per capita supply of water
		12.3 Quality of water supplied
		12.4 Level of non-revenue water – NRW
		12.5 Percentage of water connections covered through meters
		12.6 Percentage of plots with rainwater harvesting facility
	13. Waste Water Management	13.1 Coverage of toilets
		13.2 Coverage of sewerage network and/or septage
		13.3 Collection efficiency of sewerage network
		13.4 Extent of reuse and recycling of waste water
		13.5 Coverage of storm water drains
	14. Solid Waste Management	14.1 Household level coverage of municipal solid waste collection
		14.2 Efficiency of collection of municipal solid waste
		14.3 Extent of municipal solid waste recovered through reuse
	15. Reduced Pollution	15.1 Concentration of SO2- air pollution
		15.2 Concentration of NO2- air pollution
		15.3 Concentration of PM10 - air pollution
		15.4 Level of noise pollution
		15.5 Quality of water in public surface water bodies

3.2 Scoring and Computing Category Indices of Liveability

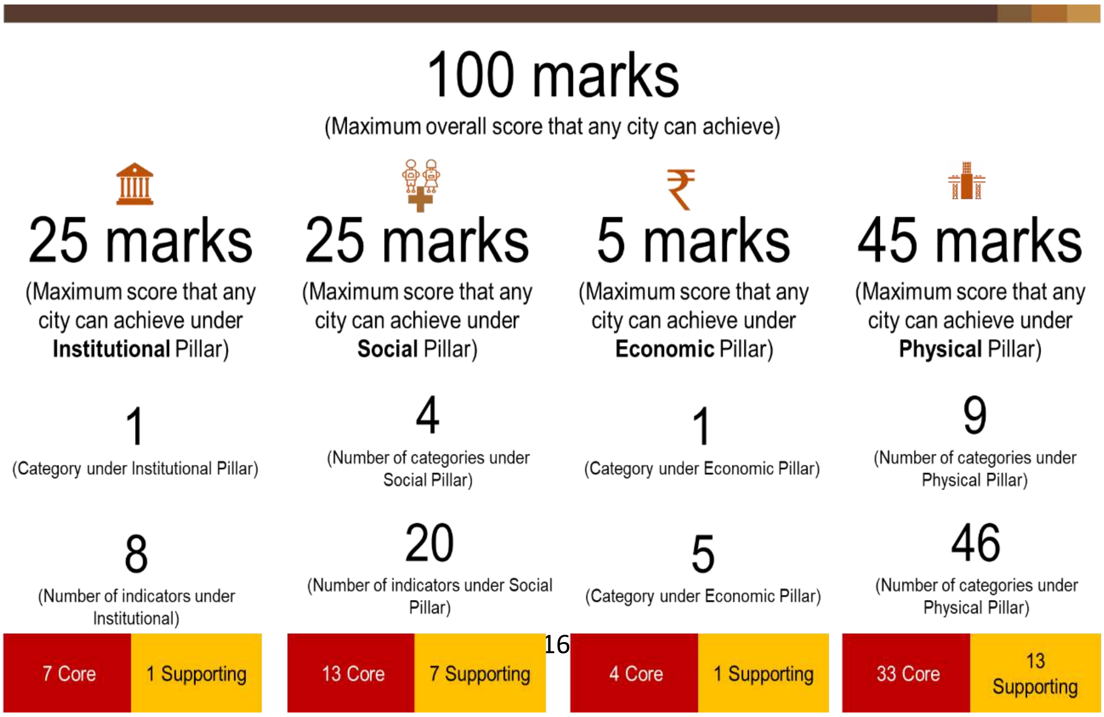
The performance achieved by cities against 79 indicators, will be assessed against given benchmarks. Where no international/national norms are available, city with the best performance in its group (population range) will be treated as a benchmark. The groups are given in the table below.

Table 2 Details on Population Range

Category	Population range
Category 1	Population ≥ 4 million
Category 2	1 million ≤ Population < 4 million
Category 3	0.5 million ≤ Population < 1 million
Category 4	Population < 0.5 million

3.3 Scoring Approach and Methodology

A city can earn a maximum score of 100 points for 79 indicators across four pillars. The pillar weights are as follows: Institutional (25 points), Social (25 points), Economy and Employment (5 points) and Physical (45 points). Based on the number and nature of indicators i.e., core vs. secondary, indicator wise maximum marks were computed.



100 marks
(Maximum overall score that any city can achieve)
25 marks
(Maximum score that any city can achieve under **Institutional** Pillar)
25 marks
(Maximum score that any city can achieve under **Social** Pillar)
5 marks
(Maximum score that any city can achieve under **Economic** Pillar)
45 marks
(Maximum score that any city can achieve under **Physical** Pillar)

Dimensional Index Methodology (DIM) has been used to compute scores for each indicator with reference to "maximum within the comparison group" or "absolute benchmarks". For indicators where benchmarks are available, cities getting the benchmark score (or above) are given the maximum mark, and the marks awarded to other cities are calculated proportionately. For indicators where benchmarks are not available, the best performing cities in each population group are given the maximum mark, and the marks awarded to other cities (within the population group) are calculated proportionately. For indicators where benchmarks do not exist, the city data has been tested for outliers before scoring.

3.4 Scoring Normalisation:

To construct aggregate scores across cities as well as to make the scores across indicators comparable, indicator values were normalised using a min-max approach. The following formula was used to normalise the indicator values-

$$\frac{indicator\ value\ for\ the\ city - indicator\ value\ for\ the\ worst\ performing\ city}{benchmark - \ indicator\ value\ for\ the\ worst\ performing\ city}$$

This approach would restrict the normalised indicator value between 0 and 1. Cities that met or exceeded the benchmark received a normalised indicator value of 1. Worst performing cities are given a normalised indicator value of 0. After normalisation, the normalised value is weighted according to the category and the indicator being core or supporting.

To illustrate, consider the indicator 12.3 Quality of Water Supplied in the Category 12 for Assured Water Supply. If in City A 50% of the water samples collected qualify the potable water standards specified by the CPHEEO, and only 10% of the samples from worst performing city qualify the standards. Then, the normalised value for the indicator for city A would be 0.44 [(0.5-0.1)/(1-0.1)].

The weight for indicator 12.3 is 1.03, so the final weighted score for City A would come out to 0.45 [1.03*0.44].

4. Data Collection and Verification

4.1 Submission of Data by the cities

The Liveability Assessment is based on secondary data submitted by the urban local bodies and other concerned government agencies (collectively called as data owners). The 79 indicators were broken down into a set of easy to understand and relatable 553 questions mapped to data owners. Submission of the data was enabled through an online data entry portal on the smartnet platform of the Ministry. The portal also allowed the ULBs to download the liveability assessment questionnaire and upload filled in questionnaire. To familiarise and assist cities in identifying, mapping and collation of data points, a city level nodal person was available during the entire period of data submission process.

4.2 Mapping of Data Owners for the City

For the assessment of liveability indices broadly 12 data owners such as Central/state Pollution control board, Development authority, DISCOM/Electricity Board, State Disaster Management Authority, State Education Department, State Health department, State Renewable energy and development agency, State sales and commercial taxes department, town and country planning department, Traffic and police department, Transport authority, and Urban local body were identified to respond to the questions on the portal. However, during state workshop and subsequent city level discussions, more data owners were mapped to respond to different categories and sub categories. The following table provides the details of city level data owners mapped under the 12 data owner.

Table 3:Details of Data Owners

Designated data owners	Subcategories	Data owners at city level
Urban Local Body	For Accounts Related Questions	Accounts Department
Urban Local Body	For Park and Recreation Related Questions	Town and country Planning
Urban Local Body	For Water Supply and Drainage related questions	Water Management
Urban Local Body	For Heritage sites related data	…….
Urban Local Body	For Ecological sites related data	……..
Urban Local Body	For Housing related data	Twon and Country Planning Dev.
Urban Local Body	For Building plan related data	Unban local body.
Urban Local Body	For Roads related data	Transport AUTHORITIES .
Urban Local Body	For Solid waste management related data	STATe DISASTER Management
Urban Local Body	For IT services related data	…….
Urban Local Body	For Vendor committee related data	…
Urban Local Body	Any other departments involved in providing data for questions mentioned under Urban Local Body	…
Central / state	Water Quality, Air Quality, Noise	Pollution control board

Designated data owners	Subcategories	Data owners at city level
Pollution control Board	Quality	
Development Authority	Building Infrastructure	Traffic and Police Department
	Construction planning	Bandhkam dep.
	Green Building	……
	Rain water harvesting	Bandhkam dep.
	Universal Design Principle	Town planing
DISCOM/Electricity Board	Electrical Connection/ Grievance Redressal/ Power supply	MGVCL
State Disaster management authority		
State Education Department		
State Health Department	Health care professionals	health Department
	Citizen Services	…
	Disease Prevalence	Fier dep.
	Health Infrastructure	State Health Dipart ment
State Renewable Energy Development Agency		MGVCL
State Sales / Commercial Taxes Department		
Town and Country Planning Department	Land Use	Town planning
Traffic and Police Department		Traffic and police dep.
Transport Authorities	Buses	N.A.
	Registered Vehicles	R.T.O
	Sub urban rail transport	N.A.
	Mono Rail Authority	N.A.
	Tramways	N.A.
	Marine Transport Authority	N.A.

4.3 List of secondary documents available as supportive

City has provided supporting documents/evidences against the responses given by city on the online portal. In support of their responses on the portal, city submitted 60 number of documents. Documents submitted includes reports, official orders, copy of data maintained in official register, signed copy of questionnaire, and signed letters/submissions from concern departments. Verification includes mapping of documents against responses given by city, checking the type/category of documents, and validation of data provided.

The following table presents the data owner wise number of documents:

Table 4: Data owner wise number of secondary documents submitted by city

Data Owners	Number of Documents
Sales and Commercial Taxes	**2**
State Education Department	**2**
DISCOM/Electricity Department	**1**
Traffic and Police Department	**2**
Development Authority	**1**
Pollution Control Board	**2**
State Renewable Energy Department	**1**
Town and Country Planning	**4**
State Health Department	**2**
Transport Authority	**2**
Disaster Management	**1**
Urban Local Body	**40**
Total	**60**

4.4 Data Verification

A three-stage data quality check comprising verification of data against secondary documents furnished by data owners, logical inconsistency checks including outliers, and physical audit for select indicators (Refer the exhibit below) is being undertaken. The objective of the data quality check is to ensure that data from the source documents are accurate and verifiable. Sources of data included reports, administrative data, survey results and other statistical records, log books among other.

Physical audit of eight indicators – one indicator from the Institutional pillar, one from the Social pillar, one from the Economy pillar and five from the Physical pillar is also being carried out by the

field team to ascertain the degree of reliability of data reported by the cities. The list of these eight indicators is presented below:

1.2 | Percentage of services integrated through Command Centre

2.3 | Hotel occupancy

3.4 | Percentage of schools with access to digital education

5.1| Number of streets, public places, junctions covered through surveillance systems

6.5 | Percentage of vendors registered and provided formal spaces

11.7 | Availability of Passenger Information System

11.11 | Percentage of traffic intersections with pedestrian crossing facilities

11.12 | Extent to which universal accessibility is incorporated in public rights-of-way

For a set of five indicators namely, unemployment rate, mode share of public transport, mode share of non-motorised transport, quality of water supplied and level of noise pollution, existing datasets were found to be not available consistently across all cities and/or were inadequate. To help cities that do not have data on these five indicators, dipstick assessments are being carried to fill data gaps.

6.4 | Unemployment Rate

11.3 | Mode share of public transport

11.5 | Mode share of Non Motorized Transport

12.3 | Quality of Water Supplied

15.4 | Level of Noise Pollution

4.5 Physical Audit

The following map presents the indicators audited at city level.

5. City Score on 15 categories of Assessment

Liveability Assessment covered 15 categories and 78 indicators. The below table presents the scores for all 15 indicators namely governance, identity & culture, education, health, safety and security, economy & employment, housing & inclusiveness, public open spaces, mixed land use & compactness, power supply, transport & mobility, assured water supply, waste water management, solid waste management and reduced pollution.

Table 5: Category wise scores

Categories	Scores in Percentage
Governance	40.42%
Identity & Culture	19%
Education	61%
Health	100%
Safety & Security	65%

Economy & Employment	34%
Housing & Inclusiveness	0%
Public Open Spaces	0%
Mixed Land Use & Compactness	50%
Power Supply	55%
Transport & Mobility	16%
Assured Water Supply	60%
Waste Water Management	42%
Solid Waste Management	79%
Reduced Pollution	1%

The rank of the city is based on the performance and scores in each of the category. The final city rank is submitted separately.

Executive Summary

Assessment of liveability indices is an initiative by the Ministry of Housing and Urban Affairs to improve quality of life of citizens and achieve sustainable development goals by encouraging cities to adopt "outcome based" approach for urban planning. Assessment process aimed to provide opportunity to cities to review the development components holistically by involving 79 measurable indicators categorized under governance, health, education, safety, economy, power supply, transportation and mobility, identity, culture, housing, waste management and pollution.

This report highlights the assessment process, key milestones, and the final outcome of the data submitted. Implementation of liveability assessment commenced formally on 19th January 2018. A national level workshop was organized on 13th February 2018 to explain the importance and process of liveability assessment and get feedback on methodology from the city authorities.

This was followed by the next stage of Questionnaire development. The questionnaire was arranged under 12 categories representing 12 data owners namely urban local body, Central and state pollution control board, development authority, DISCOM/Electricity board, State disaster management authority, state education department, state health department, state renewable energy development agency, state sales and commercial taxes department, town and country planning department, traffic and police department and transport authorities.

An online data entry portal was developed to facilitate data submission by the cities. Each city had a unique log in to access the portal and submit the data. Both online and off-line options (download the questionnaire in an excel) to submit the data were available for cities. An email help desk was set up for the cities to raise any queries and seek clarification when responding to the questions.

A team for each state comprising of State Coordinator and City Coordinator (one per city) was deployed that facilitated the process and supported the cities. A total of 6 regional coordinators/ consultants, 29 State Coordinators, and 99 city coordinators were deployed across 116 cities. Training for state coordinators was held from 26th to 28th February 2018 at Chennai to make coordinators understand overall liveability assessment, indicators, data sources, protocols and roles and responsibilities.

City Reconnaissance Meetings were initiated by the state and city coordinators. The discussion began with discussions to finalize the state workshop schedule, mapping of data owners, and assist cities in data collection. The City Coordinators were based in the cities for over 6 weeks and during this time, they liase with ULB and other data owners to explain the liveability framework, online portal, and facilitate the online submission.

A total of 33 state workshops were conducted at the state level. The objective of the workshop was to orient the city stakeholders on liveability assessment, indicators, components of data collection, timelines, expectations of support and support extended by MoHUA. The state level workshops brought various city level departments on a single platform to understand and discuss the methodology and components of city liveability assessment.

Nodal agency at state level supported by the City and State Coordinator and city level (Municipality corporation/smart city limited) coordinated with city specific data owners/departments for data gathering, collation, and submission. Nodal persons in each department were appointed for timely data collection and submission. Of 116, 112 cities submitted data as per the timeline on 16th April 2018.

Post submission, the city and state coordinators supported by the central team followed up extensively with the cities to support secondary documents as evidence to substantiate their submissions. Secondary documents such as reports, official orders, copy of office register, signed copy of liveability assessment questionnaire furnished by cities against the submitted data. Documents are verified to map the documents for the reponses provided by city and to check the type data provided by city. The document check outcomes were shared with the cities as a part of data quality check.

For checking consistency of data, logical check of data, verifying data from other public sources were undertaken. Quality check was done to ensure data validity and provide opportunity to cities to review the data provided by them and correct in case of wrong data entry.

For 8 selected indicators namely, percentage of services integrated through command and control center, hotel occupancy rate, percentage of schools with access to digital education, number of CCTV cameras per unit road length, percentage of vendors registered and provided formal spaces, availability of passenger information system, percentage of traffic intersection with pedestrian crossing facility, and extent to which universal accessibility is incorporated in public rights of way. Physical audit was conducted in 110 cities by physical auditors appointed and trained by the consortium. In consultation with ULB nodal person, locations and indicators for physical audit was selected in each city. A mobile based application was developed to capture the physical audit related data.

Primary data collection was done for five indicators such as unemployment rates, mode share of public transport, mode share of non-motorized transport, quality of water supplied, and level of noise pollution. Protocols for water and noise test were prepared in consultation with experts. Water quality test involved physical, chemical and bacteriological test of water as per the CPCB norms. For testing quality of water at consumer end, the auditors worked closely with the ULB and Water department. Samples were collected from consumer end and submitted to the lab suggested by city. For noise pollution, in about 20 cities the state pollution board or city level

environment department took the responsibility for providing noise pollution data as per the protocols. In rest of the cities, mobile based application was used to measure noise pollution.

During implementation, MoHUA facilitated the process by conducting video conferences with cities to address any queries, reiterate the importance, and ensure that cities adequately engages in the process and submit their responses in time and respond to requests for clarifications.

In addition to secondary data collection, physical audit and primary data collection, citizen survey was conducted to understand their perception and level of satisfaction on various services such as health, education, water supply, electricity, waste management etc. provided by urban local bodies. Over 60000 citizens participated in the survey across India.

The final scores and ranks have been generated based on the scoring methodology that has been discussed extensively and minor modifications made that are summarized as below:

#	**Challenges**	**Proposed Solutions**
1	Only 23 cities of 111 cities have City Mobility Plan (CMP) or any and hence able to provide data for Mode Share of Public Transport and Non-Motorised Transport. To address the data gap, as advised by the MoHUA, the consortia undertook a sample dipstick across all cities covering a sample of 150 Households. Understandably, the dipstick findings will not match the rigor of a CMP.	We recommend the following: 1) Cities which have provided CMP Data will be evaluated on 100% of the maximum score 2) For the cities where the dipstick data is used, the city receives a 50% discount on the overall score Alternatively, another approach is to assign 0 score to all 88 cities that don't have a CMP
2	Variance was observed on data reported by cities on road network and data presented in the smart city proposals during the verifications.	We recommend taking the data reported by the cities in the Smart City Proposals.
3	There is no secondary source/ organization that provides unemployment data at city level. As a result, most cities do not have the data. Fully cognizance of the challenges of generating this data in a short span of time, it was agreed to collect this data through a dipstick survey on lines of NSSO questions. The	The indicator on unemployment will be excluded from scores. For final ranking, the cities will be scored on 78 indicators.

#	Challenges	Proposed Solutions
	data generated needs further scrutiny and triangulation with some inputs from experts. This may not be possible in the short window.	
4	Many cities did not have data on noise pollution and it was decided that data will be collected using a mobile app for all the 111 cities. However, many cities have expressed reservations with the approach especially with respect to the reliability of using this data. Further, some cities have relied on the SPCB to collect the data as per the approach proposed by the consortia. Thus, noise pollution data is currently from two sources: 1. SPCB- 20 cities 2. Noise-based app- 91 cities	The data collected through the primary survey will be used for scoring the cities. Currently, there is no differential scoring for the data from the SPCB and the data collected through the mobile app. However, a certain higher weightage can be provided to those cities which used the state apparatus to collect noise pollution data.
5	For the indicator on quality of water supplied, the methodology document states that samples should be drawn both at the treatment plant outlet as well as the consumer end. However, the data provided by the cities were predominantly from the distribution point. Hence for consumer end results with MoHUA intervention, consortia coordinated with cities to collect the data at the consumer end. The cities facilitated the testing. The outcome of the process is as below: 1. Sample given- 102 cities 2. Report received- 86 cities 3. Report awaited- 16 cities 4. Tests not completed due to lack of cooperation and other reasons – 9	The maximum score for this indicator will be distributed equally (50%) for results based on samples from the treatment plant and consumer end. Cities that did not complete tests or provide the results will be given a score 0 for against consumer end tests.
6	City level population is not projected annually by most of the cities. So, estimates for 2017 population are not available with the cities.	As recommended by MoHUA, 2011 census population is being used for the ranking purpose.
7	The age category specific data for 9 cities is not available at a city level	The age category specific population data has been taken at a district level for these cities.

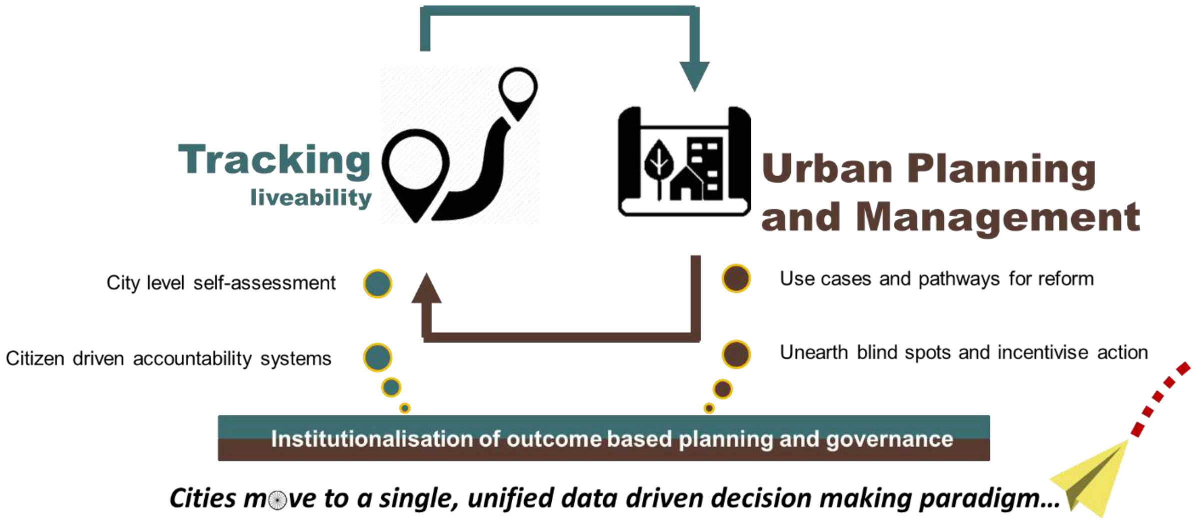
#	Challenges	Proposed Solutions
8	Indicators on non-motorised transports like- Dedicated bicycle tracks, bicycle parking facilities and mode share of non-motorised transport are not relevant for hilly terrains.	As discussed during the PMC meeting, these indicators have been treated as non-applicable for the hilly cities and the weights have been redistributed among other indicators within the same category.
9	The indicator on increase in professional tax is not relevant to cities which do not levy the professional tax.	As discussed during the PMC meeting, this indicator has been non-applicable to the cities belonging to states where professional tax is not levied, and the weights have been redistributed among other indicators within the same category.
10	The indicator on increase in VAT collection is not applicable to Port Blair and Kavaratti, as there was no provision of VAT collection in these cities.	As discussed during the PMC meeting, these indicatosr has been treated as non-applicable for these two cities and the weights have been redistributed among other indicators within the same category.
11	Indicator on coverage of basic services to slum households does not concern cities with no slums (notified/ non-notified.	As discussed during the PMC meeting, this indicators has been treated as non-applicable for these cities and the weights have been redistributed among other indicators within the same category.

1. Introduction

The Ministry of Housing and Urban Affairs (MoHUA) is implementing several flagship urban missions such as the Smart Cities Mission (SCM), Atal Mission for Urban Rejuvenation and Transformation (AMRUT), Heritage City Development and Augmentation Yojana (HRIDAY), Housing for All (HFA). Theses mission along with other transformative initiatives of the Government including National Water Mission, Power for All, National Health Mission are aimed at making Indian cities more 'liveable.' The overarching goal of these initiatives is to move from an input-based approach to a 'citizen centric-outcome based' assessment of urban liveability.

To develop a common minimum framework for cities to assess their existing status and chart their pathway towards providing a better quality of life to their citizens, the MoHUA developed a set of 'Liveability Standards' relevant to cities to generate a Liveability Index and ranking of cities. These standards were launched in June, 2017. The MoHUA has planned to conduct an 'Annual Assessment of Liveability Standards in Cities – an ambitious national project that will involve yearly submission of data by cities across the various indicators, compilation and analysis, development of indices and ranking of cities. The Liveability Index is envisioned as a 360° tool for tracking, planning and transforming Indian cities. The Liveability Index is aimed at the following objectives:

- Providing strong evidence-based approach for future interventions and investments to deliver liveability outcomes
- Catalysing actions to improve the overall quality of the city's liveability and achieve broader development outcomes including the Sustainable Development Goals
- Assessing the implementation of government policies and schemes governing characteristics of cities that can contribute to creating liveable communities



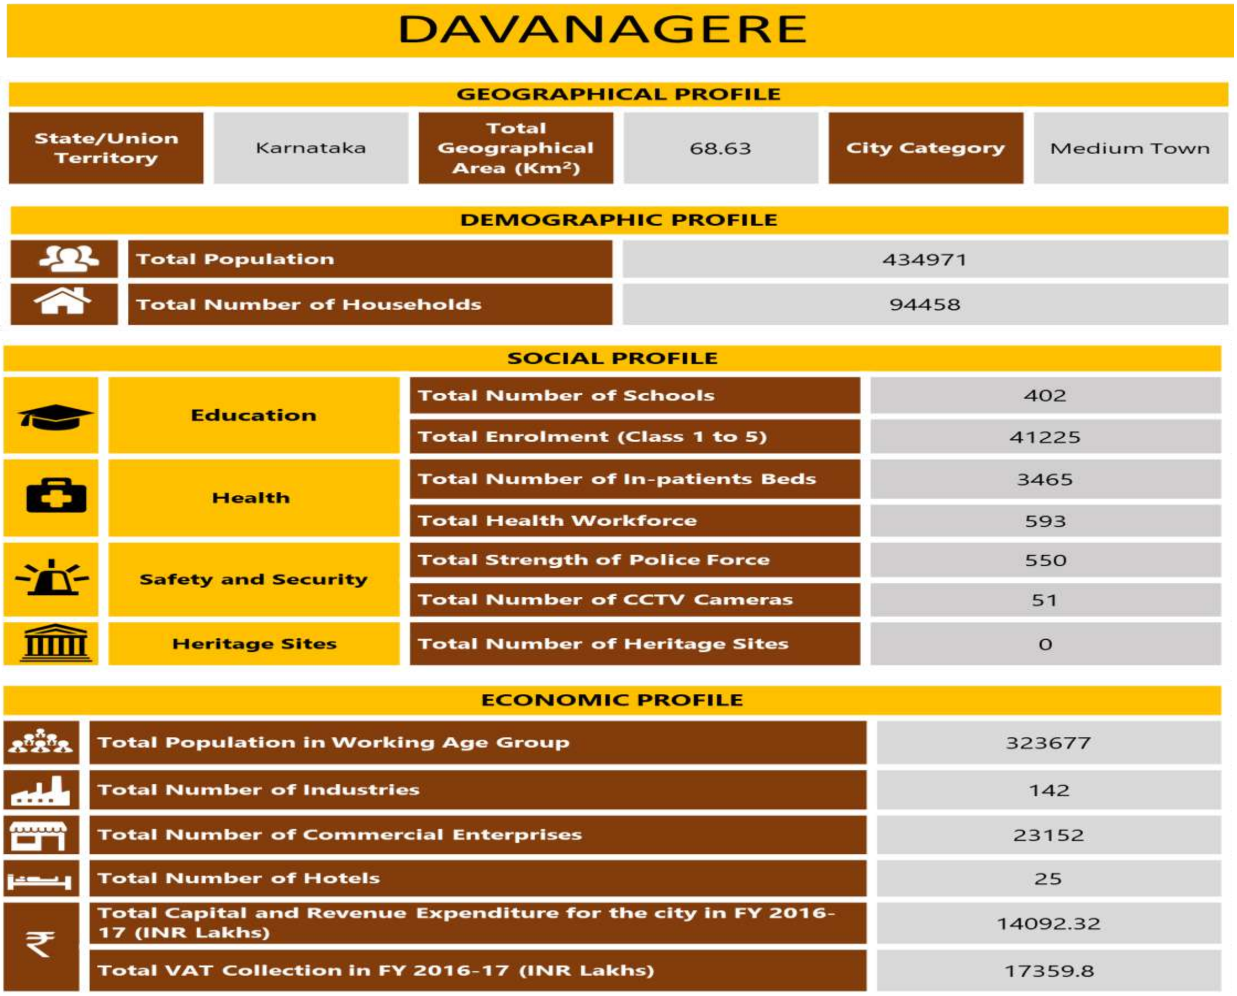
Tracking
liveability
Urban Planning
and Management
City level self-assessment
Citizen driven accountability systems
Use cases and pathways for reform
Unearth blind spots and incentivise action
Institutionalisation of outcome based planning and governance

Cities move to a single, unified data driven decision making paradigm...

The first round of the assessment commenced in January 2018 covering 116 major cities including smart cities, capital cities and cities with population of above one million each. Implementation of the liveability assessment commenced in January 2018 with a national level orientation workshop for the urban local bodies. The workshop aimed at orienting the states and urban local bodies on the overall framework, indicators, data sources, methodology and key milestones and timelines involved in the liveability assessment. Subsequently, a series of State/ Union Territory level orientation workshops were carried out in 33 states/UTs for a detailed discussion on the framework. Online data collection commenced from 9th March through an online data collection platform that supported both online and offline data submission modes. On the date of closure of the online data entry portal i.e., 16th April, 2018 112 cities submitted their data. Subsequently, comprehensive checks on the submitted data was undertaken that involved checking for outliers, logical inconsistencies etc. post which round-1 of data reconciliation was conducted. This draft report is based on round-1 of reconciled data as on 28th April, 2018.

2. City Profile

This chapter presents the city profile -Geographic and Demographic, Social (Education Health, Safety and Security, Heritage), Economic profile, and Physical (Water, sanitation and Waste Management, Electricity, Open space and roads).



DAVANAGERE

GEOGRAPHICAL PROFILE

State/Union Territory	Karnataka	Total Geographical Area (Km²)	68.63	City Category	Medium Town

	Total VAT Collection in FY 2016-17 (INR Lakhs)	17359.8

PHYSICAL PROFILE		
Water	**Average Quantity of Water Supplied (MLD)**	56
	Total Number of Water Connections	46349
Sanitation Facilities	**Total number of households with access to individual toilets in the city**	88835
	Total number of households in the city with access to community toilets in the city	0
Solid Waste Management	**Daily average quantity of municipal solid waste collected in the city (Tonnes/day)**	90
	Total number of households covered through door-to-door collection of solid waste	64000
Waste Water	**Daily Average Quantum of Waste Water Generated in the City (MLD)**	44.8
	Daily average quantum of waste water treated by STPs in the city (MLD)	10
Electricity	**Total number of authorized electrical connections in the city**	153065
	Total electricity supplied to the city (kWh)	1516467200
Public and Open Spaces	**Total area covered by green spaces in the city (m^2)**	386080.4
Roads and Transport	**Total Length of Road Network in the City (Km)**	1227.7
	Total length of arterial and sub-arterial road network in the city (Km)	692.7
	Total length of footpath (wider than 1.2 metres) in the city along the street network (Km)	18

3. Liveability Framework and Indicators

The Liveability Framework comprises a total of 79 indicators (57 Core Indicators and 22 Supporting Indicators). A core indicator carries 70% weightage and a supporting indicator carries 30% weightage. These indicators are grouped under 15 thematic categories which in turn are part of four pillars of comprehensive development of cities i.e., institutional, social, economic and physical. Based on the performance of cities against the various core and supporting indicators, various 'Category Sub-Indexes' and a composite 'City Liveability Index' will be developed for each city.

3.1 Scoring and Computing Category Indices of Liveability

The set of 79 indicators, associated categories and pillars are presented in the table below:

Table 1 List of Pillars, Categories and Indicators

Pillars of Comprehensive Development	Category	Indicators
Institutional	1. Governance	1.1 Percentage of citizen services available online
		1.2 Percentage of services integrated through Command Centre
		1.3 Percentage of citizens using online services
		1.4 Average delay in grievance redressal
		1.5 Tax collected as percentage of tax billed
		1.6 Extent of cost recovery (O&M) in water supply services
		1.7 Capital spending as percentage of total expenditure
		1.8 Percentage of population covered under Ward Committees/Area *Sabhas*
Social	**2. Identity and Culture**	2.1 Restoration and reuse of historic buildings
		2.2 Percentage of ecologically important areas covered through projects for restoration
		2.3 Hotel occupancy
		2.4 Percentage of budget allocated towards cultural/sports activities
		2.5 Number of cultural/sports events hosted by city
	3. Education	3.1 Percentage of school-aged population enrolled in schools
		3.2 Percentage of female school-aged population enrolled in schools
		3.3 Primary education student-teacher ratio

Pillars of Comprehensive Development	Category	Indicators
		3.4 Percentage of schools with access to digital education
		3.5 Percentage of students completing primary education
		3.6 Percentage of students completing secondary education
	4. Health	4.1 Number of in-patient hospital beds per 10,000 population
		4.2 Healthcare professionals per 10,000 population
		4.3 Average response time in case of health emergencies
		4.4 Period prevalence of water borne diseases
		4.5 Period prevalence of vector borne diseases
	5. Safety and Security	5.1 Number of CCTV Cameras
		5.2 Number of recorded crimes per lakh population
		5.3 Extent of crimes recorded against women, children and elderly per year
		5.4 Transport-related fatality per lakh population
Economic	**6. Economy and Employment**	6.1 Increase in VAT/GST collection
		6.2 Increase in collection of Professional Tax
		6.3 Increase in issuance of Construction permits
		6.4 Unemployment rate
		6.5 Percentage of vendors registered and provided formal spaces
Physical	**7. Housing and Inclusiveness**	7.1 Percentage of Slum/EWS households covered through formal/affordable housing
		7.2 Percentage of slum areas covered through basic services

Pillars of Comprehensive Development	Category	Indicators
	8. Public Open Spaces	8.1 Per capita availability of green spaces
		8.2 Per capita availability of public and recreational places
	9. Mixed Land Use and Compactness	9.1 Share of mixed land use area in overall city land use
		9.2 Net Density
	10. Power Supply	10.1 Percentage of city population with authorized electrical services
		10.2 Percentage of electrical connections covered through smart meters
		10.3 Average number of electrical interruptions per year
		10.4 Average length of electrical interruptions per year
		10.5 Percentage of total energy derived from renewable sources
		10.6 Energy consumption per unit - water supply and sewerage
		10.7 Energy consumption per unit - street lighting
		10.8 Percentage of new and redeveloped buildings following green building norms
		10.9 Total energy consumption per capita
	11. Transportation and Mobility	11.1 Geographical coverage of public transport
		11.2 Availability of public transport
		11.3 Mode share of public transport
		11.4 Percentage of road network with dedicated bicycle tracks
		11.5 Percentage of interchanges with bicycle parking facilities

Pillars of Comprehensive Development	Category	Indicators
		11.6 Mode share of non-motorized transport
		11.7 Availability of Passenger Information System
		11.8 Extent of signal synchronization
		11.9 Availability of paid parking spaces
		11.10 Percentage coverage of footpaths – wider than 1.2 m
		11.11 Percentage of traffic intersections with pedestrian crossing facilities
		11.12 Extent to which universal accessibility is incorporated in public rights-of-way
	12. Assured Water Supply	12.1 Household level coverage of direct water supply connections
		12.2 Per capita supply of water
		12.3 Quality of water supplied
		12.4 Level of non-revenue water – NRW
		12.5 Percentage of water connections covered through meters
		12.6 Percentage of plots with rainwater harvesting facility
	13. Waste Water Management	13.1 Coverage of toilets
		13.2 Coverage of sewerage network and/or septage
		13.3 Collection efficiency of sewerage network
		13.4 Extent of reuse and recycling of waste water
		13.5 Coverage of storm water drains
	14. Solid Waste Management	14.1 Household level coverage of municipal solid waste collection

Pillars of Comprehensive Development	Category	Indicators
		14.2 Efficiency of collection of municipal solid waste
		14.3 Extent of municipal solid waste recovered through reuse
	15. Reduced Pollution	15.1 Concentration of SO2- air pollution
		15.2 Concentration of NO2- air pollution
		15.3 Concentration of PM10 - air pollution
		15.4 Level of noise pollution
		15.5 Quality of water in public surface water bodies

3.2 Scoring and Computing Category Indices of Liveability

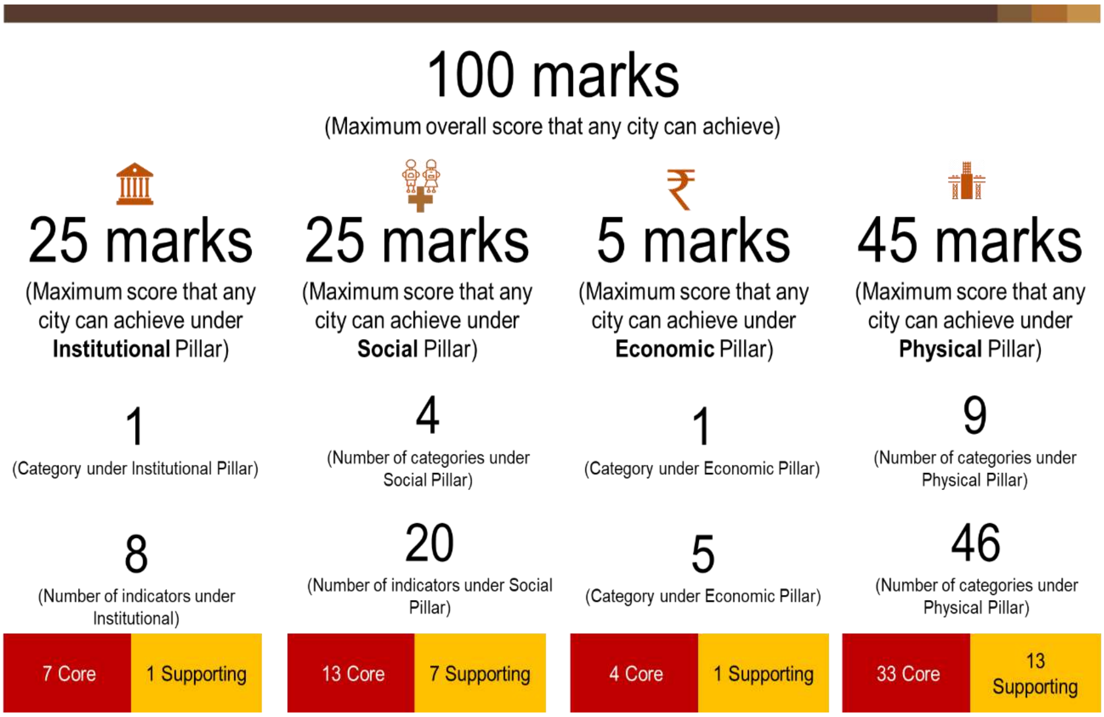
The performance achieved by cities against 79 indicators, will be assessed against given benchmarks. Where no international/national norms are available, city with the best performance in its group (population range) will be treated as a benchmark. The groups are given in the table below.

Table 2 Details on Population Range

Category	Population range
Category 1	Population ≥ 4 million
Category 2	1 million ≤ Population < 4 million
Category 3	0.5 million ≤ Population < 1 million
Category 4	Population < 0.5 million

3.3 Scoring Approach and Methodology

A city can earn a maximum score of 100 points for 79 indicators across four pillars. The pillar weights are as follows: Institutional (25 points), Social (25 points), Economy and Employment (5 points) and Physical (45 points). Based on the number and nature of indicators i.e., core vs. secondary, indicator wise maximum marks were computed.



100 marks

(Maximum overall score that any city can achieve)

25 marks	25 marks	5 marks	45 marks
(Maximum score that any city can achieve under **Institutional** Pillar)	(Maximum score that any city can achieve under **Social** Pillar)	(Maximum score that any city can achieve under **Economic** Pillar)	(Maximum score that any city can achieve under **Physical** Pillar)
1 (Category under Institutional Pillar)	4 (Number of categories under Social Pillar)	1 (Category under Economic Pillar)	9 (Number of categories under Physical Pillar)
8 (Number of indicators under Institutional)	20 (Number of indicators under Social Pillar)	5 (Category under Economic Pillar)	46 (Number of categories under Physical Pillar)
7 Core 1 Supporting	13 Core 7 Supporting	4 Core 1 Supporting	33 Core 13 Supporting

Dimensional Index Methodology (DIM) has been used to compute scores for each indicator with reference to “maximum within the comparison group” or “absolute benchmarks”. For indicators where benchmarks are available, cities getting the benchmark score (or above) are given the maximum mark, and the marks awarded to other cities are calculated proportionately. For indicators where benchmarks are not available, the best performing cities in each population group are given the maximum mark, and the marks awarded to other cities (within the population group) are calculated proportionately. For indicators where benchmarks do not exist, the city data has been tested for outliers before scoring.

3.4 Scoring Normalisation:

To construct aggregate scores across cities as well as to make the scores across indicators comparable, indicator values were normalised using a min-max approach. The following formula was used to normalise the indicator values-

$$\frac{indicator\ value\ for\ the\ city - indicator\ value\ for\ the\ worst\ performing\ city}{benchmark - \ indicator\ value\ for\ the\ worst\ performing\ city}$$

This approach would restrict the normalised indicator value between 0 and 1. Cities that met or exceeded the benchmark received a normalised indicator value of 1. Worst performing cities are given a normalised indicator value of 0. After normalisation, the normalised value is weighted according to the category and the indicator being core or supporting.

To illustrate, consider the indicator 12.3 Quality of Water Supplied in the Category 12 for Assured Water Supply. If in City A 50% of the water samples collected qualify the potable water standards specified by the CPHEEO, and only 10% of the samples from worst performing city qualify the standards. Then, the normalised value for the indicator for city A would be 0.44 [(0.5-0.1)/(1-0.1)].

The weight for indicator 12.3 is 1.03, so the final weighted score for City A would come out to 0.45 [1.03*0.44].

4. Data Collection and Verification

4.1 Submission of Data by the cities

The Liveability Assessment is based on secondary data submitted by the urban local bodies and other concerned government agencies (collectively called as data owners). The 79 indicators were broken down into a set of easy to understand and relatable 553 questions mapped to data owners. Submission of the data was enabled through an online data entry portal on the smartnet platform of the Ministry. The portal also allowed the ULBs to download the liveability assessment questionnaire and upload filled in questionnaire. To familiarise and assist cities in identifying, mapping and collation of data points, a city level nodal person was available during the entire period of data submission process.

4.2 Mapping of Data Owners for the City

For the assessment of liveability indices broadly 12 data owners such as Central/state Pollution control board, Development authority, DISCOM/Electricity Board, State Disaster Management Authority, State Education Department, State Health department, State Renewable energy and development agency, State sales and commercial taxes department, town and country planning department, Traffic and police department, Transport authority, and Urban local body were identified to respond to the questions on the portal. However, during state workshop and subsequent city level discussions, more data owners were mapped to respond to different categories and sub categories. The following table provides the details of city level data owners mapped under the 12 data owner.

Table 3: Details of Data Owners

Designated data owners	Subcategories	Data owners at city level
Urban Local Body	For Accounts Related Questions	Accounts Department DCC
Urban Local Body	For Park and Recreation Related Questions	Town Planning Department DCC
Urban Local Body	For Water Supply and Drainage related questions	Engineering Department DCC
Urban Local Body	For Heritage sites related data	Town Planning Department DCC
Urban Local Body	For Ecological sites related data	Department of forest, ecology and environment
Urban Local Body	For Housing related data	Rajiv Gandhi rural housing corporation limited. MCC
Urban Local Body	For Building plan related data	Town Planning Department DCC
Urban Local Body	For Roads related data	Engineering Department DCC
Urban Local Body	For Solid waste management related data	Environment Department DCC
Urban Local Body	For IT services related data	IT Department
Urban Local Body	For Vendor committee related data	Urban Poverty Alleviation Cell Deendayal Antyodaya Yojana National Urban Livelihood Mission. DCC (DAY_NULM)
Urban Local Body	Any other departments involved in providing data for questions mentioned	Commercial Tax Department (Professional Tax related queries), Education Department (Population of age group between 6-14), Revenue Department, PMAY, District

Designated data owners	Subcategories	Data owners at city level
	under Urban Local Body	Employment Exchange, Development Authority, DULT (CMP related), KMDS (No. of Hits in the online service portals), Health Department, ,Karnataka Pollution Control Board, Slum Board, Hotel owners Association, Police, Road Transport
Central / state Pollution control Board	Water Quality, Air Quality, Noise Quality	Karnataka State Pollution Control Board
Development Authority	Building Infrastructure	Development Authority
	Construction planning	Development Authority and Town Planning Department, DCC
	Green Building	Town Planning Department, DCC
	Rain water harvesting	Town Planning Department, DCC
	Universal Design Principle	Development Authority
DISCOM/Electricity Board	Electrical Connection/ Grievance Redressal/ Power supply	Bangalore Electricity Supply Company (BESCOM)
State Disaster management authority		Deputy Commissioner's Office (Office of District Collector)
State Education Department		
State Health Department	Health care professionals	District Health Office
	Citizen Services	District Health Office
	Disease Prevalence	District Health Office
	Health Infrastructure	District Health Office
State Renewable Energy Development Agency	Renewable Energy	Bangalore Electricity Supply Company Limited
State Sales / Commercial Taxes Department		Joint Commissioner, Commercial Tax Office
Town and Country Planning Department	Land Use	Development Authority
Traffic and Police Department		Superintendent of Police
Transport Authorities	Buses	Regional Transport Officer's Office

Designated data owners	Subcategories	Data owners at city level
	Registered Vehicles	Regional Transport Officer's Office
	Sub urban rail transport	Not Applicable
	Mono Rail Authority	Not Applicable
	Tramways	Not Applicable
	Marine Transport Authority	Not Applicable

4.3 List of secondary documents available as supportive

City has provided supporting documents/evidences against the responses given by city on the online portal. In support of their responses on the portal, city submitted 66 number of documents. Documents submitted includes reports, official orders, copy of data maintained in official register, signed copy of questionnaire, and signed letters/submissions from concern departments. Verification includes mapping of documents against responses given by city, checking the type/category of documents, and validation of data provided.

The following table presents the data owner wise number of documents:

Table 4: Data owner wise number of secondary documents submitted by city

Data Owners	Number of Documents
Sales and Commercial Taxes	**7**
State Education Department	**3**
DISCOM/Electricity Department	**1**
Traffic and Police Department	**2**
Development Authority	**2**
Pollution Control Board	**4**
State Renewable Energy Department	**1**
Town and Country Planning	**1**
State Health Department	**1**
Transport Authority	**2**
Disaster Management	**2**
Urban Local Body	**40**
Total	**66**

4.4 Data Verification

A three-stage data quality check comprising verification of data against secondary documents furnished by data owners, logical inconsistency checks including outliers, and physical audit for select indicators (Refer the exhibit below) is being undertaken. The objective of the data quality check is to ensure that data from the source documents are accurate and verifiable. Sources of data included reports, administrative data, survey results and other statistical records, log books among other.

Physical audit of eight indicators – one indicator from the Institutional pillar, one from the Social pillar, one from the Economy pillar and five from the Physical pillar is also being carried out by the field team to ascertain the degree of reliability of data reported by the cities. The list of these eight indicators is presented below:

1.2 | Percentage of services integrated through Command Centre

2.3 | Hotel occupancy

3.4 | Percentage of schools with access to digital education

5.1 | Number of streets, public places, junctions covered through surveillance systems

6.5 | Percentage of vendors registered and provided formal spaces

11.7 | Availability of Passenger Information System

11.11 | Percentage of traffic intersections with pedestrian crossing facilities

11.12 | Extent to which universal accessibility is incorporated in public rights-of-way

For a set of five indicators namely, unemployment rate, mode share of public transport, mode share of non-motorised transport, quality of water supplied and level of noise pollution, existing datasets were found to be not available consistently across all cities and/or were inadequate. To help cities that do not have data on these five indicators, dipstick assessments are being carried to fill data gaps.

6.4 | Unemployment Rate

11.3 | Mode share of public transport

11.5 | Mode share of Non Motorized Transport

12.3 | Quality of Water Supplied

15.4 | Level of Noise Pollution

4.5 Physical Audit

The following map presents the indicators audited at city level.

7. LA - Street Vendors
8. LA - Universal Design Principles

5. City Score on 15 categories of Assessment

Liveability Assessment covered 15 categories and 78 indicators. The below table presents the scores for all 15 indicators namely governance, identity & culture, education, health, safety and security, economy & employment, housing & inclusiveness, public open spaces, mixed land use & compactness, power supply, transport & mobility, assured water supply, waste water management, solid waste management and reduced pollution.

Table 5: Category wise scores

Categories	Scores in Percentage
Governance	47.17%
Identity & Culture	0%
Education	82%
Health	93%
Safety & Security	60%
Economy & Employment	28%
Housing & Inclusiveness	15%
Public Open Spaces	5%
Mixed Land Use & Compactness	0%
Power Supply	45%
Transport & Mobility	45%
Assured Water Supply	53%
Waste Water Management	36%
Solid Waste Management	47%
Reduced Pollution	95%

The rank of the city is based on the performance and scores in each of the category. The final city rank is submitted separately.

Executive Summary

Assessment of liveability indices is an initiative by the Ministry of Housing and Urban Affairs to improve quality of life of citizens and achieve sustainable development goals by encouraging cities to adopt "outcome based" approach for urban planning. Assessment process aimed to provide opportunity to cities to review the development components holistically by involving 79 measurable indicators categorized under governance, health, education, safety, economy, power supply, transportation and mobility, identity, culture, housing, waste management and pollution.

This report highlights the assessment process, key milestones, and the final outcome of the data submitted. Implementation of liveability assessment commenced formally on 19th January 2018. A national level workshop was organized on 13th February 2018 to explain the importance and process of liveability assessment and get feedback on methodology from the city authorities.

This was followed by the next stage of Questionnaire development. The questionnaire was arranged under 12 categories representing 12 data owners namely urban local body, Central and state pollution control board, development authority, DISCOM/Electricity board, State disaster management authority, state education department, state health department, state renewable energy development agency, state sales and commercial taxes department, town and country planning department, traffic and police department and transport authorities.

An online data entry portal was developed to facilitate data submission by the cities. Each city had a unique log in to access the portal and submit the data. Both online and off-line options (download the questionnaire in an excel) to submit the data were available for cities. An email help desk was set up for the cities to raise any queries and seek clarification when responding to the questions.

A team for each state comprising of State Coordinator and City Coordinator (one per city) was deployed that facilitated the process and supported the cities. A total of 6 regional coordinators/ consultants, 29 State Coordinators, and 99 city coordinators were deployed across 116 cities. Training for state coordinators was held from 26th to 28th February 2018 at Chennai to make coordinators understand overall liveability assessment, indicators, data sources, protocols and roles and responsibilities.

City Reconnaissance Meetings were initiated by the state and city coordinators. The discussion began with discussions to finalize the state workshop schedule, mapping of data owners, and assist cities in data collection. The City Coordinators were based in the cities for over 6 weeks and during this time, they liase with ULB and other data owners to explain the liveability framework, online portal, and facilitate the online submission.

A total of 33 state workshops were conducted at the state level. The objective of the workshop was to orient the city stakeholders on liveability assessment, indicators, components of data collection, timelines, expectations of support and support extended by MoHUA. The state level workshops brought various city level departments on a single platform to understand and discuss the methodology and components of city liveability assessment.

Nodal agency at state level supported by the City and State Coordinator and city level (Municipality corporation/smart city limited) coordinated with city specific data owners/departments for data gathering, collation, and submission. Nodal persons in each department were appointed for timely data collection and submission. Of 116, 112 cities submitted data as per the timeline on 16th April 2018.

Post submission, the city and state coordinators supported by the central team followed up extensively with the cities to support secondary documents as evidence to substantiate their submissions. Secondary documents such as reports, official orders, copy of office register, signed copy of liveability assessment questionnaire furnished by cities against the submitted data. Documents are verified to map the documents for the reponses provided by city and to check the type data provided by city. The document check outcomes were shared with the cities as a part of data quality check.

For checking consistency of data, logical check of data, verifying data from other public sources were undertaken. Quality check was done to ensure data validity and provide opportunity to cities to review the data provided by them and correct in case of wrong data entry.

For 8 selected indicators namely, percentage of services integrated through command and control center, hotel occupancy rate, percentage of schools with access to digital education, number of CCTV cameras per unit road length, percentage of vendors registered and provided formal spaces, availability of passenger information system, percentage of traffic intersection with pedestrian crossing facility, and extent to which universal accessibility is incorporated in public rights of way. Physical audit was conducted in 110 cities by physical auditors appointed and trained by the consortium. In consultation with ULB nodal person, locations and indicators for physical audit was selected in each city. A mobile based application was developed to capture the physical audit related data.

Primary data collection was done for five indicators such as unemployment rates, mode share of public transport, mode share of non-motorized transport, quality of water supplied, and level of noise pollution. Protocols for water and noise test were prepared in consultation with experts. Water quality test involved physical, chemical and bacteriological test of water as per the CPCB norms. For testing quality of water at consumer end, the auditors worked closely with the ULB and Water department. Samples were collected from consumer end and submitted to the lab suggested by city. For noise pollution, in about 20 cities the state pollution board or city level environment department took the responsibility for providing noise pollution data as per the protocols. In rest of the cities, mobile based application was used to measure noise pollution.

During implementation, MoHUA facilitated the process by conducting video conferences with cities to address any queries, reiterate the importance, and ensure that cities adequately engages in the process and submit their responses in time and respond to requests for clarifications.

In addition to secondary data collection, physical audit and primary data collection, citizen survey was conducted to understand their perception and level of satisfaction on various services such as health, education, water supply, electricity, waste management etc. provided by urban local bodies. Over 60000 citizens participated in the survey across India.

The final scores and ranks have been generated based on the scoring methodology that has been discussed extensively and minor modifications made that are summarized as below:

#	Challenges	Proposed Solutions
1	Only 23 cities of 111 cities have City Mobility Plan (CMP) or any and hence able to provide data for Mode Share of Public Transport and Non-Motorised Transport. To address the data gap, as advised by the MoHUA, the consortia undertook a sample dipstick across all cities covering a sample of 150 Households. Understandably, the dipstick findings will not match the rigor of a CMP.	We recommend the following: 1) Cities which have provided CMP Data will be evaluated on 100% of the maximum score 2) For the cities where the dipstick data is used, the city receives a 50% discount on the overall score Alternatively, another approach is to assign 0 score to all 88 cities that don’t have a CMP

#	Challenges	Proposed Solutions
2	Variance was observed on data reported by cities on road network and data presented in the smart city proposals during the verifications.	We recommend taking the data reported by the cities in the Smart City Proposals.
3	There is no secondary source/ organization that provides unemployment data at city level. As a result, most cities do not have the data. Fully cognizance of the challenges of generating this data in a short span of time, it was agreed to collect this data through a dipstick survey on lines of NSSO questions. The data generated needs further scrutiny and triangulation with some inputs from experts. This may not be possible in the short window.	The indicator on unemployment will be excluded from scores. For final ranking, the cities will be scored on 78 indicators.
4	Many cities did not have data on noise pollution and it was decided that data will be collected using a mobile app for all the 111 cities. However, many cities have expressed reservations with the approach especially with respect to the reliability of using this data. Further, some cities have relied on the SPCB to collect the data as per the approach proposed by the consortia. Thus, noise pollution data is currently from two sources: 1. SPCB- 20 cities 2. Noise-based app- 91 cities	The data collected through the primary survey will be used for scoring the cities. Currently, there is no differential scoring for the data from the SPCB and the data collected through the mobile app. However, a certain higher weightage can be provided to those cities which used the state apparatus to collect noise pollution data.
5	For the indicator on quality of water supplied, the methodology document states that samples should be drawn both at the treatment plant outlet as well as the consumer end. However, the data provided by the cities were predominantly from the distribution point. Hence for consumer end results with MoHUA intervention, consortia coordinated with cities to collect the data at the consumer end. The cities facilitated the testing. The outcome of the process is as below: 1. Sample given- 102 cities 2. Report received- 86 cities 3. Report awaited- 16 cities 4. Tests not completed due to lack of cooperation and other reasons – 9	The maximum score for this indicator will be distributed equally (50%) for results based on samples from the treatment plant and consumer end. Cities that did not complete tests or provide the results will be given a score 0 for against consumer end tests.
6	City level population is not projected annually by most of the cities. So, estimates for 2017 population are not available with the cities.	As recommended by MoHUA, 2011 census population is being used for the ranking purpose.
7	The age category specific data for 9 cities is not available at a city level	The age category specific population data has been taken at a district level for these cities.

#	Challenges	Proposed Solutions
8	Indicators on non-motorised transports like- Dedicated bicycle tracks, bicycle parking facilities and mode share of non-motorised transport are not relevant for hilly terrains.	As discussed during the PMC meeting, these indicators have been treated as non-applicable for the hilly cities and the weights have been redistributed among other indicators within the same category.
9	The indicator on increase in professional tax is not relevant to cities which do not levy the professional tax.	As discussed during the PMC meeting, this indicator has been non-applicable to the cities belonging to states where professional tax is not levied, and the weights have been redistributed among other indicators within the same category.
10	The indicator on increase in VAT collection is not applicable to Port Blair and Kavaratti, as there was no provision of VAT collection in these cities.	As discussed during the PMC meeting, these indicatosr has been treated as non-applicable for these two cities and the weights have been redistributed among other indicators within the same category.
11	Indicator on coverage of basic services to slum households does not concern cities with no slums (notified/ non-notified.	As discussed during the PMC meeting, this indicators has been treated as non-applicable for these cities and the weights have been redistributed among other indicators within the same category.

1. Introduction

The Ministry of Housing and Urban Affairs (MoHUA) is implementing several flagship urban missions such as the Smart Cities Mission (SCM), Atal Mission for Urban Rejuvenation and Transformation (AMRUT), Heritage City Development and Augmentation Yojana (HRIDAY), Housing for All (HFA). Theses mission along with other transformative initiatives of the Government including National Water Mission, Power for All, National Health Mission are aimed at making Indian cities more 'liveable.' The overarching goal of these initiatives is to move from an input-based approach to a 'citizen centric-outcome based' assessment of urban liveability.

To develop a common minimum framework for cities to assess their existing status and chart their pathway towards providing a better quality of life to their citizens, the MoHUA developed a set of 'Liveability Standards' relevant to cities to generate a Liveability Index and ranking of cities. These standards were launched in June, 2017. The MoHUA has planned to conduct an 'Annual Assessment of Liveability Standards in Cities – an ambitious national project that will involve yearly submission of data by cities across the various indicators, compilation and analysis, development of indices and ranking of cities. The Liveability Index is envisioned as a 360° tool for tracking, planning and transforming Indian cities. The Liveability Index is aimed at the following objectives:

- Providing strong evidence-based approach for future interventions and investments to deliver liveability outcomes
- Catalysing actions to improve the overall quality of the city's liveability and achieve broader development outcomes including the Sustainable Development Goals
- Assessing the implementation of government policies and schemes governing characteristics of cities that can contribute to creating liveable communities

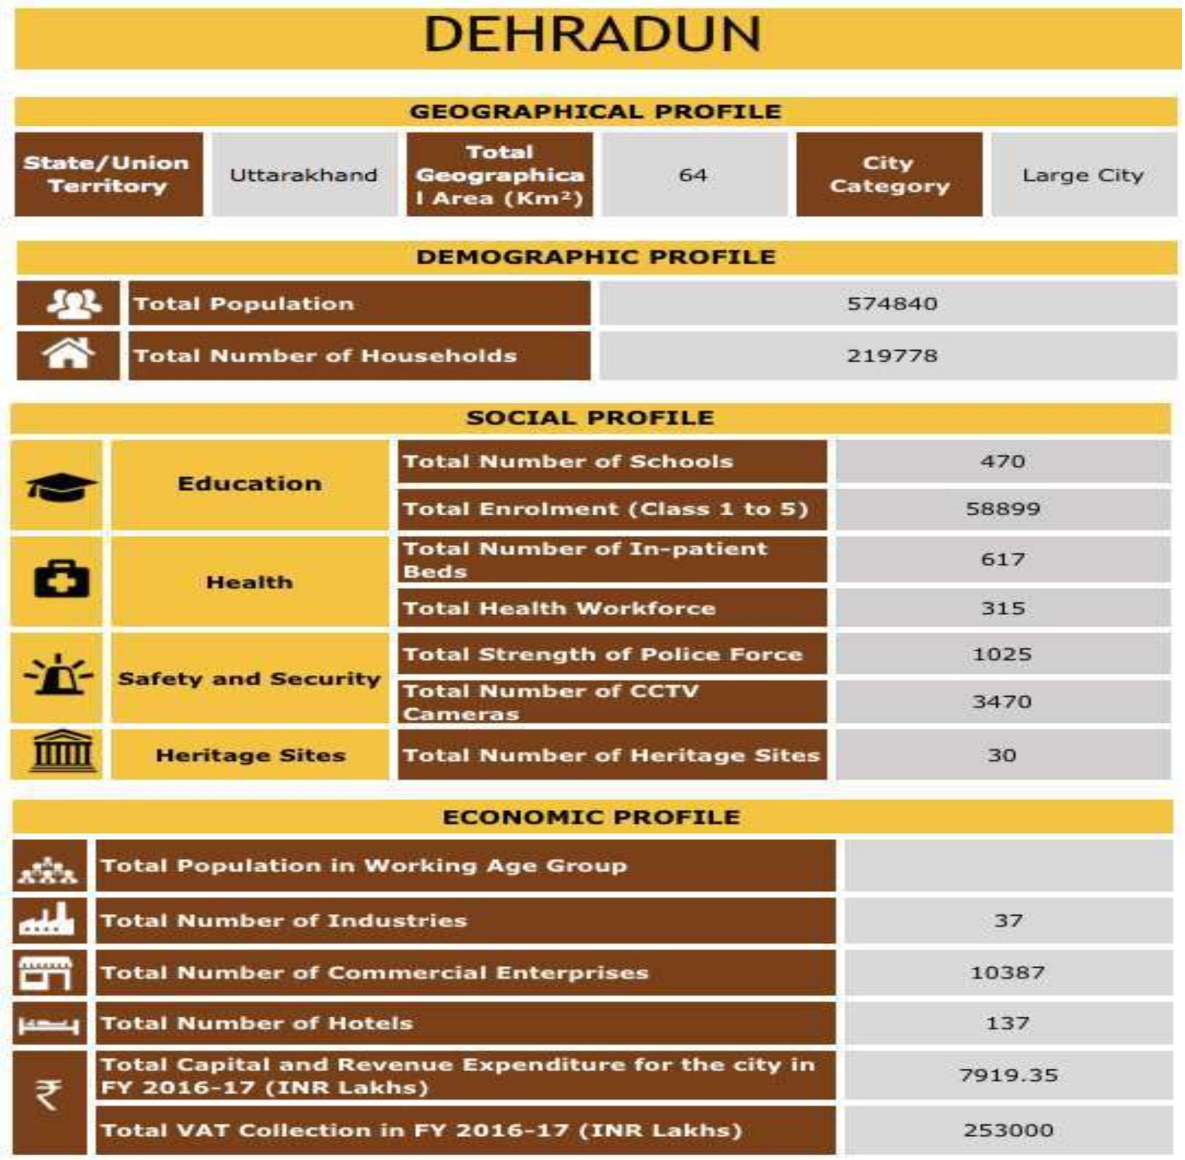
Institutionalisation of outcome based planning and governance
Cities move to a single, unified data driven decision making paradigm...

The first round of the assessment commenced in January 2018 covering 116 major cities including smart cities, capital cities and cities with population of above one million each. Implementation of the liveability assessment commenced in January 2018 with a national level orientation workshop for the urban local bodies. The workshop aimed at orienting the states and urban local bodies on the overall framework, indicators, data sources, methodology and key milestones and timelines involved in the liveability assessment. Subsequently, a series of State/ Union Territory level orientation workshops were carried out in 33 states/UTs for a detailed discussion on the framework. Online data collection commenced from 9th March through an online data collection platform that supported both online and offline data submission modes. On the date of closure of the online data entry portal i.e., 16th April, 2018 112 cities submitted their data. Subsequently, comprehensive checks on the submitted data was undertaken that involved checking for outliers, logical inconsistencies etc. post which round-1 of data reconciliation was conducted. This draft report is based on round-1 of reconciled data as on 28th April, 2018.

2. City Profile

This chapter presents the city profile -Geographic and Demographic, Social (Education Health, Safety and Security, Heritage), Economic profile, and Physical (Water, sanitation and Waste Management, Electricity, Open space and roads).



DEHRADUN

GEOGRAPHICAL PROFILE

State/Union Territory	Uttarakhand	**Total Geographical Area (Km^2)**	64	**City Category**	Large City

DEMOGRAPHIC PROFILE

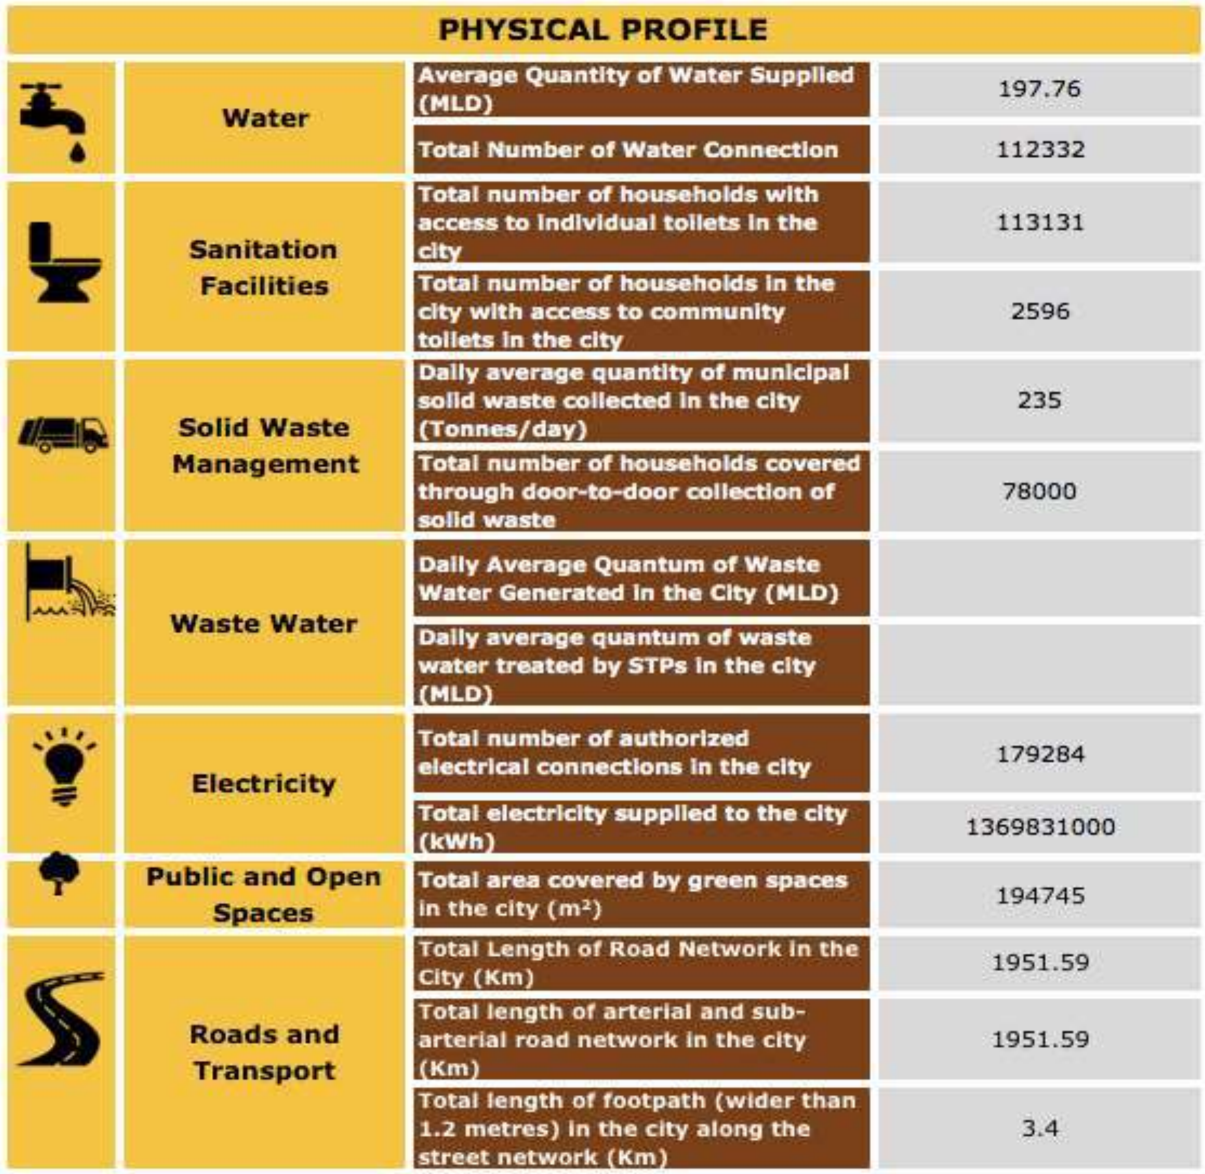
Total Population	574840
Total Number of Households	219778

SOCIAL PROFILE

Education	**Total Number of Schools**	470
	Total Enrolment (Class 1 to 5)	58899
Health	**Total Number of In-patient Beds**	617
	Total Health Workforce	315
Safety and Security	**Total Strength of Police Force**	1025
	Total Number of CCTV Cameras	3470
Heritage Sites	**Total Number of Heritage Sites**	30

ECONOMIC PROFILE

Total Population in Working Age Group	
Total Number of Industries	37
Total Number of Commercial Enterprises	10387
Total Number of Hotels	137
Total Capital and Revenue Expenditure for the city in FY 2016-17 (INR Lakhs)	7919.35
Total VAT Collection in FY 2016-17 (INR Lakhs)	253000



PHYSICAL PROFILE		
Water	Average Quantity of Water Supplied (MLD)	197.76
	Total Number of Water Connection	112332
Sanitation Facilities	Total number of households with access to individual toilets in the city	113131
	Total number of households in the city with access to community toilets in the city	2596
Solid Waste Management	Daily average quantity of municipal solid waste collected in the city (Tonnes/day)	235
	Total number of households covered through door-to-door collection of solid waste	78000
Waste Water	Daily Average Quantum of Waste Water Generated in the City (MLD)	
	Daily average quantum of waste water treated by STPs in the city (MLD)	
Electricity	Total number of authorized electrical connections in the city	179284
	Total electricity supplied to the city (kWh)	1369831000
Public and Open Spaces	Total area covered by green spaces in the city (m^2)	194745
Roads and Transport	Total Length of Road Network in the City (Km)	1951.59
	Total length of arterial and sub-arterial road network in the city (Km)	1951.59
	Total length of footpath (wider than 1.2 metres) in the city along the street network (Km)	3.4

3. Liveability Framework and Indicators

The Liveability Framework comprises a total of 79 indicators (57 Core Indicators and 22 Supporting Indicators). A core indicator carries 70% weightage and a supporting indicator carries 30% weightage. These indicators are grouped under 15 thematic categories which in turn are part of four pillars of comprehensive development of cities i.e., institutional, social, economic and physical. Based on the performance of cities against the various core and supporting indicators, various 'Category Sub-Indexes' and a composite 'City Liveability Index' will be developed for each city.

3.1. Scoring and Computing Category Indices of Liveability

The set of 79 indicators, associated categories and pillars are presented in the table below:

Table 1 List of Pillars, Categories and Indicators

Pillars of Comprehensive Development	Category	Indicators
Institutional	1. Governance	1.1 Percentage of citizen services available online
		1.2 Percentage of services integrated through Command Centre
		1.3 Percentage of citizens using online services
		1.4 Average delay in grievance redressal
		1.5 Tax collected as percentage of tax billed
		1.6 Extent of cost recovery (O&M) in water supply services
		1.7 Capital spending as percentage of total expenditure
		1.8 Percentage of population covered under Ward Committees/Area *Sabhas*
Social	**2. Identity and Culture**	2.1 Restoration and reuse of historic buildings
		2.2 Percentage of ecologically important areas covered through projects for restoration
		2.3 Hotel occupancy
		2.4 Percentage of budget allocated towards cultural/sports activities
		2.5 Number of cultural/sports events hosted by city
	3. Education	3.1 Percentage of school-aged population enrolled in schools
		3.2 Percentage of female school-aged population enrolled in schools
		3.3 Primary education student-teacher ratio
		3.4 Percentage of schools with access to digital education

Pillars of Comprehensive Development	Category	Indicators
		3.5 Percentage of students completing primary education
		3.6 Percentage of students completing secondary education
	4. Health	4.1 Number of in-patient hospital beds per 10,000 population
		4.2 Healthcare professionals per 10,000 population
		4.3 Average response time in case of health emergencies
		4.4 Period prevalence of water borne diseases
		4.5 Period prevalence of vector borne diseases
	5. Safety and Security	5.1 Number of CCTV Cameras
		5.2 Number of recorded crimes per lakh population
		5.3 Extent of crimes recorded against women, children and elderly per year
		5.4 Transport-related fatality per lakh population
Economic	**6. Economy and Employment**	6.1 Increase in VAT/GST collection
		6.2 Increase in collection of Professional Tax
		6.3 Increase in issuance of Construction permits
		6.4 Unemployment rate
		6.5 Percentage of vendors registered and provided formal spaces
Physical	**7. Housing and Inclusiveness**	7.1 Percentage of Slum/EWS households covered through formal/affordable housing
		7.2 Percentage of slum areas covered through basic services
	8. Public Open Spaces	8.1 Per capita availability of green spaces
		8.2 Per capita availability of public and recreational places
	9. Mixed Land	9.1 Share of mixed land use area in overall city land use

Pillars of Comprehensive Development	Category	Indicators
	Use and Compactness	9.2 Net Density
	10. Power Supply	10.1 Percentage of city population with authorized electrical services
		10.2 Percentage of electrical connections covered through smart meters
		10.3 Average number of electrical interruptions per year
		10.4 Average length of electrical interruptions per year
		10.5 Percentage of total energy derived from renewable sources
		10.6 Energy consumption per unit - water supply and sewerage
		10.7 Energy consumption per unit - street lighting
		10.8 Percentage of new and redeveloped buildings following green building norms
		10.9 Total energy consumption per capita
	11. Transportation and Mobility	11.1 Geographical coverage of public transport
		11.2 Availability of public transport
		11.3 Mode share of public transport
		11.4 Percentage of road network with dedicated bicycle tracks
		11.5 Percentage of interchanges with bicycle parking facilities
		11.6 Mode share of non-motorized transport
		11.7 Availability of Passenger Information System
		11.8 Extent of signal synchronization
		11.9 Availability of paid parking spaces

Pillars of Comprehensive Development	Category	Indicators
		11.10 Percentage coverage of footpaths – wider than 1.2 m
		11.11 Percentage of traffic intersections with pedestrian crossing facilities
		11.12 Extent to which universal accessibility is incorporated in public rights-of-way
	12. Assured Water Supply	12.1 Household level coverage of direct water supply connections
		12.2 Per capita supply of water
		12.3 Quality of water supplied
		12.4 Level of non-revenue water – NRW
		12.5 Percentage of water connections covered through meters
		12.6 Percentage of plots with rainwater harvesting facility
	13. Waste Water Management	13.1 Coverage of toilets
		13.2 Coverage of sewerage network and/or septage
		13.3 Collection efficiency of sewerage network
		13.4 Extent of reuse and recycling of waste water
		13.5 Coverage of storm water drains
	14. Solid Waste Management	14.1 Household level coverage of municipal solid waste collection
		14.2 Efficiency of collection of municipal solid waste
		14.3 Extent of municipal solid waste recovered through reuse
	15. Reduced Pollution	15.1 Concentration of SO2- air pollution
		15.2 Concentration of NO2- air pollution
		15.3 Concentration of PM10 - air pollution

Pillars of Comprehensive Development	Category	Indicators
		15.4 Level of noise pollution
		15.5 Quality of water in public surface water bodies

3.2. Scoring and Computing Category Indices of Liveability

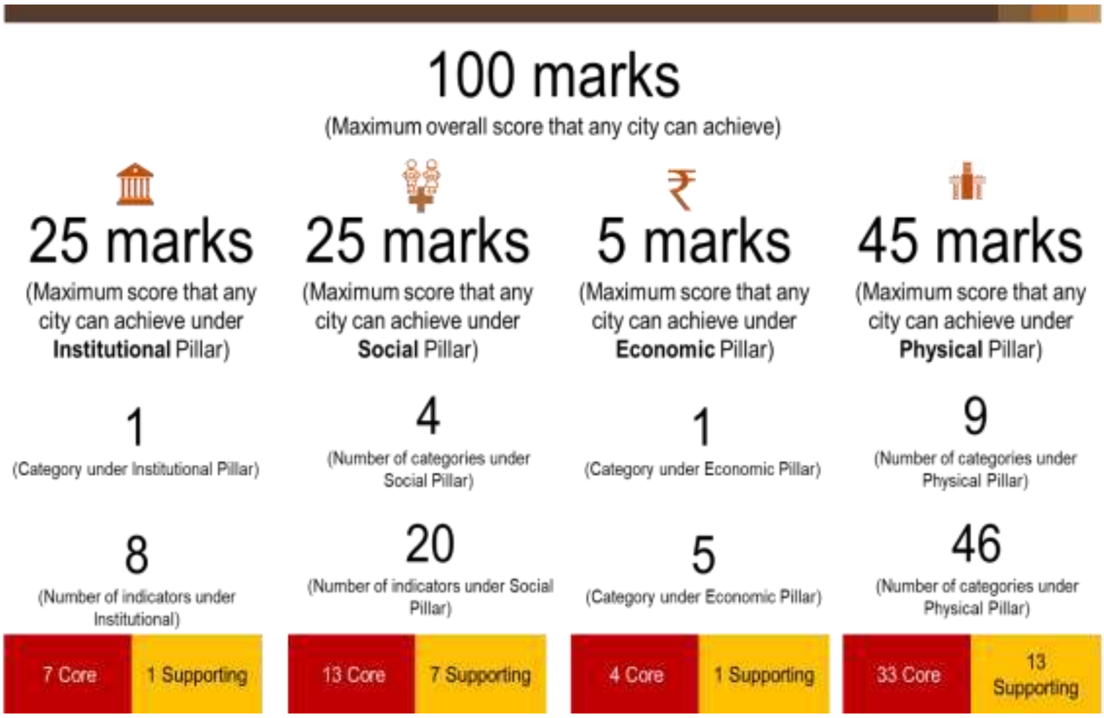
The performance achieved by cities against 79 indicators, will be assessed against given benchmarks. Where no international/national norms are available, city with the best performance in its group (population range) will be treated as a benchmark. The groups are given in the table below.

Table 2 Details on Population Range

Category	Population range
Category 1	Population ≥ 4 million
Category 2	1 million ≤ Population < 4 million
Category 3	0.5 million ≤ Population < 1 million
Category 4	Population < 0.5 million

3.3. Scoring Approach and Methodology

A city can earn a maximum score of 100 points for 79 indicators across four pillars. The pillar weights are as follows: Institutional (25 points), Social (25 points), Economy and Employment (5 points) and Physical (45 points). Based on the number and nature of indicators i.e., core vs. secondary, indicator wise maximum marks were computed.



100 marks
(Maximum overall score that any city can achieve)
25 marks
(Maximum score that any city can achieve under Institutional Pillar)
25 marks
(Maximum score that any city can achieve under Social Pillar)
5 marks
(Maximum score that any city can achieve under Economic Pillar)
45 marks
(Maximum score that any city can achieve under Physical Pillar)
1
(Category under Institutional Pillar)
4
(Number of categories under Social Pillar)
1
(Category under Economic Pillar)
9
(Number of categories under Physical Pillar)
8
(Number of indicators under Institutional)
20
(Number of indicators under Social Pillar)
5
(Category under Economic Pillar)
46
(Number of categories under Physical Pillar)
7 Core

1 Supporting
33 Core
13 Supporting

Dimensional Index Methodology (DIM) has been used to compute scores for each indicator with reference to “maximum within the comparison group” or “absolute benchmarks”. For indicators where benchmarks are available, cities getting the benchmark score (or above) are given the maximum mark, and the marks awarded to other cities are calculated proportionately. For indicators where benchmarks are not available, the best performing cities in each population group are given the maximum mark, and the marks awarded to other cities (within the population group) are calculated proportionately. For indicators where benchmarks do not exist, the city data has been tested for outliers before scoring.

3.4. Scoring Normalisation:

To construct aggregate scores across cities as well as to make the scores across indicators comparable, indicator values were normalised using a min-max approach. The following formula was used to normalise the indicator values-

This approach would restrict the normalised indicator value between 0 and 1. Cities that met or exceeded the benchmark received a normalised indicator value of 1. Worst performing cities are given a normalised indicator value of 0. After normalisation, the normalised value is weighted according to the category and the indicator being core or supporting.

To illustrate, consider the indicator 12.3 Quality of Water Supplied in the Category 12 for Assured Water Supply. If in City A 50% of the water samples collected qualify the potable water standards specified by the CPHEEO, and only 10% of the samples from worst performing city qualify the standards. Then, the normalised value for the indicator for city A would be 0.44 [(0.5-0.1)/(1-0.1)].

The weight for indicator 12.3 is 1.03, so the final weighted score for City A would come out to 0.45 [1.03*0.44].

4. Data Collection and Verification

4.1. Submission of Data by the cities

The Liveability Assessment is based on secondary data submitted by the urban local bodies and other concerned government agencies (collectively called as data owners). The 79 indicators were broken down into a set of easy to understand and relatable 553 questions mapped to data owners. Submission of the data was enabled through an online data entry portal on the smartnet platform of the Ministry. The portal also allowed the ULBs to download the liveability assessment questionnaire and upload filled in questionnaire. To familiarise and assist cities in identifying, mapping and collation of data points, a city level nodal person was available during the entire period of data submission process.

4.2. Mapping of Data Owners for the City

For the assessment of liveability indices broadly 12 data owners such as Central/state Pollution control board, Development authority, DISCOM/Electricity Board, State Disaster Management Authority, State Education Department, State Health department, State Renewable energy and de-

velopment agency, State sales and commercial taxes department, town and country planning department, Traffic and police department, Transport authority, and Urban local body were identified to respond to the questions on the portal. However, during state workshop and subsequent city level discussions, more data owners were mapped to respond to different categories and sub categories. The following table provides the details of city level data owners mapped under the 12 data owner.

Table 3:Details of Data Owners

Designated data owners	Subcategories	Data owners at city level
Urban Local Body	For Accounts Related Questions	Accounts section
Urban Local Body	For Park and Recreation Related Questions	Lok Nirman Anubhag, Nagar Nigam, MDDA
Urban Local Body	For Water Supply and Drainage related questions	Jal Sansthan
Urban Local Body	For Heritage sites related data	ASI website.
Urban Local Body	For Ecological sites related data	Website of forest department
Urban Local Body	For Housing related data	Project Cell, PMAY
Urban Local Body	For Building plan related data	MDDA
Urban Local Body	For Roads related data	Public Works Department, Nagar Nigam
Urban Local Body	For Solid waste management related data	Health Department
Urban Local Body	For IT services related data	IT Department
Urban Local Body	For Vendor committee related data	Land Department
Urban Local Body	Any other departments involved in providing data for questions mentioned under Urban Local Body	Statistics Department
Central / state Pollution control Board	Water Quality, Air Quality, Noise Quality	Uttarakhand Environment protection and pollution control board
Development Authority	Building Infrastructure	IT Department
	Construction planning	IT Department
	Green Building	IT Department

Designated data owners	Subcategories	Data owners at city level
	Rain water harvesting	IT Department
	Universal Design Principle	IT Department
DISCOM/Electricity Board	Electrical Connection/ Grievance Redressal/ Power supply	Uttarakhand Power Corporation Limited
State Disaster management authority		Disaster management Authority
State Education Department		State Education Department
State Health Department	Health care professionals	CMO Office Dehradun
	Citizen Services	CMO Office Dehradun
	Disease Prevalence	NHM and IDSP
	Health Infrastructure	CMO Office Dehradun
State Renewable Energy Development Agency		Uttarakhand Renewable Energy Development Agency
State Sales / Commercial Taxes Department		Sales Tax Office, Uttarakhand
Town and Country Planning Department	Land Use	Town and Country Planning Department
Traffic and Police Department		Traffice Police Department
Transport Authorities	Buses	RTO Dehradun
	Registered Vehicles	RTO Dehradun
	Sub urban rail transport	N/A
	Mono Rail Authority	N/A
	Tramways	N/A
	Marine Transport Authority	N/A

4.3. List of secondary documents available as supportive

City has provided supporting documents/evidences against the responses given by city on the online portal. In support of their responses on the portal, city submitted 32 number of documents.

Documents submitted includes reports, official orders, copy of data maintained in official register, signed copy of questionnaire, and signed letters/submissions from concern departments. Verification includes mapping of documents against responses given by city, checking the type/category of documents, and validation of data provided.

The following table presents the data owner wise number of documents:

Table 4: Data owner wise number of secondary documents submitted by city

Data Owners	Number of Documents
Sales and Commercial Taxes	0
State Education Department	1
DISCOM/Electricity Department	0
Traffic and Police Department	0
Development Authority	0
Pollution Control Board	0
State Renewable Energy Department	0
Town and Country Planning	0
State Health Department	10
Transport Authority	0
Disaster Management	0
Urban Local Body	21
Total	32

4.4. Data Verification

A three-stage data quality check comprising verification of data against secondary documents furnished by data owners, logical inconsistency checks including outliers, and physical audit for select indicators (Refer the exhibit below) is being undertaken. The objective of the data quality check is to ensure that data from the source documents are accurate and verifiable. Sources of data included reports, administrative data, survey results and other statistical records, log books among other.

Physical audit of eight indicators – one indicator from the Institutional pillar, one from the Social pillar, one from the Economy pillar and five from the Physical pillar is also being carried out by the field team to ascertain the degree of reliability of data reported by the cities. The list of these eight indicators is presented below:

1.2 | Percentage of services integrated through Command Centre

2.3 | Hotel occupancy

3.4 | Percentage of schools with access to digital education

5.1 | Number of streets, public places, junctions covered through surveillance systems

6.5 | Percentage of vendors registered and provided formal spaces

11.7 | Availability of Passenger Information System

11.11 | Percentage of traffic intersections with pedestrian crossing facilities

11.12 | Extent to which universal accessibility is incorporated in public rights-of-way

For a set of five indicators namely, unemployment rate, mode share of public transport, mode share of non-motorised transport, quality of water supplied and level of noise pollution, existing datasets were found to be not available consistently across all cities and/or were inadequate. To help cities that do not have data on these five indicators, dipstick assessments are being carried to fill data gaps.

6.4 | Unemployment Rate

11.3 | Mode share of public transport

11.5 | Mode share of Non Motorized Transport

12.3 | Quality of Water Supplied

15.4 | Level of Noise Pollution

4.5. Physical Audit

The following map presents the indicators audited at city level.

5. LA - Surveillance Camera
7. LA - Street Vendors
8. LA - Universal Design Principles

5. City Score on 15 categories of Assessment

Liveability Assessment covered 15 categories and 78 indicators. The below table presents the scores for all 15 indicators namely governance, identity & culture, education, health, safety and security, economy & employment, housing & inclusiveness, public open spaces, mixed land use & compactness, power supply, transport & mobility, assured water supply, waste water management, solid waste management and reduced pollution.

Table 1: Category wise scores

Categories	Scores in Percentage
Governance	66.28%
Identity & Culture	31%
Education	89%
Health	45%
Safety & Security	60%
Economy & Employment	14%
Housing & Inclusiveness	15%
Public Open Spaces	3%
Mixed Land Use & Compactness	50%
Power Supply	47%
Transport & Mobility	43%
Assured Water Supply	39%
Waste Water Management	35%
Solid Waste Management	51%
Reduced Pollution	65%

The rank of the city is based on the performance and scores in each of the category. The final city rank is submitted separately.

Executive Summary

Assessment of liveability indices is an initiative by the Ministry of Housing and Urban Affairs to improve quality of life of citizens and achieve sustainable development goals by encouraging cities to adopt "outcome based" approach for urban planning. Assessment process aimed to provide opportunity to cities to review the development components holistically by involving 79 measurable indicators categorized under governance, health, education, safety, economy, power supply, transportation and mobility, identity, culture, housing, waste management and pollution.

This report highlights the assessment process, key milestones, and the final outcome of the data submitted. Implementation of liveability assessment commenced formally on 19th January 2018. A national level workshop was organized on 13th February 2018 to explain the importance and process of liveability assessment and get feedback on methodology from the city authorities.

This was followed by the next stage of Questionnaire development. The questionnaire was arranged under 12 categories representing 12 data owners namely urban local body, Central and state pollution control board, development authority, DISCOM/Electricity board, State disaster management authority, state education department, state health department, state renewable energy development agency, state sales and commercial taxes department, town and country planning department, traffic and police department and transport authorities.

An online data entry portal was developed to facilitate data submission by the cities. Each city had a unique log in to access the portal and submit the data. Both online and off-line options (download the questionnaire in an excel) to submit the data were available for cities. An email help desk was set up for the cities to raise any queries and seek clarification when responding to the questions.

A team for each state comprising of State Coordinator and City Coordinator (one per city) was deployed that facilitated the process and supported the cities. A total of 6 regional coordinators/ consultants, 29 State Coordinators, and 99 city coordinators were deployed across 116 cities. Training for state coordinators was held from 26th to 28th February 2018 at Chennai to make coordinators understand overall liveability assessment, indicators, data sources, protocols and roles and responsibilities.

City Reconnaissance Meetings were initiated by the state and city coordinators. The discussion began with discussions to finalize the state workshop schedule, mapping of data owners, and assist cities in data collection. The City Coordinators were based in the cities for over 6 weeks and during this time, they liase with ULB and other data owners to explain the liveability framework, online portal, and facilitate the online submission.

A total of 33 state workshops were conducted at the state level. The objective of the workshop was to orient the city stakeholders on liveability assessment, indicators, components of data collection, timelines, expectations of support and support extended by MoHUA. The state level workshops brought various city level departments on a single platform to understand and discuss the methodology and components of city liveability assessment.

Nodal agency at state level supported by the City and State Coordinator and city level (Municipality corporation/smart city limited) coordinated with city specific data owners/departments for data gathering, collation, and submission. Nodal persons in each department were appointed for timely data collection and submission. Of 116, 112 cities submitted data as per the timeline on 16th April 2018.

Post submission, the city and state coordinators supported by the central team followed up extensively with the cities to support secondary documents as evidence to substantiate their submissions. Secondary documents such as reports, official orders, copy of office register, signed copy of liveability assessment questionnaire furnished by cities against the submitted data. Documents are verified to map the documents for the reponses provided by city and to check the type data provided by city. The document check outcomes were shared with the cities as a part of data quality check.

For checking consistency of data, logical check of data, verifying data from other public sources were undertaken. Quality check was done to ensure data validity and provide opportunity to cities to review the data provided by them and correct in case of wrong data entry.

For 8 selected indicators namely, percentage of services integrated through command and control center, hotel occupancy rate, percentage of schools with access to digital education, number of CCTV cameras per unit road length, percentage of vendors registered and provided formal spaces, availability of passenger information system, percentage of traffic intersection with pedestrian crossing facility, and extent to which universal accessibility is incorporated in public rights of way. Physical audit was conducted in 110 cities by physical auditors appointed and trained by the consortium. In consultation with ULB nodal person, locations and indicators for physical audit was selected in each city. A mobile based application was developed to capture the physical audit related data.

Primary data collection was done for five indicators such as unemployment rates, mode share of public transport, mode share of non-motorized transport, quality of water supplied, and level of noise pollution. Protocols for water and noise test were prepared in consultation with experts. Water quality test involved physical, chemical and bacteriological test of water as per the CPCB norms. For testing quality of water at consumer end, the auditors worked closely with the ULB and Water department. Samples were collected from consumer end and submitted to the lab suggested by city. For noise pollution, in about 20 cities the state pollution board or city level

environment department took the responsibility for providing noise pollution data as per the protocols. In rest of the cities, mobile based application was used to measure noise pollution.

During implementation, MoHUA facilitated the process by conducting video conferences with cities to address any queries, reiterate the importance, and ensure that cities adequately engages in the process and submit their responses in time and respond to requests for clarifications.

In addition to secondary data collection, physical audit and primary data collection, citizen survey was conducted to understand their perception and level of satisfaction on various services such as health, education, water supply, electricity, waste management etc. provided by urban local bodies. Over 60000 citizens participated in the survey across India.

The final scores and ranks have been generated based on the scoring methodology that has been discussed extensively and minor modifications made that are summarized as below:

#	**Challenges**	**Proposed Solutions**
1	Only 23 cities of 111 cities have City Mobility Plan (CMP) or any and hence able to provide data for Mode Share of Public Transport and Non-Motorised Transport. To address the data gap, as advised by the MoHUA, the consortia undertook a sample dipstick across all cities covering a sample of 150 Households. Understandably, the dipstick findings will not match the rigor of a CMP.	We recommend the following: 1) Cities which have provided CMP Data will be evaluated on 100% of the maximum score 2) For the cities where the dipstick data is used, the city receives a 50% discount on the overall score Alternatively, another approach is to assign 0 score to all 88 cities that don't have a CMP
2	Variance was observed on data reported by cities on road network and data presented in the smart city proposals during the verifications.	We recommend taking the data reported by the cities in the Smart City Proposals.
3	There is no secondary source/ organization that provides unemployment data at city level. As a result, most cities do not have the data. Fully cognizance of the challenges of generating this data in a short span of time, it was agreed to collect this data through a dipstick survey on lines of NSSO questions. The	The indicator on unemployment will be excluded from scores. For final ranking, the cities will be scored on 78 indicators.

#	Challenges	Proposed Solutions
	data generated needs further scrutiny and triangulation with some inputs from experts. This may not be possible in the short window.	
4	Many cities did not have data on noise pollution and it was decided that data will be collected using a mobile app for all the 111 cities. However, many cities have expressed reservations with the approach especially with respect to the reliability of using this data. Further, some cities have relied on the SPCB to collect the data as per the approach proposed by the consortia. Thus, noise pollution data is currently from two sources: 1. SPCB- 20 cities 2. Noise-based app- 91 cities	The data collected through the primary survey will be used for scoring the cities. Currently, there is no differential scoring for the data from the SPCB and the data collected through the mobile app. However, a certain higher weightage can be provided to those cities which used the state apparatus to collect noise pollution data.
5	For the indicator on quality of water supplied, the methodology document states that samples should be drawn both at the treatment plant outlet as well as the consumer end. However, the data provided by the cities were predominantly from the distribution point. Hence for consumer end results with MoHUA intervention, consortia coordinated with cities to collect the data at the consumer end. The cities facilitated the testing. The outcome of the process is as below: 1. Sample given- 102 cities 2. Report received- 86 cities 3. Report awaited- 16 cities 4. Tests not completed due to lack of cooperation and other reasons – 9	The maximum score for this indicator will be distributed equally (50%) for results based on samples from the treatment plant and consumer end. Cities that did not complete tests or provide the results will be given a score 0 for against consumer end tests.
6	City level population is not projected annually by most of the cities. So, estimates for 2017 population are not available with the cities.	As recommended by MoHUA, 2011 census population is being used for the ranking purpose.
7	The age category specific data for 9 cities is not available at a city level	The age category specific population data has been taken at a district level for these cities.

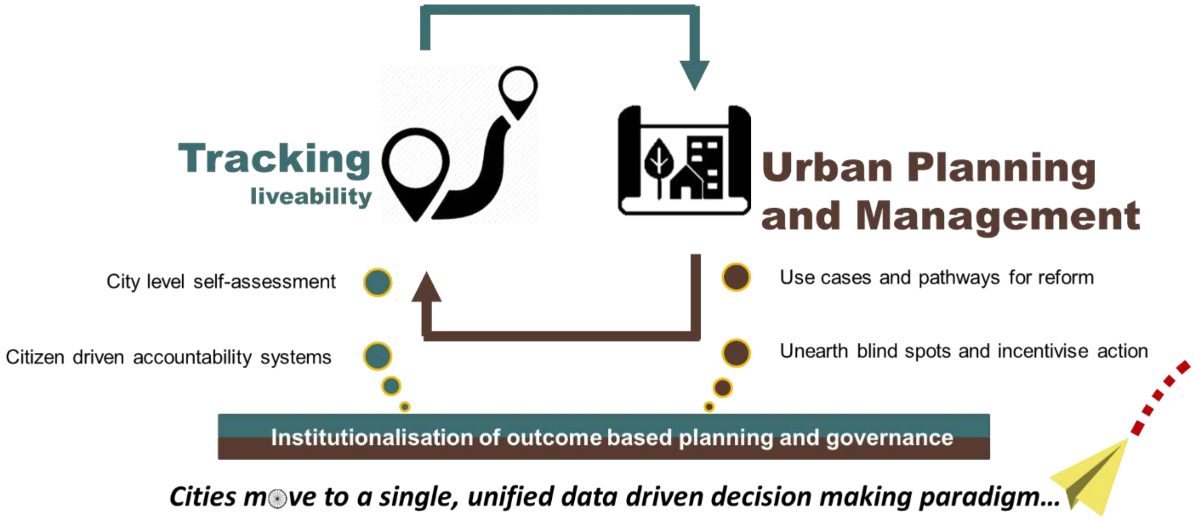
#	Challenges	Proposed Solutions
8	Indicators on non-motorised transports like- Dedicated bicycle tracks, bicycle parking facilities and mode share of non-motorised transport are not relevant for hilly terrains.	As discussed during the PMC meeting, these indicators have been treated as non-applicable for the hilly cities and the weights have been redistributed among other indicators within the same category.
9	The indicator on increase in professional tax is not relevant to cities which do not levy the professional tax.	As discussed during the PMC meeting, this indicator has been non-applicable to the cities belonging to states where professional tax is not levied, and the weights have been redistributed among other indicators within the same category.
10	The indicator on increase in VAT collection is not applicable to Port Blair and Kavaratti, as there was no provision of VAT collection in these cities.	As discussed during the PMC meeting, these indicatosr has been treated as non-applicable for these two cities and the weights have been redistributed among other indicators within the same category.
11	Indicator on coverage of basic services to slum households does not concern cities with no slums (notified/ non-notified.	As discussed during the PMC meeting, this indicators has been treated as non-applicable for these cities and the weights have been redistributed among other indicators within the same category.

1. Introduction

The Ministry of Housing and Urban Affairs (MoHUA) is implementing several flagship urban missions such as the Smart Cities Mission (SCM), Atal Mission for Urban Rejuvenation and Transformation (AMRUT), Heritage City Development and Augmentation Yojana (HRIDAY), Housing for All (HFA). Theses mission along with other transformative initiatives of the Government including National Water Mission, Power for All, National Health Mission are aimed at making Indian cities more 'liveable.' The overarching goal of these initiatives is to move from an input-based approach to a 'citizen centric-outcome based' assessment of urban liveability.

To develop a common minimum framework for cities to assess their existing status and chart their pathway towards providing a better quality of life to their citizens, the MoHUA developed a set of 'Liveability Standards' relevant to cities to generate a Liveability Index and ranking of cities. These standards were launched in June, 2017. The MoHUA has planned to conduct an 'Annual Assessment of Liveability Standards in Cities – an ambitious national project that will involve yearly submission of data by cities across the various indicators, compilation and analysis, development of indices and ranking of cities. The Liveability Index is envisioned as a 360° tool for tracking, planning and transforming Indian cities. The Liveability Index is aimed at the following objectives:

- Providing strong evidence-based approach for future interventions and investments to deliver liveability outcomes
- Catalysing actions to improve the overall quality of the city's liveability and achieve broader development outcomes including the Sustainable Development Goals
- Assessing the implementation of government policies and schemes governing characteristics of cities that can contribute to creating liveable communities



Tracking
liveability
Urban Planning and Management
City level self-assessment
Citizen driven accountability systems
Use cases and pathways for reform
Unearth blind spots and incentivise action
Institutionalisation of outcome based planning and governance

Cities move to a single, unified data driven decision making paradigm...

The first round of the assessment commenced in January 2018 covering 116 major cities including smart cities, capital cities and cities with population of above one million each. Implementation of the liveability assessment commenced in January 2018 with a national level orientation workshop for the urban local bodies. The workshop aimed at orienting the states and urban local bodies on the overall framework, indicators, data sources, methodology and key milestones and timelines involved in the liveability assessment. Subsequently, a series of State/ Union Territory level orientation workshops were carried out in 33 states/UTs for a detailed discussion on the framework. Online data collection commenced from 9th March through an online data collection platform that supported both online and offline data submission modes. On the date of closure of the online data entry portal i.e., 16th April, 2018 112 cities submitted their data. Subsequently, comprehensive checks on the submitted data was undertaken that involved checking for outliers, logical inconsistencies etc. post which round-1 of data reconciliation was conducted. This draft report is based on round-1 of reconciled data as on 28th April, 2018.

2. City Profile

This chapter presents the city profile -Geographic and Demographic, Social (Education Health, Safety and Security, Heritage), Economic profile, and Physical (Water, sanitation and Waste Management, Electricity, Open space and roads).

DELHI

GEOGRAPHICAL PROFILE

State/Union Territory	Delhi	**Total Geographical Area (Km^2)**	2293.71	**City Category**	Megapolis

DEMOGRAPHIC PROFILE

Total Population	11292358
Total Number of Households	4924559

SOCIAL PROFILE

Education	**Total Number of Schools**	6952
	Total Enrolment (Class 1 to 5)	2288144
Health	**Total Number of In-patient Beds**	30031
	Total Health Workforce	3485
Safety and Security	**Total Strength of Police Force**	84596
	Total Number of CCTV Cameras	221810
Heritage Sites	**Total Number of Heritage Sites**	391

ECONOMIC PROFILE

Total Population in Working Age Group	8194739
Total Number of Industries	35320
Total Number of Commercial Enterprises	145919
Total Number of Hotels	78
Total Capital and Revenue Expenditure for the city in FY 2016-17 (INR Lakhs)	1339332.89
Total VAT Collection in FY 2016-17 (INR Lakhs)	1889114.89

PHYSICAL PROFILE		
Water	**Average Quantity of Water Supplied (MLD)**	4157.52
	Total Number of Water Connections	2516154
Sanitation Facilities	**Total number of households with access to individual toilets in the city**	3007680
	Total number of households in the city with access to community toilets in the city	641
Solid Waste Management	**Daily average quantity of municipal solid waste collected in the city (Tonnes/day)**	9800
	Total number of households covered through door-to-door collection of solid waste	2065850
Waste Water	**Daily Average Quantum of Waste Water Generated in the City (MLD)**	3380.5
	Daily average quantum of waste water treated by STPs in the city (MLD)	2052.11
Electricity	**Total number of authorized electrical connections in the city**	3509320
	Total electricity supplied to the city (kWh)	8333123361
Public and Open Spaces	**Total area covered by green spaces in the city (m^2)**	151441026
Roads and Transport	**Total Length of Road Network in the City (Km)**	11537.36
	Total length of arterial and sub-arterial road network in the city (Km)	2126.46
	Total length of footpath (wider than 1.2 metres) in the city along the street network (Km)	2892

3. Liveability Framework and Indicators

The Liveability Framework comprises a total of 79 indicators (57 Core Indicators and 22 Supporting Indicators). A core indicator carries 70% weightage and a supporting indicator carries 30% weightage. These indicators are grouped under 15 thematic categories which in turn are part of four pillars of comprehensive development of cities i.e., institutional, social, economic and physical. Based on the performance of cities against the various core and supporting indicators, various 'Category Sub-Indexes' and a composite 'City Liveability Index' will be developed for each city.

3.1 Scoring and Computing Category Indices of Liveability

The set of 79 indicators, associated categories and pillars are presented in the table below:

Table 1 List of Pillars, Categories and Indicators

Pillars of Comprehensive Development	Category	Indicators
Institutional	1. Governance	1.1 Percentage of citizen services available online
		1.2 Percentage of services integrated through Command Centre
		1.3 Percentage of citizens using online services
		1.4 Average delay in grievance redressal
		1.5 Tax collected as percentage of tax billed
		1.6 Extent of cost recovery (O&M) in water supply services
		1.7 Capital spending as percentage of total expenditure
		1.8 Percentage of population covered under Ward Committees/Area *Sabhas*
Social	**2. Identity and Culture**	2.1 Restoration and reuse of historic buildings
		2.2 Percentage of ecologically important areas covered through projects for restoration
		2.3 Hotel occupancy
		2.4 Percentage of budget allocated towards cultural/sports activities
		2.5 Number of cultural/sports events hosted by city
	3. Education	3.1 Percentage of school-aged population enrolled in schools
		3.2 Percentage of female school-aged population enrolled in schools
		3.3 Primary education student-teacher ratio
		3.4 Percentage of schools with access to digital education
		3.5 Percentage of students completing primary education
		3.6 Percentage of students completing secondary education
	4. Health	4.1 Number of in-patient hospital beds per 10,000

Pillars of Comprehensive Development	Category	Indicators
		population
		4.2 Healthcare professionals per 10,000 population
		4.3 Average response time in case of health emergencies
		4.4 Period prevalence of water borne diseases
		4.5 Period prevalence of vector borne diseases
	5. Safety and Security	5.1 Number of CCTV Cameras
		5.2 Number of recorded crimes per lakh population
		5.3 Extent of crimes recorded against women, children and elderly per year
		5.4 Transport-related fatality per lakh population
Economic	**6. Economy and Employment**	6.1 Increase in VAT/GST collection
		6.2 Increase in collection of Professional Tax
		6.3 Increase in issuance of Construction permits
		6.4 Unemployment rate
		6.5 Percentage of vendors registered and provided formal spaces
Physical	**7. Housing and Inclusiveness**	7.1 Percentage of Slum/EWS households covered through formal/affordable housing
		7.2 Percentage of slum areas covered through basic services
	8. Public Open Spaces	8.1 Per capita availability of green spaces
		8.2 Per capita availability of public and recreational places
	9. Mixed Land Use and Compactness	9.1 Share of mixed land use area in overall city land use
		9.2 Net Density
	10. Power Supply	10.1 Percentage of city population with authorized electrical services
		10.2 Percentage of electrical connections covered through smart meters
		10.3 Average number of electrical interruptions per year
		10.4 Average length of electrical interruptions per year
		10.5 Percentage of total energy derived from renewable sources
		10.6 Energy consumption per unit - water supply and sewerage
		10.7 Energy consumption per unit - street lighting

Pillars of Comprehensive Development	Category	Indicators
		10.8 Percentage of new and redeveloped buildings following green building norms
		10.9 Total energy consumption per capita
	11. Transportation and Mobility	11.1 Geographical coverage of public transport
		11.2 Availability of public transport
		11.3 Mode share of public transport
		11.4 Percentage of road network with dedicated bicycle tracks
		11.5 Percentage of interchanges with bicycle parking facilities
		11.6 Mode share of non-motorized transport
		11.7 Availability of Passenger Information System
		11.8 Extent of signal synchronization
		11.9 Availability of paid parking spaces
		11.10 Percentage coverage of footpaths – wider than 1.2 m
		11.11 Percentage of traffic intersections with pedestrian crossing facilities
		11.12 Extent to which universal accessibility is incorporated in public rights-of-way
	12. Assured Water Supply	12.1 Household level coverage of direct water supply connections
		12.2 Per capita supply of water
		12.3 Quality of water supplied
		12.4 Level of non-revenue water – NRW
		12.5 Percentage of water connections covered through meters
		12.6 Percentage of plots with rainwater harvesting facility
	13. Waste Water Management	13.1 Coverage of toilets
		13.2 Coverage of sewerage network and/or septage
		13.3 Collection efficiency of sewerage network
		13.4 Extent of reuse and recycling of waste water
		13.5 Coverage of storm water drains
	14. Solid Waste Management	14.1 Household level coverage of municipal solid waste collection
		14.2 Efficiency of collection of municipal solid waste

Pillars of Comprehensive Development	Category	Indicators
		14.3 Extent of municipal solid waste recovered through reuse
	15. Reduced Pollution	15.1 Concentration of SO2- air pollution
		15.2 Concentration of NO2- air pollution
		15.3 Concentration of PM10 - air pollution
		15.4 Level of noise pollution
		15.5 Quality of water in public surface water bodies

3.2 Scoring and Computing Category Indices of Liveability

The performance achieved by cities against 79 indicators, will be assessed against given benchmarks. Where no international/national norms are available, city with the best performance in its group (population range) will be treated as a benchmark. The groups are given in the table below.

Table 2 Details on Population Range

Category	Population range
Category 1	Population ≥ 4 million
Category 2	1 million ≤ Population < 4 million
Category 3	0.5 million ≤ Population < 1 million
Category 4	Population < 0.5 million

3.3 Scoring Approach and Methodology

A city can earn a maximum score of 100 points for 79 indicators across four pillars. The pillar weights are as follows: Institutional (25 points), Social (25 points), Economy and Employment (5 points) and Physical (45 points). Based on the number and nature of indicators i.e., core vs. secondary, indicator wise maximum marks were computed.

100 marks

(Maximum overall score that any city can achieve)

25 marks (Maximum score that any city can achieve under **Institutional** Pillar)	25 marks (Maximum score that any city can achieve under **Social** Pillar)	5 marks (Maximum score that any city can achieve under **Economic** Pillar)	45 marks (Maximum score that any city can achieve under **Physical** Pillar)
1 (Category under Institutional Pillar)	4 (Number of categories under Social Pillar)	1 (Category under Economic Pillar)	9 (Number of categories under Physical Pillar)
8 (Number of indicators under Institutional)	20 (Number of indicators under Social Pillar)	5 (Category under Economic Pillar)	46 (Number of categories under Physical Pillar)
7 Core 1 Supporting	13 Core 7 Supporting	4 Core 1 Supporting	33 Core 13 Supporting

Dimensional Index Methodology (DIM) has been used to compute scores for each indicator with reference to "maximum within the comparison group" or "absolute benchmarks". For indicators where benchmarks are available, cities getting the benchmark score (or above) are given the maximum mark, and the marks awarded to other cities are calculated proportionately. For indicators where benchmarks are not available, the best performing cities in each population group are given the maximum mark, and the marks awarded to other cities (within the population group) are calculated proportionately. For indicators where benchmarks do not exist, the city data has been tested for outliers before scoring.

3.4 Scoring Normalisation:

To construct aggregate scores across cities as well as to make the scores across indicators comparable, indicator values were normalised using a min-max approach. The following formula was used to normalise the indicator values-

$$\frac{indicator\ value\ for\ the\ city - indicator\ value\ for\ the\ worst\ performing\ city}{benchmark - \ indicator\ value\ for\ the\ worst\ performing\ city}$$

This approach would restrict the normalised indicator value between 0 and 1. Cities that met or exceeded the benchmark received a normalised indicator value of 1. Worst performing cities are given a normalised indicator value of 0. After normalisation, the normalised value is weighted according to the category and the indicator being core or supporting.

To illustrate, consider the indicator 12.3 Quality of Water Supplied in the Category 12 for Assured Water Supply. If in City A 50% of the water samples collected qualify the potable water standards specified by the CPHEEO, and only 10% of the samples from worst performing city qualify the standards. Then, the normalised value for the indicator for city A would be 0.44 [(0.5-0.1)/(1-0.1)].

The weight for indicator 12.3 is 1.03, so the final weighted score for City A would come out to 0.45 [1.03*0.44].

4. Data Collection and Verification

4.1 Submission of Data by the cities

The Liveability Assessment is based on secondary data submitted by the urban local bodies and other concerned government agencies (collectively called as data owners). The 79 indicators were broken down into a set of easy to understand and relatable 553 questions mapped to data owners. Submission of the data was enabled through an online data entry portal on the smartnet platform of the Ministry. The portal also allowed the ULBs to download the liveability assessment questionnaire and upload filled in questionnaire. To familiarise and assist cities in identifying, mapping and collation of data points, a city level nodal person was available during the entire period of data submission process.

4.2 Mapping of Data Owners for the City

For the assessment of liveability indices broadly 12 data owners such as Central/state Pollution control board, Development authority, DISCOM/Electricity Board, State Disaster Management Authority, State Education Department, State Health department, State Renewable energy and development agency, State sales and commercial taxes department, town and country planning department, Traffic and police department, Transport authority, and Urban local body were identified to respond to the questions on the portal. However, during state workshop and subsequent city level discussions, more data owners were mapped to respond to different categories and sub categories. The following table provides the details of city level data owners mapped under the 12 data owner.

Table 3:Details of Data Owners

EAST DELHI

Designated data owners	Subcategories	Data owners at city level
Urban Local Body	For Accounts Related Questions	Data shared by ULB's nodal officer

4.3 List of secondary documents available as supportive

City has provided supporting documents/evidences against the responses given by city on the online portal. In support of their responses on the portal, North Delhi, South Delhi, East Delhi and NDMC have submitted 15,10,12, and 1 documents respectively. Documents submitted includes reports, official orders, copy of data maintained in official register, signed copy of questionnaire, and signed letters/submissions from concern departments. Verification includes mapping of documents against responses given by city, checking the type/category of documents, and validation of data provided.

The following table presents the data owner wise number of documents:

Table 4: Data owner wise number of secondary documents submitted by city –

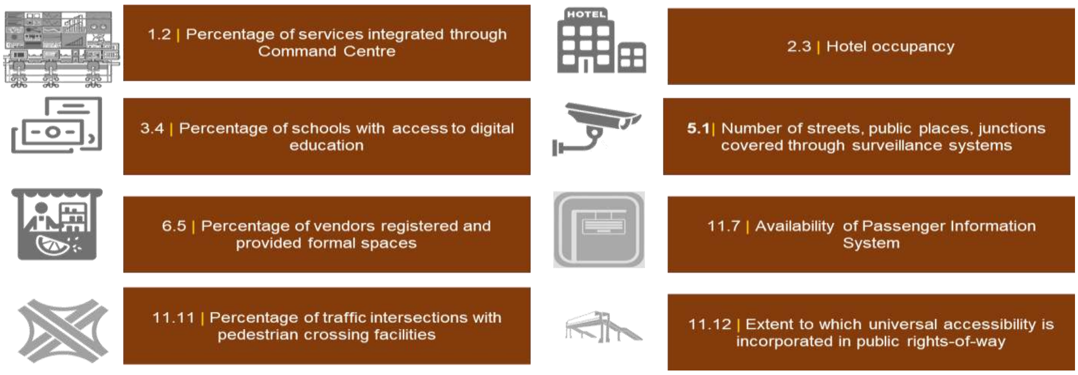
4.4 Data Verification

A three-stage data quality check comprising verification of data against secondary documents furnished by data owners, logical inconsistency checks including outliers, and physical audit for select indicators (Refer the exhibit below) is being undertaken. The objective of the data quality check is to ensure that data from the source documents are accurate and verifiable. Sources of data included reports, administrative data, survey results and other statistical records, log books among other.

Physical audit of eight indicators – one indicator from the Institutional pillar, one from the Social pillar, one from the Economy pillar and five from the Physical pillar is also being carried out by the field team to ascertain the degree of reliability of data reported by the cities. The list of these eight indicators is presented below:



1.2 | Percentage of services integrated through Command Centre

2.3 | Hotel occupancy

3.4 | Percentage of schools with access to digital education

5.1| Number of streets, public places, junctions covered through surveillance systems

6.5 | Percentage of vendors registered and provided formal spaces

11.7 | Availability of Passenger Information System

11.11 | Percentage of traffic intersections with pedestrian crossing facilities

11.12 | Extent to which universal accessibility is incorporated in public rights-of-way

For a set of five indicators namely, unemployment rate, mode share of public transport, mode share of non-motorised transport, quality of water supplied and level of noise pollution, existing datasets were found to be not available consistently across all cities and/or were inadequate. To help cities that do not have data on these five indicators, dipstick assessments are being carried to fill data gaps.

6.4 | Unemployment Rate

11.3 | Mode share of public transport

11.5 | Mode share of Non Motorized Transport

12.3 | Quality of Water Supplied

15.4 | Level of Noise Pollution

4.5-Physical Audit

5. City Score on 15 categories of Assessment

Liveability Assessment covered 15 categories and 78 indicators. The below table presents the scores for all 15 indicators namely governance, identity & culture, education, health, safety and security, economy & employment, housing & inclusiveness, public open spaces, mixed land use & compactness, power supply, transport & mobility, assured water supply, waste water management, solid waste management and reduced pollution.

Table 5: Category wise scores

Categories	Scores in Percentage
Governance	71.81%
Identity & Culture	44%
Education	92%
Health	39%
Safety & Security	61%
Economy & Employment	41%
Housing & Inclusiveness	0%

Public Open Spaces	53%
Mixed Land Use & Compactness	0%
Power Supply	24%
Transport & Mobility	30%
Assured Water Supply	76%
Waste Water Management	78%
Solid Waste Management	79%
Reduced Pollution	60%

The rank of the city is based on the performance and scores in each of the category. The final city rank is submitted separately.

Executive Summary

Assessment of liveability indices is an initiative by the Ministry of Housing and Urban Affairs to improve quality of life of citizens and achieve sustainable development goals by encouraging cities to adopt "outcome based" approach for urban planning. Assessment process aimed to provide opportunity to cities to review the development components holistically by involving 79 measurable indicators categorized under governance, health, education, safety, economy, power supply, transportation and mobility, identity, culture, housing, waste management and pollution.

This report highlights the assessment process, key milestones, and the final outcome of the data submitted. Implementation of liveability assessment commenced formally on 19th January 2018. A national level workshop was organized on 13th February 2018 to explain the importance and process of liveability assessment and get feedback on methodology from the city authorities.

This was followed by the next stage of Questionnaire development. The questionnaire was arranged under 12 categories representing 12 data owners namely urban local body, Central and state pollution control board, development authority, DISCOM/Electricity board, State disaster management authority, state education department, state health department, state renewable energy development agency, state sales and commercial taxes department, town and country planning department, traffic and police department and transport authorities.

An online data entry portal was developed to facilitate data submission by the cities. Each city had a unique log in to access the portal and submit the data. Both online and off-line options (download the questionnaire in an excel) to submit the data were available for cities. An email help desk was set up for the cities to raise any queries and seek clarification when responding to the questions.

A team for each state comprising of State Coordinator and City Coordinator (one per city) was deployed that facilitated the process and supported the cities. A total of 6 regional coordinators/ consultants, 29 State Coordinators, and 99 city coordinators were deployed across 116 cities. Training for state coordinators was held from 26th to 28th February 2018 at Chennai to make coordinators understand overall liveability assessment, indicators, data sources, protocols and roles and responsibilities.

City Reconnaissance Meetings were initiated by the state and city coordinators. The discussion began with discussions to finalize the state workshop schedule, mapping of data owners, and assist cities in data collection. The City Coordinators were based in the cities for over 6 weeks and during this time, they liase with ULB and other data owners to explain the liveability framework, online portal, and facilitate the online submission.

A total of 33 state workshops were conducted at the state level. The objective of the workshop was to orient the city stakeholders on liveability assessment, indicators, components of data collection, timelines, expectations of support and support extended by MoHUA. The state level workshops brought various city level departments on a single platform to understand and discuss the methodology and components of city liveability assessment.

Nodal agency at state level supported by the City and State Coordinator and city level (Municipality corporation/smart city limited) coordinated with city specific data owners/departments for data gathering, collation, and submission. Nodal persons in each department were appointed for timely data collection and submission. Of 116, 112 cities submitted data as per the timeline on 16th April 2018.

Post submission, the city and state coordinators supported by the central team followed up extensively with the cities to support secondary documents as evidence to substantiate their submissions. Secondary documents such as reports, official orders, copy of office register, signed copy of liveability assessment questionnaire furnished by cities against the submitted data. Documents are verified to map the documents for the reponses provided by city and to check the type data provided by city. The document check outcomes were shared with the cities as a part of data quality check.

For checking consistency of data, logical check of data, verifying data from other public sources were undertaken. Quality check was done to ensure data validity and provide opportunity to cities to review the data provided by them and correct in case of wrong data entry.

For 8 selected indicators namely, percentage of services integrated through command and control center, hotel occupancy rate, percentage of schools with access to digital education, number of CCTV cameras per unit road length, percentage of vendors registered and provided formal spaces, availability of passenger information system, percentage of traffic intersection with pedestrian crossing facility, and extent to which universal accessibility is incorporated in public rights of way. Physical audit was conducted in 110 cities by physical auditors appointed and trained by the consortium. In consultation with ULB nodal person, locations and indicators for physical audit was selected in each city. A mobile based application was developed to capture the physical audit related data.

Primary data collection was done for five indicators such as unemployment rates, mode share of public transport, mode share of non-motorized transport, quality of water supplied, and level of noise pollution. Protocols for water and noise test were prepared in consultation with experts. Water quality test involved physical, chemical and bacteriological test of water as per the CPCB norms. For testing quality of water at consumer end, the auditors worked closely with the ULB and Water department. Samples were collected from consumer end and submitted to the lab suggested by city. For noise pollution, in about 20 cities the state pollution board or city level

environment department took the responsibility for providing noise pollution data as per the protocols. In rest of the cities, mobile based application was used to measure noise pollution.

During implementation, MoHUA facilitated the process by conducting video conferences with cities to address any queries, reiterate the importance, and ensure that cities adequately engages in the process and submit their responses in time and respond to requests for clarifications.

In addition to secondary data collection, physical audit and primary data collection, citizen survey was conducted to understand their perception and level of satisfaction on various services such as health, education, water supply, electricity, waste management etc. provided by urban local bodies. Over 60000 citizens participated in the survey across India.

The final scores and ranks have been generated based on the scoring methodology that has been discussed extensively and minor modifications made that are summarized as below:

#	**Challenges**	**Proposed Solutions**
1	Only 23 cities of 111 cities have City Mobility Plan (CMP) or any and hence able to provide data for Mode Share of Public Transport and Non-Motorised Transport. To address the data gap, as advised by the MoHUA, the consortia undertook a sample dipstick across all cities covering a sample of 150 Households. Understandably, the dipstick findings will not match the rigor of a CMP.	We recommend the following: 1) Cities which have provided CMP Data will be evaluated on 100% of the maximum score 2) For the cities where the dipstick data is used, the city receives a 50% discount on the overall score Alternatively, another approach is to assign 0 score to all 88 cities that don't have a CMP
2	Variance was observed on data reported by cities on road network and data presented in the smart city proposals during the verifications.	We recommend taking the data reported by the cities in the Smart City Proposals.
3	There is no secondary source/ organization that provides unemployment data at city level. As a result, most cities do not have the data. Fully cognizance of the challenges of generating this data in a short span of time, it was agreed to collect this data through a dipstick survey on lines of NSSO questions. The	The indicator on unemployment will be excluded from scores. For final ranking, the cities will be scored on 78 indicators.

#	Challenges	Proposed Solutions
	data generated needs further scrutiny and triangulation with some inputs from experts. This may not be possible in the short window.	
4	Many cities did not have data on noise pollution and it was decided that data will be collected using a mobile app for all the 111 cities. However, many cities have expressed reservations with the approach especially with respect to the reliability of using this data. Further, some cities have relied on the SPCB to collect the data as per the approach proposed by the consortia. Thus, noise pollution data is currently from two sources: 1. SPCB- 20 cities 2. Noise-based app- 91 cities	The data collected through the primary survey will be used for scoring the cities. Currently, there is no differential scoring for the data from the SPCB and the data collected through the mobile app. However, a certain higher weightage can be provided to those cities which used the state apparatus to collect noise pollution data.
5	For the indicator on quality of water supplied, the methodology document states that samples should be drawn both at the treatment plant outlet as well as the consumer end. However, the data provided by the cities were predominantly from the distribution point. Hence for consumer end results with MoHUA intervention, consortia coordinated with cities to collect the data at the consumer end. The cities facilitated the testing. The outcome of the process is as below: 1. Sample given- 102 cities 2. Report received- 86 cities 3. Report awaited- 16 cities 4. Tests not completed due to lack of cooperation and other reasons – 9	The maximum score for this indicator will be distributed equally (50%) for results based on samples from the treatment plant and consumer end. Cities that did not complete tests or provide the results will be given a score 0 for against consumer end tests.
6	City level population is not projected annually by most of the cities. So, estimates for 2017 population are not available with the cities.	As recommended by MoHUA, 2011 census population is being used for the ranking purpose.
7	The age category specific data for 9 cities is not available at a city level	The age category specific population data has been taken at a district level for these cities.

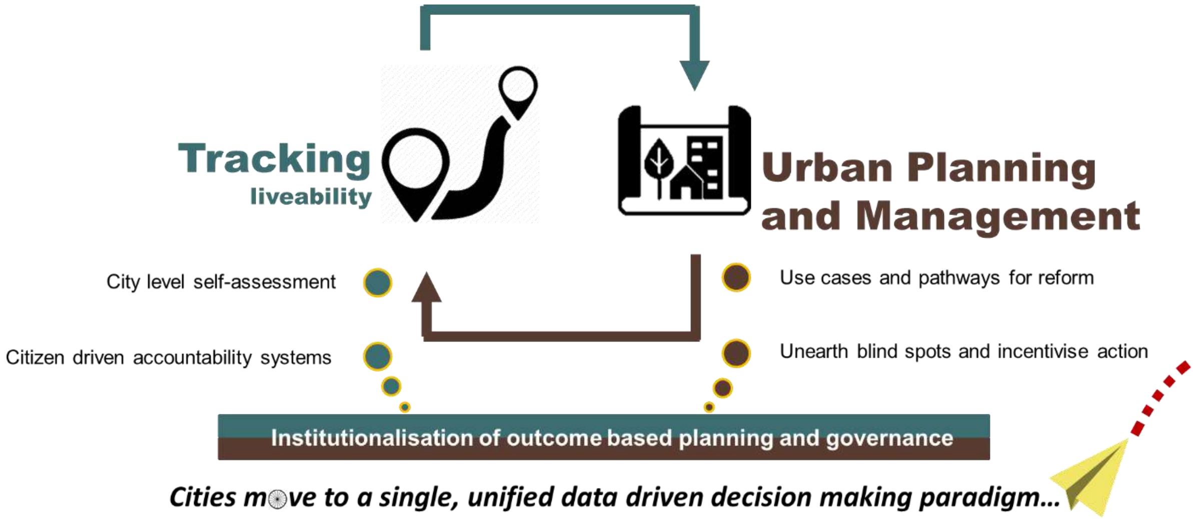
#	Challenges	Proposed Solutions
8	Indicators on non-motorised transports like- Dedicated bicycle tracks, bicycle parking facilities and mode share of non-motorised transport are not relevant for hilly terrains.	As discussed during the PMC meeting, these indicators have been treated as non-applicable for the hilly cities and the weights have been redistributed among other indicators within the same category.
9	The indicator on increase in professional tax is not relevant to cities which do not levy the professional tax.	As discussed during the PMC meeting, this indicator has been non-applicable to the cities belonging to states where professional tax is not levied, and the weights have been redistributed among other indicators within the same category.
10	The indicator on increase in VAT collection is not applicable to Port Blair and Kavaratti, as there was no provision of VAT collection in these cities.	As discussed during the PMC meeting, these indicatosr has been treated as non-applicable for these two cities and the weights have been redistributed among other indicators within the same category.
11	Indicator on coverage of basic services to slum households does not concern cities with no slums (notified/ non-notified.	As discussed during the PMC meeting, this indicators has been treated as non-applicable for these cities and the weights have been redistributed among other indicators within the same category.

1. Introduction

The Ministry of Housing and Urban Affairs (MoHUA) is implementing several flagship urban missions such as the Smart Cities Mission (SCM), Atal Mission for Urban Rejuvenation and Transformation (AMRUT), Heritage City Development and Augmentation Yojana (HRIDAY), Housing for All (HFA). Theses mission along with other transformative initiatives of the Government including National Water Mission, Power for All, National Health Mission are aimed at making Indian cities more 'liveable.' The overarching goal of these initiatives is to move from an input-based approach to a 'citizen centric-outcome based' assessment of urban liveability.

To develop a common minimum framework for cities to assess their existing status and chart their pathway towards providing a better quality of life to their citizens, the MoHUA developed a set of 'Liveability Standards' relevant to cities to generate a Liveability Index and ranking of cities. These standards were launched in June, 2017. The MoHUA has planned to conduct an 'Annual Assessment of Liveability Standards in Cities – an ambitious national project that will involve yearly submission of data by cities across the various indicators, compilation and analysis, development of indices and ranking of cities. The Liveability Index is envisioned as a 360° tool for tracking, planning and transforming Indian cities. The Liveability Index is aimed at the following objectives:

- Providing strong evidence-based approach for future interventions and investments to deliver liveability outcomes
- Catalysing actions to improve the overall quality of the city's liveability and achieve broader development outcomes including the Sustainable Development Goals
- Assessing the implementation of government policies and schemes governing characteristics of cities that can contribute to creating liveable communities



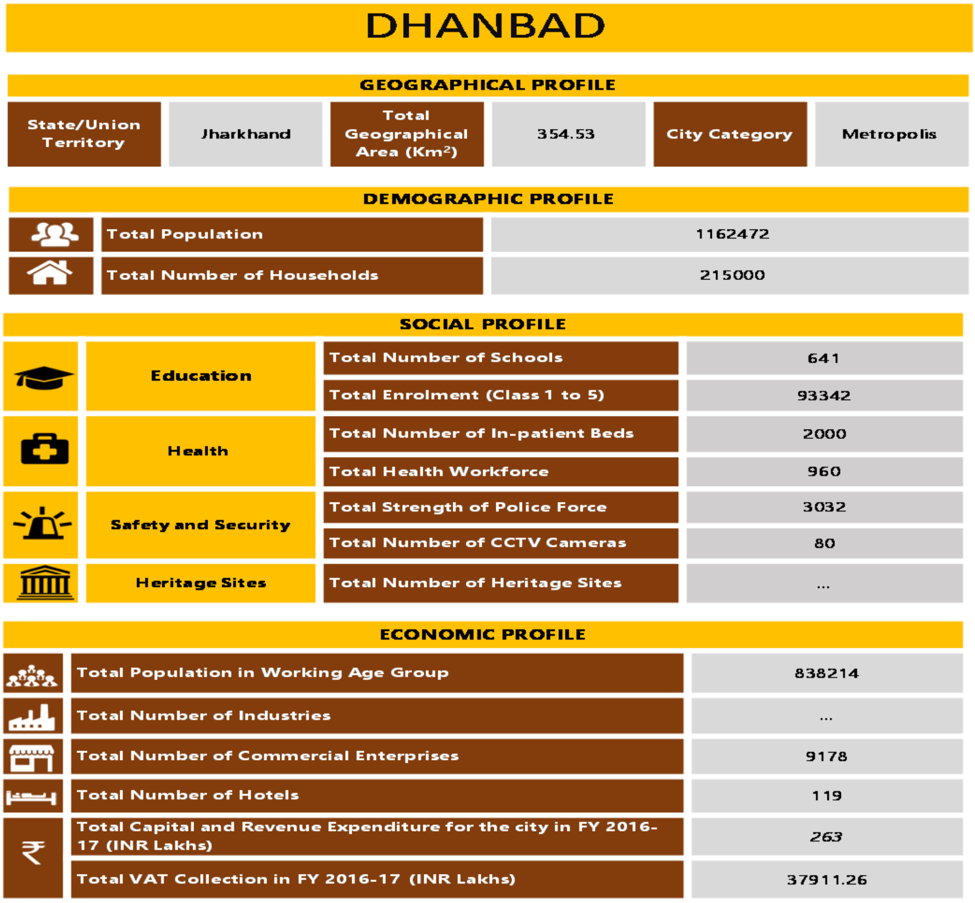
Tracking
liveability
Urban Planning
and Management
City level self-assessment
Citizen driven accountability systems
Use cases and pathways for reform
Unearth blind spots and incentivise action
Institutionalisation of outcome based planning and governance

Cities move to a single, unified data driven decision making paradigm...

The first round of the assessment commenced in January 2018 covering 116 major cities including smart cities, capital cities and cities with population of above one million each. Implementation of the liveability assessment commenced in January 2018 with a national level orientation workshop for the urban local bodies. The workshop aimed at orienting the states and urban local bodies on the overall framework, indicators, data sources, methodology and key milestones and timelines involved in the liveability assessment. Subsequently, a series of State/ Union Territory level orientation workshops were carried out in 33 states/UTs for a detailed discussion on the framework. Online data collection commenced from 9th March through an online data collection platform that supported both online and offline data submission modes. On the date of closure of the online data entry portal i.e., 16th April, 2018 112 cities submitted their data. Subsequently, comprehensive checks on the submitted data was undertaken that involved checking for outliers, logical inconsistencies etc. post which round-1 of data reconciliation was conducted. This draft report is based on round-1 of reconciled data as on 28th April, 2018.

2. City Profile

This chapter presents the city profile -Geographic and Demographic, Social (Education Health, Safety and Security, Heritage), Economic profile, and Physical (Water, sanitation and Waste Management, Electricity, Open space and roads).



DHANBAD

GEOGRAPHICAL PROFILE

State/Union Territory	Jharkhand	Total Geographical Area (Km²)	354.53	City Category	Metropolis

DEMOGRAPHIC PROFILE

Total Population	1162472
Total Number of Households	215000

SOCIAL PROFILE

Education	Total Number of Schools	641
	Total Enrolment (Class 1 to 5)	93342
Health	Total Number of In-patient Beds	2000
	Total Health Workforce	960
Safety and Security	Total Strength of Police Force	3032
	Total Number of CCTV Cameras	80
Heritage Sites	Total Number of Heritage Sites	...

ECONOMIC PROFILE

Total Population in Working Age Group	838214
Total Number of Industries	...
Total Number of Commercial Enterprises	9178
Total Number of Hotels	119
Total Capital and Revenue Expenditure for the city in FY 2016-17 (INR Lakhs)	*263*
Total VAT Collection in FY 2016-17 (INR Lakhs)	37911.26

PHYSICAL PROFILE		
Water	**Average Quantity of Water Supplied (MLD)**	119
	Total Number of Water Connection	131385
Sanitation Facilities	**Total number of households with access to individual toilets in the city**	204000
	Total number of households in the city with access to community toilets in the city	11304
Solid Waste Management	**Daily average quantity of municipal solid waste collected in the city (Tonnes/day)**	502
	Total number of households covered through door-to-door collection of solid waste	197000
Waste Water	**Daily Average Quantum of Waste Water Generated in the City (MLD)**	...
	Daily average quantum of waste water treated by STPs in the city (MLD)	0.6
Electricity	**Total number of authorized electrical connections in the city**	212567
	Total electricity supplied to the city (kWh)	1776244000
Public and Open Spaces	**Total area covered by green spaces in the city (m^2)**	412531
Roads and Transport	**Total Length of Road Network in the City (Km)**	322
	Total length of arterial and sub-arterial road network in the city (Km)	150
	Total length of footpath (wider than 1.2 metres) in the city along the street network (Km)	12

3. Liveability Framework and Indicators

The Liveability Framework comprises a total of 79 indicators (57 Core Indicators and 22 Supporting Indicators). A core indicator carries 70% weightage and a supporting indicator carries 30% weightage. These indicators are grouped under 15 thematic categories which in turn are part of four pillars of comprehensive development of cities i.e., institutional, social, economic and physical. Based on the performance of cities against the various core and supporting indicators, various 'Category Sub-Indexes' and a composite 'City Liveability Index' will be developed for each city.

3.1 Scoring and Computing Category Indices of Liveability

The set of 79 indicators, associated categories and pillars are presented in the table below:

Table 1 List of Pillars, Categories and Indicators

Pillars of Comprehensive Development	Category	Indicators
Institutional	1. Governance	1.1 Percentage of citizen services available online
		1.2 Percentage of services integrated through Command Centre
		1.3 Percentage of citizens using online services
		1.4 Average delay in grievance redressal
		1.5 Tax collected as percentage of tax billed
		1.6 Extent of cost recovery (O&M) in water supply services
		1.7 Capital spending as percentage of total expenditure
		1.8 Percentage of population covered under Ward Committees/Area *Sabhas*
Social	**2. Identity and Culture**	2.1 Restoration and reuse of historic buildings
		2.2 Percentage of ecologically important areas covered through projects for restoration
		2.3 Hotel occupancy
		2.4 Percentage of budget allocated towards cultural/sports activities
		2.5 Number of cultural/sports events hosted by city
	3. Education	3.1 Percentage of school-aged population enrolled in schools
		3.2 Percentage of female school-aged population enrolled in schools
		3.3 Primary education student-teacher ratio
		3.4 Percentage of schools with access to digital

Pillars of Comprehensive Development	Category	Indicators
		education
		3.5 Percentage of students completing primary education
		3.6 Percentage of students completing secondary education
	4. Health	4.1 Number of in-patient hospital beds per 10,000 population
		4.2 Healthcare professionals per 10,000 population
		4.3 Average response time in case of health emergencies
		4.4 Period prevalence of water borne diseases
		4.5 Period prevalence of vector borne diseases
	5. Safety and Security	5.1 Number of CCTV Cameras
		5.2 Number of recorded crimes per lakh population
		5.3 Extent of crimes recorded against women, children and elderly per year
		5.4 Transport-related fatality per lakh population
Economic	**6. Economy and Employment**	6.1 Increase in VAT/GST collection
		6.2 Increase in collection of Professional Tax
		6.3 Increase in issuance of Construction permits
		6.4 Unemployment rate
		6.5 Percentage of vendors registered and provided formal spaces
Physical	**7. Housing and Inclusiveness**	7.1 Percentage of Slum/EWS households covered through formal/affordable housing
		7.2 Percentage of slum areas covered through basic services

Pillars of Comprehensive Development	Category	Indicators
	8. Public Open Spaces	8.1 Per capita availability of green spaces
		8.2 Per capita availability of public and recreational places
	9. Mixed Land Use and Compactness	9.1 Share of mixed land use area in overall city land use
		9.2 Net Density
	10. Power Supply	10.1 Percentage of city population with authorized electrical services
		10.2 Percentage of electrical connections covered through smart meters
		10.3 Average number of electrical interruptions per year
		10.4 Average length of electrical interruptions per year
		10.5 Percentage of total energy derived from renewable sources
		10.6 Energy consumption per unit - water supply and sewerage
		10.7 Energy consumption per unit - street lighting
		10.8 Percentage of new and redeveloped buildings following green building norms
		10.9 Total energy consumption per capita
	11. Transportation and Mobility	11.1 Geographical coverage of public transport
		11.2 Availability of public transport
		11.3 Mode share of public transport
		11.4 Percentage of road network with dedicated bicycle tracks
		11.5 Percentage of interchanges with bicycle parking facilities

Pillars of Comprehensive Development	Category	Indicators
		11.6 Mode share of non-motorized transport
		11.7 Availability of Passenger Information System
		11.8 Extent of signal synchronization
		11.9 Availability of paid parking spaces
		11.10 Percentage coverage of footpaths – wider than 1.2 m
		11.11 Percentage of traffic intersections with pedestrian crossing facilities
		11.12 Extent to which universal accessibility is incorporated in public rights-of-way
	12. Assured Water Supply	12.1 Household level coverage of direct water supply connections
		12.2 Per capita supply of water
		12.3 Quality of water supplied
		12.4 Level of non-revenue water – NRW
		12.5 Percentage of water connections covered through meters
		12.6 Percentage of plots with rainwater harvesting facility
	13. Waste Water Management	13.1 Coverage of toilets
		13.2 Coverage of sewerage network and/or septage
		13.3 Collection efficiency of sewerage network
		13.4 Extent of reuse and recycling of waste water
		13.5 Coverage of storm water drains
	14. Solid Waste Management	14.1 Household level coverage of municipal solid waste collection

Pillars of Comprehensive Development	Category	Indicators
		14.2 Efficiency of collection of municipal solid waste
		14.3 Extent of municipal solid waste recovered through reuse
	15. Reduced Pollution	15.1 Concentration of SO2- air pollution
		15.2 Concentration of NO2- air pollution
		15.3 Concentration of PM10 - air pollution
		15.4 Level of noise pollution
		15.5 Quality of water in public surface water bodies

3.2 Scoring and Computing Category Indices of Liveability

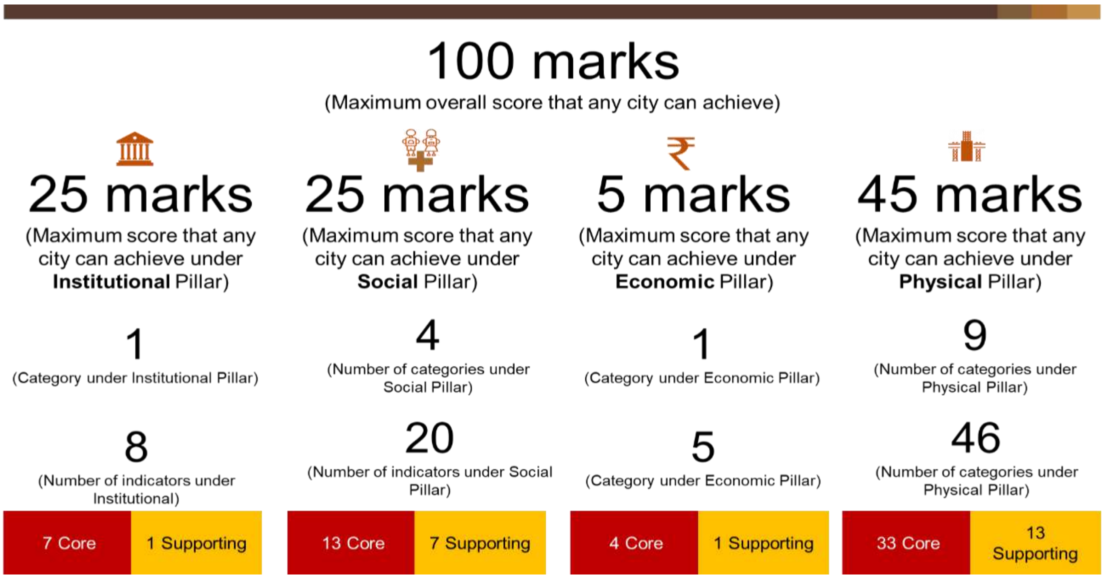
The performance achieved by cities against 79 indicators, will be assessed against given benchmarks. Where no international/national norms are available, city with the best performance in its group (population range) will be treated as a benchmark. The groups are given in the table below.

Table 2 Details on Population Range

Category	Population range
Category 1	Population ≥ 4 million
Category 2	1 million ≤ Population < 4 million
Category 3	0.5 million ≤ Population < 1 million
Category 4	Population < 0.5 million

3.3 Scoring Approach and Methodology

A city can earn a maximum score of 100 points for 79 indicators across four pillars. The pillar weights are as follows: Institutional (25 points), Social (25 points), Economy and Employment (5 points) and Physical (45 points). Based on the number and nature of indicators i.e., core vs. secondary, indicator wise maximum marks were computed.



100 marks
(Maximum overall score that any city can achieve)

25 marks (Maximum score that any city can achieve under **Institutional** Pillar)		25 marks (Maximum score that any city can achieve under **Social** Pillar)		5 marks (Maximum score that any city can achieve under **Economic** Pillar)		45 marks (Maximum score that any city can achieve under **Physical** Pillar)	
1 (Category under Institutional Pillar)		4 (Number of categories under Social Pillar)		1 (Category under Economic Pillar)		9 (Number of categories under Physical Pillar)	
8 (Number of indicators under Institutional)		20 (Number of indicators under Social Pillar)		5 (Category under Economic Pillar)		46 (Number of categories under Physical Pillar)	
7 Core	1 Supporting	13 Core	7 Supporting	4 Core	1 Supporting	33 Core	13 Supporting

Dimensional Index Methodology (DIM) has been used to compute scores for each indicator with reference to "maximum within the comparison group" or "absolute benchmarks". For indicators where benchmarks are available, cities getting the benchmark score (or above) are given the maximum mark, and the marks awarded to other cities are calculated proportionately. For indicators where benchmarks are not available, the best performing cities in each population group are given the maximum mark, and the marks awarded to other cities (within the population group) are calculated proportionately. For indicators where benchmarks do not exist, the city data has been tested for outliers before scoring. The list of benchmarks is presented in Annexure 1.

3.4 Scoring Normalisation:

To construct aggregate scores across cities as well as to make the scores across indicators comparable, indicator values were normalised using a min-max approach. The following formula was used to normalise the indicator values-

$$\frac{indicator\ value\ for\ the\ city - indicator\ value\ for\ the\ worst\ performing\ city}{benchmark - \ indicator\ value\ for\ the\ worst\ performing\ city}$$

This approach would restrict the normalised indicator value between 0 and 1. Cities that met or exceeded the benchmark received a normalised indicator value of 1. Worst performing cities are given a normalised indicator value of 0. After normalisation, the normalised value is weighted according to the category and the indicator being core or supporting.

To illustrate, consider the indicator 12.3 Quality of Water Supplied in the Category 12 for Assured Water Supply. If in City A 50% of the water samples collected qualify the potable water standards specified by the CPHEEO, and only 10% of the samples from worst performing city qualify the standards. Then, the normalised value for the indicator for city A would be 0.44 [(0.5-0.1)/(1-0.1)].

The weight for indicator 12.3 is 1.03, so the final weighted score for City A would come out to 0.45 [1.03*0.44].

4. Data Collection and Verification

4.1 Submission of Data by the cities

The Liveability Assessment is based on secondary data submitted by the urban local bodies and other concerned government agencies (collectively called as data owners). The 79 indicators were broken down into a set of easy to understand and relatable 553 questions mapped to data owners. Submission of the data was enabled through an online data entry portal on the smartnet platform of the Ministry. The portal also allowed the ULBs to download the liveability assessment questionnaire and upload filled in questionnaire. To familiarise and assist cities in identifying, mapping and collation of data points, a city level nodal person was available during the entire period of data submission process.

4.2 Mapping of Data Owners for the City

For the assessment of liveability indices broadly 12 data owners such as Central/state Pollution control board, Development authority, DISCOM/Electricity Board, State Disaster Management Authority, State Education Department, State Health department, State Renewable energy and development agency, State sales and commercial taxes department, town and country planning department, Traffic and police department, Transport authority, and Urban local body were identified to respond to the questions on the portal. However, during state workshop and subsequent city level discussions, more data owners were mapped to respond to different

categories and sub categories. The following table provides the details of city level data owners mapped under the 12 data owner.

Table 3:Details of Data Owners

Designated data owners	Subcategories	Data owners at city level
Urban Local Body	For Accounts Related Questions	Urban Local Body
Urban Local Body	For Park and Recreation Related Questions	Urban Local Body
Urban Local Body	For Water Supply and Drainage related questions	Urban Local Body
Urban Local Body	For Heritage sites related data	Urban Local Body
Urban Local Body	For Ecological sites related data	Urban Local Body
Urban Local Body	For Housing related data	Urban Local Body
Urban Local Body	For Building plan related data	Building plan department
Urban Local Body	For Roads related data	ULB, Transport Authority
Urban Local Body	For Solid waste management related data	Urban Local Body
Urban Local Body	For IT services related data	Urban Local Body
Urban Local Body	For Vendor committee related data	Urban Local Body
Urban Local Body	Any other departments involved in providing data for questions mentioned under Urban Local Body	Urban Local Body
Central / state Pollution control Board	Water Quality, Air Quality, Noise Quality	Regional Pollution Control Board, Dhanbad
Development Authority	Building Infrastructure	Urban Local Body
	Construction planning	Urban Local Body
	Green Building	Urban Local Body
	Rain water harvesting	Revenue Department
	Universal Design Principle	Development Authority
DISCOM/Electricity Board	Electrical Connection/ Grievance Redressal/ Power supply	Jharkhand Vidut Vitran Nigam Limited

Traffic and Police Department		SP Office Dhanbad
Transport Authorities	Buses	District Transport Office
	Registered Vehicles	District Transport Office
	Sub urban rail transport	
	Mono Rail Authority	
	Tramways	
	Marine Transport Authority	

4.3 List of secondary documents available as supportive

City has provided supporting documents/evidences against the responses given by city on the online portal. In support of their responses on the portal, city submitted 10 number of documents. Documents submitted includes reports, official orders, copy of data maintained in official register, signed copy of questionnaire, and signed letters/submissions from concern departments. Verification includes mapping of documents against responses given by city, checking the type/category of documents, and validation of data provided.

The following table presents the data owner wise number of documents:

Table 4: Data owner wise number of secondary documents submitted by city

Data Owners	Number of Documents
Sales and Commercial Taxes	0
State Education Department	2
DISCOM/Electricity Department	0
Traffic and Police Department	1
Development Authority	0
Pollution Control Board	3

State Renewable Energy Department	0
Town and Country Planning	1
State Health Department	1
Transport Authority	0
Disaster Management	0
Urban Local Body	2
Total	10

4.4 Data Verification

A three-stage data quality check comprising verification of data against secondary documents furnished by data owners, logical inconsistency checks including outliers, and physical audit for select indicators (Refer the exhibit below) is being undertaken. The objective of the data quality check is to ensure that data from the source documents are accurate and verifiable. Sources of data included reports, administrative data, survey results and other statistical records, log books among other.

Physical audit of eight indicators – one indicator from the Institutional pillar, one from the Social pillar, one from the Economy pillar and five from the Physical pillar is also being carried out by the field team to ascertain the degree of reliability of data reported by the cities. The list of these eight indicators is presented below:

1.2 | Percentage of services integrated through Command Centre

2.3 | Hotel occupancy

3.4 | Percentage of schools with access to digital education

5.1| Number of streets, public places, junctions covered through surveillance systems

6.5 | Percentage of vendors registered and provided formal spaces

11.7 | Availability of Passenger Information System

11.11 | Percentage of traffic intersections with pedestrian crossing facilities

11.12 | Extent to which universal accessibility is incorporated in public rights-of-way

For a set of five indicators namely, unemployment rate, mode share of public transport, mode share of non-motorised transport, quality of water supplied and level of noise pollution, existing datasets were found to be not available consistently across all cities and/or were inadequate. To help cities that do not have data on these five indicators, dipstick assessments are being carried to fill data gaps.

6.4 | Unemployment Rate

11.3 | Mode share of public transport

11.5 | Mode share of Non Motorized Transport

12.3 | Quality of Water Supplied

15.4 | Level of Noise Pollution

4.5 Physical Audit

The following map presents the indicators audited at city level.

5. City Score on 15 categories of Assessment

Liveability Assessment covered 15 categories and 78 indicators. The below table presents the scores for all 15 indicators namely governance, identity & culture, education, health, safety and security, economy & employment, housing & inclusiveness, public open spaces, mixed land use & compactness, power supply, transport & mobility, assured water supply, waste water management, solid waste management and reduced pollution.

Table 5: Category wise scores

Categories	**Scores in Percentage**
Governance	64.67%
Identity & Culture	31%
Education	75%
Health	63%
Safety & Security	70%
Economy & Employment	24%
Housing & Inclusiveness	13%
Public Open Spaces	1%
Mixed Land Use & Compactness	0%
Power Supply	56%
Transport & Mobility	29%
Assured Water Supply	65%
Waste Water Management	20%
Solid Waste Management	61%
Reduced Pollution	57%

The rank of the city is based on the performance and scores in each of the category. The final city rank is submitted separately.

Executive Summary

Assessment of liveability indices is an initiative by the Ministry of Housing and Urban Affairs to improve quality of life of citizens and achieve sustainable development goals by encouraging cities to adopt "outcome based" approach for urban planning. Assessment process aimed to provide opportunity to cities to review the development components holistically by involving 79 measurable indicators categorized under governance, health, education, safety, economy, power supply, transportation and mobility, identity, culture, housing, waste management and pollution.

This report highlights the assessment process, key milestones, and the final outcome of the data submitted. Implementation of liveability assessment commenced formally on 19th January 2018. A national level workshop was organized on 13th February 2018 to explain the importance and process of liveability assessment and get feedback on methodology from the city authorities.

This was followed by the next stage of Questionnaire development. The questionnaire was arranged under 12 categories representing 12 data owners namely urban local body, Central and state pollution control board, development authority, DISCOM/Electricity board, State disaster management authority, state education department, state health department, state renewable energy development agency, state sales and commercial taxes department, town and country planning department, traffic and police department and transport authorities.

An online data entry portal was developed to facilitate data submission by the cities. Each city had a unique log in to access the portal and submit the data. Both online and off-line options (download the questionnaire in an excel) to submit the data were available for cities. An email help desk was set up for the cities to raise any queries and seek clarification when responding to the questions.

A team for each state comprising of State Coordinator and City Coordinator (one per city) was deployed that facilitated the process and supported the cities. A total of 6 regional coordinators/ consultants, 29 State Coordinators, and 99 city coordinators were deployed across 116 cities. Training for state coordinators was held from 26th to 28th February 2018 at Chennai to make coordinators understand overall liveability assessment, indicators, data sources, protocols and roles and responsibilities.

City Reconnaissance Meetings were initiated by the state and city coordinators. The discussion began with discussions to finalize the state workshop schedule, mapping of data owners, and assist cities in data collection. The City Coordinators were based in the cities for over 6 weeks and during this time, they liase with ULB and other data owners to explain the liveability framework, online portal, and facilitate the online submission.

A total of 33 state workshops were conducted at the state level. The objective of the workshop was to orient the city stakeholders on liveability assessment, indicators, components of data collection, timelines, expectations of support and support extended by MoHUA. The state level workshops brought various city level departments on a single platform to understand and discuss the methodology and components of city liveability assessment.

Nodal agency at state level supported by the City and State Coordinator and city level (Municipality corporation/smart city limited) coordinated with city specific data owners/departments for data gathering, collation, and submission. Nodal persons in each department were appointed for timely data collection and submission. Of 116, 112 cities submitted data as per the timeline on 16th April 2018.

Post submission, the city and state coordinators supported by the central team followed up extensively with the cities to support secondary documents as evidence to substantiate their submissions. Secondary documents such as reports, official orders, copy of office register, signed copy of liveability assessment questionnaire furnished by cities against the submitted data. Documents are verified to map the documents for the reponses provided by city and to check the type data provided by city. The document check outcomes were shared with the cities as a part of data quality check.

For checking consistency of data, logical check of data, verifying data from other public sources were undertaken. Quality check was done to ensure data validity and provide opportunity to cities to review the data provided by them and correct in case of wrong data entry.

For 8 selected indicators namely, percentage of services integrated through command and control center, hotel occupancy rate, percentage of schools with access to digital education, number of CCTV cameras per unit road length, percentage of vendors registered and provided formal spaces, availability of passenger information system, percentage of traffic intersection with pedestrian crossing facility, and extent to which universal accessibility is incorporated in public rights of way. Physical audit was conducted in 110 cities by physical auditors appointed and trained by the consortium. In consultation with ULB nodal person, locations and indicators for physical audit was selected in each city. A mobile based application was developed to capture the physical audit related data.

Primary data collection was done for five indicators such as unemployment rates, mode share of public transport, mode share of non-motorized transport, quality of water supplied, and level of noise pollution. Protocols for water and noise test were prepared in consultation with experts.

Water quality test involved physical, chemical and bacteriological test of water as per the CPCB norms. For testing quality of water at consumer end, the auditors worked closely with the ULB and Water department. Samples were collected from consumer end and submitted to the lab suggested by city. For noise pollution, in about 20 cities the state pollution board or city level environment department took the responsibility for providing noise pollution data as per the protocols. In rest of the cities, mobile based application was used to measure noise pollution.

During implementation, MoHUA facilitated the process by conducting video conferences with cities to address any queries, reiterate the importance, and ensure that cities adequately engages in the process and submit their responses in time and respond to requests for clarifications.

In addition to secondary data collection, physical audit and primary data collection, citizen survey was conducted to understand their perception and level of satisfaction on various services such as health, education, water supply, electricity, waste management etc. provided by urban local bodies. Over 60000 citizens participated in the survey across India.

The final scores and ranks have been generated based on the scoring methodology that has been discussed extensively and minor modifications made that are summarized as below:

#	Challenges	Proposed Solutions
1	Only 23 cities of 111 cities have City Mobility Plan (CMP) or any and hence able to provide data for Mode Share of Public Transport and Non-Motorised Transport. To address the data gap, as advised by the MoHUA, the consortia undertook a sample dipstick across all cities covering a sample of 150 Households. Understandably, the dipstick findings will not match the rigor of a CMP.	We recommend the following: 1) Cities which have provided CMP Data will be evaluated on 100% of the maximum score 2) For the cities where the dipstick data is used, the city receives a 50% discount on the overall score Alternatively, another approach is to assign 0 score to all 88 cities that don't have a CMP
2	Variance was observed on data reported by cities on road network and data presented in the smart city proposals during the verifications.	We recommend taking the data reported by the cities in the Smart City Proposals.

#	Challenges	Proposed Solutions
3	There is no secondary source/ organization that provides unemployment data at city level. As a result, most cities do not have the data. Fully cognizance of the challenges of generating this data in a short span of time, it was agreed to collect this data through a dipstick survey on lines of NSSO questions. The data generated needs further scrutiny and triangulation with some inputs from experts. This may not be possible in the short window.	The indicator on unemployment will be excluded from scores. For final ranking, the cities will be scored on 78 indicators.
4	Many cities did not have data on noise pollution and it was decided that data will be collected using a mobile app for all the 111 cities. However, many cities have expressed reservations with the approach especially with respect to the reliability of using this data. Further, some cities have relied on the SPCB to collect the data as per the approach proposed by the consortia. Thus, noise pollution data is currently from two sources: 1. SPCB- 20 cities 2. Noise-based app- 91 cities	The data collected through the primary survey will be used for scoring the cities. Currently, there is no differential scoring for the data from the SPCB and the data collected through the mobile app. However, a certain higher weightage can be provided to those cities which used the state apparatus to collect noise pollution data.
5	For the indicator on quality of water supplied, the methodology document states that samples should be drawn both at the treatment plant outlet as well as the consumer end. However, the data provided by the cities were predominantly from the distribution point. Hence for consumer end results with MoHUA intervention, consortia coordinated with cities to collect the data at the consumer end. The cities facilitated the testing. The outcome of the process is as below: 1. Sample given- 102 cities 2. Report received- 86 cities 3. Report awaited- 16 cities 4. Tests not completed due to lack of cooperation and other reasons – 9	The maximum score for this indicator will be distributed equally (50%) for results based on samples from the treatment plant and consumer end. Cities that did not complete tests or provide the results will be given a score 0 for against consumer end tests.
6	City level population is not projected annually by most of the cities. So, estimates for 2017 population are not available with the cities.	As recommended by MoHUA, 2011 census population is being used for the ranking purpose.

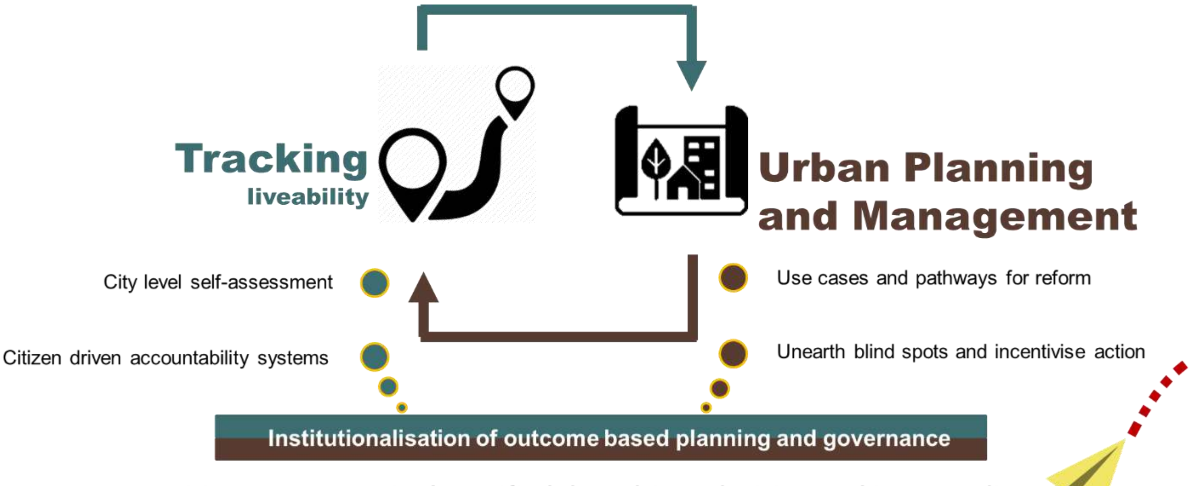
#	Challenges	Proposed Solutions
7	The age category specific data for 9 cities is not available at a city level	The age category specific population data has been taken at a district level for these cities.
8	Indicators on non-motorised transports like- Dedicated bicycle tracks, bicycle parking facilities and mode share of non-motorised transport are not relevant for hilly terrains.	As discussed during the PMC meeting, these indicators have been treated as non-applicable for the hilly cities and the weights have been redistributed among other indicators within the same category.
9	The indicator on increase in professional tax is not relevant to cities which do not levy the professional tax.	As discussed during the PMC meeting, this indicator has been non-applicable to the cities belonging to states where professional tax is not levied, and the weights have been redistributed among other indicators within the same category.
10	The indicator on increase in VAT collection is not applicable to Port Blair and Kavaratti, as there was no provision of VAT collection in these cities.	As discussed during the PMC meeting, these indicatosr has been treated as non-applicable for these two cities and the weights have been redistributed among other indicators within the same category.
11	Indicator on coverage of basic services to slum households does not concern cities with no slums (notified/ non-notified.	As discussed during the PMC meeting, this indicators has been treated as non-applicable for these cities and the weights have been redistributed among other indicators within the same category.

1. Introduction

The Ministry of Housing and Urban Affairs (MoHUA) is implementing several flagship urban missions such as the Smart Cities Mission (SCM), Atal Mission for Urban Rejuvenation and Transformation (AMRUT), Heritage City Development and Augmentation Yojana (HRIDAY), Housing for All (HFA). Theses mission along with other transformative initiatives of the Government including National Water Mission, Power for All, National Health Mission are aimed at making Indian cities more 'liveable.' The overarching goal of these initiatives is to move from an input-based approach to a 'citizen centric-outcome based' assessment of urban liveability.

To develop a common minimum framework for cities to assess their existing status and chart their pathway towards providing a better quality of life to their citizens, the MoHUA developed a set of 'Liveability Standards' relevant to cities to generate a Liveability Index and ranking of cities. These standards were launched in June, 2017. The MoHUA has planned to conduct an 'Annual Assessment of Liveability Standards in Cities – an ambitious national project that will involve yearly submission of data by cities across the various indicators, compilation and analysis, development of indices and ranking of cities. The Liveability Index is envisioned as a 360° tool for tracking, planning and transforming Indian cities. The Liveability Index is aimed at the following objectives:

- Providing strong evidence-based approach for future interventions and investments to deliver liveability outcomes
- Catalysing actions to improve the overall quality of the city's liveability and achieve broader development outcomes including the Sustainable Development Goals
- Assessing the implementation of government policies and schemes governing characteristics of cities that can contribute to creating liveable communities



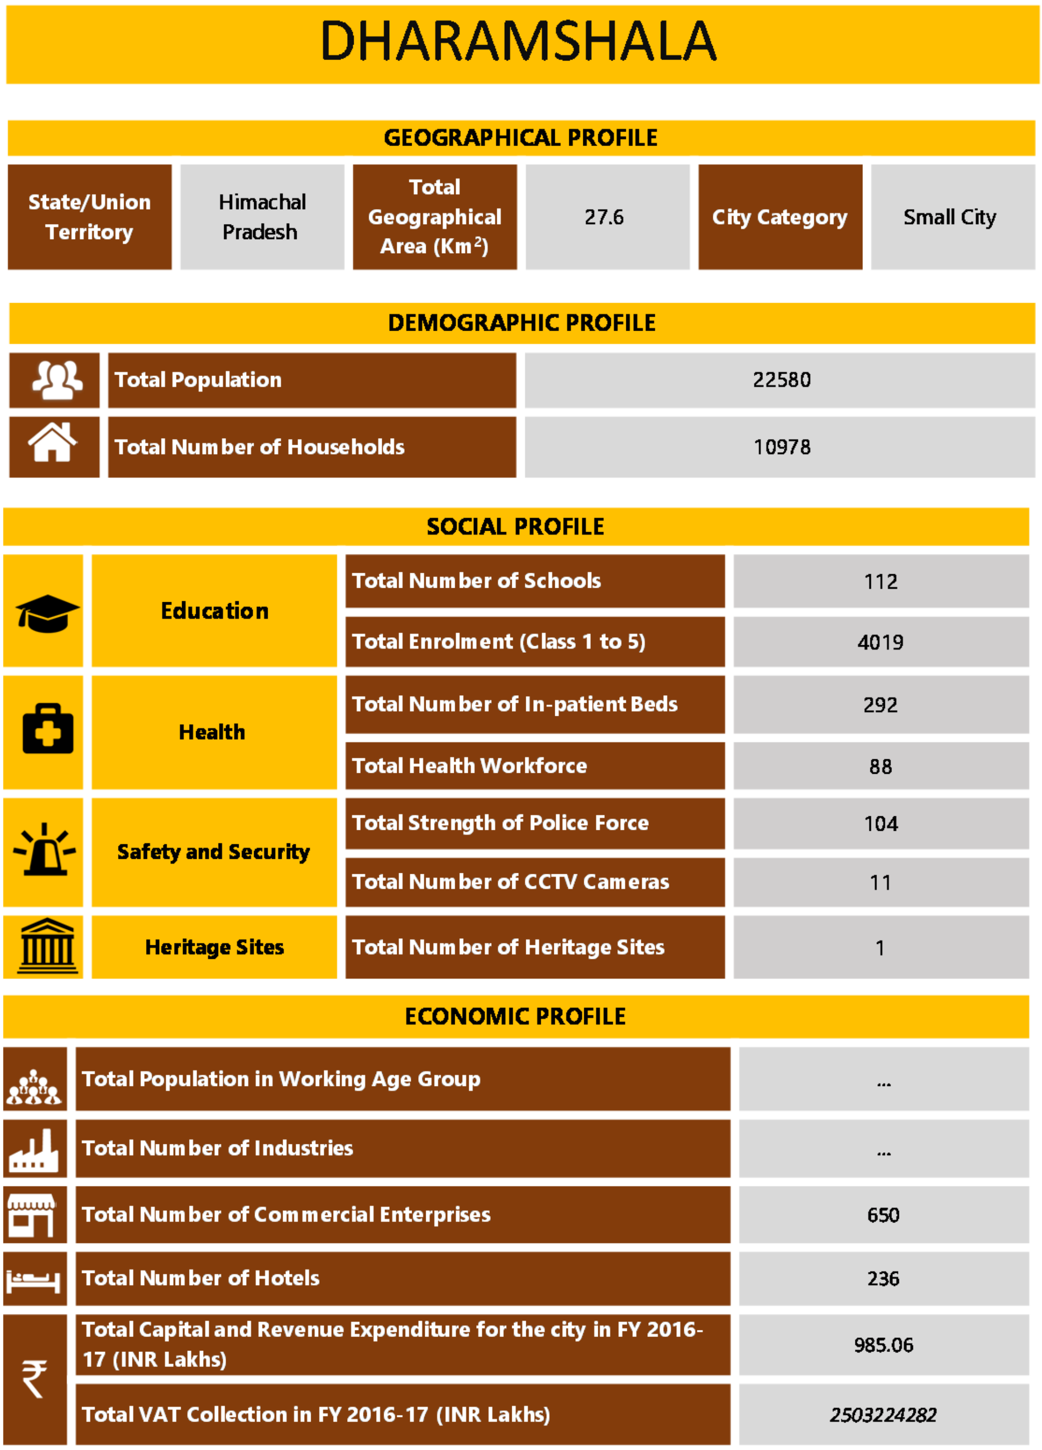
Tracking
liveability
Urban Planning
and Management
City level self-assessment
Citizen driven accountability systems
Use cases and pathways for reform
Unearth blind spots and incentivise action
Institutionalisation of outcome based planning and governance

Cities move to a single, unified data driven decision making paradigm…

The first round of the assessment commenced in January 2018 covering 116 major cities including smart cities, capital cities and cities with population of above one million each. Implementation of the liveability assessment commenced in January 2018 with a national level orientation workshop for the urban local bodies. The workshop aimed at orienting the states and urban local bodies on the overall framework, indicators, data sources, methodology and key milestones and timelines involved in the liveability assessment. Subsequently, a series of State/ Union Territory level orientation workshops were carried out in 33 states/UTs for a detailed discussion on the framework. Online data collection commenced from 9th March through an online data collection platform that supported both online and offline data submission modes. On the date of closure of the online data entry portal i.e., 16th April, 2018 112 cities submitted their data. Subsequently, comprehensive checks on the submitted data was undertaken that involved checking for outliers, logical inconsistencies etc. post which round-1 of data reconciliation was conducted. This draft report is based on round-1 of reconciled data as on 28th April, 2018.

2. City Profile

This chapter presents the city profile -Geographic and Demographic, Social (Education Health, Safety and Security, Heritage), Economic profile, and Physical (Water, sanitation and Waste Management, Electricity, Open space and roads).



DHARAMSHALA

GEOGRAPHICAL PROFILE

State/Union Territory	Himachal Pradesh	**Total Geographical Area (Km^2)**	27.6	**City Category**	Small City

DEMOGRAPHIC PROFILE

Total Population	22580
Total Number of Households	10978

SOCIAL PROFILE

Education	**Total Number of Schools**	112
	Total Enrolment (Class 1 to 5)	4019
Health	**Total Number of In-patient Beds**	292
	Total Health Workforce	88
Safety and Security	**Total Strength of Police Force**	104
	Total Number of CCTV Cameras	11
Heritage Sites	**Total Number of Heritage Sites**	1

ECONOMIC PROFILE

Total Number of Industries	...
Total Number of Commercial Enterprises	650
Total Number of Hotels	236
Total Capital and Revenue Expenditure for the city in FY 2016-17 (INR Lakhs)	985.06
Total VAT Collection in FY 2016-17 (INR Lakhs)	*2503224282*

PHYSICAL PROFILE

Water	Average Quantity of Water Supplied (MLD)	3.42
	Total Number of Water Connection	5823
Sanitation Facilities	Total number of households with access to individual toilets in the city	...
	Total number of households in the city with access to community toilets in the city	...
Solid Waste Management	Daily average quantity of municipal solid waste collected in the city (Tonnes/day)	20
	Total number of households covered through door-to-door collection of solid waste	...
Waste Water	Daily Average Quantum of Waste Water Generated in the City (MLD)	2.73
	Daily average quantum of waste water treated by STPs in the city (MLD)	2.7
Electricity	Total number of authorized electrical connections in the city	25631
	Total electricity supplied to the city (kWh)	27663300
Public and Open Spaces	Total area covered by green spaces in the city (m^2)	303400
Roads and Transport	Total Length of Road Network in the City (Km)	136.98
	Total length of arterial and sub-arterial road network in the city (Km)	20
	Total length of footpath (wider than 1.2 metres) in the city along the street network (Km)	...

3. Liveability Framework and Indicators

The Liveability Framework comprises a total of 79 indicators (57 Core Indicators and 22 Supporting Indicators). A core indicator carries 70% weightage and a supporting indicator carries 30% weightage. These indicators are grouped under 15 thematic categories which in turn are part of four pillars of comprehensive development of cities i.e., institutional, social, economic and physical. Based on the performance of cities against the various core and supporting indicators, various 'Category Sub-Indexes' and a composite 'City Liveability Index' will be developed for each city.

3.1 Scoring and Computing Category Indices of Liveability

The set of 79 indicators, associated categories and pillars are presented in the table below:

Table 1 List of Pillars, Categories and Indicators

Pillars of Comprehensive Development	Category	Indicators
Institutional	1. Governance	1.1 Percentage of citizen services available online
		1.2 Percentage of services integrated through Command Centre
		1.3 Percentage of citizens using online services
		1.4 Average delay in grievance redressal
		1.5 Tax collected as percentage of tax billed
		1.6 Extent of cost recovery (O&M) in water supply services
		1.7 Capital spending as percentage of total expenditure
		1.8 Percentage of population covered under Ward Committees/Area *Sabhas*
Social	**2. Identity and Culture**	2.1 Restoration and reuse of historic buildings
		2.2 Percentage of ecologically important areas covered through projects for restoration
		2.3 Hotel occupancy
		2.4 Percentage of budget allocated towards cultural/sports activities
		2.5 Number of cultural/sports events hosted by city
	3. Education	3.1 Percentage of school-aged population enrolled in

Pillars of Comprehensive Development	Category	Indicators
		schools
		3.2 Percentage of female school-aged population enrolled in schools
		3.3 Primary education student-teacher ratio
		3.4 Percentage of schools with access to digital education
		3.5 Percentage of students completing primary education
		3.6 Percentage of students completing secondary education
	4. Health	4.1 Number of in-patient hospital beds per 10,000 population
		4.2 Healthcare professionals per 10,000 population
		4.3 Average response time in case of health emergencies
		4.4 Period prevalence of water borne diseases
		4.5 Period prevalence of vector borne diseases
	5. Safety and Security	5.1 Number of CCTV Cameras
		5.2 Number of recorded crimes per lakh population
		5.3 Extent of crimes recorded against women, children and elderly per year
		5.4 Transport-related fatality per lakh population
Economic	**6. Economy and Employment**	6.1 Increase in VAT/GST collection
		6.2 Increase in collection of Professional Tax
		6.3 Increase in issuance of Construction permits
		6.4 Unemployment rate
		6.5 Percentage of vendors registered and provided formal spaces
Physical	**7. Housing and Inclusiveness**	7.1 Percentage of Slum/EWS households covered through formal/affordable housing
		7.2 Percentage of slum areas covered through basic services
	8. Public Open Spaces	8.1 Per capita availability of green spaces
		8.2 Per capita availability of public and recreational places
	9. Mixed Land Use and Compactness	9.1 Share of mixed land use area in overall city land use
		9.2 Net Density

Pillars of Comprehensive Development	Category	Indicators
	10. Power Supply	10.1 Percentage of city population with authorized electrical services
		10.2 Percentage of electrical connections covered through smart meters
		10.3 Average number of electrical interruptions per year
		10.4 Average length of electrical interruptions per year
		10.5 Percentage of total energy derived from renewable sources
		10.6 Energy consumption per unit - water supply and sewerage
		10.7 Energy consumption per unit - street lighting
		10.8 Percentage of new and redeveloped buildings following green building norms
		10.9 Total energy consumption per capita
	11. Transportation and Mobility	11.1 Geographical coverage of public transport
		11.2 Availability of public transport
		11.3 Mode share of public transport
		11.4 Percentage of road network with dedicated bicycle tracks
		11.5 Percentage of interchanges with bicycle parking facilities
		11.6 Mode share of non-motorized transport
		11.7 Availability of Passenger Information System
		11.8 Extent of signal synchronization
		11.9 Availability of paid parking spaces
		11.10 Percentage coverage of footpaths – wider than 1.2 m
		11.11 Percentage of traffic intersections with pedestrian crossing facilities
		11.12 Extent to which universal accessibility is incorporated in public rights-of-way
	12. Assured Water Supply	12.1 Household level coverage of direct water supply connections
		12.2 Per capita supply of water
		12.3 Quality of water supplied
		12.4 Level of non-revenue water – NRW
		12.5 Percentage of water connections covered through

Pillars of Comprehensive Development	Category	Indicators
		meters
		12.6 Percentage of plots with rainwater harvesting facility
	13. Waste Water Management	13.1 Coverage of toilets
		13.2 Coverage of sewerage network and/or septage
		13.3 Collection efficiency of sewerage network
		13.4 Extent of reuse and recycling of waste water
		13.5 Coverage of storm water drains
	14. Solid Waste Management	14.1 Household level coverage of municipal solid waste collection
		14.2 Efficiency of collection of municipal solid waste
		14.3 Extent of municipal solid waste recovered through reuse
	15. Reduced Pollution	15.1 Concentration of SO2- air pollution
		15.2 Concentration of NO2- air pollution
		15.3 Concentration of PM10 - air pollution
		15.4 Level of noise pollution
		15.5 Quality of water in public surface water bodies

3.2 Scoring and Computing Category Indices of Liveability

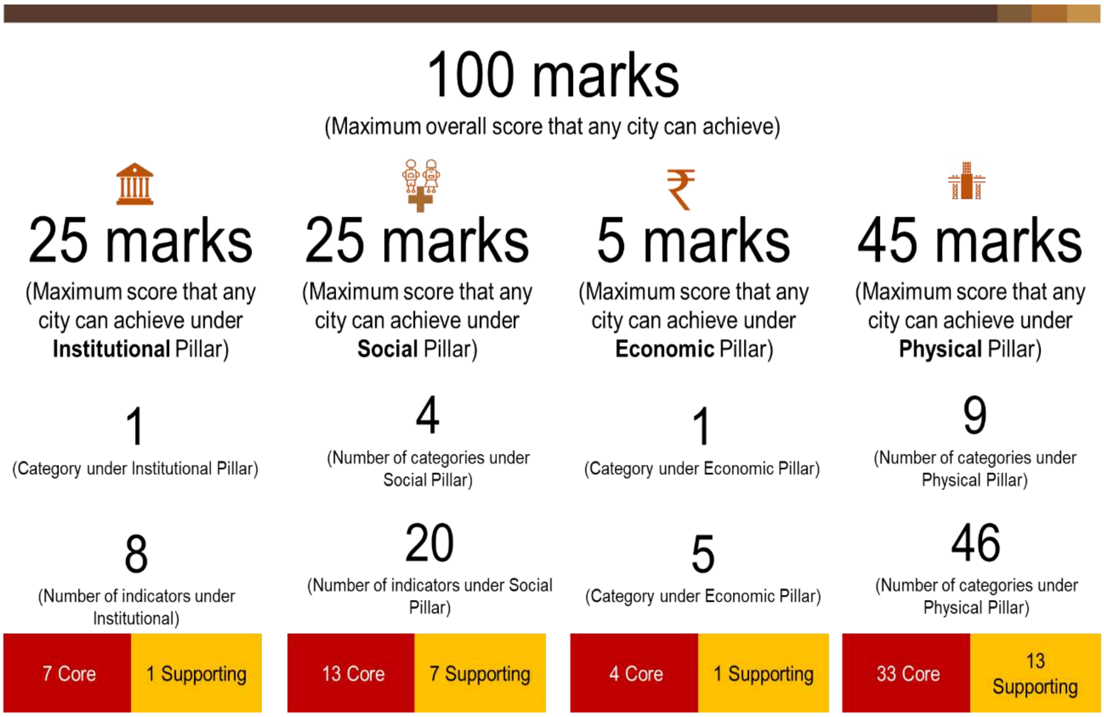
The performance achieved by cities against 79 indicators, will be assessed against given benchmarks. Where no international/national norms are available, city with the best performance in its group (population range) will be treated as a benchmark. The groups are given in the table below.

Table 2 Details on Population Range

Category	Population range
Category 1	Population ≥ 4 million
Category 2	1 million ≤ Population < 4 million
Category 3	0.5 million ≤ Population < 1 million
Category 4	Population < 0.5 million

3.3 Scoring Approach and Methodology

A city can earn a maximum score of 100 points for 79 indicators across four pillars. The pillar weights are as follows: Institutional (25 points), Social (25 points), Economy and Employment (5 points) and Physical (45 points). Based on the number and nature of indicators i.e., core vs. secondary, indicator wise maximum marks were computed.



100 marks
(Maximum overall score that any city can achieve)

25 marks
(Maximum score that any city can achieve under **Institutional** Pillar)
1
(Category under Institutional Pillar)
8
(Number of indicators under Institutional)
7 Core | 1 Supporting

25 marks
(Maximum score that any city can achieve under **Social** Pillar)
4
(Number of categories under Social Pillar)
20
(Number of indicators under Social Pillar)
13 Core | 7 Supporting

5 marks
(Maximum score that any city can achieve under **Economic** Pillar)
1
(Category under Economic Pillar)
5
(Category under Economic Pillar)
4 Core | 1 Supporting

45 marks
(Maximum score that any city can achieve under **Physical** Pillar)
9
(Number of categories under Physical Pillar)
46
(Number of categories under Physical Pillar)
33 Core | 13 Supporting

Dimensional Index Methodology (DIM) has been used to compute scores for each indicator with reference to “maximum within the comparison group” or “absolute benchmarks”. For indicators where benchmarks are available, cities getting the benchmark score (or above) are given the maximum mark, and the marks awarded to other cities are calculated proportionately. For indicators where benchmarks are not available, the best performing cities in each population group are given the maximum mark, and the marks awarded to other cities (within the population group) are calculated proportionately. For indicators where benchmarks do not exist, the city data has been tested for outliers before scoring.

3.4 Scoring Normalisation:

To construct aggregate scores across cities as well as to make the scores across indicators comparable, indicator values were normalised using a min-max approach. The following formula was used to normalise the indicator values-

$$\frac{indicator\ value\ for\ the\ city - indicator\ value\ for\ the\ worst\ performing\ city}{benchmark -\ indicator\ value\ for\ the\ worst\ performing\ city}$$

This approach would restrict the normalised indicator value between 0 and 1. Cities that met or exceeded the benchmark received a normalised indicator value of 1. Worst performing cities are given a normalised indicator value of 0. After normalisation, the normalised value is weighted according to the category and the indicator being core or supporting.

To illustrate, consider the indicator 12.3 Quality of Water Supplied in the Category 12 for Assured Water Supply. If in City A 50% of the water samples collected qualify the potable water standards specified by the CPHEEO, and only 10% of the samples from worst performing city qualify the standards. Then, the normalised value for the indicator for city A would be 0.44 [(0.5-0.1)/(1-0.1)].

The weight for indicator 12.3 is 1.03, so the final weighted score for City A would come out to 0.45 [1.03*0.44].

4. Data Collection and Verification

4.1 Submission of Data by the cities

The Liveability Assessment is based on secondary data submitted by the urban local bodies and other concerned government agencies (collectively called as data owners). The 79 indicators were broken down into a set of easy to understand and relatable 553 questions mapped to data owners. Submission of the data was enabled through an online data entry portal on the smartnet platform of the Ministry. The portal also allowed the ULBs to download the liveability assessment questionnaire and upload filled in questionnaire. To familiarise and assist cities in identifying, mapping and collation of data points, a city level nodal person was available during the entire period of data submission process.

4.2 Mapping of Data Owners for the City

For the assessment of liveability indices broadly 12 data owners such as Central/state Pollution control board, Development authority, DISCOM/Electricity Board, State Disaster Management Authority, State Education Department, State Health department, State Renewable energy and development agency, State sales and commercial taxes department, town and country planning department, Traffic and police department, Transport authority, and Urban local body were identified to respond to the questions on the portal. However, during state workshop and subsequent city level discussions, more data owners were mapped to respond to different categories and sub categories. The following table provides the details of city level data owners mapped under the 12 data owner.

Table 3:Details of Data Owners

Designated data owners	Subcategories	Data owners at city level
Urban Local Body	For Accounts Related Questions	MC Dharamshala
Urban Local Body	For Park and Recreation Related Questions	Town and Country Planning
Urban Local Body	For Water Supply and Drainage related questions	Irrigation and Public Health Department
Urban Local Body	For Heritage sites related data	Tourism Department
Urban Local Body	For Ecological sites related data	MC Dharamshala
Urban Local Body	For Housing related data	MC Dharamshala
Urban Local Body	For Building plan related data	MC Dharamshala
Urban Local Body	For Roads related data	Public Work Department
Urban Local Body	For Solid waste management related data	MC Dharamshala
Urban Local Body	For IT services related data	MC Dharamshala
Urban Local Body	For Vendor committee related data	MC Dharamshala
Urban Local Body	Any other departments involved in providing data for questions mentioned under Urban Local Body	Tourism, PWD, Education, Irrigation & Public Health, RTO and electricity board.
Central / state Pollution control Board	Water Quality, Air Quality, Noise Quality	State Pollution Control Board Department
Development Authority	Building Infrastructure	MC Dharamshala
	Construction planning	MC Dharamshala
	Green Building	MC Dharamshala

Designated data owners	Subcategories	Data owners at city level
	Rain water harvesting	MC Dharamshala
	Universal Design Principle	MC Dharamshala
DISCOM/Electricity Board	Electrical Connection/ Grievance Redressal/ Power supply	State Electricity Board Department
State Disaster management authority		DC office
State Education Department		Directory of state elementary & secondary
State Health Department	Health care professionals	Zonal Hospital – Chief Medical Officer
	Citizen Services	Zonal Hospital – CMO
	Disease Prevalence	Zonal Hospital – CMO
	Health Infrastructure	Zonal Hospital - CMO
State Renewable Energy Development Agency		State Renewable Energy Development department
State Sales / Commercial Taxes Department		State Taxation Department
Town and Country Planning Department	Land Use	Town and country Planning Department
Traffic and Police Department		Police Department – SP office
Transport Authorities	Buses	Regional transportation Office
	Registered Vehicles	RTO
	Sub urban rail transport	RTO
	Mono Rail Authority	RTO
	Tramways	RTO
	Marine Transport Authority	RTO

4.3 List of secondary documents available as supportive

City has provided supporting documents/evidences against the responses given by city on the online portal. In support of their responses on the portal, city submitted 31 number of documents. Documents submitted includes reports, official orders, copy of data maintained in official register, signed copy of questionnaire, and signed letters/submissions from concern departments.

Verification includes mapping of documents against responses given by city, checking the type/category of documents, and validation of data provided.

The following table presents the data owner wise number of documents:

Table 4: Data owner wise number of secondary documents submitted by city

Data Owners	Number of Documents
Sales and Commercial Taxes	1
State Education Department	2
DISCOM/Electricity Department	0
Traffic and Police Department	5
Development Authority	0
Pollution Control Board	3
State Renewable Energy Department	0
Town and Country Planning	1
State Health Department	1
Transport Authority	9
Disaster Management	0
Urban Local Body	9
Total	31

4.4 Data Verification

A three-stage data quality check comprising verification of data against secondary documents furnished by data owners, logical inconsistency checks including outliers, and physical audit for select indicators (Refer the exhibit below) is being undertaken. The objective of the data quality check is to ensure that data from the source documents are accurate and verifiable. Sources of data included reports, administrative data, survey results and other statistical records, log books among other.

Physical audit of eight indicators – one indicator from the Institutional pillar, one from the Social pillar, one from the Economy pillar and five from the Physical pillar is also being carried out by the field team to ascertain the degree of reliability of data reported by the cities. The list of these eight indicators is presented below:

1.2 | Percentage of services integrated through Command Centre

2.3 | Hotel occupancy

3.4 | Percentage of schools with access to digital education

5.1| Number of streets, public places, junctions covered through surveillance systems

6.5 | Percentage of vendors registered and provided formal spaces

11.7 | Availability of Passenger Information System

11.11 | Percentage of traffic intersections with pedestrian crossing facilities

11.12 | Extent to which universal accessibility is incorporated in public rights-of-way

For a set of five indicators namely, unemployment rate, mode share of public transport, mode share of non-motorised transport, quality of water supplied and level of noise pollution, existing datasets were found to be not available consistently across all cities and/or were inadequate. To help cities that do not have data on these five indicators, dipstick assessments are being carried to fill data gaps.

6.4 | Unemployment Rate

11.3 | Mode share of public transport

11.5 | Mode share of Non Motorized Transport

12.3 | Quality of Water Supplied

15.4 | Level of Noise Pollution

4.5 Physical Audit

The following map presents the indicators audited at city level.

5. City Score on 15 categories of Assessment

Liveability Assessment covered 15 categories and 78 indicators. The below table presents the scores for all 15 indicators namely governance, identity & culture, education, health, safety and security, economy & employment, housing & inclusiveness, public open spaces, mixed land use & compactness, power supply, transport & mobility, assured water supply, waste water management, solid waste management and reduced pollution.

Table 5: Category wise scores

Categories	Scores in Percentage
Governance	48.33%
Identity & Culture	0%
Education	82%
Health	84%
Safety & Security	34%
Economy & Employment	41%

Housing & Inclusiveness	72%
Public Open Spaces	73%
Mixed Land Use & Compactness	1%
Power Supply	49%
Transport & Mobility	35%
Assured Water Supply	70%
Waste Water Management	45%
Solid Waste Management	27%
Reduced Pollution	95%

The rank of the city is based on the performance and scores in each of the category. The final city rank is submitted separately.

Executive Summary

Assessment of liveability indices is an initiative by the Ministry of Housing and Urban Affairs to improve quality of life of citizens and achieve sustainable development goals by encouraging cities to adopt “outcome based” approach for urban planning. Assessment process aimed to provide opportunity to cities to review the development components holistically by involving 79 measurable indicators categorized under governance, health, education, safety, economy, power supply, transportation and mobility, identity, culture, housing, waste management and pollution.

This report highlights the assessment process, key milestones, and the final outcome of the data submitted. Implementation of liveability assessment commenced formally on 19th January 2018. A national level workshop was organized on 13th February 2018 to explain the importance and process of liveability assessment and get feedback on methodology from the city authorities.

This was followed by the next stage of Questionnaire development. The questionnaire was arranged under 12 categories representing 12 data owners namely urban local body, Central and state pollution control board, development authority, DISCOM/Electricity board, State disaster management authority, state education department, state health department, state renewable energy development agency, state sales and commercial taxes department, town and country planning department, traffic and police department and transport authorities.

An online data entry portal was developed to facilitate data submission by the cities. Each city had a unique log in to access the portal and submit the data. Both online and off-line options (download the questionnaire in an excel) to submit the data were available for cities. An email help desk was set up for the cities to raise any queries and seek clarification when responding to the questions.

A team for each state comprising of State Coordinator and City Coordinator (one per city) was deployed that facilitated the process and supported the cities. A total of 6 regional coordinators/ consultants, 29 State Coordinators, and 99 city coordinators were deployed across 116 cities. Training for state coordinators was held from 26th to 28th February 2018 at Chennai to make coordinators understand overall liveability assessment, indicators, data sources, protocols and roles and responsibilities.

City Reconnaissance Meetings were initiated by the state and city coordinators. The discussion began with discussions to finalize the state workshop schedule, mapping of data owners, and assist cities in data collection. The City Coordinators were based in the cities for over 6 weeks and during this time, they liase with ULB and other data owners to explain the liveability framework, online portal, and facilitate the online submission.

A total of 33 state workshops were conducted at the state level. The objective of the workshop was to orient the city stakeholders on liveability assessment, indicators, components of data collection, timelines, expectations of support and support extended by MoHUA. The state level workshops brought various city level departments on a single platform to understand and discuss the methodology and components of city liveability assessment.

Nodal agency at state level supported by the City and State Coordinator and city level (Municipality corporation/smart city limited) coordinated with city specific data owners/departments for data gathering, collation, and submission. Nodal persons in each department were appointed for timely data collection and submission. Of 116, 112 cities submitted data as per the timeline on 16th April 2018.

Post submission, the city and state coordinators supported by the central team followed up extensively with the cities to support secondary documents as evidence to substantiate their submissions. Secondary documents such as reports, official orders, copy of office register, signed copy of liveability assessment questionnaire furnished by cities against the submitted data. Documents are verified to map the documents for the reponses provided by city and to check the type data provided by city. The document check outcomes were shared with the cities as a part of data quality check.

For checking consistency of data, logical check of data, verifying data from other public sources were undertaken. Quality check was done to ensure data validity and provide opportunity to cities to review the data provided by them and correct in case of wrong data entry.

For 8 selected indicators namely, percentage of services integrated through command and control center, hotel occupancy rate, percentage of schools with access to digital education, number of CCTV cameras per unit road length, percentage of vendors registered and provided formal spaces, availability of passenger information system, percentage of traffic intersection with pedestrian crossing facility, and extent to which universal accessibility is incorporated in public rights of way. Physical audit was conducted in 110 cities by physical auditors appointed and trained by the consortium. In consultation with ULB nodal person, locations and indicators for physical audit was selected in each city. A mobile based application was developed to capture the physical audit related data.

Primary data collection was done for five indicators such as unemployment rates, mode share of public transport, mode share of non-motorized transport, quality of water supplied, and level of noise pollution. Protocols for water and noise test were prepared in consultation with experts. Water quality test involved physical, chemical and bacteriological test of water as per the CPCB norms. For testing quality of water at consumer end, the auditors worked closely with the ULB and Water department. Samples were collected from consumer end and submitted to the lab suggested by city. For noise pollution, in about 20 cities the state pollution board or city level

environment department took the responsibility for providing noise pollution data as per the protocols. In rest of the cities, mobile based application was used to measure noise pollution.

During implementation, MoHUA facilitated the process by conducting video conferences with cities to address any queries, reiterate the importance, and ensure that cities adequately engages in the process and submit their responses in time and respond to requests for clarifications.

In addition to secondary data collection, physical audit and primary data collection, citizen survey was conducted to understand their perception and level of satisfaction on various services such as health, education, water supply, electricity, waste management etc. provided by urban local bodies. Over 60000 citizens participated in the survey across India.

The final scores and ranks have been generated based on the scoring methodology that has been discussed extensively and minor modifications made that are summarized as below:

#	**Challenges**	**Proposed Solutions**
1	Only 23 cities of 111 cities have City Mobility Plan (CMP) or any and hence able to provide data for Mode Share of Public Transport and Non-Motorised Transport. To address the data gap, as advised by the MoHUA, the consortia undertook a sample dipstick across all cities covering a sample of 150 Households. Understandably, the dipstick findings will not match the rigor of a CMP.	We recommend the following: 1) Cities which have provided CMP Data will be evaluated on 100% of the maximum score 2) For the cities where the dipstick data is used, the city receives a 50% discount on the overall score Alternatively, another approach is to assign 0 score to all 88 cities that don't have a CMP
2	Variance was observed on data reported by cities on road network and data presented in the smart city proposals during the verifications.	We recommend taking the data reported by the cities in the Smart City Proposals.
3	There is no secondary source/ organization that provides unemployment data at city level. As a result, most cities do not have the data. Fully cognizance of the challenges of generating this data in a short span of time, it was agreed to collect this data through a dipstick survey on lines of NSSO questions. The	The indicator on unemployment will be excluded from scores. For final ranking, the cities will be scored on 78 indicators.

#	Challenges	Proposed Solutions
	data generated needs further scrutiny and triangulation with some inputs from experts. This may not be possible in the short window.	
4	Many cities did not have data on noise pollution and it was decided that data will be collected using a mobile app for all the 111 cities. However, many cities have expressed reservations with the approach especially with respect to the reliability of using this data. Further, some cities have relied on the SPCB to collect the data as per the approach proposed by the consortia. Thus, noise pollution data is currently from two sources: 1. SPCB- 20 cities 2. Noise-based app- 91 cities	The data collected through the primary survey will be used for scoring the cities. Currently, there is no differential scoring for the data from the SPCB and the data collected through the mobile app. However, a certain higher weightage can be provided to those cities which used the state apparatus to collect noise pollution data.
5	For the indicator on quality of water supplied, the methodology document states that samples should be drawn both at the treatment plant outlet as well as the consumer end. However, the data provided by the cities were predominantly from the distribution point. Hence for consumer end results with MoHUA intervention, consortia coordinated with cities to collect the data at the consumer end. The cities facilitated the testing. The outcome of the process is as below: 1. Sample given- 102 cities 2. Report received- 86 cities 3. Report awaited- 16 cities 4. Tests not completed due to lack of cooperation and other reasons – 9	The maximum score for this indicator will be distributed equally (50%) for results based on samples from the treatment plant and consumer end. Cities that did not complete tests or provide the results will be given a score 0 for against consumer end tests.
6	City level population is not projected annually by most of the cities. So, estimates for 2017 population are not available with the cities.	As recommended by MoHUA, 2011 census population is being used for the ranking purpose.
7	The age category specific data for 9 cities is not available at a city level	The age category specific population data has been taken at a district level for these cities.

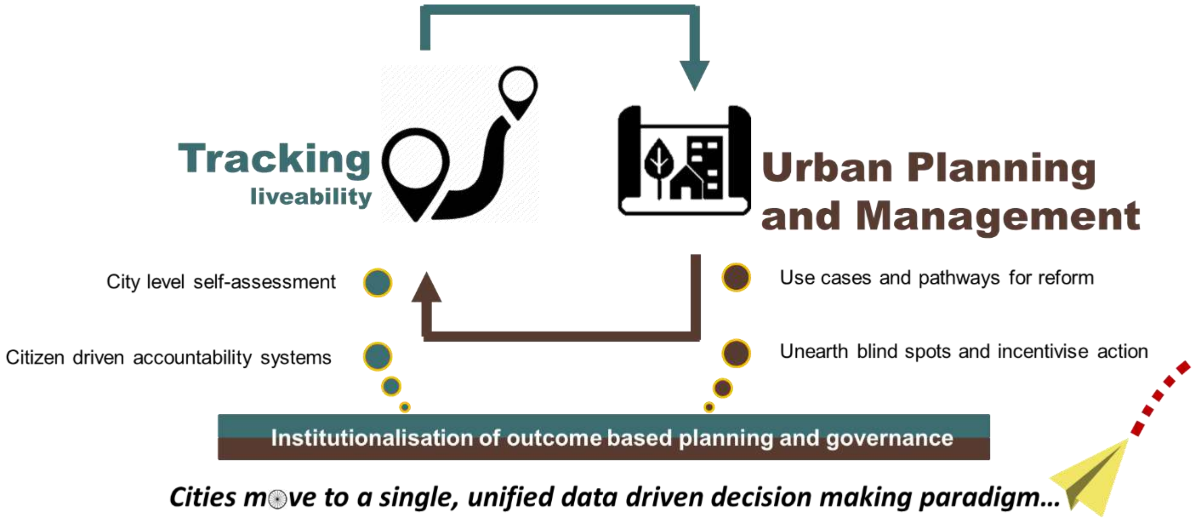
#	Challenges	Proposed Solutions
8	Indicators on non-motorised transports like- Dedicated bicycle tracks, bicycle parking facilities and mode share of non-motorised transport are not relevant for hilly terrains.	As discussed during the PMC meeting, these indicators have been treated as non-applicable for the hilly cities and the weights have been redistributed among other indicators within the same category.
9	The indicator on increase in professional tax is not relevant to cities which do not levy the professional tax.	As discussed during the PMC meeting, this indicator has been non-applicable to the cities belonging to states where professional tax is not levied, and the weights have been redistributed among other indicators within the same category.
10	The indicator on increase in VAT collection is not applicable to Port Blair and Kavaratti, as there was no provision of VAT collection in these cities.	As discussed during the PMC meeting, these indicatosr has been treated as non-applicable for these two cities and the weights have been redistributed among other indicators within the same category.
11	Indicator on coverage of basic services to slum households does not concern cities with no slums (notified/ non-notified.	As discussed during the PMC meeting, this indicators has been treated as non-applicable for these cities and the weights have been redistributed among other indicators within the same category.

1. Introduction

The Ministry of Housing and Urban Affairs (MoHUA) is implementing several flagship urban missions such as the Smart Cities Mission (SCM), Atal Mission for Urban Rejuvenation and Transformation (AMRUT), Heritage City Development and Augmentation Yojana (HRIDAY), Housing for All (HFA). Theses mission along with other transformative initiatives of the Government including National Water Mission, Power for All, National Health Mission are aimed at making Indian cities more 'liveable.' The overarching goal of these initiatives is to move from an input-based approach to a 'citizen centric-outcome based' assessment of urban liveability.

To develop a common minimum framework for cities to assess their existing status and chart their pathway towards providing a better quality of life to their citizens, the MoHUA developed a set of 'Liveability Standards' relevant to cities to generate a Liveability Index and ranking of cities. These standards were launched in June, 2017. The MoHUA has planned to conduct an 'Annual Assessment of Liveability Standards in Cities – an ambitious national project that will involve yearly submission of data by cities across the various indicators, compilation and analysis, development of indices and ranking of cities. The Liveability Index is envisioned as a 360° tool for tracking, planning and transforming Indian cities. The Liveability Index is aimed at the following objectives:

- Providing strong evidence-based approach for future interventions and investments to deliver liveability outcomes
- Catalysing actions to improve the overall quality of the city's liveability and achieve broader development outcomes including the Sustainable Development Goals
- Assessing the implementation of government policies and schemes governing characteristics of cities that can contribute to creating liveable communities



Tracking
liveability
Urban Planning
and Management
City level self-assessment
Citizen driven accountability systems
Use cases and pathways for reform
Unearth blind spots and incentivise action
Institutionalisation of outcome based planning and governance
Cities move to a single, unified data driven decision making paradigm...

The first round of the assessment commenced in January 2018 covering 116 major cities including smart cities, capital cities and cities with population of above one million each. Implementation of the liveability assessment commenced in January 2018 with a national level orientation workshop for the urban local bodies. The workshop aimed at orienting the states and urban local bodies on the overall framework, indicators, data sources, methodology and key milestones and timelines involved in the liveability assessment. Subsequently, a series of State/ Union Territory level orientation workshops were carried out in 33 states/UTs for a detailed discussion on the framework. Online data collection commenced from 9th March through an online data collection platform that supported both online and offline data submission modes. On the date of closure of the online data entry portal i.e., 16th April, 2018 112 cities submitted their data. Subsequently, comprehensive checks on the submitted data was undertaken that involved checking for outliers, logical inconsistencies etc. post which round-1 of data reconciliation was conducted. This draft report is based on round-1 of reconciled data as on 28th April, 2018.

2. City Profile

This chapter presents the city profile -Geographic and Demographic, Social (Education Health, Safety and Security, Heritage), Economic profile, and Physical (Water, sanitation and Waste Management, Electricity, Open space and roads).

DINDIGUL

GEOGRAPHICAL PROFILE

State/Union Territory	Tamil Nadu	**Total Geographical Area (Km^2)**	14.01	**City Category**	Small City

DEMOGRAPHIC PROFILE

Total Population	207327
Total Number of Households	58175

SOCIAL PROFILE

Education	**Total Number of Schools**	93
	Total Enrolment (Class 1 to 5)	17749
Health	**Total Number of In-patients Beds**	1560
	Total Health Workforce	456
Safety and Security	**Total Strength of Police Force**	214
	Total Number of CCTV Cameras	98
Heritage Sites	**Total Number of Heritage Sites**	1

ECONOMIC PROFILE

Total Population in Working Age Group	146783
Total Number of Industries	133
Total Number of Commercial Enterprises	6786
Total Number of Hotels	104
Total Capital and Revenue Expenditure for the city in FY 2016-17 (INR Lakhs)	5787.78
Total VAT Collection in FY 2016-17 (INR Lakhs)	5792.7

PHYSICAL PROFILE

	Water	**Average Quantity of Water Supplied (MLD)**	15.5
		Total Number of Water Connections	27785
	Sanitation Facilities	**Total number of households with access to individual toilets in the city**	53113
		Total number of households in the city with access to community toilets in the city	1335
	Solid Waste Management	**Daily average quantity of municipal solid waste collected in the city (Tonnes/day)**	2.367
		Total number of households covered through door-to-door collection of solid waste	54448
	Waste Water	**Daily Average Quantum of Waste Water Generated in the City (MLD)**	13.65
		Daily average quantum of waste water treated by STPs in the city (MLD)	1.4
	Electricity	**Total number of authorized electrical connections in the city**	79435
		Total electricity supplied to the city (kWh)	139002590
	Public and Open Spaces	**Total area covered by green spaces in the city (m^2)**	0
	Roads and Transport	**Total Length of Road Network in the City (Km)**	210
		Total length of arterial and sub-arterial road network in the city (Km)	181.733
		Total length of footpath (wider than 1.2 metres) in the city along the street network (Km)	12

3. Liveability Framework and Indicators

The Liveability Framework comprises a total of 79 indicators (57 Core Indicators and 22 Supporting Indicators). A core indicator carries 70% weightage and a supporting indicator carries 30% weightage. These indicators are grouped under 15 thematic categories which in turn are part of four pillars of comprehensive development of cities i.e., institutional, social, economic and physical. Based on the performance of cities against the various core and supporting indicators, various 'Category Sub-Indexes' and a composite 'City Liveability Index' will be developed for each city.

3.1 Scoring and Computing Category Indices of Liveability

The set of 79 indicators, associated categories and pillars are presented in the table below:

Table 1 List of Pillars, Categories and Indicators

Pillars of Comprehensive Development	Category	Indicators
Institutional	1. Governance	1.1 Percentage of citizen services available online
		1.2 Percentage of services integrated through Command Centre
		1.3 Percentage of citizens using online services
		1.4 Average delay in grievance redressal
		1.5 Tax collected as percentage of tax billed
		1.6 Extent of cost recovery (O&M) in water supply services
		1.7 Capital spending as percentage of total expenditure
		1.8 Percentage of population covered under Ward Committees/Area *Sabhas*
Social	**2. Identity and Culture**	2.1 Restoration and reuse of historic buildings
		2.2 Percentage of ecologically important areas covered through projects for restoration
		2.3 Hotel occupancy
		2.4 Percentage of budget allocated towards cultural/sports activities
		2.5 Number of cultural/sports events hosted by city
	3. Education	3.1 Percentage of school-aged population enrolled in

Pillars of Comprehensive Development	Category	Indicators
		schools
		3.2 Percentage of female school-aged population enrolled in schools
		3.3 Primary education student-teacher ratio
		3.4 Percentage of schools with access to digital education
		3.5 Percentage of students completing primary education
		3.6 Percentage of students completing secondary education
	4. Health	4.1 Number of in-patient hospital beds per 10,000 population
		4.2 Healthcare professionals per 10,000 population
		4.3 Average response time in case of health emergencies
		4.4 Period prevalence of water borne diseases
		4.5 Period prevalence of vector borne diseases
	5. Safety and Security	5.1 Number of CCTV Cameras
		5.2 Number of recorded crimes per lakh population
		5.3 Extent of crimes recorded against women, children and elderly per year
		5.4 Transport-related fatality per lakh population
Economic	**6. Economy and Employment**	6.1 Increase in VAT/GST collection
		6.2 Increase in collection of Professional Tax
		6.3 Increase in issuance of Construction permits
		6.4 Unemployment rate
		6.5 Percentage of vendors registered and provided formal spaces
Physical	**7. Housing and Inclusiveness**	7.1 Percentage of Slum/EWS households covered through formal/affordable housing
		7.2 Percentage of slum areas covered through basic services
	8. Public Open Spaces	8.1 Per capita availability of green spaces
		8.2 Per capita availability of public and recreational places
	9. Mixed Land Use and Compactness	9.1 Share of mixed land use area in overall city land use
		9.2 Net Density

Pillars of Comprehensive Development	Category	Indicators
	10. Power Supply	10.1 Percentage of city population with authorized electrical services
		10.2 Percentage of electrical connections covered through smart meters
		10.3 Average number of electrical interruptions per year
		10.4 Average length of electrical interruptions per year
		10.5 Percentage of total energy derived from renewable sources
		10.6 Energy consumption per unit - water supply and sewerage
		10.7 Energy consumption per unit - street lighting
		10.8 Percentage of new and redeveloped buildings following green building norms
		10.9 Total energy consumption per capita
	11. Transportation and Mobility	11.1 Geographical coverage of public transport
		11.2 Availability of public transport
		11.3 Mode share of public transport
		11.4 Percentage of road network with dedicated bicycle tracks
		11.5 Percentage of interchanges with bicycle parking facilities
		11.6 Mode share of non-motorized transport
		11.7 Availability of Passenger Information System
		11.8 Extent of signal synchronization
		11.9 Availability of paid parking spaces
		11.10 Percentage coverage of footpaths – wider than 1.2 m
		11.11 Percentage of traffic intersections with pedestrian crossing facilities
		11.12 Extent to which universal accessibility is incorporated in public rights-of-way
	12. Assured Water Supply	12.1 Household level coverage of direct water supply connections
		12.2 Per capita supply of water
		12.3 Quality of water supplied
		12.4 Level of non-revenue water – NRW
		12.5 Percentage of water connections covered through

Pillars of Comprehensive Development	Category	Indicators
		meters
		12.6 Percentage of plots with rainwater harvesting facility
	13. Waste Water Management	13.1 Coverage of toilets
		13.2 Coverage of sewerage network and/or septage
		13.3 Collection efficiency of sewerage network
		13.4 Extent of reuse and recycling of waste water
		13.5 Coverage of storm water drains
	14. Solid Waste Management	14.1 Household level coverage of municipal solid waste collection
		14.2 Efficiency of collection of municipal solid waste
		14.3 Extent of municipal solid waste recovered through reuse
	15. Reduced Pollution	15.1 Concentration of SO2- air pollution
		15.2 Concentration of NO2- air pollution
		15.3 Concentration of PM10 - air pollution
		15.4 Level of noise pollution
		15.5 Quality of water in public surface water bodies

3.2 Scoring and Computing Category Indices of Liveability

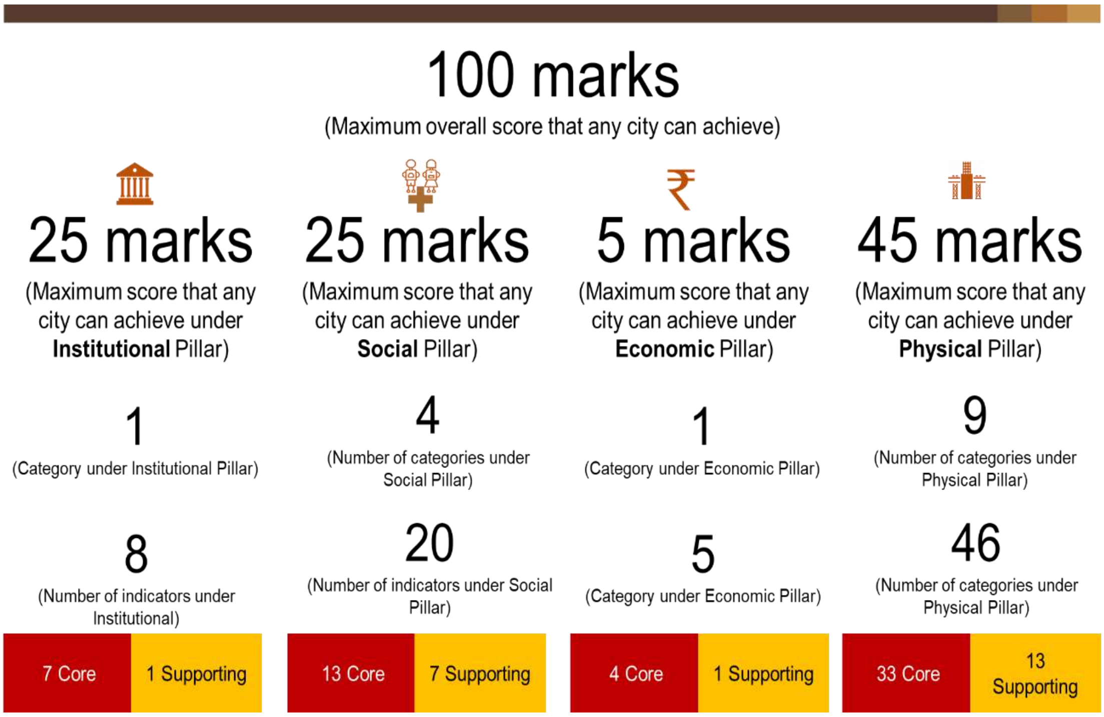
The performance achieved by cities against 79 indicators, will be assessed against given benchmarks. Where no international/national norms are available, city with the best performance in its group (population range) will be treated as a benchmark. The groups are given in the table below.

Table 2 Details on Population Range

Category	Population range
Category 1	Population ≥ 4 million
Category 2	1 million ≤ Population < 4 million
Category 3	0.5 million ≤ Population < 1 million
Category 4	Population < 0.5 million

3.3 Scoring Approach and Methodology

A city can earn a maximum score of 100 points for 79 indicators across four pillars. The pillar weights are as follows: Institutional (25 points), Social (25 points), Economy and Employment (5 points) and Physical (45 points). Based on the number and nature of indicators i.e., core vs. secondary, indicator wise maximum marks were computed.



100 marks
(Maximum overall score that any city can achieve)

7 Core 1 Supporting	13 Core 7 Supporting	4 Core 1 Supporting	33 Core 13 Supporting

Dimensional Index Methodology (DIM) has been used to compute scores for each indicator with reference to “maximum within the comparison group” or “absolute benchmarks”. For indicators where benchmarks are available, cities getting the benchmark score (or above) are given the maximum mark, and the marks awarded to other cities are calculated proportionately. For indicators where benchmarks are not available, the best performing cities in each population group are given the maximum mark, and the marks awarded to other cities (within the population group) are calculated proportionately. For indicators where benchmarks do not exist, the city data has been tested for outliers before scoring.

3.4 Scoring Normalisation:

To construct aggregate scores across cities as well as to make the scores across indicators comparable, indicator values were normalised using a min-max approach. The following formula was used to normalise the indicator values-

$$\frac{indicator\ value\ for\ the\ city - indicator\ value\ for\ the\ worst\ performing\ city}{benchmark - \ indicator\ value\ for\ the\ worst\ performing\ city}$$

This approach would restrict the normalised indicator value between 0 and 1. Cities that met or exceeded the benchmark received a normalised indicator value of 1. Worst performing cities are given a normalised indicator value of 0. After normalisation, the normalised value is weighted according to the category and the indicator being core or supporting.

To illustrate, consider the indicator 12.3 Quality of Water Supplied in the Category 12 for Assured Water Supply. If in City A 50% of the water samples collected qualify the potable water standards specified by the CPHEEO, and only 10% of the samples from worst performing city qualify the standards. Then, the normalised value for the indicator for city A would be 0.44 [(0.5-0.1)/(1-0.1)].

The weight for indicator 12.3 is 1.03, so the final weighted score for City A would come out to 0.45 [1.03*0.44].

4. Data Collection and Verification

4.1 Submission of Data by the cities

The Liveability Assessment is based on secondary data submitted by the urban local bodies and other concerned government agencies (collectively called as data owners). The 79 indicators were broken down into a set of easy to understand and relatable 553 questions mapped to data owners. Submission of the data was enabled through an online data entry portal on the smartnet platform of the Ministry. The portal also allowed the ULBs to download the liveability assessment questionnaire and upload filled in questionnaire. To familiarise and assist cities in identifying, mapping and collation of data points, a city level nodal person was available during the entire period of data submission process.

4.2 Mapping of Data Owners for the City

For the assessment of liveability indices broadly 12 data owners such as Central/state Pollution control board, Development authority, DISCOM/Electricity Board, State Disaster Management Authority, State Education Department, State Health department, State Renewable energy and development agency, State sales and commercial taxes department, town and country planning department, Traffic and police department, Transport authority, and Urban local body were identified to respond to the questions on the portal. However, during state workshop and subsequent city level discussions, more data owners were mapped to respond to different categories and sub categories. The following table provides the details of city level data owners mapped under the 12 data owner.

Table 3:Details of Data Owners

Designated data owners	Subcategories	Data owners at city level
Urban Local Body	For Accounts Related Questions	Accounts department, Dindigul Corporation
Urban Local Body	For Park and Recreation Related Questions	Engineering Section, Dindigul Corporation
Urban Local Body	For Water Supply and Drainage related questions	Engineering Section, Dindigul Corporation
Urban Local Body	For Heritage sites related data	Town planning, Dindigul Corporation
Urban Local Body	For Ecological sites related data	Town planning, Dindigul Corporation
Urban Local Body	For Housing related data	Town planning, Dindigul Corporation
Urban Local Body	For Building plan related data	Town planning, Dindigul Corporation
Urban Local Body	For Roads related data	Engineering Section, Dindigul Corporation
Urban Local Body	For Solid waste management related data	Health Department , ULB , Dindigul corporation
Urban Local Body	For IT services related data	IT department, Dindigul Corporation
Urban Local Body	For Vendor committee related data	Town planning, Dindigul Corporation
Urban Local Body	Any other departments involved in providing data for questions	Revenue Section , Dindigul Corporation

Designated data owners	Subcategories	Data owners at city level
	mentioned under Urban Local Body	
Central / state Pollution control Board	Water Quality, Air Quality, Noise Quality	
Development Authority	Building Infrastructure	Town planning, Dindigul Corporation
	Construction planning	Town planning, Dindigul Corporation
	Green Building	Town planning, Dindigul Corporation
	Rain water harvesting	Town planning, Dindigul Corporation
	Universal Design Principle	Engineering Department, Dindigul Corporation
DISCOM/Electricity Board	Electrical Connection/ Grievance Redressal/ Power supply	Tamilnadu Electricity Board , Dindigul
State Disaster management authority		Revenue and Disaster Management Department
State Education Department		District Education Department , Dindigul
State Health Department	Health care professionals	Joint Director, Health Services, Dindigul
	Citizen Services	Joint Director, Health Services, Dindigul
	Disease Prevalence	Joint Director, Health Services, Dindigul
	Health Infrastructure	Joint Director, Health Services, Dindigul
State Renewable Energy Development Agency		
State Sales / Commercial Taxes Department		District Commercial Tax Department, Dindigul
Town and Country Planning Department	Land Use	Local Planning Authority & Town Planning Department
Traffic and Police Department		Police Department, Dindigul
Transport Authorities	Buses	Tamilnadu State Transport Corporation, Dindigul
	Registered Vehicles	Regional Transport Office, Dindigul
	Sub urban rail transport	Not Applicable
	Mono Rail Authority	Not Applicable

Designated data owners	Subcategories	Data owners at city level
	Tramways	Not Applicable
	Marine Transport Authority	Not Applicable

4.3 List of secondary documents available as supportive

City has provided supporting documents/evidences against the responses given by city on the online portal. In support of their responses on the portal, city submitted 180 number of documents. Documents submitted includes reports, official orders, copy of data maintained in official register, signed copy of questionnaire, and signed letters/submissions from concern departments. Verification includes mapping of documents against responses given by city, checking the type/category of documents, and validation of data provided.

The following table presents the data owner wise number of documents:

Table 4: Data owner wise number of secondary documents submitted by city

Data Owners	Number of Documents
Sales and Commercial Taxes	1
State Education Department	6
DISCOM/Electricity Department	2
Traffic and Police Department	2
Development Authority	15
Pollution Control Board	7
State Renewable Energy Department	1
Town and Country Planning	2
State Health Department	12
Transport Authority	8
Disaster Management	1
Urban Local Body	123
Total	180

4.4 Data Verification

A three-stage data quality check comprising verification of data against secondary documents furnished by data owners, logical inconsistency checks including outliers, and physical audit for select indicators (Refer the exhibit below) is being undertaken. The objective of the data quality check is to ensure that data from the source documents are accurate and verifiable. Sources of

data included reports, administrative data, survey results and other statistical records, log books among other.

Physical audit of eight indicators – one indicator from the Institutional pillar, one from the Social pillar, one from the Economy pillar and five from the Physical pillar is also being carried out by the field team to ascertain the degree of reliability of data reported by the cities. The list of these eight indicators is presented below:

1.2 | Percentage of services integrated through Command Centre

2.3 | Hotel occupancy

3.4 | Percentage of schools with access to digital education

5.1| Number of streets, public places, junctions covered through surveillance systems

6.5 | Percentage of vendors registered and provided formal spaces

11.7 | Availability of Passenger Information System

11.11 | Percentage of traffic intersections with pedestrian crossing facilities

11.12 | Extent to which universal accessibility is incorporated in public rights-of-way

For a set of five indicators namely, unemployment rate, mode share of public transport, mode share of non-motorised transport, quality of water supplied and level of noise pollution, existing datasets were found to be not available consistently across all cities and/or were inadequate. To help cities that do not have data on these five indicators, dipstick assessments are being carried to fill data gaps.

6.4 | Unemployment Rate

11.3 | Mode share of public transport

11.5 | Mode share of Non Motorized Transport

12.3 | Quality of Water Supplied

15.4 | Level of Noise Pollution

4.5 Physical Audit

The following map presents the indicators audited at city level.

5. City Score on 15 categories of Assessment

Liveability Assessment covered 15 categories and 78 indicators. The below table presents the scores for all 15 indicators namely governance, identity & culture, education, health, safety and security, economy & employment, housing & inclusiveness, public open spaces, mixed land use & compactness, power supply, transport & mobility, assured water supply, waste water management, solid waste management and reduced pollution.

Table 5: Category wise scores

Categories	Scores in Percentage
Governance	33.10%
Identity & Culture	32%
Education	88%
Health	98%
Safety & Security	64%
Economy & Employment	23%

Housing & Inclusiveness	21%
Public Open Spaces	0%
Mixed Land Use & Compactness	6%
Power Supply	48%
Transport & Mobility	35%
Assured Water Supply	69%
Waste Water Management	63%
Solid Waste Management	76%
Reduced Pollution	67%

The rank of the city is based on the performance and scores in each of the category. The final city rank is submitted separately.

Executive Summary

Assessment of liveability indices is an initiative by the Ministry of Housing and Urban Affairs to improve quality of life of citizens and achieve sustainable development goals by encouraging cities to adopt "outcome based" approach for urban planning. Assessment process aimed to provide opportunity to cities to review the development components holistically by involving 79 measurable indicators categorized under governance, health, education, safety, economy, power supply, transportation and mobility, identity, culture, housing, waste management and pollution.

This report highlights the assessment process, key milestones, and the final outcome of the data submitted. Implementation of liveability assessment commenced formally on 19th January 2018. A national level workshop was organized on 13th February 2018 to explain the importance and process of liveability assessment and get feedback on methodology from the city authorities.

This was followed by the next stage of Questionnaire development. The questionnaire was arranged under 12 categories representing 12 data owners namely urban local body, Central and state pollution control board, development authority, DISCOM/Electricity board, State disaster management authority, state education department, state health department, state renewable energy development agency, state sales and commercial taxes department, town and country planning department, traffic and police department and transport authorities.

An online data entry portal was developed to facilitate data submission by the cities. Each city had a unique log in to access the portal and submit the data. Both online and off-line options (download the questionnaire in an excel) to submit the data were available for cities. An email help desk was set up for the cities to raise any queries and seek clarification when responding to the questions.

A team for each state comprising of State Coordinator and City Coordinator (one per city) was deployed that facilitated the process and supported the cities. A total of 6 regional coordinators/ consultants, 29 State Coordinators, and 99 city coordinators were deployed across 116 cities. Training for state coordinators was held from 26th to 28th February 2018 at Chennai to make coordinators understand overall liveability assessment, indicators, data sources, protocols and roles and responsibilities.

City Reconnaissance Meetings were initiated by the state and city coordinators. The discussion began with discussions to finalize the state workshop schedule, mapping of data owners, and assist cities in data collection. The City Coordinators were based in the cities for over 6 weeks and during this time, they liase with ULB and other data owners to explain the liveability framework, online portal, and facilitate the online submission.

A total of 33 state workshops were conducted at the state level. The objective of the workshop was to orient the city stakeholders on liveability assessment, indicators, components of data collection, timelines, expectations of support and support extended by MoHUA. The state level workshops brought various city level departments on a single platform to understand and discuss the methodology and components of city liveability assessment.

Nodal agency at state level supported by the City and State Coordinator and city level (Municipality corporation/smart city limited) coordinated with city specific data owners/departments for data gathering, collation, and submission. Nodal persons in each department were appointed for timely data collection and submission. Of 116, 112 cities submitted data as per the timeline on 16th April 2018.

Post submission, the city and state coordinators supported by the central team followed up extensively with the cities to support secondary documents as evidence to substantiate their submissions. Secondary documents such as reports, official orders, copy of office register, signed copy of liveability assessment questionnaire furnished by cities against the submitted data. Documents are verified to map the documents for the reponses provided by city and to check the type data provided by city. The document check outcomes were shared with the cities as a part of data quality check.

For checking consistency of data, logical check of data, verifying data from other public sources were undertaken. Quality check was done to ensure data validity and provide opportunity to cities to review the data provided by them and correct in case of wrong data entry.

For 8 selected indicators namely, percentage of services integrated through command and control center, hotel occupancy rate, percentage of schools with access to digital education, number of CCTV cameras per unit road length, percentage of vendors registered and provided formal spaces, availability of passenger information system, percentage of traffic intersection with pedestrian crossing facility, and extent to which universal accessibility is incorporated in public rights of way. Physical audit was conducted in 110 cities by physical auditors appointed and trained by the consortium. In consultation with ULB nodal person, locations and indicators for physical audit was selected in each city. A mobile based application was developed to capture the physical audit related data.

Primary data collection was done for five indicators such as unemployment rates, mode share of public transport, mode share of non-motorized transport, quality of water supplied, and level of noise pollution. Protocols for water and noise test were prepared in consultation with experts. Water quality test involved physical, chemical and bacteriological test of water as per the CPCB norms. For testing quality of water at consumer end, the auditors worked closely with the ULB and Water department. Samples were collected from consumer end and submitted to the lab suggested by city. For noise pollution, in about 20 cities the state pollution board or city level environment department took the responsibility for providing noise pollution data as per the protocols. In rest of the cities, mobile based application was used to measure noise pollution.

During implementation, MoHUA facilitated the process by conducting video conferences with cities to address any queries, reiterate the importance, and ensure that cities adequately engages in the process and submit their responses in time and respond to requests for clarifications.

In addition to secondary data collection, physical audit and primary data collection, citizen survey was conducted to understand their perception and level of satisfaction on various services such as health, education, water supply, electricity, waste management etc. provided by urban local bodies. Over 60000 citizens participated in the survey across India.

The final scores and ranks have been generated based on the scoring methodology that has been discussed extensively and minor modifications made that are summarized as below:

#	**Challenges**	**Proposed Solutions**
1	Only 23 cities of 111 cities have City Mobility Plan (CMP) or any and hence able to provide data for Mode Share of Public Transport and Non-Motorised Transport. To address the data gap, as advised by the MoHUA, the consortia undertook a sample dipstick across all cities covering a sample of 150 Households. Understandably, the dipstick findings will not match the rigor of a CMP.	We recommend the following: 1) Cities which have provided CMP Data will be evaluated on 100% of the maximum score 2) For the cities where the dipstick data is used, the city receives a 50% discount on the overall score Alternatively, another approach is to assign 0 score to all 88 cities that don’t have a CMP
2	Variance was observed on data reported by cities on road network and data presented in the smart city proposals during the verifications.	We recommend taking the data reported by the cities in the Smart City Proposals.
3	There is no secondary source/ organization that provides unemployment data at city level. As a result, most cities do not	The indicator on unemployment will be excluded from scores. For final

#	Challenges	Proposed Solutions
	have the data. Fully cognizance of the challenges of generating this data in a short span of time, it was agreed to collect this data through a dipstick survey on lines of NSSO questions. The data generated needs further scrutiny and triangulation with some inputs from experts. This may not be possible in the short window.	ranking, the cities will be scored on 78 indicators.
4	Many cities did not have data on noise pollution and it was decided that data will be collected using a mobile app for all the 111 cities. However, many cities have expressed reservations with the approach especially with respect to the reliability of using this data. Further, some cities have relied on the SPCB to collect the data as per the approach proposed by the consortia. Thus, noise pollution data is currently from two sources: 1. SPCB- 20 cities 2. Noise-based app- 91 cities	The data collected through the primary survey will be used for scoring the cities. Currently, there is no differential scoring for the data from the SPCB and the data collected through the mobile app. However, a certain higher weightage can be provided to those cities which used the state apparatus to collect noise pollution data.
5	For the indicator on quality of water supplied, the methodology document states that samples should be drawn both at the treatment plant outlet as well as the consumer end. However, the data provided by the cities were predominantly from the distribution point. Hence for consumer end results with MoHUA intervention, consortia coordinated with cities to collect the data at the consumer end. The cities facilitated the testing. The outcome of the process is as below: 1. Sample given- 102 cities 2. Report received- 86 cities 3. Report awaited- 16 cities 4. Tests not completed due to lack of cooperation and other reasons – 9	The maximum score for this indicator will be distributed equally (50%) for results based on samples from the treatment plant and consumer end. Cities that did not complete tests or provide the results will be given a score 0 for against consumer end tests.
6	City level population is not projected annually by most of the cities. So, estimates for 2017 population are not available with the cities.	As recommended by MoHUA, 2011 census population is being used for the ranking purpose.
7	The age category specific data for 9 cities is not available at a city level	The age category specific population data has been taken at a district level for these cities.
8	Indicators on non-motorised transports like- Dedicated bicycle tracks, bicycle parking facilities and mode share of non-motorised transport are not relevant for hilly terrains.	As discussed during the PMC meeting, these indicators have been treated as non-applicable for the hilly cities and the weights have been redistributed among other indicators within the same category.

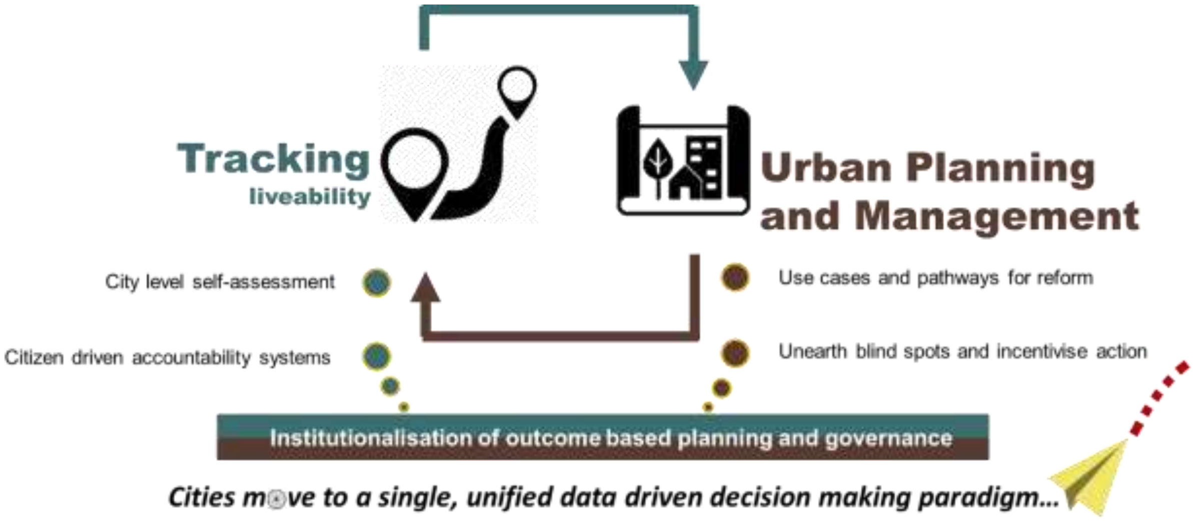
#	Challenges	Proposed Solutions
9	The indicator on increase in professional tax is not relevant to cities which do not levy the professional tax.	As discussed during the PMC meeting, this indicator has been non-applicable to the cities belonging to states where professional tax is not levied, and the weights have been redistributed among other indicators within the same category.
10	The indicator on increase in VAT collection is not applicable to Port Blair and Kavaratti, as there was no provision of VAT collection in these cities.	As discussed during the PMC meeting, these indicatosr has been treated as non-applicable for these two cities and the weights have been redistributed among other indicators within the same category.
11	Indicator on coverage of basic services to slum households does not concern cities with no slums (notified/ non-notified.	As discussed during the PMC meeting, this indicators has been treated as non-applicable for these cities and the weights have been redistributed among other indicators within the same category.

1. Introduction

The Ministry of Housing and Urban Affairs (MoHUA) is implementing several flagship urban missions such as the Smart Cities Mission (SCM), Atal Mission for Urban Rejuvenation and Transformation (AMRUT), Heritage City Development and Augmentation Yojana (HRIDAY), Housing for All (HFA). Theses mission along with other transformative initiatives of the Government including National Water Mission, Power for All, National Health Mission are aimed at making Indian cities more 'liveable.' The overarching goal of these initiatives is to move from an input-based approach to a 'citizen centric-outcome based' assessment of urban liveability.

To develop a common minimum framework for cities to assess their existing status and chart their pathway towards providing a better quality of life to their citizens, the MoHUA developed a set of 'Liveability Standards' relevant to cities to generate a Liveability Index and ranking of cities. These standards were launched in June, 2017. The MoHUA has planned to conduct an 'Annual Assessment of Liveability Standards in Cities – an ambitious national project that will involve yearly submission of data by cities across the various indicators, compilation and analysis, development of indices and ranking of cities. The Liveability Index is envisioned as a 360° tool for tracking, planning and transforming Indian cities. The Liveability Index is aimed at the following objectives:

- Providing strong evidence-based approach for future interventions and investments to deliver liveability outcomes
- Catalysing actions to improve the overall quality of the city's liveability and achieve broader development outcomes including the Sustainable Development Goals
- Assessing the implementation of government policies and schemes governing characteristics of cities that can contribute to creating liveable communities



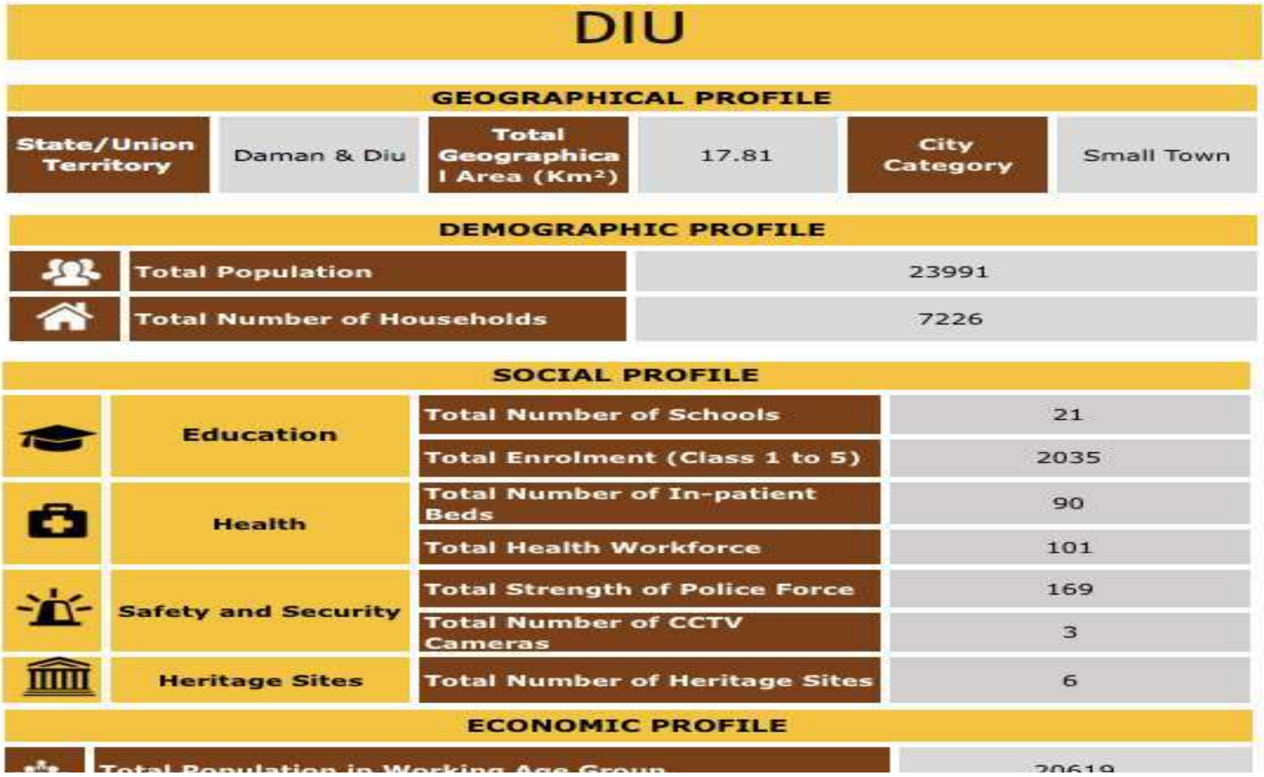
Tracking
liveability
Urban Planning and Management
City level self-assessment
Citizen driven accountability systems
Use cases and pathways for reform
Unearth blind spots and incentivise action
Institutionalisation of outcome based planning and governance
Cities move to a single, unified data driven decision making paradigm...

The first round of the assessment commenced in January 2018 covering 116 major cities including smart cities, capital cities and cities with population of above one million each. Implementation of the liveability assessment commenced in January 2018 with a national level orientation workshop for the urban local bodies. The workshop aimed at orienting the states and urban local bodies on the overall framework, indicators, data sources, methodology and key milestones and timelines involved in the liveability assessment. Subsequently, a series of State/ Union Territory level orientation workshops were carried out in 33 states/UTs for a detailed discussion on the framework. Online data collection commenced from 9th March through an online data collection platform that supported both online and offline data submission modes. On the date of closure of the online data entry portal i.e., 16th April, 2018 112 cities submitted their data. Subsequently, comprehensive checks on the submitted data was undertaken that involved checking for outliers, logical inconsistencies etc. post which round-1 of data reconciliation was conducted. This draft report is based on round-1 of reconciled data as on 28th April, 2018.

2. City Profile

This chapter presents the city profile -Geographic and Demographic, Social (Education Health, Safety and Security, Heritage), Economic profile, and Physical (Water, sanitation and Waste Management, Electricity,

Open space and roads).



DIU

GEOGRAPHICAL PROFILE

State/Union Territory	Daman & Diu	Total Geographical Area (Km²)	17.81	City Category	Small Town

DEMOGRAPHIC PROFILE

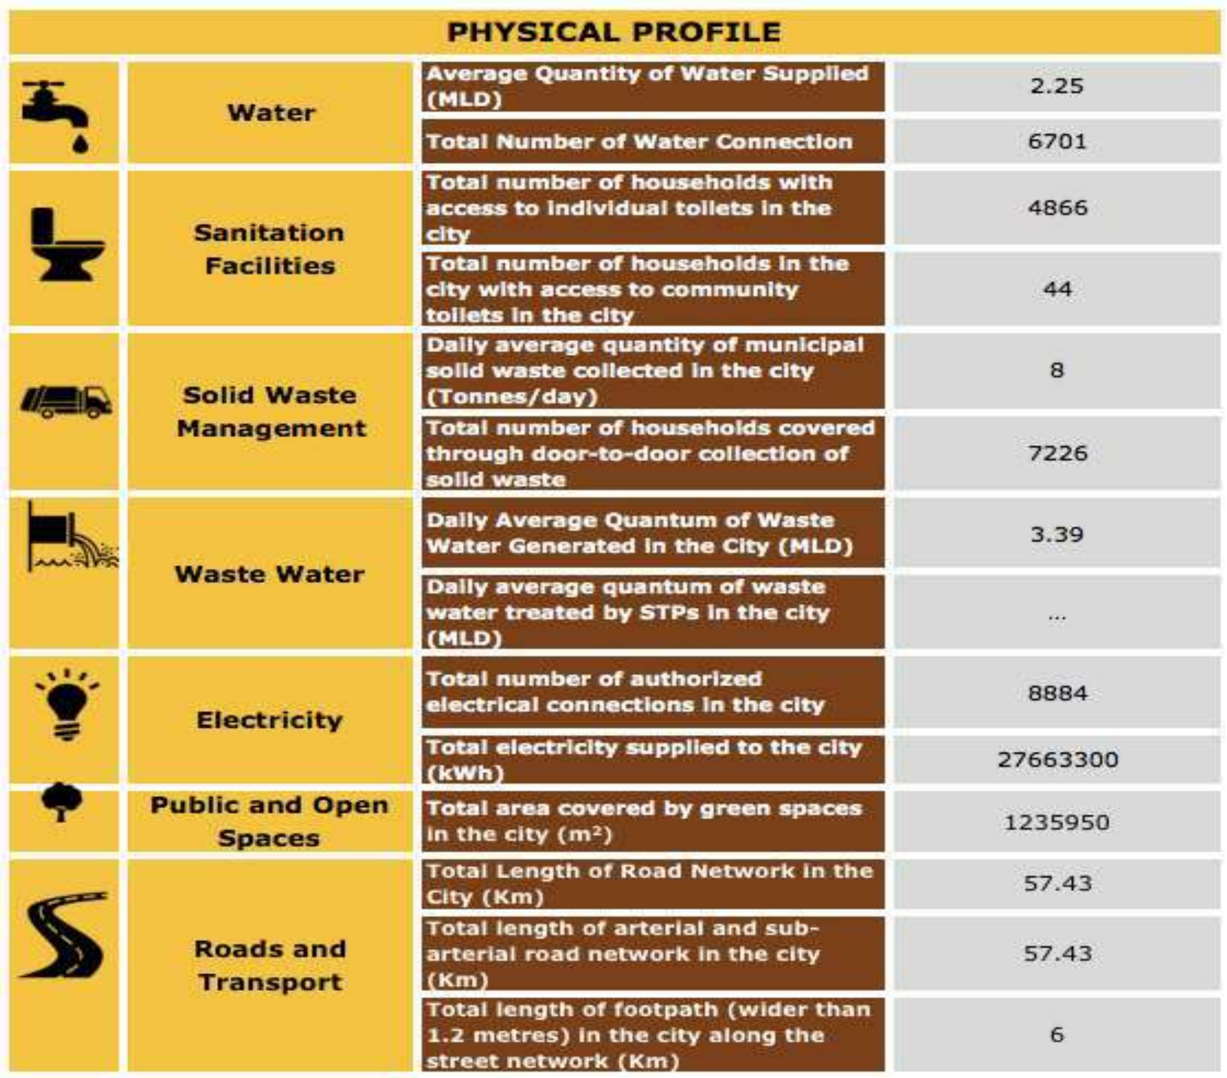
Total Population	23991
Total Number of Households	7226

SOCIAL PROFILE

Education	Total Number of Schools	21
	Total Enrolment (Class 1 to 5)	2035
Health	Total Number of In-patient Beds	90
	Total Health Workforce	101
Safety and Security	Total Strength of Police Force	169
	Total Number of CCTV Cameras	3
Heritage Sites	Total Number of Heritage Sites	6

ECONOMIC PROFILE

Total Population in Working Age Group	20619



PHYSICAL PROFILE		
Water	Average Quantity of Water Supplied (MLD)	2.25
	Total Number of Water Connection	6701
Sanitation Facilities	Total number of households with access to individual toilets in the city	4866
	Total number of households in the city with access to community toilets in the city	44
Solid Waste Management	Daily average quantity of municipal solid waste collected in the city (Tonnes/day)	8
	Total number of households covered through door-to-door collection of solid waste	7226
Waste Water	Daily Average Quantum of Waste Water Generated in the City (MLD)	3.39
	Daily average quantum of waste water treated by STPs in the city (MLD)	...
Electricity	Total number of authorized electrical connections in the city	8884
	Total electricity supplied to the city (kWh)	27663300
Public and Open Spaces	Total area covered by green spaces in the city (m^2)	1235950
Roads and Transport	Total Length of Road Network in the City (Km)	57.43
	Total length of arterial and sub-arterial road network in the city (Km)	57.43
	Total length of footpath (wider than 1.2 metres) in the city along the street network (Km)	6

3. Liveability Framework and Indicators

The Liveability Framework comprises a total of 79 indicators (57 Core Indicators and 22 Supporting Indicators). A core indicator carries 70% weightage and a supporting indicator carries 30% weightage. These indicators are grouped under 15 thematic categories which in turn are part of four pillars of comprehensive development of cities i.e., institutional, social, economic and physical. Based on the performance of cities against the various core and supporting indicators, various 'Category Sub-Indexes' and a composite 'City Liveability Index' will be developed for each city.

3.1. Scoring and Computing Category Indices of Liveability

The set of 79 indicators, associated categories and pillars are presented in the table below:

Table 1 List of Pillars, Categories and Indicators

Pillars of Comprehensive Development	Category	Indicators
Institutional	1. Governance	1.1 Percentage of citizen services available online
		1.2 Percentage of services integrated through Command Centre
		1.3 Percentage of citizens using online services
		1.4 Average delay in grievance redressal
		1.5 Tax collected as percentage of tax billed
		1.6 Extent of cost recovery (O&M) in water supply services
		1.7 Capital spending as percentage of total expenditure
		1.8 Percentage of population covered under Ward Committees/Area *Sabhas*
Social	**2. Identity and Culture**	2.1 Restoration and reuse of historic buildings
		2.2 Percentage of ecologically important areas covered through projects for restoration
		2.3 Hotel occupancy
		2.4 Percentage of budget allocated towards cultural/sports activities
		2.5 Number of cultural/sports events hosted by city
	3. Education	3.1 Percentage of school-aged population enrolled in schools
		3.2 Percentage of female school-aged population enrolled in schools
		3.3 Primary education student-teacher ratio

Pillars of Comprehensive Development	Category	Indicators
		3.4 Percentage of schools with access to digital education
		3.5 Percentage of students completing primary education
		3.6 Percentage of students completing secondary education
	4. Health	4.1 Number of in-patient hospital beds per 10,000 population
		4.2 Healthcare professionals per 10,000 population
		4.3 Average response time in case of health emergencies
		4.4 Period prevalence of water borne diseases
		4.5 Period prevalence of vector borne diseases
	5. Safety and Security	5.1 Number of CCTV Cameras
		5.2 Number of recorded crimes per lakh population
		5.3 Extent of crimes recorded against women, children and elderly per year
		5.4 Transport-related fatality per lakh population
Economic	**6. Economy and Employment**	6.1 Increase in VAT/GST collection
		6.2 Increase in collection of Professional Tax
		6.3 Increase in issuance of Construction permits
		6.4 Unemployment rate
		6.5 Percentage of vendors registered and provided formal spaces
Physical	**7. Housing and Inclusiveness**	7.1 Percentage of Slum/EWS households covered through formal/affordable housing
		7.2 Percentage of slum areas covered through basic

Pillars of Comprehensive Development	Category	Indicators
		services
	8. Public Open Spaces	8.1 Per capita availability of green spaces
		8.2 Per capita availability of public and recreational places
	9. Mixed Land Use and Compactness	9.1 Share of mixed land use area in overall city land use
		9.2 Net Density
	10. Power Supply	10.1 Percentage of city population with authorized electrical services
		10.2 Percentage of electrical connections covered through smart meters
		10.3 Average number of electrical interruptions per year
		10.4 Average length of electrical interruptions per year
		10.5 Percentage of total energy derived from renewable sources
		10.6 Energy consumption per unit - water supply and sewerage
		10.7 Energy consumption per unit - street lighting
		10.8 Percentage of new and redeveloped buildings following green building norms
		10.9 Total energy consumption per capita
	11. Transportation and Mobility	11.1 Geographical coverage of public transport
		11.2 Availability of public transport
		11.3 Mode share of public transport
		11.4 Percentage of road network with dedicated bicycle tracks
		11.5 Percentage of interchanges with bicycle parking

Pillars of Comprehensive Development	Category	Indicators
		facilities
		11.6 Mode share of non-motorized transport
		11.7 Availability of Passenger Information System
		11.8 Extent of signal synchronization
		11.9 Availability of paid parking spaces
		11.10 Percentage coverage of footpaths – wider than 1.2 m
		11.11 Percentage of traffic intersections with pedestrian crossing facilities
		11.12 Extent to which universal accessibility is incorporated in public rights-of-way
	12. Assured Water Supply	12.1 Household level coverage of direct water supply connections
		12.2 Per capita supply of water
		12.3 Quality of water supplied
		12.4 Level of non-revenue water – NRW
		12.5 Percentage of water connections covered through meters
		12.6 Percentage of plots with rainwater harvesting facility
	13. Waste Water Management	13.1 Coverage of toilets
		13.2 Coverage of sewerage network and/or septage
		13.3 Collection efficiency of sewerage network
		13.4 Extent of reuse and recycling of waste water
		13.5 Coverage of storm water drains
	14. Solid Waste	14.1 Household level coverage of municipal solid waste

Pillars of Comprehensive Development	Category	Indicators
	Management	collection
		14.2 Efficiency of collection of municipal solid waste
		14.3 Extent of municipal solid waste recovered through reuse
	15. Reduced Pollution	15.1 Concentration of SO2- air pollution
		15.2 Concentration of NO2- air pollution
		15.3 Concentration of PM10 - air pollution
		15.4 Level of noise pollution
		15.5 Quality of water in public surface water bodies

3.2. Scoring and Computing Category Indices of Liveability

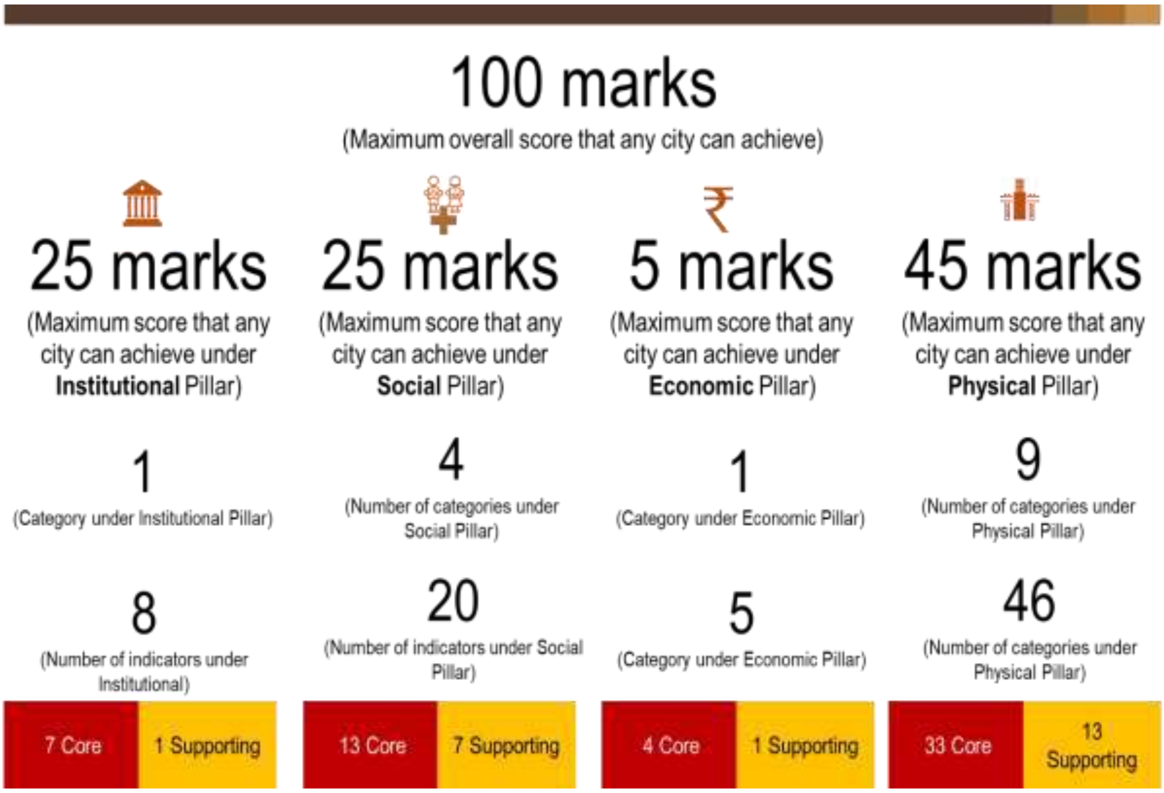
The performance achieved by cities against 79 indicators, will be assessed against given benchmarks. Where no international/national norms are available, city with the best performance in its group (population range) will be treated as a benchmark. The groups are given in the table below.

Table 2 Details on Population Range

Category	Population range
Category 1	Population ≥ 4 million
Category 2	1 million ≤ Population < 4 million
Category 3	0.5 million ≤ Population < 1 million
Category 4	Population < 0.5 million

3.3. Scoring Approach and Methodology

A city can earn a maximum score of 100 points for 79 indicators across four pillars. The pillar weights are as follows: Institutional (25 points), Social (25 points), Economy and Employment (5 points) and Physical (45 points). Based on the number and nature of indicators i.e., core vs. secondary, indicator wise maximum marks were computed.



100 marks

(Maximum overall score that any city can achieve)

25 marks	**25 marks**	**5 marks**	**45 marks**
(Maximum score that any city can achieve under **Institutional** Pillar)	(Maximum score that any city can achieve under **Social** Pillar)	(Maximum score that any city can achieve under **Economic** Pillar)	(Maximum score that any city can achieve under **Physical** Pillar)
1	4	1	9
(Category under Institutional Pillar)	(Number of categories under Social Pillar)	(Category under Economic Pillar)	(Number of categories under Physical Pillar)
8	20	5	46
(Number of indicators under Institutional)	(Number of indicators under Social Pillar)	(Category under Economic Pillar)	(Number of categories under Physical Pillar)
7 Core 1 Supporting	13 Core 7 Supporting	4 Core 1 Supporting	33 Core 13 Supporting

Dimensional Index Methodology (DIM) has been used to compute scores for each indicator with reference to "maximum within the comparison group" or "absolute benchmarks". For indicators where benchmarks are available, cities getting the benchmark score (or above) are given the maximum mark, and the marks awarded to other cities are calculated proportionately. For indicators where benchmarks are not available, the best performing cities in each population group are given the maximum mark, and the marks awarded to other cities (within the population group) are calculated proportionately. For indicators where benchmarks do not exist, the city data has been tested for outliers before scoring.

3.4. Scoring Normalisation:

To construct aggregate scores across cities as well as to make the scores across indicators comparable, indicator values were normalised using a min-max approach. The following formula was used to normalise the indicator values-

This approach would restrict the normalised indicator value between 0 and 1. Cities that met or exceeded the benchmark received a normalised indicator value of 1. Worst performing cities are given a normalised indicator value of 0. After normalisation, the normalised value is weighted according to the category and the indicator being core or supporting.

To illustrate, consider the indicator 12.3 Quality of Water Supplied in the Category 12 for Assured Water Supply. If in City A 50% of the water samples collected qualify the potable water standards specified by the CPHEEO, and only 10% of the samples from worst performing city qualify the standards. Then, the normalised value for the indicator for city A would be 0.44 [(0.5-0.1)/(1-0.1)].

The weight for indicator 12.3 is 1.03, so the final weighted score for City A would come out to 0.45 [1.03*0.44].

4. Data Collection and Verification

4.1. Submission of Data by the cities

The Liveability Assessment is based on secondary data submitted by the urban local bodies and other concerned government agencies (collectively called as data owners). The 79 indicators were broken down into a set of easy to understand and relatable 553 questions mapped to data owners. Submission of the data was enabled through an online data entry portal on the smartnet platform of the Ministry. The portal also allowed the ULBs to download the liveability assessment questionnaire and upload filled in questionnaire. To familiarise and assist cities in identifying, mapping and collation of data points, a city level nodal person was available during the entire period of data submission process.

4.2. Mapping of Data Owners for the City

For the assessment of liveability indices broadly 12 data owners such as Central/state Pollution control board, Development authority, DISCOM/Electricity Board, State Disaster Management Authority, State Education Department, State Health department, State Renewable energy and development agency, State sales and commercial taxes department, town and country planning department, Traffic and police department, Transport authority, and Urban local body were identified to respond to the questions on the portal. However, during state workshop and subsequent city level discussions, more data owners were mapped to respond to different categories and sub categories. The following table provides the details of city level data owners mapped under the 12 data owner.

Table 3:Details of Data Owners

Designated data owners	Subcategories	Data owners at city level
Urban Local Body	For Accounts Related Questions	Account Department – ULB
Urban Local Body	For Park and Recreation Related Questions	Technical Department – ULB
Urban Local Body	For Water Supply and Drainage related questions	P.W.D
Urban Local Body	For Heritage sites related data	-
Urban Local Body	For Ecological sites related data	Forest
Urban Local Body	For Housing related data	Technical Department – ULB
Urban Local Body	For Building plan related data	Technical Department – ULB
Urban Local Body	For Roads related data	Technical Department – ULB
Urban Local Body	For Solid waste management related data	D.M.C. – ULB
Urban Local Body	For IT services related data	Computer Division- ULB
Urban Local Body	For Vendor committee related data	Tax Section- ULB
Urban Local Body	Any other departments involved in providing data for questions mentioned under Urban Local Body	
Central / state Pollution control Board	Water Quality, Air Quality, Noise Quality	PCC
Development Authority	Building Infrastructure	Technical Department- ULB
	Construction planning	Technical Department- ULB
	Green Building	Technical Department- ULB
	Rain water harvesting	Technical Department- ULB

	Universal Design Principle	
DISCOM/Electricity Board	Electrical Connection/ Grievance Redressal/ Power supply	Electrical Department
State Disaster management authority		Department of Disaster Management
State Education Department		Asst. Director Education
State Health Department	Health care professionals	C.H.C & Hospital – Diu
	Citizen Services	C.H.C & Hospital – GAD
	Disease Prevalence	C.H.C & Hospita, NRHM AYUSH
	Health Infrastructure	GAD & Establishment CHC & Hospital
State Renewable Energy Development Agency		
State Sales / Commercial Taxes Department		VAT & TAX Department
Town and Country Planning Department	Land Use	ATPO
Traffic and Police Department		Police Department
Transport Authorities	Buses	RTO
	Registered Vehicles	RTO
	Sub urban rail transport	
	Mono Rail Authority	
	Tramways	
	Marine Transport Authority	

4.3. List of secondary documents available as supportive

City has provided supporting documents/evidences against the responses given by city on the online portal. In support of their responses on the portal, city submitted 7 number of documents. Documents submitted includes reports, official orders, copy of data maintained in official register, signed copy of questionnaire, and signed letters/submissions from concern departments. Verification includes mapping of documents against responses given by city, checking the type/category of documents, and validation of data provided.

The following table presents the data owner wise number of documents:

Table 4: Data owner wise number of secondary documents submitted by city

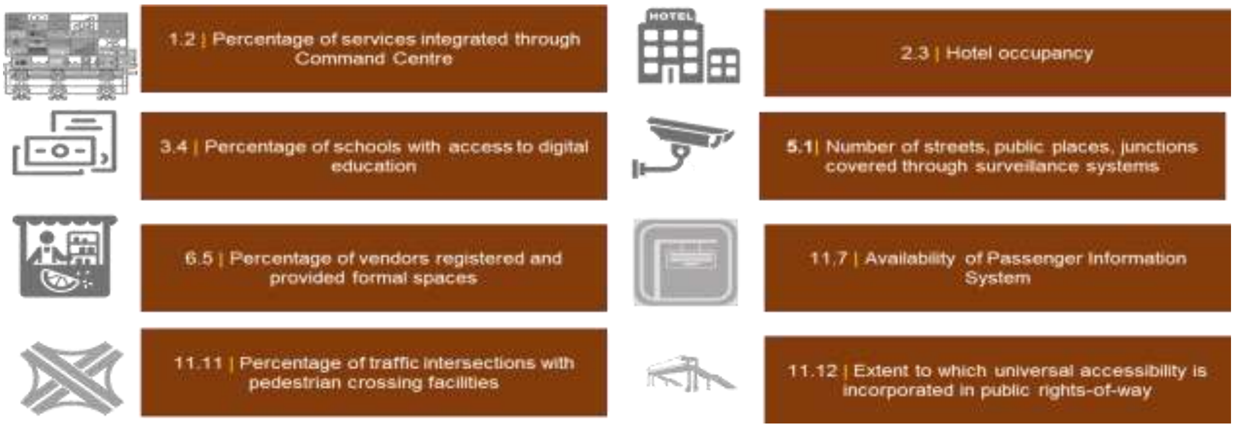
Data Owners	Number of Documents
Sales and Commercial Taxes	1
State Education Department	7
DISCOM/Electricity Department	7
Traffic and Police Department	2
Development Authority	0
Pollution Control Board	2
State Renewable Energy Department	2
Town and Country Planning	0
State Health Department	16
Transport Authority	1
Disaster Management	0
Urban Local Body	24
Total	62

.

4.4. Data Verification

A three-stage data quality check comprising verification of data against secondary documents furnished by data owners, logical inconsistency checks including outliers, and physical audit for select indicators (Refer the exhibit below) is being undertaken. The objective of the data quality check is to ensure that data from the source documents are accurate and verifiable. Sources of data included reports, administrative data, survey results and other statistical records, log books among other.

Physical audit of eight indicators – one indicator from the Institutional pillar, one from the Social pillar, one from the Economy pillar and five from the Physical pillar is also being carried out by the field team to ascertain the degree of reliability of data reported by the cities. The list of these eight indicators is presented below:



1.2 | Percentage of services integrated through Command Centre
2.3 | Hotel occupancy
3.4 | Percentage of schools with access to digital education
5.1 | Number of streets, public places, junctions covered through surveillance systems
6.5 | Percentage of vendors registered and provided formal spaces
11.7 | Availability of Passenger Information System
11.11 | Percentage of traffic intersections with pedestrian crossing facilities
11.12 | Extent to which universal accessibility is incorporated in public rights-of-way

For a set of five indicators namely, unemployment rate, mode share of public transport, mode share of non-motorised transport, quality of water supplied and level of noise pollution, existing datasets were found to be not available consistently across all cities and/or were inadequate. To help cities that do not have data on these five indicators, dipstick assessments are being carried to fill data gaps.

6.4 | Unemployment Rate

11.3 | Mode share of public transport

11.5 | Mode share of Non Motorized Transport

12.3 | Quality of Water Supplied

15.4 | Level of Noise Pollution

4.5. Physical Audit

The following map presents the indicators audited at city level.

Chakratirth Beach
Pani Kotha
Hanumanji Temple
Gangeshwar Mahadev Temple
Vasai Branch Post Office

5. City Score on 15 categories of Assessment

Liveability Assessment covered 15 categories and 78 indicators. The below table presents the scores for all 15 indicators namely governance, identity & culture, education, health, safety and security, economy & employment, housing & inclusiveness, public open spaces, mixed land use & compactness, power supply, transport & mobility, assured water supply, waste water management, solid waste management and reduced pollution.

Table 1: Category wise scores

Categories	**Scores in Percentage**
Governance	38.21%
Identity & Culture	52%
Education	79%
Health	97%
Safety & Security	57%
Economy & Employment	47%
Housing & Inclusiveness	0%
Public Open Spaces	89%
Mixed Land Use & Compactness	14%
Power Supply	54%
Transport & Mobility	23%
Assured Water Supply	84%
Waste Water Management	31%
Solid Waste Management	67%
Reduced Pollution	20%

The rank of the city is based on the performance and scores in each of the category. The final city rank is submitted separately.

Assessment of liveability indices is an initiative by the Ministry of Housing and Urban Affairs to improve quality of life of citizens and achieve sustainable development goals by encouraging cities to adopt "outcome based" approach for urban planning. Assessment process aimed to provide opportunity to cities to review the development components holistically by involving 79 measurable indicators categorized under governance, health, education, safety, economy, power supply, transportation and mobility, identity, culture, housing, waste management and pollution.

This report highlights the assessment process, key milestones, and the final outcome of the data submitted. Implementation of liveability assessment commenced formally on 19th January 2018. A national level workshop was organized on 13th February 2018 to explain the importance and process of liveability assessment and get feedback on methodology from the city authorities.

This was followed by the next stage of Questionnaire development. The questionnaire was arranged under 12 categories representing 12 data owners namely urban local body, Central and state pollution control board, development authority, DISCOM/Electricity board, State disaster management authority, state education department, state health department, state renewable energy development agency, state sales and commercial taxes department, town and country planning department, traffic and police department and transport authorities.

An online data entry portal was developed to facilitate data submission by the cities. Each city had a unique log in to access the portal and submit the data. Both online and off-line options (download the questionnaire in an excel) to submit the data were available for cities. An email help desk was set up for the cities to raise any queries and seek clarification when responding to the questions.

A team for each state comprising of State Coordinator and City Coordinator (one per city) was deployed that facilitated the process and supported the cities. A total of 6 regional coordinators/ consultants, 29 State Coordinators, and 99 city coordinators were deployed across 116 cities. Training for state coordinators was held from 26th to 28th February 2018 at Chennai to make coordinators understand overall liveability assessment, indicators, data sources, protocols and roles and responsibilities.

City Reconnaissance Meetings were initiated by the state and city coordinators. The discussion began with discussions to finalize the state workshop schedule, mapping of data owners, and assist cities in data collection. The City Coordinators were based in the cities for over 6 weeks and during this time, they liase with ULB and other data owners to explain the liveability framework, online portal, and facilitate the online submission.

nducted at the state level. The objective of the workshop n liveability assessment, indicators, components of data collection, timelines, expectations of support and support extended by MoHUA. The state level workshops brought various city level departments on a single platform to understand and discuss the methodology and components of city liveability assessment.

Nodal agency at state level supported by the City and State Coordinator and city level (Municipality corporation/smart city limited) coordinated with city specific data owners/departments for data gathering, collation, and submission. Nodal persons in each department were appointed for timely data collection and submission. Of 116, 112 cities submitted data as per the timeline on 16th April 2018.

Post submission, the city and state coordinators supported by the central team followed up extensively with the cities to support secondary documents as evidence to substantiate their submissions. Secondary documents such as reports, official orders, copy of office register, signed copy of liveability assessment questionnaire furnished by cities against the submitted data. Documents are verified to map the documents for the reponses provided by city and to check the type data provided by city. The document check outcomes were shared with the cities as a part of data quality check.

For checking consistency of data, logical check of data, verifying data from other public sources were undertaken. Quality check was done to ensure data validity and provide opportunity to cities to review the data provided by them and correct in case of wrong data entry.

For 8 selected indicators namely, percentage of services integrated through command and control center, hotel occupancy rate, percentage of schools with access to digital education, number of CCTV cameras per unit road length, percentage of vendors registered and provided formal spaces, availability of passenger information system, percentage of traffic intersection with pedestrian crossing facility, and extent to which universal accessibility is incorporated in public rights of way. Physical audit was conducted in 110 cities by physical auditors appointed and trained by the consortium. In consultation with ULB nodal person, locations and indicators for physical audit was selected in each city. A mobile based application was developed to capture the physical audit related data.

Primary data collection was done for five indicators such as unemployment rates, mode share of public transport, mode share of non-motorized transport, quality of water supplied, and level of noise pollution. Protocols for water and noise test were prepared in consultation with experts. Water quality test involved physical, chemical and bacteriological test of water as per the CPCB norms. For testing quality of water at consumer end, the auditors worked closely with the ULB and Water department. Samples were collected from consumer end and submitted to the lab suggested by city. For noise pollution, in about 20 cities the state pollution board or city level

sponsibility for providing noise pollution data as per the ased application was used to measure noise pollution.

During implementation, MoHUA facilitated the process by conducting video conferences with cities to address any queries, reiterate the importance, and ensure that cities adequately engages in the process and submit their responses in time and respond to requests for clarifications.

In addition to secondary data collection, physical audit and primary data collection, citizen survey was conducted to understand their perception and level of satisfaction on various services such as health, education, water supply, electricity, waste management etc. provided by urban local bodies. Over 60000 citizens participated in the survey across India.

The final scores and ranks have been generated based on the scoring methodology that has been discussed extensively and minor modifications made that are summarized as below:

#	Challenges	Proposed Solutions
1	Only 23 cities of 111 cities have City Mobility Plan (CMP) or any and hence able to provide data for Mode Share of Public Transport and Non-Motorised Transport. To address the data gap, as advised by the MoHUA, the consortia undertook a sample dipstick across all cities covering a sample of 150 Households. Understandably, the dipstick findings will not match the rigor of a CMP.	We recommend the following: 1) Cities which have provided CMP Data will be evaluated on 100% of the maximum score 2) For the cities where the dipstick data is used, the city receives a 50% discount on the overall score Alternatively, another approach is to assign 0 score to all 88 cities that don't have a CMP
2	Variance was observed on data reported by cities on road network and data presented in the smart city proposals during the verifications.	We recommend taking the data reported by the cities in the Smart City Proposals.
3	There is no secondary source/ organization that provides unemployment data at city level. As a result, most cities do not have the data. Fully cognizance of the challenges of generating this data in a short span of time, it was agreed to collect this data through a dipstick survey on lines of NSSO questions. The	The indicator on unemployment will be excluded from scores. For final ranking, the cities will be scored on 78 indicators.

		Proposed Solutions
	data generated needs further scrutiny and triangulation with some inputs from experts. This may not be possible in the short window.	
4	Many cities did not have data on noise pollution and it was decided that data will be collected using a mobile app for all the 111 cities. However, many cities have expressed reservations with the approach especially with respect to the reliability of using this data. Further, some cities have relied on the SPCB to collect the data as per the approach proposed by the consortia. Thus, noise pollution data is currently from two sources: 1. SPCB- 20 cities 2. Noise-based app- 91 cities	The data collected through the primary survey will be used for scoring the cities. Currently, there is no differential scoring for the data from the SPCB and the data collected through the mobile app. However, a certain higher weightage can be provided to those cities which used the state apparatus to collect noise pollution data.
5	For the indicator on quality of water supplied, the methodology document states that samples should be drawn both at the treatment plant outlet as well as the consumer end. However, the data provided by the cities were predominantly from the distribution point. Hence for consumer end results with MoHUA intervention, consortia coordinated with cities to collect the data at the consumer end. The cities facilitated the testing. The outcome of the process is as below: 1. Sample given- 102 cities 2. Report received- 86 cities 3. Report awaited- 16 cities 4. Tests not completed due to lack of cooperation and other reasons – 9	The maximum score for this indicator will be distributed equally (50%) for results based on samples from the treatment plant and consumer end. Cities that did not complete tests or provide the results will be given a score 0 for against consumer end tests.
6	City level population is not projected annually by most of the cities. So, estimates for 2017 population are not available with the cities.	As recommended by MoHUA, 2011 census population is being used for the ranking purpose.
7	The age category specific data for 9 cities is not available at a city level	The age category specific population data has been taken at a district level for these cities.

		Proposed Solutions
8	Indicators on non-motorised transports like- Dedicated bicycle tracks, bicycle parking facilities and mode share of non-motorised transport are not relevant for hilly terrains.	As discussed during the PMC meeting, these indicators have been treated as non-applicable for the hilly cities and the weights have been redistributed among other indicators within the same category.
9	The indicator on increase in professional tax is not relevant to cities which do not levy the professional tax.	As discussed during the PMC meeting, this indicator has been non-applicable to the cities belonging to states where professional tax is not levied, and the weights have been redistributed among other indicators within the same category.
10	The indicator on increase in VAT collection is not applicable to Port Blair and Kavaratti, as there was no provision of VAT collection in these cities.	As discussed during the PMC meeting, these indicatosr has been treated as non-applicable for these two cities and the weights have been redistributed among other indicators within the same category.
11	Indicator on coverage of basic services to slum households does not concern cities with no slums (notified/ non-notified.	As discussed during the PMC meeting, this indicators has been treated as non-applicable for these cities and the weights have been redistributed among other indicators within the same category.

The Ministry of Housing and Urban Affairs (MoHUA) is implementing several flagship urban missions such as the Smart Cities Mission (SCM), Atal Mission for Urban Rejuvenation and Transformation (AMRUT), Heritage City Development and Augmentation Yojana (HRIDAY), Housing for All (HFA). Theses mission along with other transformative initiatives of the Government including National Water Mission, Power for All, National Health Mission are aimed at making Indian cities more 'liveable.' The overarching goal of these initiatives is to move from an input-based approach to a 'citizen centric-outcome based' assessment of urban liveability.

To develop a common minimum framework for cities to assess their existing status and chart their pathway towards providing a better quality of life to their citizens, the MoHUA developed a set of 'Liveability Standards' relevant to cities to generate a Liveability Index and ranking of cities. These standards were launched in June, 2017. The MoHUA has planned to conduct an 'Annual Assessment of Liveability Standards in Cities – an ambitious national project that will involve yearly submission of data by cities across the various indicators, compilation and analysis, development of indices and ranking of cities. The Liveability Index is envisioned as a 360° tool for tracking, planning and transforming Indian cities. The Liveability Index is aimed at the following objectives:

- Providing strong evidence-based approach for future interventions and investments to deliver liveability outcomes
- Catalysing actions to improve the overall quality of the city's liveability and achieve broader development outcomes including the Sustainable Development Goals
- Assessing the implementation of government policies and schemes governing characteristics of cities that can contribute to creating liveable communities

liveability
Urban Planning and Management
City level self-assessment
Citizen driven accountability systems
Use cases and pathways for reform
Unearth blind spots and incentivise action
Institutionalisation of outcome based planning and governance

Cities move to a single, unified data driven decision making paradigm...

The first round of the assessment commenced in January 2018 covering 116 major cities including smart cities, capital cities and cities with population of above one million each. Implementation of the liveability assessment commenced in January 2018 with a national level orientation workshop for the urban local bodies. The workshop aimed at orienting the states and urban local bodies on the overall framework, indicators, data sources, methodology and key milestones and timelines involved in the liveability assessment. Subsequently, a series of State/ Union Territory level orientation workshops were carried out in 33 states/UTs for a detailed discussion on the framework. Online data collection commenced from 9th March through an online data collection platform that supported both online and offline data submission modes. On the date of closure of the online data entry portal i.e., 16th April, 2018 112 cities submitted their data. Subsequently, comprehensive checks on the submitted data was undertaken that involved checking for outliers, logical inconsistencies etc. post which round-1 of data reconciliation was conducted. This draft report is based on round-1 of reconciled data as on 28th April, 2018.

tors

The Liveability Framework comprises a total of 79 indicators (57 Core Indicators and 22 Supporting Indicators). A core indicator carries 70% weightage and a supporting indicator carries 30% weightage. These indicators are grouped under 15 thematic categories which in turn are part of four pillars of comprehensive development of cities i.e., institutional, social, economic and physical. Based on the performance of cities against the various core and supporting indicators, various 'Category Sub-Indexes' and a composite 'City Liveability Index' will be developed for each city.

3.1 Scoring and Computing Category Indices of Liveability

The set of 79 indicators, associated categories and pillars are presented in the table below:

Table 1 List of Pillars, Categories and Indicators

Pillars of Comprehensive Development	Category	Indicators
Institutional	1. Governance	1.1 Percentage of citizen services available online
		1.2 Percentage of services integrated through Command Centre
		1.3 Percentage of citizens using online services
		1.4 Average delay in grievance redressal
		1.5 Tax collected as percentage of tax billed
		1.6 Extent of cost recovery (O&M) in water supply services
		1.7 Capital spending as percentage of total expenditure
		1.8 Percentage of population covered under Ward Committees/Area *Sabhas*
Social	**2. Identity and Culture**	2.1 Restoration and reuse of historic buildings
		2.2 Percentage of ecologically important areas covered through projects for restoration
		2.3 Hotel occupancy
		2.4 Percentage of budget allocated towards cultural/sports activities
		2.5 Number of cultural/sports events hosted by city
	3. Education	3.1 Percentage of school-aged population enrolled in schools

		13.2 Coverage of sewerage network and/or septage
		13.3 Collection efficiency of sewerage network
		13.4 Extent of reuse and recycling of waste water
		13.5 Coverage of storm water drains
	14. Solid Waste Management	14.1 Household level coverage of municipal solid waste collection
		14.2 Efficiency of collection of municipal solid waste
		14.3 Extent of municipal solid waste recovered through reuse
	15. Reduced Pollution	15.1 Concentration of SO2- air pollution
		15.2 Concentration of NO2- air pollution
		15.3 Concentration of PM10 - air pollution
		15.4 Level of noise pollution
		15.5 Quality of water in public surface water bodies

3.2 Scoring and Computing Category Indices of Liveability

The performance achieved by cities against 79 indicators, will be assessed against given benchmarks. Where no international/national norms are available, city with the best performance in its group (population range) will be treated as a benchmark. The groups are given in the table below.

Table 2 Details on Population Range

Category	Population range
Category 1	Population ≥ 4 million
Category 2	1 million ≤ Population < 4 million
Category 3	0.5 million ≤ Population < 1 million
Category 4	Population < 0.5 million

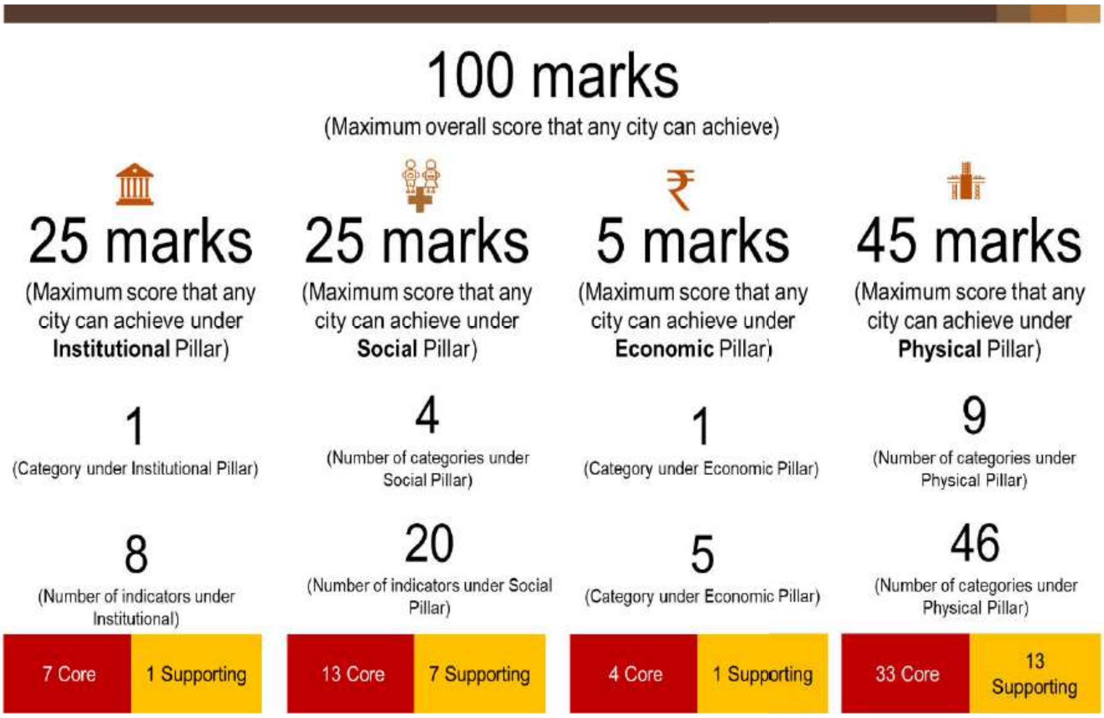
dology

A city can earn a maximum score of 100 points for 79 indicators across four pillars. The pillar weights are as follows: Institutional (25 points), Social (25 points), Economy and Employment (5 points) and Physical (45 points). Based on the number and nature of indicators i.e., core vs. secondary, indicator wise maximum marks were computed.



100 marks

(Maximum overall score that any city can achieve)

25 marks (Maximum score that any city can achieve under **Institutional** Pillar)	25 marks (Maximum score that any city can achieve under **Social** Pillar)	5 marks (Maximum score that any city can achieve under **Economic** Pillar)	45 marks (Maximum score that any city can achieve under **Physical** Pillar)
1 (Category under Institutional Pillar)	4 (Number of categories under Social Pillar)	1 (Category under Economic Pillar)	9 (Number of categories under Physical Pillar)
8 (Number of indicators under Institutional)	20 (Number of indicators under Social Pillar)	5 (Category under Economic Pillar)	46 (Number of categories under Physical Pillar)
7 Core 1 Supporting	13 Core 7 Supporting	4 Core 1 Supporting	33 Core 13 Supporting

Dimensional Index Methodology (DIM) has been used to compute scores for each indicator with reference to "maximum within the comparison group" or "absolute benchmarks". For indicators where benchmarks are available, cities getting the benchmark score (or above) are given the maximum mark, and the marks awarded to other cities are calculated proportionately. For indicators where benchmarks are not available, the best performing cities in each population group are given the maximum mark, and the marks awarded to other cities (within the population group) are calculated proportionately. For indicators where benchmarks do not exist, the city data has been tested for outliers before scoring.

Click Here to upgrade to Unlimited Pages and Expanded Features

To construct aggregate scores across cities as well as to make the scores across indicators comparable, indicator values were normalised using a min-max approach. The following formula was used to normalise the indicator values-

$$\frac{indicator\ value\ for\ the\ city - indicator\ value\ for\ the\ worst\ performing\ city}{benchmark - indicator\ value\ for\ the\ worst\ performing\ city}$$

This approach would restrict the normalised indicator value between 0 and 1. Cities that met or exceeded the benchmark received a normalised indicator value of 1. Worst performing cities are given a normalised indicator value of 0. After normalisation, the normalised value is weighted according to the category and the indicator being core or supporting.

To illustrate, consider the indicator 12.3 Quality of Water Supplied in the Category 12 for Assured Water Supply. If in City A 50% of the water samples collected qualify the potable water standards specified by the CPHEEO, and only 10% of the samples from worst performing city qualify the standards. Then, the normalised value for the indicator for city A would be 0.44 [(0.5-0.1)/(1-0.1)].

The weight for indicator 12.3 is 1.03, so the final weighted score for City A would come out to 0.45 [1.03*0.44].

4. Data Collection and Verification

4.1 Submission of Data by the cities

The Liveability Assessment is based on secondary data submitted by the urban local bodies and other concerned government agencies (collectively called as data owners). The 79 indicators were broken down into a set of easy to understand and relatable 553 questions mapped to data owners. Submission of the data was enabled through an online data entry portal on the smartnet platform of the Ministry. The portal also allowed the ULBs to download the liveability assessment questionnaire and upload filled in questionnaire. To familiarise and assist cities in identifying, mapping and collation of data points, a city level nodal person was available during the entire period of data submission process.

the City

For the assessment of liveability indices broadly 12 data owners such as Central/state Pollution control board, Development authority, DISCOM/Electricity Board, State Disaster Management Authority, State Education Department, State Health department, State Renewable energy and development agency, State sales and commercial taxes department, town and country planning department, Traffic and police department, Transport authority, and Urban local body were identified to respond to the questions on the portal. However, during state workshop and subsequent city level discussions, more data owners were mapped to respond to different categories and sub categories. The following table provides the details of city level data owners mapped under the 12 data owner.

Table 3:Details of Data Owners

Designated data owners	Subcategories	Data owners at city level
Urban Local Body	For Accounts Related Questions	Accounts Department
Urban Local Body	For Park and Recreation Related Questions	Engineering department
Urban Local Body	For Water Supply and Drainage related questions	Engineering department
Urban Local Body	For Heritage sites related data	Not Applicable

available as supportive

City has provided supporting documents/evidences against the responses given by city on the online portal. In support of their responses on the portal, city submitted 110 number of documents. Documents submitted includes reports, official orders, copy of data maintained in official register, signed copy of questionnaire, and signed letters/submissions from concern departments. Verification includes mapping of documents against responses given by city, checking the type/category of documents, and validation of data provided.

The following table presents the data owner wise number of documents:

Table 4: Data owner wise number of secondary documents submitted by city

Data Owners	Number of Documents
Sales and Commercial Taxes	1
State Education Department	6
DISCOM/Electricity Department	3
Traffic and Police Department	3
Development Authority	5
Pollution Control Board	10
State Renewable Energy Department	3
Town and Country Planning	3
State Health Department	5
Transport Authority	7
Disaster Management	1
Urban Local Body	63
Total	110

4.4 Data Verification

A three-stage data quality check comprising verification of data against secondary documents furnished by data owners, logical inconsistency checks including outliers, and physical audit for select indicators (Refer the exhibit below) is being undertaken. The objective of the data quality check is to ensure that data from the source documents are accurate and verifiable. Sources of data included reports, administrative data, survey results and other statistical records, log books among other.

Physical audit of eight indicators – one indicator from the Institutional pillar, one from the Social pillar, one from the Economy pillar and five from the Physical pillar is also being carried out by the

Executive Summary

Assessment of liveability indices is an initiative by the Ministry of Housing and Urban Affairs to improve quality of life of citizens and achieve sustainable development goals by encouraging cities to adopt "outcome based" approach for urban planning. Assessment process aimed to provide opportunity to cities to review the development components holistically by involving 79 measurable indicators categorized under governance, health, education, safety, economy, power supply, transportation and mobility, identity, culture, housing, waste management and pollution.

This report highlights the assessment process, key milestones, and the final outcome of the data submitted. Implementation of liveability assessment commenced formally on 19th January 2018. A national level workshop was organized on 13th February 2018 to explain the importance and process of liveability assessment and get feedback on methodology from the city authorities.

This was followed by the next stage of Questionnaire development. The questionnaire was arranged under 12 categories representing 12 data owners namely urban local body, Central and state pollution control board, development authority, DISCOM/Electricity board, State disaster management authority, state education department, state health department, state renewable energy development agency, state sales and commercial taxes department, town and country planning department, traffic and police department and transport authorities.

An online data entry portal was developed to facilitate data submission by the cities. Each city had a unique log in to access the portal and submit the data. Both online and off-line options (download the questionnaire in an excel) to submit the data were available for cities. An email help desk was set up for the cities to raise any queries and seek clarification when responding to the questions.

A team for each state comprising of State Coordinator and City Coordinator (one per city) was deployed that facilitated the process and supported the cities. A total of 6 regional coordinators/ consultants, 29 State Coordinators, and 99 city coordinators were deployed across 116 cities. Training for state coordinators was held from 26th to 28th February 2018 at Chennai to make coordinators understand overall liveability assessment, indicators, data sources, protocols and roles and responsibilities.

City Reconnaissance Meetings were initiated by the state and city coordinators. The discussion began with discussions to finalize the state workshop schedule, mapping of data owners, and assist cities in data collection. The City Coordinators were based in the cities for over 6 weeks and during this time, they liase with ULB and other data owners to explain the liveability framework, online portal, and facilitate the online submission.

A total of 33 state workshops were conducted at the state level. The objective of the workshop was to orient the city stakeholders on liveability assessment, indicators, components of data collection, timelines, expectations of support and support extended by MoHUA. The state level workshops brought

various city level departments on a single platform to understand and discuss the methodology and components of city liveability assessment.

Nodal agency at state level supported by the City and State Coordinator and city level (Municipality corporation/smart city limited) coordinated with city specific data owners/departments for data gathering, collation, and submission. Nodal persons in each department were appointed for timely data collection and submission. Of 116, 112 cities submitted data as per the timeline on 16th April 2018.

Post submission, the city and state coordinators supported by the central team followed up extensively with the cities to support secondary documents as evidence to substantiate their submissions. Secondary documents such as reports, official orders, copy of office register, signed copy of liveability assessment questionnaire furnished by cities against the submitted data. Documents are verified to map the documents for the reponses provided by city and to check the type data provided by city. The document check outcomes were shared with the cities as a part of data quality check.

For checking consistency of data, logical check of data, verifying data from other public sources were undertaken. Quality check was done to ensure data validity and provide opportunity to cities to review the data provided by them and correct in case of wrong data entry.

For 8 selected indicators namely, percentage of services integrated through command and control center, hotel occupancy rate, percentage of schools with access to digital education, number of CCTV cameras per unit road length, percentage of vendors registered and provided formal spaces, availability of passenger information system, percentage of traffic intersection with pedestrian crossing facility, and extent to which universal accessibility is incorporated in public rights of way. Physical audit was conducted in 110 cities by physical auditors appointed and trained by the consortium. In consultation with ULB nodal person, locations and indicators for physical audit was selected in each city. A mobile based application was developed to capture the physical audit related data.

Primary data collection was done for five indicators such as unemployment rates, mode share of public transport, mode share of non-motorized transport, quality of water supplied, and level of noise pollution. Protocols for water and noise test were prepared in consultation with experts. Water quality test involved physical, chemical and bacteriological test of water as per the CPCB norms. For testing quality of water at consumer end, the auditors worked closely with the ULB and Water department. Samples were collected from consumer end and submitted to the lab suggested by city. For noise pollution, in about 20 cities the state pollution board or city level environment department took the responsibility for providing noise pollution data as per the protocols. In rest of the cities, mobile based application was used to measure noise pollution.

During implementation, MoHUA facilitated the process by conducting video conferences with cities to address any queries, reiterate the importance, and ensure that cities adequately engages in the process and submit their responses in time and respond to requests for clarifications.

In addition to secondary data collection, physical audit and primary data collection, citizen survey was conducted to understand their perception and level of satisfaction on various services such as health, education, water supply, electricity, waste management etc. provided by urban local bodies. Over 60000 citizens participated in the survey across India.

The final scores and ranks have been generated based on the scoring methodology that has been discussed extensively and minor modifications made that are summarized as below:

#	Challenges	Proposed Solutions
1	Only 23 cities of 111 cities have City Mobility Plan (CMP) or any and hence able to provide data for Mode Share of Public Transport and Non-Motorised Transport. To address the data gap, as advised by the MoHUA, the consortia undertook a sample dipstick across all cities covering a sample of 150 Households. Understandably, the dipstick findings will not match the rigor of a CMP.	We recommend the following: 1) Cities which have provided CMP Data will be evaluated on 100% of the maximum score 2) For the cities where the dipstick data is used, the city receives a 50% discount on the overall score Alternatively, another approach is to assign 0 score to all 88 cities that don't have a CMP
2	Variance was observed on data reported by cities on road network and data presented in the smart city proposals during the verifications.	We recommend taking the data reported by the cities in the Smart City Proposals.
3	There is no secondary source/ organization that provides unemployment data at city level. As a result, most cities do not have the data. Fully cognizance of the challenges of generating this data in a short span of time, it was agreed to collect this data through a dipstick survey on lines of NSSO questions. The data generated needs further scrutiny and triangulation with some inputs from experts. This may not be	The indicator on unemployment will be excluded from scores. For final ranking, the cities will be scored on 78 indicators.

#	Challenges	Proposed Solutions
	possible in the short window.	
4	Many cities did not have data on noise pollution and it was decided that data will be collected using a mobile app for all the 111 cities. However, many cities have expressed reservations with the approach especially with respect to the reliability of using this data. Further, some cities have relied on the SPCB to collect the data as per the approach proposed by the consortia. Thus, noise pollution data is currently from two sources: 1. SPCB- 20 cities 2. Noise-based app- 91 cities	The data collected through the primary survey will be used for scoring the cities. Currently, there is no differential scoring for the data from the SPCB and the data collected through the mobile app. However, a certain higher weightage can be provided to those cities which used the state apparatus to collect noise pollution data.
5	For the indicator on quality of water supplied, the methodology document states that samples should be drawn both at the treatment plant outlet as well as the consumer end. However, the data provided by the cities were predominantly from the distribution point. Hence for consumer end results with MoHUA intervention, consortia coordinated with cities to collect the data at the consumer end. The cities facilitated the testing. The outcome of the process is as below: 1. Sample given- 102 cities 2. Report received- 86 cities 3. Report awaited- 16 cities 4. Tests not completed due to lack of cooperation and other reasons – 9	The maximum score for this indicator will be distributed equally (50%) for results based on samples from the treatment plant and consumer end. Cities that did not complete tests or provide the results will be given a score 0 for against consumer end tests.
6	City level population is not projected annually by most of the cities. So, estimates for 2017 population are not available with the cities.	As recommended by MoHUA, 2011 census population is being used for the ranking purpose.

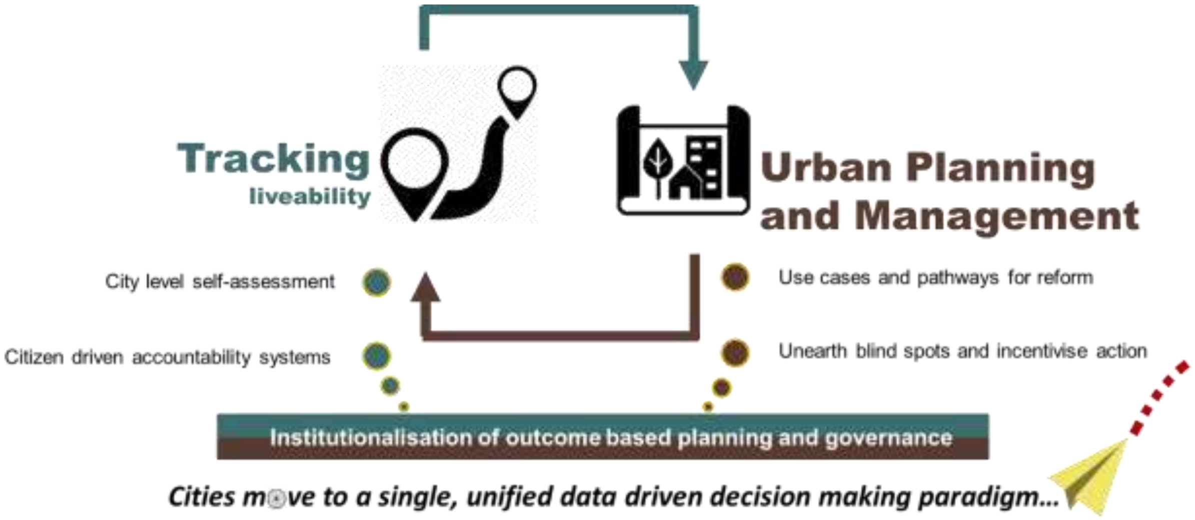
#	Challenges	Proposed Solutions
7	The age category specific data for 9 cities is not available at a city level	The age category specific population data has been taken at a district level for these cities.
8	Indicators on non-motorised transports like- Dedicated bicycle tracks, bicycle parking facilities and mode share of non-motorised transport are not relevant for hilly terrains.	As discussed during the PMC meeting, these indicators have been treated as non-applicable for the hilly cities and the weights have been redistributed among other indicators within the same category.
9	The indicator on increase in professional tax is not relevant to cities which do not levy the professional tax.	As discussed during the PMC meeting, this indicator has been non-applicable to the cities belonging to states where professional tax is not levied, and the weights have been redistributed among other indicators within the same category.
10	The indicator on increase in VAT collection is not applicable to Port Blair and Kavaratti, as there was no provision of VAT collection in these cities.	As discussed during the PMC meeting, these indicatosr has been treated as non-applicable for these two cities and the weights have been redistributed among other indicators within the same category.
11	Indicator on coverage of basic services to slum households does not concern cities with no slums (notified/ non-notified.	As discussed during the PMC meeting, this indicators has been treated as non-applicable for these cities and the weights have been redistributed among other indicators within the same category.

1. Introduction

The Ministry of Housing and Urban Affairs (MoHUA) is implementing several flagship urban missions such as the Smart Cities Mission (SCM), Atal Mission for Urban Rejuvenation and Transformation (AMRUT), Heritage City Development and Augmentation Yojana (HRIDAY), Housing for All (HFA). Theses mission along with other transformative initiatives of the Government including National Water Mission, Power for All, National Health Mission are aimed at making Indian cities more 'liveable.' The overarching goal of these initiatives is to move from an input-based approach to a 'citizen centric-outcome based' assessment of urban liveability.

To develop a common minimum framework for cities to assess their existing status and chart their pathway towards providing a better quality of life to their citizens, the MoHUA developed a set of 'Liveability Standards' relevant to cities to generate a Liveability Index and ranking of cities. These standards were launched in June, 2017. The MoHUA has planned to conduct an 'Annual Assessment of Liveability Standards in Cities – an ambitious national project that will involve yearly submission of data by cities across the various indicators, compilation and analysis, development of indices and ranking of cities. The Liveability Index is envisioned as a 360° tool for tracking, planning and transforming Indian cities. The Liveability Index is aimed at the following objectives:

- Providing strong evidence-based approach for future interventions and investments to deliver liveability outcomes
- Catalysing actions to improve the overall quality of the city's liveability and achieve broader development outcomes including the Sustainable Development Goals
- Assessing the implementation of government policies and schemes governing characteristics of cities that can contribute to creating liveable communities



Tracking
liveability
Urban Planning
and Management
City level self-assessment
Citizen driven accountability systems
Use cases and pathways for reform
Unearth blind spots and incentivise action
Institutionalisation of outcome based planning and governance

Cities move to a single, unified data driven decision making paradigm...

The first round of the assessment commenced in January 2018 covering 116 major cities including smart cities, capital cities and cities with population of above one million each. Implementation of the liveability assessment commenced in January 2018 with a national level orientation workshop for the urban local bodies. The workshop aimed at orienting the states and urban local bodies on the overall framework, indicators, data sources, methodology and key milestones and timelines involved in the liveability assessment. Subsequently, a series of State/ Union Territory level orientation workshops were carried out in 33 states/UTs for a detailed discussion on the framework. Online data collection commenced from 9th March through an online data collection platform that supported both online and offline data submission modes. On the date of closure of the online data entry portal i.e., 16th April, 2018 112 cities submitted their data. Subsequently, comprehensive checks on the submitted data was undertaken that involved checking for outliers, logical inconsistencies etc. post which round-1 of data reconciliation was conducted. This draft report is based on round-1 of reconciled data as on 28th April, 2018.

2. City Profile

This chapter presents the city profile -Geographic and Demographic, Social (Education Health, Safety and Security, Heritage), Economic profile, and Physical (Water, sanitation and Waste Management, Electricity, Open space and roads).

Sanitation Facilities	Total number of households with access to individual toilets in the city	24000
	Total number of households in the city with access to community toilets in the city	14500
Solid Waste Management	Daily average quantity of municipal solid waste collected in the city (Tonnes/day)	650
	Total number of households covered through door-to-door collection of solid waste	50000
Waste Water	Daily Average Quantum of Waste Water Generated in the City (MLD)	200
	Daily average quantum of waste water treated by STPs in the city (MLD)	145
Electricity	Total number of authorized electrical connections in the city	501517
	Total electricity supplied to the city (kWh)	1049272
Public and Open Spaces	Total area covered by green spaces in the city (m^2)	53140000
Roads and Transport	Total Length of Road Network in the City (Km)	1440
	Total length of arterial and sub-arterial road network in the city (Km)	1440
	Total length of footpath (wider than 1.2 metres) in the city along the street network (Km)	...

3. Liveability Framework and Indicators

The Liveability Framework comprises a total of 79 indicators (57 Core Indicators and 22 Supporting Indicators). A core indicator carries 70% weightage and a supporting indicator carries 30% weightage. These indicators are grouped under 15 thematic categories which in turn are part of four pillars of comprehensive development of cities i.e., institutional, social, economic and physical. Based on the performance of cities against the various core and supporting indicators, various 'Category Sub-Indexes' and a composite 'City Liveability Index' will be developed for each city.

3.1 Scoring and Computing Category Indices of Liveability

The set of 79 indicators, associated categories and pillars are presented in the table below:

Table 1 List of Pillars, Categories and Indicators

Pillars of Comprehensive Development	Category	Indicators
Institutional	1. Governance	1.1 Percentage of citizen services available online
		1.2 Percentage of services integrated through Command Centre
		1.3 Percentage of citizens using online services
		1.4 Average delay in grievance redressal
		1.5 Tax collected as percentage of tax billed
		1.6 Extent of cost recovery (O&M) in water supply services
		1.7 Capital spending as percentage of total expenditure
		1.8 Percentage of population covered under Ward Committees/Area *Sabhas*
Social	**2. Identity and Culture**	2.1 Restoration and reuse of historic buildings
		2.2 Percentage of ecologically important areas covered through projects for restoration
		2.3 Hotel occupancy
		2.4 Percentage of budget allocated towards cultural/sports activities
		2.5 Number of cultural/sports events hosted by city
	3. Education	3.1 Percentage of school-aged population enrolled in schools
		3.2 Percentage of female school-aged population

Pillars of Comprehensive Development	Category	Indicators
		enrolled in schools
		3.3 Primary education student-teacher ratio
		3.4 Percentage of schools with access to digital education
		3.5 Percentage of students completing primary education
		3.6 Percentage of students completing secondary education
	4. Health	4.1 Number of in-patient hospital beds per 10,000 population
		4.2 Healthcare professionals per 10,000 population
		4.3 Average response time in case of health emergencies
		4.4 Period prevalence of water borne diseases
		4.5 Period prevalence of vector borne diseases
	5. Safety and Security	5.1 Number of CCTV Cameras
		5.2 Number of recorded crimes per lakh population
		5.3 Extent of crimes recorded against women, children and elderly per year
		5.4 Transport-related fatality per lakh population
Economic	**6. Economy and Employment**	6.1 Increase in VAT/GST collection
		6.2 Increase in collection of Professional Tax
		6.3 Increase in issuance of Construction permits
		6.4 Unemployment rate
		6.5 Percentage of vendors registered and provided formal spaces
Physical	**7. Housing and Inclusiveness**	7.1 Percentage of Slum/EWS households covered through formal/affordable housing
		7.2 Percentage of slum areas covered through basic services
	8. Public Open Spaces	8.1 Per capita availability of green spaces
		8.2 Per capita availability of public and recreational places
	9. Mixed Land Use and Compactness	9.1 Share of mixed land use area in overall city land use
		9.2 Net Density
	10. Power Supply	10.1 Percentage of city population with authorized electrical services

Pillars of Comprehensive Development	Category	Indicators
		10.2 Percentage of electrical connections covered through smart meters
		10.3 Average number of electrical interruptions per year
		10.4 Average length of electrical interruptions per year
		10.5 Percentage of total energy derived from renewable sources
		10.6 Energy consumption per unit - water supply and sewerage
		10.7 Energy consumption per unit - street lighting
		10.8 Percentage of new and redeveloped buildings following green building norms
		10.9 Total energy consumption per capita
	11. Transportation and Mobility	11.1 Geographical coverage of public transport
		11.2 Availability of public transport
		11.3 Mode share of public transport
		11.4 Percentage of road network with dedicated bicycle tracks
		11.5 Percentage of interchanges with bicycle parking facilities
		11.6 Mode share of non-motorized transport
		11.7 Availability of Passenger Information System
		11.8 Extent of signal synchronization
		11.9 Availability of paid parking spaces
		11.10 Percentage coverage of footpaths – wider than 1.2 m
		11.11 Percentage of traffic intersections with pedestrian crossing facilities
		11.12 Extent to which universal accessibility is incorporated in public rights-of-way
	12. Assured Water Supply	12.1 Household level coverage of direct water supply connections
		12.2 Per capita supply of water
		12.3 Quality of water supplied
		12.4 Level of non-revenue water – NRW
		12.5 Percentage of water connections covered through meters
		12.6 Percentage of plots with rainwater harvesting

Pillars of Comprehensive Development	Category	Indicators
		facility
	13. Waste Water Management	13.1 Coverage of toilets
		13.2 Coverage of sewerage network and/or septage
		13.3 Collection efficiency of sewerage network
		13.4 Extent of reuse and recycling of waste water
		13.5 Coverage of storm water drains
	14. Solid Waste Management	14.1 Household level coverage of municipal solid waste collection
		14.2 Efficiency of collection of municipal solid waste
		14.3 Extent of municipal solid waste recovered through reuse
	15. Reduced Pollution	15.1 Concentration of SO2- air pollution
		15.2 Concentration of NO2- air pollution
		15.3 Concentration of PM10 - air pollution
		15.4 Level of noise pollution
		15.5 Quality of water in public surface water bodies

3.2 Scoring and Computing Category Indices of Liveability

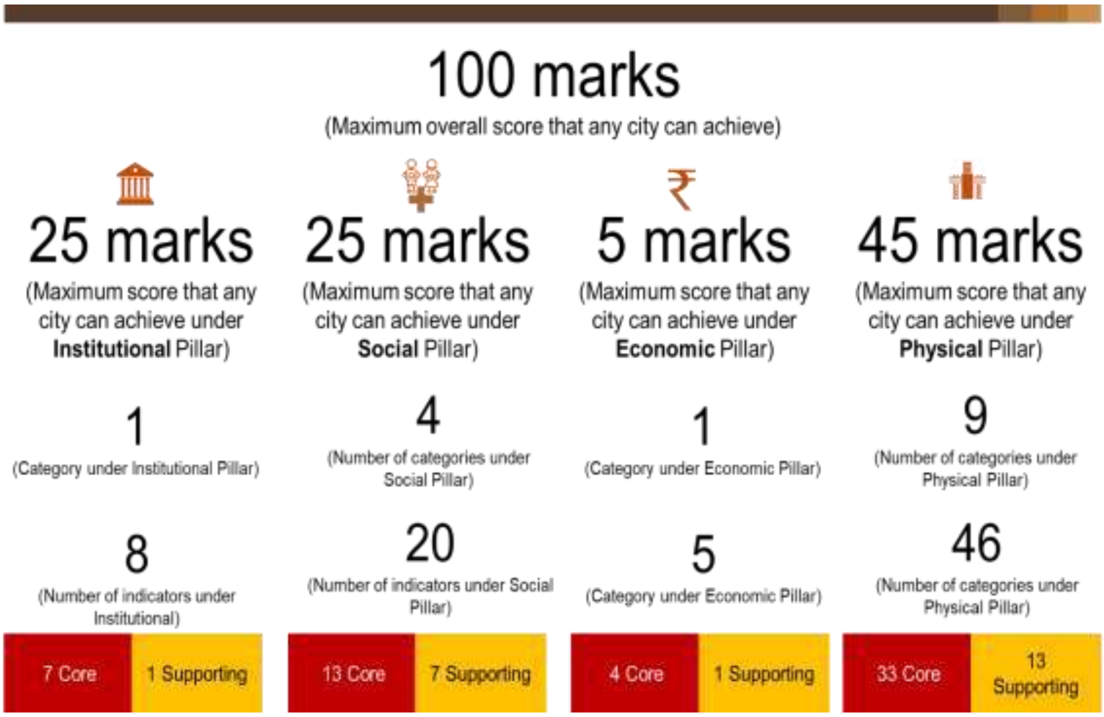
The performance achieved by cities against 79 indicators, will be assessed against given benchmarks. Where no international/national norms are available, city with the best performance in its group (population range) will be treated as a benchmark. The groups are given in the table below.

Table 2 Details on Population Range

Category	Population range
Category 1	Population ≥ 4 million
Category 2	1 million ≤ Population < 4 million
Category 3	0.5 million ≤ Population < 1 million
Category 4	Population < 0.5 million

3.3 Scoring Approach and Methodology

A city can earn a maximum score of 100 points for 79 indicators across four pillars. The pillar weights are as follows: Institutional (25 points), Social (25 points), Economy and Employment (5 points) and Physical (45 points). Based on the number and nature of indicators i.e., core vs. secondary, indicator wise maximum marks were computed.



100 marks
(Maximum overall score that any city can achieve)

25 marks (Maximum score that any city can achieve under **Institutional** Pillar)	25 marks (Maximum score that any city can achieve under **Social** Pillar)	5 marks (Maximum score that any city can achieve under **Economic** Pillar)	45 marks (Maximum score that any city can achieve under **Physical** Pillar)
1 (Category under Institutional Pillar)	4 (Number of categories under Social Pillar)	1 (Category under Economic Pillar)	9 (Number of categories under Physical Pillar)
8 (Number of indicators under Institutional)	20 (Number of indicators under Social Pillar)	5 (Category under Economic Pillar)	46 (Number of categories under Physical Pillar)
7 Core 1 Supporting	13 Core 7 Supporting	4 Core 1 Supporting	33 Core 13 Supporting

Dimensional Index Methodology (DIM) has been used to compute scores for each indicator with reference to "maximum within the comparison group" or "absolute benchmarks". For indicators where benchmarks are available, cities getting the benchmark score (or above) are given the maximum mark, and the marks awarded to other cities are calculated proportionately. For indicators where benchmarks are not available, the best performing cities in each population group are given the maximum mark, and the marks awarded to other cities (within the population group) are calculated proportionately. For indicators where benchmarks do not exist, the city data has been tested for outliers before scoring.

3.4 Scoring Normalisation:

To construct aggregate scores across cities as well as to make the scores across indicators comparable, indicator values were normalised using a min-max approach. The following formula was used to normalise the indicator values-

$$\frac{indicator\ value\ for\ the\ city - indicator\ value\ for\ the\ worst\ performing\ city}{benchmark - \ indicator\ value\ for\ the\ worst\ performing\ city}$$

This approach would restrict the normalised indicator value between 0 and 1. Cities that met or exceeded the benchmark received a normalised indicator value of 1. Worst performing cities are given a normalised indicator value of 0. After normalisation, the normalised value is weighted according to the category and the indicator being core or supporting.

To illustrate, consider the indicator 12.3 Quality of Water Supplied in the Category 12 for Assured Water Supply. If in City A 50% of the water samples collected qualify the potable water standards specified by the CPHEEO, and only 10% of the samples from worst performing city qualify the standards. Then, the normalised value for the indicator for city A would be 0.44 [(0.5-0.1)/(1-0.1)].

The weight for indicator 12.3 is 1.03, so the final weighted score for City A would come out to 0.45 [1.03*0.44].

4. Data Collection and Verification

4.1 Submission of Data by the cities

The Liveability Assessment is based on secondary data submitted by the urban local bodies and other concerned government agencies (collectively called as data owners). The 79 indicators were broken down into a set of easy to understand and relatable 553 questions mapped to data owners. Submission of the data was enabled through an online data entry portal on the smartnet platform of the Ministry. The portal also allowed the ULBs to download the liveability assessment questionnaire and upload filled in questionnaire. To familiarise and assist cities in identifying, mapping and collation of data points, a city level nodal person was available during the entire period of data submission process.

4.2 Mapping of Data Owners for the City

For the assessment of liveability indices broadly 12 data owners such as Central/state Pollution control board, Development authority, DISCOM/Electricity Board, State Disaster Management Authority, State Education Department, State Health department, State Renewable energy and development agency, State sales and commercial taxes department, town and country planning department, Traffic and police department, Transport authority, and Urban local body were identified to respond to the questions on the portal. However, during state workshop and subsequent city level discussions, more data owners were mapped to respond to different categories and sub categories. The following table provides the details of city level data owners mapped under the 12 data owner.

Table 3:Details of Data Owners

Designated data owners	Subcategories	Data owners at city level
Urban Local Body	For Accounts Related Questions	Municipal Corporation Faridabad
Urban Local Body	For Park and Recreation Related Questions	Municipal Corporation Faridabad
Urban Local Body	For Water Supply and Drainage related questions	Municipal Corporation Faridabad
Urban Local Body	For Heritage sites related data	Municipal Corporation Faridabad
Urban Local Body	For Ecological sites related data	Municipal Corporation Faridabad
Urban Local Body	For Housing related data	Municipal Corporation Faridabad
Urban Local Body	For Building plan related data	Municipal Corporation Faridabad
Urban Local Body	For Roads related data	Municipal Corporation Faridabad
Urban Local Body	For Solid waste management related data	Municipal Corporation Faridabad
Urban Local Body	For IT services related data	Municipal Corporation Faridabad
Urban Local Body	For Vendor committee related data	Municipal Corporation Faridabad
Urban Local Body	Any other departments involved in providing data for questions mentioned under Urban	Municipal Corporation Faridabad

Designated data owners	Subcategories	Data owners at city level
	Local Body	
Central / state Pollution control Board	Water Quality, Air Quality, Noise Quality	Haryana State Pollution Control Board - Faridabad Region
Development Authority	Building Infrastructure	Haryana Urban Development Authority
	Construction planning	Haryana Urban Development Authority
	Green Building	Haryana Urban Development Authority
	Rain water harvesting	Haryana Urban Development Authority
	Universal Design Principle	Haryana Urban Development Authority
DISCOM/Electricity Board	Electrical Connection/ Grievance Redressal/ Power supply	Dakshin Haryana Bijli Vitran Nigam
State Disaster management authority		District Disaster Management Authority
State Education Department		District Education Department
State Health Department	Health care professionals	Civil Hospital Faridabad
	Citizen Services	Civil Hospital Faridabad
	Disease Prevalence	Civil Hospital Faridabad
	Health Infrastructure	Civil Hospital Faridabad
State Renewable Energy Development Agency	Renewable Energy	District Renewable Energy Agency Development Authority
State Sales / Commercial Taxes Department		Excise & Taxation Department
Town and Country Planning Department	Land Use	District Town & Country Planning Department
Traffic and Police Department		Haryana Police
Transport Authorities	Buses	Haryana Roadways
	Registered Vehicles	Faridabad Smart City Limited
	Sub urban rail transport	Data Unavailable
	Mono Rail Authority	Not Applicable
	Tramways	Not Applicable

Designated data owners	Subcategories	Data owners at city level
	Marine Transport Authority	Not Applicable

4.3 List of secondary documents available as supportive

City has provided supporting documents/evidences against the responses given by city on the online portal. In support of their responses on the portal, city submitted 17 number of documents. Documents submitted includes reports, official orders, copy of data maintained in official register, signed copy of questionnaire, and signed letters/submissions from concern departments. Verification includes mapping of documents against responses given by city, checking the type/category of documents, and validation of data provided.

The following table presents the data owner wise number of documents:

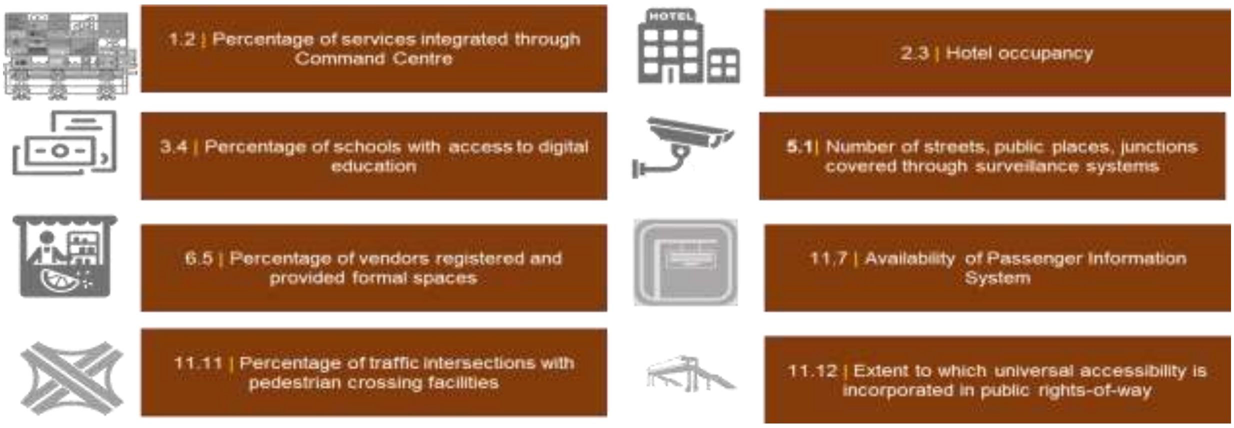
Table 4: Data owner wise number of secondary documents submitted by city

Data Owners	Number of Documents
Sales and Commercial Taxes	**0**
State Education Department	**3**
DISCOM/Electricity Department	**1**
Traffic and Police Department	**0**
Development Authority	**0**
Pollution Control Board	**0**
State Renewable Energy Department	**1**
Town and Country Planning	**0**
State Health Department	**1**
Transport Authority	**2**
Disaster Management	**1**
Urban Local Body	**8**
Total	**17***

4.4 Data Verification

A three-stage data quality check comprising verification of data against secondary documents furnished by data owners, logical inconsistency checks including outliers, and physical audit for select indicators (Refer the exhibit below) is being undertaken. The objective of the data quality check is to ensure that data from the source documents are accurate and verifiable. Sources of data included reports, administrative data, survey results and other statistical records, log books among other.

Physical audit of eight indicators – one indicator from the Institutional pillar, one from the Social pillar, one from the Economy pillar and five from the Physical pillar is also being carried out by the field team to ascertain the degree of reliability of data reported by the cities. The list of these eight indicators is presented below:



1.2 | Percentage of services integrated through Command Centre

2.3 | Hotel occupancy

3.4 | Percentage of schools with access to digital education

5.1 | Number of streets, public places, junctions covered through surveillance systems

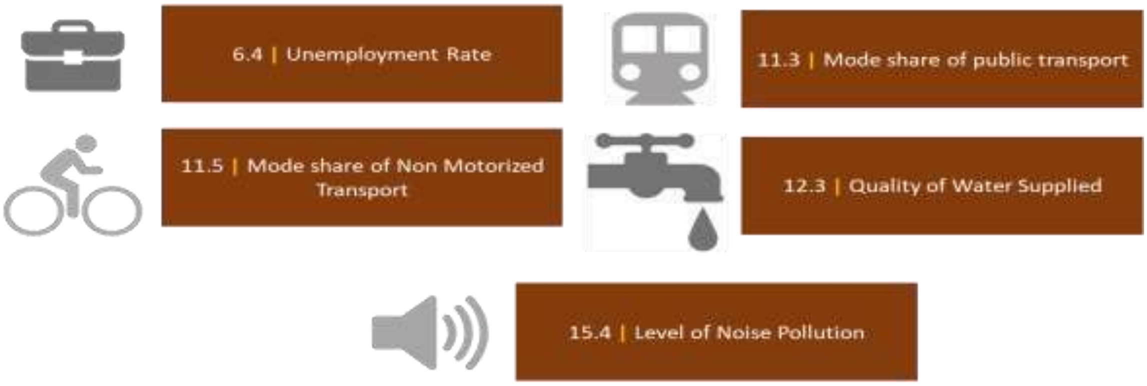
6.5 | Percentage of vendors registered and provided formal spaces

11.7 | Availability of Passenger Information System

11.11 | Percentage of traffic intersections with pedestrian crossing facilities

11.12 | Extent to which universal accessibility is incorporated in public rights-of-way

For a set of five indicators namely, unemployment rate, mode share of public transport, mode share of non-motorised transport, quality of water supplied and level of noise pollution, existing datasets were found to be not available consistently across all cities and/or were inadequate. To help cities that do not have data on these five indicators, dipstick assessments are being carried to fill data gaps.



6.4 | Unemployment Rate

11.3 | Mode share of public transport

11.5 | Mode share of Non Motorized Transport

12.3 | Quality of Water Supplied

15.4 | Level of Noise Pollution

4.5 Physical Audit

The following map presents the indicators audited at city level.

8. LA - Universal Design Principles

5. City Score on 15 categories of Assessment

Liveability Assessment covered 15 categories and 78 indicators. The below table presents the scores for all 15 indicators namely governance, identity & culture, education, health, safety and security, economy & employment, housing & inclusiveness, public open spaces, mixed land use & compactness, power supply, transport & mobility, assured water supply, waste water management, solid waste management and reduced pollution.

Table 5: Category wise scores

Categories	Scores in Percentage
Governance	67.00%
Identity & Culture	13%
Education	96%
Health	96%
Safety & Security	27%
Economy & Employment	2%
Housing & Inclusiveness	14%
Public Open Spaces	50%
Mixed Land Use & Compactness	2%
Power Supply	77%
Transport & Mobility	35%
Assured Water Supply	74%
Waste Water Management	48%
Solid Waste Management	39%
Reduced Pollution	75%

The rank of the city is based on the performance and scores in each of the category. The final city rank is submitted separately.

Executive Summary

Assessment of liveability indices is an initiative by the Ministry of Housing and Urban Affairs to improve quality of life of citizens and achieve sustainable development goals by encouraging cities to adopt "outcome based" approach for urban planning. Assessment process aimed to provide opportunity to cities to review the development components holistically by involving 79 measurable indicators categorized under governance, health, education, safety, economy, power supply, transportation and mobility, identity, culture, housing, waste management and pollution.

This report highlights the assessment process, key milestones, and the final outcome of the data submitted. Implementation of liveability assessment commenced formally on 19th January 2018. A national level workshop was organized on 13th February 2018 to explain the importance and process of liveability assessment and get feedback on methodology from the city authorities.

This was followed by the next stage of Questionnaire development. The questionnaire was arranged under 12 categories representing 12 data owners namely urban local body, Central and state pollution control board, development authority, DISCOM/Electricity board, State disaster management authority, state education department, state health department, state renewable energy development agency, state sales and commercial taxes department, town and country planning department, traffic and police department and transport authorities.

An online data entry portal was developed to facilitate data submission by the cities. Each city had a unique log in to access the portal and submit the data. Both online and off-line options (download the questionnaire in an excel) to submit the data were available for cities. An email help desk was set up for the cities to raise any queries and seek clarification when responding to the questions.

A team for each state comprising of State Coordinator and City Coordinator (one per city) was deployed that facilitated the process and supported the cities. A total of 6 regional coordinators/ consultants, 29 State Coordinators, and 99 city coordinators were deployed across 116 cities. Training for state coordinators was held from 26th to 28th February 2018 at Chennai to make coordinators understand overall liveability assessment, indicators, data sources, protocols and roles and responsibilities.

City Reconnaissance Meetings were initiated by the state and city coordinators. The discussion began with discussions to finalize the state workshop schedule, mapping of data owners, and assist cities in data collection. The City Coordinators were based in the cities for over 6 weeks and during this time, they liase with ULB and other data owners to explain the liveability framework, online portal, and facilitate the online submission.

A total of 33 state workshops were conducted at the state level. The objective of the workshop was to orient the city stakeholders on liveability assessment, indicators, components of data collection, timelines, expectations of support and support extended by MoHUA. The state level workshops brought

various city level departments on a single platform to understand and discuss the methodology and components of city liveability assessment.

Nodal agency at state level supported by the City and State Coordinator and city level (Municipality corporation/smart city limited) coordinated with city specific data owners/departments for data gathering, collation, and submission. Nodal persons in each department were appointed for timely data collection and submission. Of 116, 112 cities submitted data as per the timeline on 16th April 2018.

Post submission, the city and state coordinators supported by the central team followed up extensively with the cities to support secondary documents as evidence to substantiate their submissions. Secondary documents such as reports, official orders, copy of office register, signed copy of liveability assessment questionnaire furnished by cities against the submitted data. Documents are verified to map the documents for the reponses provided by city and to check the type data provided by city. The document check outcomes were shared with the cities as a part of data quality check.

For checking consistency of data, logical check of data, verifying data from other public sources were undertaken. Quality check was done to ensure data validity and provide opportunity to cities to review the data provided by them and correct in case of wrong data entry.

For 8 selected indicators namely, percentage of services integrated through command and control center, hotel occupancy rate, percentage of schools with access to digital education, number of CCTV cameras per unit road length, percentage of vendors registered and provided formal spaces, availability of passenger information system, percentage of traffic intersection with pedestrian crossing facility, and extent to which universal accessibility is incorporated in public rights of way. Physical audit was conducted in 110 cities by physical auditors appointed and trained by the consortium. In consultation with ULB nodal person, locations and indicators for physical audit was selected in each city. A mobile based application was developed to capture the physical audit related data.

Primary data collection was done for five indicators such as unemployment rates, mode share of public transport, mode share of non-motorized transport, quality of water supplied, and level of noise pollution. Protocols for water and noise test were prepared in consultation with experts. Water quality test involved physical, chemical and bacteriological test of water as per the CPCB norms. For testing quality of water at consumer end, the auditors worked closely with the ULB and Water department. Samples were collected from consumer end and submitted to the lab suggested by city. For noise pollution, in about 20 cities the state pollution board or city level environment department took the responsibility for providing noise pollution data as per the protocols. In rest of the cities, mobile based application was used to measure noise pollution.

During implementation, MoHUA facilitated the process by conducting video conferences with cities to address any queries, reiterate the importance, and ensure that cities adequately engages in the process and submit their responses in time and respond to requests for clarifications.

In addition to secondary data collection, physical audit and primary data collection, citizen survey was conducted to understand their perception and level of satisfaction on various services such as health, education, water supply, electricity, waste management etc. provided by urban local bodies. Over 60000 citizens participated in the survey across India.

The final scores and ranks have been generated based on the scoring methodology that has been discussed extensively and minor modifications made that are summarized as below:

#	Challenges	Proposed Solutions
1	Only 23 cities of 111 cities have City Mobility Plan (CMP) or any and hence able to provide data for Mode Share of Public Transport and Non-Motorised Transport. To address the data gap, as advised by the MoHUA, the consortia undertook a sample dipstick across all cities covering a sample of 150 Households. Understandably, the dipstick findings will not match the rigor of a CMP.	We recommend the following: 1) Cities which have provided CMP Data will be evaluated on 100% of the maximum score 2) For the cities where the dipstick data is used, the city receives a 50% discount on the overall score Alternatively, another approach is to assign 0 score to all 88 cities that don't have a CMP
2	Variance was observed on data reported by cities on road network and data presented in the smart city proposals during the verifications.	We recommend taking the data reported by the cities in the Smart City Proposals.
3	There is no secondary source/ organization that provides unemployment data at city level. As a result, most cities do not have the data. Fully cognizance of the challenges of generating this data in a short span of time, it was agreed to collect this data through a dipstick survey on lines of NSSO questions. The data generated needs further scrutiny and triangulation with some inputs from experts. This may not be possible in the short	The indicator on unemployment will be excluded from scores. For final ranking, the cities will be scored on 78 indicators.

#	Challenges	Proposed Solutions
	window.	
4	Many cities did not have data on noise pollution and it was decided that data will be collected using a mobile app for all the 111 cities. However, many cities have expressed reservations with the approach especially with respect to the reliability of using this data. Further, some cities have relied on the SPCB to collect the data as per the approach proposed by the consortia. Thus, noise pollution data is currently from two sources: 1. SPCB- 20 cities 2. Noise-based app- 91 cities	The data collected through the primary survey will be used for scoring the cities. Currently, there is no differential scoring for the data from the SPCB and the data collected through the mobile app. However, a certain higher weightage can be provided to those cities which used the state apparatus to collect noise pollution data.
5	For the indicator on quality of water supplied, the methodology document states that samples should be drawn both at the treatment plant outlet as well as the consumer end. However, the data provided by the cities were predominantly from the distribution point. Hence for consumer end results with MoHUA intervention, consortia coordinated with cities to collect the data at the consumer end. The cities facilitated the testing. The outcome of the process is as below: 1. Sample given- 102 cities 2. Report received- 86 cities 3. Report awaited- 16 cities 4. Tests not completed due to lack of cooperation and other reasons – 9	The maximum score for this indicator will be distributed equally (50%) for results based on samples from the treatment plant and consumer end. Cities that did not complete tests or provide the results will be given a score 0 for against consumer end tests.
6	City level population is not projected annually by most of the cities. So, estimates for 2017 population are not available with the cities.	As recommended by MoHUA, 2011 census population is being used for the ranking purpose.

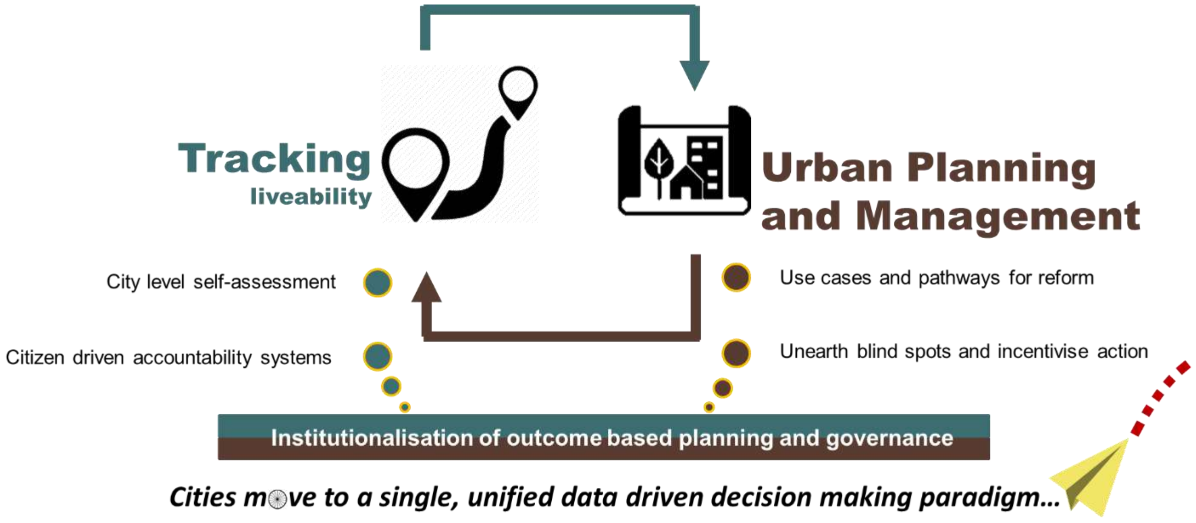
#	Challenges	Proposed Solutions
7	The age category specific data for 9 cities is not available at a city level	The age category specific population data has been taken at a district level for these cities.
8	Indicators on non-motorised transports like- Dedicated bicycle tracks, bicycle parking facilities and mode share of non-motorised transport are not relevant for hilly terrains.	As discussed during the PMC meeting, these indicators have been treated as non-applicable for the hilly cities and the weights have been redistributed among other indicators within the same category.
9	The indicator on increase in professional tax is not relevant to cities which do not levy the professional tax.	As discussed during the PMC meeting, this indicator has been non-applicable to the cities belonging to states where professional tax is not levied, and the weights have been redistributed among other indicators within the same category.
10	The indicator on increase in VAT collection is not applicable to Port Blair and Kavaratti, as there was no provision of VAT collection in these cities.	As discussed during the PMC meeting, these indicatosr has been treated as non-applicable for these two cities and the weights have been redistributed among other indicators within the same category.
11	Indicator on coverage of basic services to slum households does not concern cities with no slums (notified/ non-notified.	As discussed during the PMC meeting, this indicators has been treated as non-applicable for these cities and the weights have been redistributed among other indicators within the same category.

1. Introduction

The Ministry of Housing and Urban Affairs (MoHUA) is implementing several flagship urban missions such as the Smart Cities Mission (SCM), Atal Mission for Urban Rejuvenation and Transformation (AMRUT), Heritage City Development and Augmentation Yojana (HRIDAY), Housing for All (HFA). Theses mission along with other transformative initiatives of the Government including National Water Mission, Power for All, National Health Mission are aimed at making Indian cities more 'liveable.' The overarching goal of these initiatives is to move from an input-based approach to a 'citizen centric-outcome based' assessment of urban liveability.

To develop a common minimum framework for cities to assess their existing status and chart their pathway towards providing a better quality of life to their citizens, the MoHUA developed a set of 'Liveability Standards' relevant to cities to generate a Liveability Index and ranking of cities. These standards were launched in June, 2017. The MoHUA has planned to conduct an 'Annual Assessment of Liveability Standards in Cities – an ambitious national project that will involve yearly submission of data by cities across the various indicators, compilation and analysis, development of indices and ranking of cities. The Liveability Index is envisioned as a 360° tool for tracking, planning and transforming Indian cities. The Liveability Index is aimed at the following objectives:

- Providing strong evidence-based approach for future interventions and investments to deliver liveability outcomes
- Catalysing actions to improve the overall quality of the city's liveability and achieve broader development outcomes including the Sustainable Development Goals
- Assessing the implementation of government policies and schemes governing characteristics of cities that can contribute to creating liveable communities



Tracking

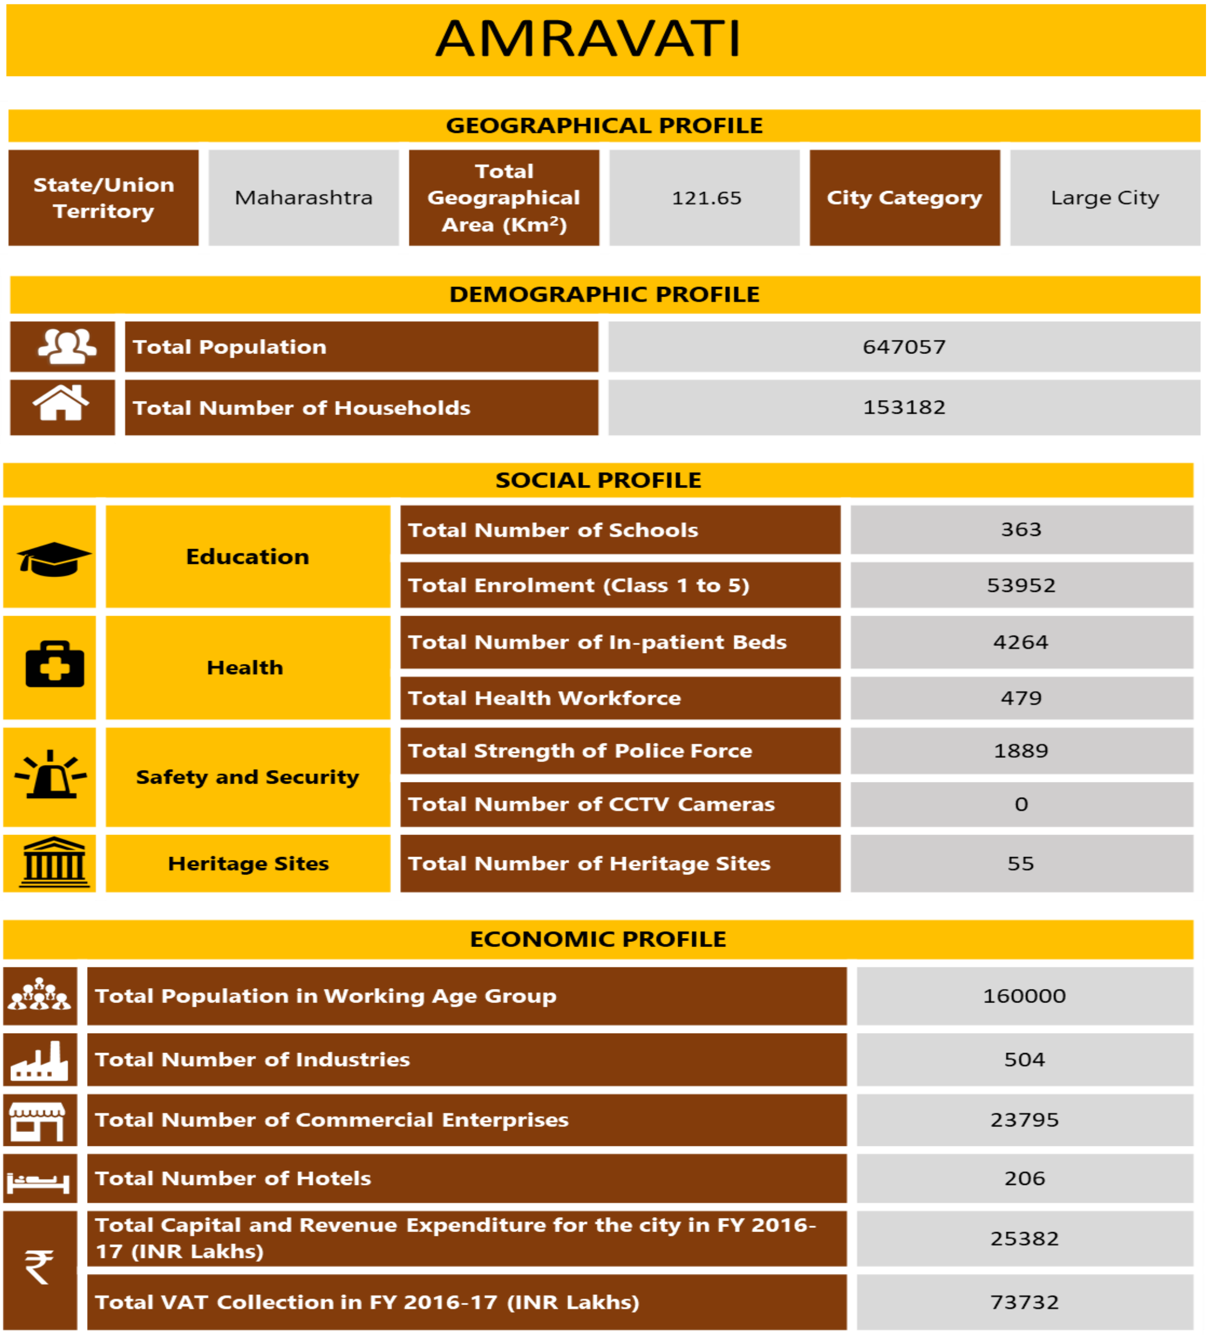
Citizen driven accountability systems
Use cases and pathways for reform
Unearth blind spots and incentivise action
Institutionalisation of outcome based planning and governance

Cities move to a single, unified data driven decision making paradigm…

The first round of the assessment commenced in January 2018 covering 116 major cities including smart cities, capital cities and cities with population of above one million each. Implementation of the liveability assessment commenced in January 2018 with a national level orientation workshop for the urban local bodies. The workshop aimed at orienting the states and urban local bodies on the overall framework, indicators, data sources, methodology and key milestones and timelines involved in the liveability assessment. Subsequently, a series of State/ Union Territory level orientation workshops were carried out in 33 states/UTs for a detailed discussion on the framework. Online data collection commenced from 9th March through an online data collection platform that supported both online and offline data submission modes. On the date of closure of the online data entry portal i.e., 16th April, 2018 112 cities submitted their data. Subsequently, comprehensive checks on the submitted data was undertaken that involved checking for outliers, logical inconsistencies etc. post which round-1 of data reconciliation was conducted. This draft report is based on round-1 of reconciled data as on 28th April, 2018.

2. City Profile

This chapter presents the city profile -Geographic and Demographic, Social (Education Health, Safety and Security, Heritage), Economic profile, and Physical (Water, sanitation and Waste Management, Electricity, Open space and roads).



AMRAVATI

GEOGRAPHICAL PROFILE

State/Union Territory	Maharashtra	**Total Geographical Area (Km^2)**	121.65	**City Category**	Large City

DEMOGRAPHIC PROFILE

Total Population	647057
Total Number of Households	153182

SOCIAL PROFILE

Education	**Total Number of Schools**	363
	Total Enrolment (Class 1 to 5)	53952
Health	**Total Number of In-patient Beds**	4264
	Total Health Workforce	479
Safety and Security	**Total Strength of Police Force**	1889
	Total Number of CCTV Cameras	0
Heritage Sites	**Total Number of Heritage Sites**	55

ECONOMIC PROFILE

Total Population in Working Age Group	160000
Total Number of Industries	504
Total Number of Commercial Enterprises	23795
Total Number of Hotels	206
Total Capital and Revenue Expenditure for the city in FY 2016-17 (INR Lakhs)	25382
Total VAT Collection in FY 2016-17 (INR Lakhs)	73732

PHYSICAL PROFILE

	Water	**Average Quantity of Water Supplied (MLD)**	96.46
		Total Number of Water Connections	88612
	Sanitation Facilities	**Total number of households with access to individual toilets in the city**	121853
		Total number of households in the city with access to community toilets in the city	15000
	Solid Waste Management	**Daily average quantity of municipal solid waste collected in the city (Tonnes/day)**	230
		Total number of households covered through door-to-door collection of solid waste	153182
	Waste Water	**Daily Average Quantum of Waste Water Generated in the City (MLD)**	91.02
		Daily average quantum of waste water treated by STPs in the city (MLD)	7.5
	Electricity	**Total number of authorized electrical connections in the city**	159678
		Total electricity supplied to the city (kWh)	432000000
	Public and Open Spaces	**Total area covered by green spaces in the city (m^2)**	438000
	Roads and Transport	**Total Length of Road Network in the City (Km)**	1048.87
		Total length of arterial and sub-arterial road network in the city (Km)	66.8
		Total length of footpath (wider than 1.2 metres) in the city along the street network (Km)	42.22

3. Liveability Framework and Indicators

The Liveability Framework comprises a total of 79 indicators (57 Core Indicators and 22 Supporting Indicators). A core indicator carries 70% weightage and a supporting indicator carries 30% weightage. These indicators are grouped under 15 thematic categories which in turn are part of four pillars of comprehensive development of cities i.e., institutional, social, economic and physical. Based on the performance of cities against the various core and supporting indicators, various 'Category Sub-Indexes' and a composite 'City Liveability Index' will be developed for each city.

3.1 Scoring and Computing Category Indices of Liveability

The set of 79 indicators, associated categories and pillars are presented in the table below:

Table 1 List of Pillars, Categories and Indicators

Pillars of Comprehensive Development	Category	Indicators
Institutional	1. Governance	1.1 Percentage of citizen services available online
		1.2 Percentage of services integrated through Command Centre
		1.3 Percentage of citizens using online services
		1.4 Average delay in grievance redressal
		1.5 Tax collected as percentage of tax billed
		1.6 Extent of cost recovery (O&M) in water supply services
		1.7 Capital spending as percentage of total expenditure
		1.8 Percentage of population covered under Ward Committees/Area *Sabhas*
Social	**2. Identity and Culture**	2.1 Restoration and reuse of historic buildings
		2.2 Percentage of ecologically important areas covered through projects for restoration
		2.3 Hotel occupancy
		2.4 Percentage of budget allocated towards cultural/sports activities
		2.5 Number of cultural/sports events hosted by city
	3. Education	3.1 Percentage of school-aged population enrolled in schools
		3.2 Percentage of female school-aged population enrolled in schools

Pillars of Comprehensive Development	Category	Indicators
		3.3 Primary education student-teacher ratio
		3.4 Percentage of schools with access to digital education
		3.5 Percentage of students completing primary education
		3.6 Percentage of students completing secondary education
	4. Health	4.1 Number of in-patient hospital beds per 10,000 population
		4.2 Healthcare professionals per 10,000 population
		4.3 Average response time in case of health emergencies
		4.4 Period prevalence of water borne diseases
		4.5 Period prevalence of vector borne diseases
	5. Safety and Security	5.1 Number of CCTV Cameras
		5.2 Number of recorded crimes per lakh population
		5.3 Extent of crimes recorded against women, children and elderly per year
		5.4 Transport-related fatality per lakh population
Economic	**6. Economy and Employment**	6.1 Increase in VAT/GST collection
		6.2 Increase in collection of Professional Tax
		6.3 Increase in issuance of Construction permits
		6.4 Unemployment rate
		6.5 Percentage of vendors registered and provided formal spaces
Physical	**7. Housing and Inclusiveness**	7.1 Percentage of Slum/EWS households covered through formal/affordable housing
		7.2 Percentage of slum areas covered through basic services
	8. Public Open Spaces	8.1 Per capita availability of green spaces
		8.2 Per capita availability of public and recreational places
	9. Mixed Land Use and Compactness	9.1 Share of mixed land use area in overall city land use
		9.2 Net Density
	10. Power Supply	10.1 Percentage of city population with authorized electrical services
		10.2 Percentage of electrical connections covered

Pillars of Comprehensive Development	Category	Indicators
		through smart meters
		10.3 Average number of electrical interruptions per year
		10.4 Average length of electrical interruptions per year
		10.5 Percentage of total energy derived from renewable sources
		10.6 Energy consumption per unit - water supply and sewerage
		10.7 Energy consumption per unit - street lighting
		10.8 Percentage of new and redeveloped buildings following green building norms
		10.9 Total energy consumption per capita
	11. Transportation and Mobility	11.1 Geographical coverage of public transport
		11.2 Availability of public transport
		11.3 Mode share of public transport
		11.4 Percentage of road network with dedicated bicycle tracks
		11.5 Percentage of interchanges with bicycle parking facilities
		11.6 Mode share of non-motorized transport
		11.7 Availability of Passenger Information System
		11.8 Extent of signal synchronization
		11.9 Availability of paid parking spaces
		11.10 Percentage coverage of footpaths – wider than 1.2 m
		11.11 Percentage of traffic intersections with pedestrian crossing facilities
		11.12 Extent to which universal accessibility is incorporated in public rights-of-way
	12. Assured Water Supply	12.1 Household level coverage of direct water supply connections
		12.2 Per capita supply of water
		12.3 Quality of water supplied
		12.4 Level of non-revenue water – NRW
		12.5 Percentage of water connections covered through meters
		12.6 Percentage of plots with rainwater harvesting facility
	13. Waste Water	13.1 Coverage of toilets

Pillars of Comprehensive Development	Category	Indicators
	Management	13.2 Coverage of sewerage network and/or septage
		13.3 Collection efficiency of sewerage network
		13.4 Extent of reuse and recycling of waste water
		13.5 Coverage of storm water drains
	14. Solid Waste Management	14.1 Household level coverage of municipal solid waste collection
		14.2 Efficiency of collection of municipal solid waste
		14.3 Extent of municipal solid waste recovered through reuse
	15. Reduced Pollution	15.1 Concentration of SO2- air pollution
		15.2 Concentration of NO2- air pollution
		15.3 Concentration of PM10 - air pollution
		15.4 Level of noise pollution
		15.5 Quality of water in public surface water bodies

3.2 Scoring and Computing Category Indices of Liveability

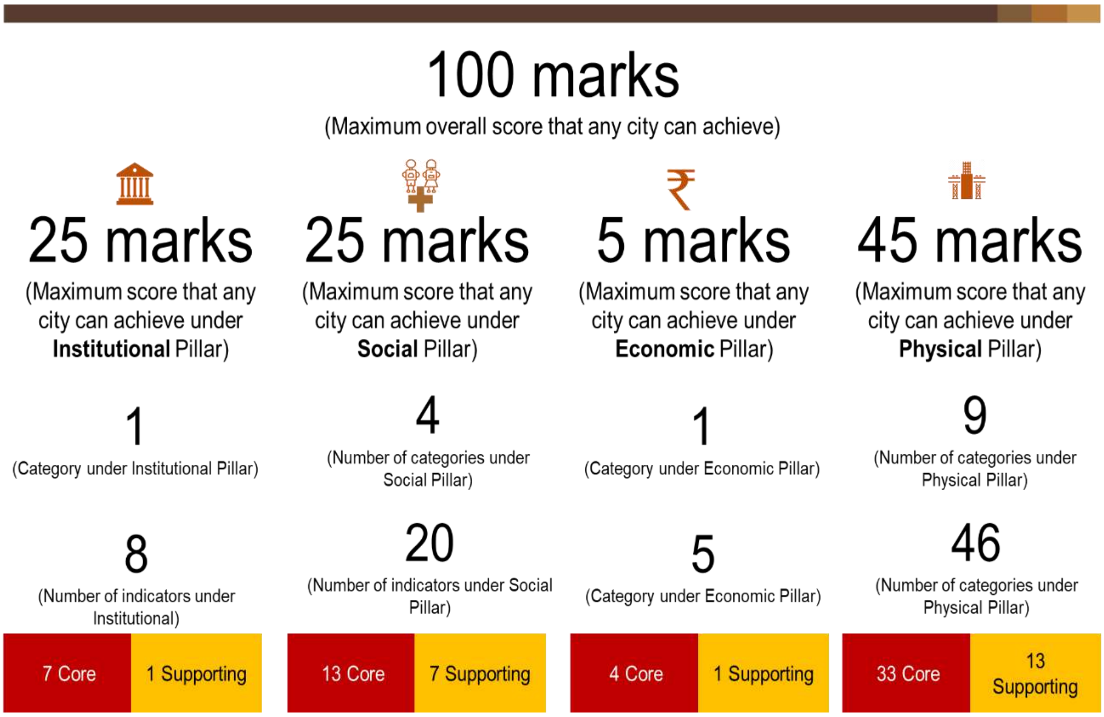
The performance achieved by cities against 79 indicators, will be assessed against given benchmarks. Where no international/national norms are available, city with the best performance in its group (population range) will be treated as a benchmark. The groups are given in the table below.

Table 2 Details on Population Range

Category	Population range
Category 1	Population ≥ 4 million
Category 2	1 million ≤ Population < 4 million
Category 3	0.5 million ≤ Population < 1 million
Category 4	Population < 0.5 million

3.3 Scoring Approach and Methodology

A city can earn a maximum score of 100 points for 79 indicators across four pillars. The pillar weights are as follows: Institutional (25 points), Social (25 points), Economy and Employment (5 points) and Physical (45 points). Based on the number and nature of indicators i.e., core vs. secondary, indicator wise maximum marks were computed.



100 marks

(Maximum overall score that any city can achieve)

25 marks	25 marks	5 marks	45 marks
(Maximum score that any city can achieve under **Institutional** Pillar)	(Maximum score that any city can achieve under **Social** Pillar)	(Maximum score that any city can achieve under **Economic** Pillar)	(Maximum score that any city can achieve under **Physical** Pillar)
1	4	1	9
(Category under Institutional Pillar)	(Number of categories under Social Pillar)	(Category under Economic Pillar)	(Number of categories under Physical Pillar)
8	20	5	46
(Number of indicators under Institutional)	(Number of indicators under Social Pillar)	(Category under Economic Pillar)	(Number of categories under Physical Pillar)
7 Core 1 Supporting	13 Core 7 Supporting	4 Core 1 Supporting	33 Core 13 Supporting

Dimensional Index Methodology (DIM) has been used to compute scores for each indicator with reference to “maximum within the comparison group” or “absolute benchmarks”. For indicators where benchmarks are available, cities getting the benchmark score (or above) are given the maximum mark, and the marks awarded to other cities are calculated proportionately. For indicators where benchmarks are not available, the best performing cities in each population group are given the maximum mark, and the marks awarded to other cities (within the population group) are calculated proportionately. For indicators where benchmarks do not exist, the city data has been tested for outliers before scoring.

3.4 Scoring Normalisation:

To construct aggregate scores across cities as well as to make the scores across indicators comparable, indicator values were normalised using a min-max approach. The following formula was used to normalise the indicator values-

$$\frac{indicator\ value\ for\ the\ city - indicator\ value\ for\ the\ worst\ performing\ city}{benchmark - \ indicator\ value\ for\ the\ worst\ performing\ city}$$

This approach would restrict the normalised indicator value between 0 and 1. Cities that met or exceeded the benchmark received a normalised indicator value of 1. Worst performing cities are given a normalised indicator value of 0. After normalisation, the normalised value is weighted according to the category and the indicator being core or supporting.

To illustrate, consider the indicator 12.3 Quality of Water Supplied in the Category 12 for Assured Water Supply. If in City A 50% of the water samples collected qualify the potable water standards specified by the CPHEEO, and only 10% of the samples from worst performing city qualify the standards. Then, the normalised value for the indicator for city A would be 0.44 [(0.5-0.1)/(1-0.1)].

The weight for indicator 12.3 is 1.03, so the final weighted score for City A would come out to 0.45 [1.03*0.44].

4. Data Collection and Verification

4.1 Submission of Data by the cities

The Liveability Assessment is based on secondary data submitted by the urban local bodies and other concerned government agencies (collectively called as data owners). The 79 indicators were broken down into a set of easy to understand and relatable 553 questions mapped to data owners. Submission of the data was enabled through an online data entry portal on the smartnet platform of the Ministry. The portal also allowed the ULBs to download the liveability assessment questionnaire and upload filled in questionnaire. To familiarise and assist cities in identifying, mapping and collation of data points, a city level nodal person was available during the entire period of data submission process.

4.2 Mapping of Data Owners for the City

For the assessment of liveability indices broadly 12 data owners such as Central/state Pollution control board, Development authority, DISCOM/Electricity Board, State Disaster Management Authority, State Education Department, State Health department, State Renewable energy and development agency, State sales and commercial taxes department, town and country planning department, Traffic and police department, Transport authority, and Urban local body were identified to respond to the questions on the portal. However, during state workshop and subsequent city level discussions, more data owners were mapped to respond to different categories and sub categories. The following table provides the details of city level data owners mapped under the 12 data owner.

Table 3:Details of Data Owners

Designated data owners	Subcategories	Data owners at city level
Urban Local Body	For Accounts Related Questions	Accounts & Audit departments
Urban Local Body	For Park and Recreation Related Questions	Assistant Director, Planning Wing and Manager, IT Department
Urban Local Body	For Water Supply and Drainage related questions	Assistant Director, Planning Wing and Manager, IT Department
Urban Local Body	For Heritage sites related data	Assistant Director, Planning Wing and Manager, IT Department
Urban Local Body	For Ecological sites related data	Assistant Director, Planning Wing and Manager, IT Department
Urban Local Body	For Housing related data	Assistant Director, Planning Wing and Manager, IT Department
Urban Local Body	For Building plan related data	Assistant Director, Planning Wing and Manager, IT Department
Urban Local Body	For Roads related data	Assistant Director, Planning Wing and Manager, IT Department
Urban Local Body	For Solid waste management related data	Assistant Director, Planning Wing and Manager, IT Department
Urban Local Body	For IT services related data	Assistant Director, Planning Wing and

		Manager, IT Department
Urban Local Body	For Vendor committee related data	NA
Urban Local Body	Any other departments involved in providing data for questions mentioned under Urban Local Body	Assistant Director, Planning Wing and Manager, IT Department
Central / state Pollution control Board	Water Quality, Air Quality, Noise Quality	Pollution Control Board
Development Authority	Building Infrastructure	Andhra Pradesh- Capital Region Development Authority (AP- CRDA)
	Construction planning	Andhra Pradesh- Capital Region Development Authority
	Green Building	Andhra Pradesh- Capital Region Development Authority
	Rain water harvesting	Andhra Pradesh- Capital Region Development Authority
	Universal Design Principle	Andhra Pradesh- Capital Region Development Authority
DISCOM/Electricity Board	Electrical Connection/ Grievance Redressal/ Power supply	Andhra Pradesh Eastern Power Distribution Company Limited (APEPDCL)
State Disaster management authority		Addition Commissioner (Projects) District DM Authority,
State Education Department		District Educational Officer
State Health Department	Health care professionals	District Medical & Health Department
	Citizen Services	District Medical & Health Department
	Disease Prevalence	District Medical & Health Department
	Health Infrastructure	District Medical & Health Department
State Renewable Energy Development Agency		National Renewable Energy Corporation Limited

State Sales / Commercial Taxes Department		Deputy Commissioner, Commercial tax Department
Town and Country Planning Department	Land Use	Town Planning Department.
Traffic and Police Department		Office of Superintendent of Police.
Transport Authorities	Buses	Road Transport Authority
	Registered Vehicles	Road Transport Authority
	Sub urban rail transport	-
	Mono Rail Authority	-
	Tramways	-
	Marine Transport Authority	-

4.3 List of secondary documents available as supportive

City has provided supporting documents/evidences against the responses given by city on the online portal. In support of their responses on the portal, city submitted 2 number of documents. Documents submitted includes reports, official orders, copy of data maintained in official register, signed copy of questionnaire, and signed letters/submissions from concern departments. Verification includes mapping of documents against responses given by city, checking the type/category of documents, and validation of data provided.

The following table presents the data owner wise number of documents:

Table 4: Data owner wise number of secondary documents submitted by city

Data Owners	Number of Documents
Sales and Commercial Taxes	0
State Education Department	0
DISCOM/Electricity Department	0
Traffic and Police Department	0
Development Authority	0
Pollution Control Board	0
State Renewable Energy Department	0
Town and Country Planning	0

State Health Department	0
Transport Authority	0
Disaster Management	0
Urban Local Body	2
Total	2*

4.4 Data Verification

A three-stage data quality check comprising verification of data against secondary documents furnished by data owners, logical inconsistency checks including outliers, and physical audit for select indicators (Refer the exhibit below) is being undertaken. The objective of the data quality check is to ensure that data from the source documents are accurate and verifiable. Sources of data included reports, administrative data, survey results and other statistical records, log books among other.

Physical audit of eight indicators – one indicator from the Institutional pillar, one from the Social pillar, one from the Economy pillar and five from the Physical pillar is also being carried out by the field team to ascertain the degree of reliability of data reported by the cities. The list of these eight indicators is presented below:

1.2 | Percentage of services integrated through Command Centre

2.3 | Hotel occupancy

3.4 | Percentage of schools with access to digital education

5.1 | Number of streets, public places, junctions covered through surveillance systems

6.5 | Percentage of vendors registered and provided formal spaces

11.7 | Availability of Passenger Information System

11.11 | Percentage of traffic intersections with pedestrian crossing facilities

11.12 | Extent to which universal accessibility is incorporated in public rights-of-way

For a set of five indicators namely, unemployment rate, mode share of public transport, mode share of non-motorised transport, quality of water supplied and level of noise pollution, existing datasets were found to be not available consistently across all cities and/or were inadequate. To help cities that do not have data on these five indicators, dipstick assessments are being carried to fill data gaps.

6.4 | Unemployment Rate

11.3 | Mode share of public transport

11.5 | Mode share of Non Motorized Transport

12.3 | Quality of Water Supplied

15.4 | Level of Noise Pollution

5. Indicator Values

In this chapter, indicator values for **74 indicators** excluding the five indicators for which primary data collection is currently underway is presented. The five indicators include:

Indicator number	Indicator title
Indicator No. 6.4	Unemployment rate
Indicator No. 11.3	Mode share of public transport
Indicator No. 11.5	Mode share of non-motorised transport
Indicator No. 12.3	Quality of drinking water
Indicator No. 15.4	Noise pollution

For each indicator, the corresponding definition, unit of expression i.e., number, percentage etc. indicator value based on the data provided for the numerator /denominator, subtrahend/minuend etc., and the corresponding benchmark values has been presented. The indicators are organized, pillar and category wise for easy reference.

Table 5: Details of Indicator Values

Pillar: Institutional

Category 1: Governance

Indicator No: 1.1	Percentage of citizen services available online	**30.77**
Description	Average citizen services available online	
Sub Indicators	1.1a birth certificate	0
	1.1b death certificate	0
	1.1c trade license	0
	1.1d solid waste management	0
	1.1e water supply	0
	1.1f sewerage/drainage	0
	1.1g fogging	0
	1.1h property tax	0
	1.1i professional tax	0
	1.1j information	1
	1.1k Grievance redressal	1
	1.1l electricity	1
	1.1m Building plan	1
Unit	Percentage	
Benchmark	100%	
Indicator No: 1.2	Percentage of services integrated through Command Centre	**130.95**
Description	Services integrated through an integrated or a singular operations command centre	27.5
Unit	Percentage	
Benchmark	100%	
Indicator No. 1.3	Percentage of citizens using online services	**109.35**
Description		
Sub Indicators	1.3a Building plan	0.24533616
	1.3b Birth/Death Certificate	NA

	1.3c water supply	NA
	1.3d solid waste management	NA
	1.3e property tax	NA
	1.3f professional tax (RC)	NA
	1.3g professional tax (EC)	NA
	1.3h complaints/ grievance redressal	NA
	1.3i information	1.941747573
	1.3j electricity	NA
Unit	Percentage	
Benchmark	100%	
Indicator No. 1.4	Average delay in grievance redressal	**2.33**
Description		
Sub Indicators	1.4a water supply	3
	1.4b solid waste	2
	1.4c street lights	3
	1.4d sewerage	3
	1.4e professional tax	NA
	1.4f parks and recreational spaces	3
	1.4g building plan	0
Unit	Days	
Benchmark	0	
Indicator No: 1.5	Tax collected as percentage of tax billed	**Non-Computable**
Formula:	*Numerator / Denominator*	
Numerator	Total tax collected in a year	Data Unavailable
Denominator	Total demand raised for the year	Data Unavailable
Unit	Percentage	
Benchmark	90%	
Indicator No: 1.6	Extent of cost recovery (O&M) in water supply services	**Non-Computable**
Formula:	*Numerator / Denominator*	

Numerator	Total collection of user charges in water supply in a year	Data Unavailable
Denominator	Total O&M cost for providing water supply services during the year	55
Unit	Percentage	
Benchmark	100%	
Indicator No: 1.7	Capital spending as percentage of total expenditure	**Non-Computable**
Formula:	*Numerator / Denominator*	
Numerator	Total capital expenditure during a year	Data Unavailable
Denominator	Total expenditure (revenue and capital accounts) in the same year	Data Unavailable
Unit	Percentage	
Benchmark	City with the highest performance (amongst cities in the same city-size classification)	
Indicator No: 1.8	Percentage of population covered under Ward Committees/ Area *Sabhas*	**Non-Computable**
Formula:	*Numerator / Denominator*	
Numerator	Number of Wards with notified ward committees	NA
Denominator	Total number of wards	29
Unit	Percentage	
Benchmark	City with the highest performance (amongst cities in the same city-size classification)	

Pillar: Social

Category 2: Identity and Culture

Indicator No: 2.1	Restoration and reuse of historic buildings	**66.67**
Formula:	*Numerator / Denominator*	
Numerator	Number of historic buildings/sites restored/preserved/brought under adaptive reuse	2
Denominator	Total number of historic buildings/sites identified	3
Unit	Percentage	
Benchmark	100%	
Indicator No: 2.2	Percentage of ecologically important areas covered through projects for restoration	**Non-Computable**
Formula:	*Numerator / Denominator*	
Numerator	Ecologically important sites covered through projects for restoration	0
Denominator	Total number of ecologically important sites identified in the city	0
Unit	Percentage	
Benchmark	100%	
Indicator No: 2.3	Hotel Occupancy	**0**
Description	Average Occupancy rate of Hotels	0
Unit	Percentage	
Benchmark	City with the highest performance (amongst cities in the same city-size classification) will be treated as the benchmark	
Indicator No: 2.4	Percentage of budget allocated towards cultural/sports activities	**Non-Computable**
Formula:	*Numerator / Denominator*	
Numerator	Budget allocated for cultural/sports activities	Data Unavailable
Denominator	Total budget of the ULB (capital and revenue)	Data Unavailable
Unit	Percentage	
Benchmark	City with the highest performance (amongst cities in the same city-size classification) will be treated as the benchmark	
Indicator No: 2.5	Number of cultural/sports events hosted by city	**7**
Description	Number of cultural/sports events hosted by the city authority in the preceding year	7

Unit		
Benchmark		

Category 3: School Education

Indicator No: 3.1	Percentage of school-aged population enrolled in schools	**Non-Computable**
Formula:	*Numerator / Denominator*	
Numerator	Total enrolment in primary and secondary schools (public and private)	6607
Denominator	Total population in the age group of 6-14 years	Data Unavailable
Unit	Percentage	
Benchmark	100%	
Indicator No: 3.2	Percentage of female school-aged population enrolled in schools	**Non-Computable**
Formula:	*Numerator / Denominator*	
Numerator	Total female enrolment in primary and secondary schools (public and private	3487
Denominator	Total female population in the age group of 6-14 years	Data Unavailable
Unit	Percentage	
Benchmark	100%	
Indicator No: 3.3	Primary education student-teacher ratio	**20.24**
Formula:	*Numerator / Denominator*	
Numerator	Total number of students in primary grades (public and private)	3988
Denominator	Total number of teachers available for primary grades (public and private schools)	197
Unit	Ratio	
Benchmark	1 teacher for every 30 students	
Indicator No: 3.4	Percentage of schools with access to digital education	**20.27**
Formula:	*Numerator / Denominator*	
Numerator	Number of schools (public and private) with facilities for using digital educational content (availability of necessary infrastructure and connection to digital resources such as NKN)	15
Denominator	Total number of schools	74
Unit	Percentage	
Benchmark	100%	
Indicator No: 3.5	Percentage of students completing primary education	**128.69**

Formula:	*Product of ratios of students passing successive grades (between grades 1 to 5) in 2016-17*	128.6882456
Numerator	Percentage	
Unit	Percentage	
Benchmark	100%	
Indicator No: 3.6	Percentage of students completing secondary education	**103.46**
Formula:	*Product of ratios of students passing successive grades (between grades 6 to 8) in 2016-17*	737877
Numerator	Percentage	
Unit	Percentage	
Benchmark	100%	

Category 4: Health

Indicator No: 4.1	Number of in-patient hospital beds per 10,000 population	**3.3**
Formula:	*Numerator / Denominator*	
Numerator	Number of in-patient hospital beds in public and private hospitals	34
Denominator	Total population of the city	103000
Unit	Number per 10,000 population	
Benchmark	25 beds per 10000 population	
Indicator No: 4.2	Healthcare professionals per 10,000 population	**10.68**
Formula:	*Numerator / Denominator*	
Numerator	Total number of qualified healthcare professionals	110
Denominator	Total population of the city	103000
Unit	Number per 10,000 population	
Benchmark	23 beds per 10000 population	
Indicator No: 4.3	Average response time in case of health emergencies	**25**
Description	Total response time for health-related distress calls received in the city	25
Unit	Minutes and seconds	
Benchmark	8 minutes	
Indicator No: 4.4	Period prevalence of water borne diseases	**0.26**
Formula:	*Numerator / Denominator*	
Numerator	Number of cases of persons affected by water borne diseases in a year	266

Denominator	Total population of the city	103000
Unit	Percentage	
Benchmark	City with the lowest prevalence of water-borne diseases (amongst cities in the same city-size classification) will be treated as a benchmark	
Indicator No: 4.5	Period prevalence of vector borne diseases	**0.01**
Formula:	*Numerator / Denominator*	
Numerator	Number of cases of persons affected by vector borne diseases in a year	6
Denominator	Total population of the city	103000
Unit	Percentage	
Benchmark	City with the lowest prevalence of vector borne diseases (amongst cities in the same city-size classification) will be treated as a benchmark	

Category 5: Safety and Security

Indicator No: 5.1	Total number of CCTV cameras installed in the city	**11.18**
Formula:	*Numerator / Denominator*	
Numerator	Total number of CCTV cameras installed	22
Denominator	Total length of road network in the city	196.81
Unit	Percentage	
Benchmark	100%	
Indicator No: 5.2	Number of recorded crimes per lakh population	**226.21**
Formula:	Numerator / Denominator	
Numerator	Total number of crimes recorded in a year	233
Denominator	Total population of the city	103000
Unit	Crimes per lakh	
Benchmark	City with the lowest crime rate (amongst cities in the same city-size classification) will be treated as a benchmark	
Indicator No: 5.3	Extent of crimes recorded against women, children and elderly per year	**15.02**
Formula:	*Numerator / Denominator*	
Numerator	Number of crimes recorded against vulnerable groups (women, children and elderly) in a year	35

Denominator	Total crimes recorded in the same year	233
Unit	Percentage	
Benchmark	City with the lowest proportion of crimes against vulnerable groups (amongst cities in the same city-size classification) will be treated as a benchmark	
Indicator No: 5.4	Transport-related fatality per lakh population	**39.81**
Formula:	*Numerator / Denominator*	
Numerator	Total number of fatalities recorded in road accidents in a year	41
Denominator	Total population of the city	103000
Unit	Fatality per lakh	
Benchmark	<=2 persons per lakh	

Economic Pillar

Category 6: Economy and Employment

Indicator No: 6.1	Increase in VAT/GST collection	**-11.26**
Formula:	*Numerator / Denominator*	
Numerator	(Total VAT/GST collection during the year – Total VAT/GST collection during preceding year)	-59.63
Denominator	Total VAT/GST collection during preceding year	5.2979
Unit	Percentage	
Benchmark	City with the highest increase in collection (amongst cities in the same city-size classification) will be treated as a benchmark	
Indicator No: 6.2	Increase in collection of Professional Tax	**Non-Computable**
Formula:	*Numerator / Denominator*	
Numerator	(Total Professional Tax collection during the year – Total collection during preceding year)	Data Unavailable
Denominator	Total Professional Tax collection during preceding year	Data Unavailable
Unit	Percentage	
Benchmark	City with the highest increase in collection (amongst cities in the same city-size classification) will be treated as a benchmark	
Indicator No: 6.3	Increase in issuance of Construction Permits	**6300**
Formula:	*Numerator / Denominator*	

Numerator	(Number of permits issued during the year – Number of permits during preceding year)	126
Denominator	Number of construction permits during preceding year	0.02
Unit	Percentage	
Benchmark	City with the highest increase in collection (amongst cities in the same city-size classification) will be treated as a benchmark	
Indicator No: 6.4	Unemployment Rate	**To be computed**
Formula:	*Numerator / Denominator*	
Numerator	Number of unemployed persons (seeking or available for work)	Data Unavailable
Denominator	Total labour force in the city	Data Unavailable
Unit	Per 1000 persons	
Benchmark	City with the lowest unemployment rate (amongst cities in the same city-size classification as given in this document) will be treated as a benchmark	
Indicator No: 6.5	Percentage of vendors registered and provided formal spaces	**Non-Computable**
Formula:	*Numerator / Denominator*	
Numerator	Number of street vendors registered and provided formal spaces	NA
Denominator	Total number of vendors in the city	Data Unavailable
Unit	Percentage	
Benchmark	100%	

Physical Pillar

Category 7: Housing and Inclusiveness

Indicator No: 7.1	Percentage of Slum/EWS households covered through formal/ housing	**276.09**
Formula:	*Numerator / Denominator*	
Numerator	Total number of slum and EWS households covered through formal/affordable housing	23332
Denominator	Total number of slum and EWS households in the city	84.51
Unit	Percentage	
Benchmark	100%	

Indicator No: 7.2	Percentage of slum areas covered through basic services	**Non-Compuatble**
Formula:	*Numerator / Denominator*	
Description	Product of ratios of slum households with access to each of water supply, toilets and solid waste management	NA
Unit	Percentage	
Benchmark	100%	

Category 8: Public Open Spaces

Indicator No: 8.1	Per capita availability of green spaces	**0**
Formula:	*Numerator / Denominator*	
Numerator	Total area of green space (sq.m.)	63.93
Denominator	Total population of the city	103000
Unit	Square metres (sq.m.)	
Benchmark	10-12 sq.m. per capita	
Indicator No: 8.2	Per capita availability of public and recreational places	**621.33**
Formula:	*Numerator / Denominator*	
Numerator	Total area of public and recreational places (sq.m.)	63996740
Denominator	Total population of the city	103000
Unit	Square metres (sq.m.)	
Benchmark	City with the highest per capita availability (amongst cities in the same city-size classification) will be treated as a benchmark	

Category 9: Mixed Land-use and Compactness

Indicator No: 9.1	Share of mixed land use area in overall city land use	**0**
Formula:	*Numerator / Denominator*	
Numerator	Total area under mixed land use	1.187
Denominator	Total area of the city (total area of all land uses)	217000000
Unit	Percentage	
Benchmark	City with the highest percentage of mixed use (amongst cities in the same city-size classification) will	

	be treated as a benchmark	
Indicator No: 9.2	Net Density	**1481.78**
Formula:	*Numerator / Denominator*	
Numerator	Total population of the city	103000
Denominator	Area allocated for residential land use (in hectares)	69.511
Unit		
Benchmark	City with the highest net density (amongst cities in the same city-size classification) will be treated as a benchmark	

Category 10: Power Supply

Indicator No: 10.1	Percentage of city population with authorized electrical service	**109.65**
Formula:	*Numerator / Denominator*	
Numerator	Number of authorized electrical connections at household level	41623
Denominator	Total number of households in the city	37959
Unit	Percentage	
Benchmark	City with the highest per capita availability (amongst cities in the same city-size classification) will be treated as a benchmark	
Indicator No: 10.2	Percentage of electrical connections covered through smart meters	**0.02**
Formula:	*Numerator / Denominator*	
Numerator	Number of electrical connections (residential and commercial) with smart meters	10
Denominator	Total number of electricity connections in the city	49838
Unit	Percentage	
Benchmark	100%	
Indicator No: 10.3	Average number of electrical interruptions per year	**Non-Computable**
Description	Total number of sustained electrical interruptions in a year	Data Unavailable
Unit	Number	

Benchmark	City with the lowest number of outages (amongst cities in the same city-size classification) will be treated as a benchmark	
Indicator No: 10.4	Average length of electrical interruptions per year	**NC**
Description	Sum of duration of all sustained electrical interruptions in a year (in hours)	Data Unavailable
Unit	Hours	
Benchmark	City with the lowest average length of outages (amongst cities in the same city-size classification) will be treated as a benchmark	
Indicator No: 10.5	Percentage of total energy derived from renewable sources	**0**
Formula:	*Numerator / Denominator*	
Numerator	Total installed capacity for generation of renewable energy in the city	49
Denominator	Total energy consumption from all sources	61510253
Unit	Percentage	
Benchmark	10%	
Indicator No: 10.6	Energy consumption per unit - water supply and sewerage	**NC**
Formula:	*Numerator / Denominator*	
Numerator	Energy consumption on water supply and sewerage services	0
Denominator	Total quantum of water and waste water handled during the period	Data Unavailable
Unit	kWh per million litres	
Benchmark	City with the lowest per unit consumption (amongst cities in the same city-size classification) will be treated as a benchmark	
Indicator No: 10.7	Energy consumption per unit – street lighting	**NC**
Formula:	*Numerator / Denominator*	
Numerator	Energy consumption on street lighting	Data Unavailable
Denominator	Total number of street light installations	7105

Unit	kWh per light installation	
Benchmark	City with the lowest per unit consumption (amongst cities in the same city-size classification) will be treated as a benchmark	
Indicator No: 10.8	Percentage of new and redeveloped buildings following green building norms	**0**
Formula:	*Numerator / Denominator*	
Numerator	Built up area of new/redeveloped buildings completed that have received green ratings	0
Denominator	Total built up area of all new/redeveloped buildings completed during the same year	37055
Unit	Percentage	
Benchmark	80%	
Indicator No: 10.9	Total energy consumption per capita	**0.79**
Formula:	*Numerator / Denominator*	
Numerator	Total energy consumption (for all uses) in the city	61510253
Denominator	Total population of the city	103000
Unit	kWh per capita	
Benchmark	City with the lowest per capita consumption (amongst cities in the same city-size classification) will be treated as a benchmark	

Category 11: Transport and Mobility

Indicator No: 11.1	Geographical coverage of public transport	**0.06**
Formula:	*Numerator / Denominator*	
Numerator	Total length of public transport network (km)	20
Denominator	Total area of the city (sq.km)	217
Unit	Transport length (kms) per square km	
Benchmark	>=1	
Indicator No: 11.2	Availability of public transport	**8.39**
Formula:	*Numerator / Denominator*	
Numerator	Average number of public transport vehicles available per day	864
Denominator	Total population of the city	103000
Unit	Number per 1000 persons	
Benchmark	>=0.6	

Indicator No: 11.3	Mode share of public transport	**To be computed**
Description	Mode share of public transport	Data Unavailable
Unit	Percentage	
Benchmark		
Indicator No: 11.4	Percentage of road network with dedicated bicycle tracks	**15.24**
Formula:	*Numerator / Denominator*	
Numerator	Total length of bicycle network	30
Denominator	Total length of road network in the city	196.81
Unit	Percentage	
Benchmark	>=50	
Indicator No: 11.5	Percentage of interchanges with bicycle parking facilities	**56.52**
Formula:	*Numerator / Denominator*	
Numerator	Total number of major transport interchanges with bicycle parking facility (within 250m radius)	13
Denominator	Total number of major transport interchanges in the city	23
Unit	Percentage	
Benchmark	>=75	
Indicator No: 11.6	Mode share of non-motorised transport[1]	**To be computed**
Description	Mode share of non-motorised transport	Data Unavailable
Unit	Percentage	
Benchmark		
Indicator No: 11.7	Availability of Passenger Information System	**0.57**
Formula:	Numerator / Denominator	
Numerator	Total number of major interchanges with PIS	13
Denominator	Total number of major interchanges in the city	23
Unit	Percentage	
Benchmark	>=75	

---

[1] The data for this indicator will be computed based on the primary data which is currently being collected

Indicator No: 11.8	Extent of signal synchronisation	**Non-Computable**
Formula:	*Numerator / Denominator*	
Numerator	Total number of signalised intersections that are synchronised	0
Denominator	Total number of signalised intersections in the city	0
Unit	Percentage	
Benchmark	>=75	
Indicator No: 11.9	Availability of paid parking spaces	**Non-Computable**
Formula:	*Numerator / Denominator*	
Numerator	Total available on-street paid parking spaces in the city	NA
Denominator	Total available on-street parking spaces in the city	NA
Unit		
Benchmark		
Indicator No: 11.10	Percentage coverage of footpaths – wider than 1.2m	**10.16**
Formula:	*Numerator / Denominator*	
Numerator	Total length of footpaths (wider than 1.2 m) available in the city	40
Denominator	Total length of road network in the city	393.62
Unit	Percentage	
Benchmark	>=75	
Indicator No: 11.11	Percentage of traffic intersections with pedestrian crossing facilities	**Non-Computable**
Formula:	*Numerator / Denominator*	
Numerator	Total number of intersections with pedestrian crossing facilities on major roads	Data Unavailable
Denominator	Total number of junctions/ intersections on major roads in the city	Data Unavailable
Unit	Percentage	
Benchmark	100%	
Indicator No: 11.12	Extent to which universal accessibility is incorporated in public rights-of-way	**10.29**
Formula:	*Numerator / Denominator*	
Numerator	Number of public right-of-way areas designed as per universal design principles	18

Denominator	Total number of public right-of-way areas in the city	175
Unit	Percentage	
Benchmark	100%	

Category 12: Assured Water Supply

Indicator No: 12.1	Household level coverage of direct water supply connections	**100**
Formula:	*Numerator / Denominator*	
Numerator	Total number of households with direct water supply connection	37959
Denominator	Total number of households in the city	37959
Unit	Percentage	
Benchmark	100%	
Indicator No: 12.2	Per capita supply of water	**Non-Computable**
Formula:	*Numerator / Denominator*	
Numerator	Total quantity of water supplied into the distribution system	Data Unavailable
Denominator	Total population of the city	103000
Unit	Litres per capita per day (lpcd)	
Benchmark	135 lpcd	
Indicator No: 12.3	Quality of water supplied[2]	**To be computed**
Formula:	*Numerator / Denominator*	
Numerator	Number of samples meeting or exceeding specified potable water standards	30
Denominator	Total number of samples tested for water quality	36
Unit	Percentage	
Benchmark	100%	
Indicator No: 12.4	Level of non-revenue water – NRW	**Non-Computable**
Formula:	*Numerator / Denominator*	
Numerator	Quantum of water put into distribution system (mld) - Quantum of water sold (mld)	Blank
Denominator	Quantum of water put into the distribution system (mld)	Data Unavailable

---

[2] The data for this indicator will be computed based on the primary data which is currently being collected

Unit	Percentage	
Benchmark	Less than 15%	
Indicator No: 12.5	Percentage of water connections covered through meters	**Non-Computable**
Formula:	*Numerator / Denominator*	
Numerator	Number of metered water connections	NA
Denominator	Total number of water connections in the city	38130
Unit	Percentage	
Benchmark	100%	
Indicator No: 12.6	Percentage of plots with rainwater harvesting facility	**18.03**
Formula:	*Numerator / Denominator*	
Numerator	Number of new developments/redevelopments (of designated plot size), commercial and public buildings with RWH facility	11
Denominator	Total number of new developments/redevelopments (of designated plot size), commercial and public buildings in the city	61
Unit	Percentage	
Benchmark	100% of all new developments/ redevelopments with minimum plot size of 300 sq. m., and all commercial and public buildings should have rainwater harvesting facilities	

Category 13: Waste Water Management

Indicator No: 13.1	Coverage of toilets	**112.24**
Formula:	*Numerator / Denominator*	
Numerator	Total number of properties with access to individual and/or community toilets	38126
Denominator	Total number of properties in the city	33967
Unit	Percentage	
Benchmark	100%	
Indicator No: 13.2	Coverage of sewerage network and/or septage	**39.64**
Formula:	*Numerator / Denominator*	
Numerator	Total number of properties with connection to waste water management systems	13466
Denominator	Total number of properties in the city	33967

Unit	Percentage	
Benchmark	100%	
Indicator No: 13.3	Collection efficiency of sewerage network	**Non-Computable**
Formula:	*Numerator / Denominator*	
Numerator	Total waste water collected per day	NA
Denominator	Total waste water generated in the city per day	NA
Unit	Percentage	
Benchmark	100%	
Indicator No: 13.4	Extent of reuse and recycling of waste water	**Non-Computable**
Formula:	*Numerator / Denominator*	
Numerator	Quantum of waste water recycled or reused per day	NA
Denominator	Total waste water received at treatment plants per day	NA
Unit	Percentage	
Benchmark	20% or more	
Indicator No: 13.5	Coverage of storm water drains	**Non-Computable**
Formula:	*Numerator / Denominator*	
Numerator	Total length of covered primary, secondary and tertiary drains (of pucca construction)	NA
Denominator	Total length of road network in the city	196.81
Unit	Percentage	
Benchmark	100%	

Category 14: Solid waste management

Indicator No: 14.1	Household level coverage of municipal solid waste collection	**99.79**
Formula:	*Numerator / Denominator*	
Numerator	Total number of households and establishments covered through doorstep collection	37959
Denominator	Total number of households and establishments in the city	38040
Unit	Percentage	
Benchmark	100% door to door collection	
Indicator No: 14.2	Efficiency of collection of municipal solid waste	**87.5**
Formula:	*Numerator / Denominator*	
Numerator	Total quantum of MSW collected by the ULB or private operator	14

Denominator	Total quantum of MSW generated in the city	16
Unit	Percentage	
Benchmark	100%	
Indicator No: 14.3	Extent of municipal solid waste recovered through reuse	**Non-Computable**
Formula:	*Numerator / Denominator*	
Numerator	Average quantum of MSW that is processed or recycled (tons per month)	NA
Denominator	Average MSW generated in the city (tons per month)	420
Unit	Percentage	
Benchmark	80% or more	

Category 15: Reduced Pollution

Indicator No: 15.1	**Concentration of SO2 - air pollution**	**8.5**
Description	Annual mean concentration OR Mean concentration over 24 hours of SO2	8.5
Unit	µg/m3	
Benchmark	Annual mean concentration of 50 µg/m3 OR Mean concentration over 24 hours of 80 µg/m3	
Indicator No: 15.2	**Concentration of NO2 - air pollution**	**28.6**
Description	Annual mean concentration OR Mean concentration over 24 hours of NO2	28.6
Unit	µg/m3	
Benchmark	Annual mean concentration of 40 µg/m3 OR Mean concentration over 24 hours of 80 µg/m3	
Indicator No: 15.3	**Concentration of PM10 - air pollution**	**74.6**
Description	Annual mean concentration OR Mean concentration over 24 hours of PM10	74.6
Unit	µg/m3	
Benchmark	Annual mean concentration of 60 µg/m3 OR Mean concentration over 24 hours of 100 µg/m3	
Indicator No: 15.4	**Level of noise pollution**	**To be computed**
Formula:	*Numerator / Denominator*	
Numerator	Number of noise samples meeting acceptable noise levels	30
Denominator	Total number of noise samples	33
Unit	Percentage	

Benchmark		
Indicator No: 15.5	**Quality of water in public surface water bodies**	**100**
Formula:	*Numerator / Denominator*	
Numerator	Number of tested samples meeting prescribed standards	30
Denominator	Total number of samples tested	30
Unit	Percentage	
Benchmark	100%	

LIVEABILITY ASSESSMENT

Executive Summary

Assessment of liveability indices is an initiative by the Ministry of Housing and Urban Affairs to improve quality of life of citizens and achieve sustainable development goals by encouraging cities to adopt "outcome based" approach for urban planning. Assessment process aimed to provide opportunity to cities to review the development components holistically by involving 79 measurable indicators categorized under governance, health, education, safety, economy, power supply, transportation and mobility, identity, culture, housing, waste management and pollution.

This report highlights the assessment process, key milestones, and the final outcome of the data submitted. Implementation of liveability assessment commenced formally on 19th January 2018. A national level workshop was organized on 13th February 2018 to explain the importance and process of liveability assessment and get feedback on methodology from the city authorities.

This was followed by the next stage of Questionnaire development. The questionnaire was arranged under 12 categories representing 12 data owners namely urban local body, Central and state pollution control board, development authority, DISCOM/Electricity board, State disaster management authority, state education department, state health department, state renewable energy development agency, state sales and commercial taxes department, town and country planning department, traffic and police department and transport authorities.

An online data entry portal was developed to facilitate data submission by the cities. Each city had a unique log in to access the portal and submit the data. Both online and off-line options (download the questionnaire in an excel) to submit the data were available for cities. An email help desk was set up for the cities to raise any queries and seek clarification when responding to the questions.

A team for each state comprising of State Coordinator and City Coordinator (one per city) was deployed that facilitated the process and supported the cities. A total of 6 regional coordinators/ consultants, 29 State Coordinators, and 99 city coordinators were deployed across 116 cities. Training for state coordinators was held from 26th to 28th February 2018 at Chennai to make coordinators understand overall liveability assessment, indicators, data sources, protocols and roles and responsibilities.

City Reconnaissance Meetings were initiated by the state and city coordinators. The discussion began with discussions to finalize the state workshop schedule, mapping of data owners, and assist cities in data collection. The City Coordinators were based in the cities for over 6 weeks and during this time, they liase with ULB and other data owners to explain the liveability framework, online portal, and facilitate the online submission.

A total of 33 state workshops were conducted at the state level. The objective of the workshop was to orient the city stakeholders on liveability assessment, indicators, components of data collection, timelines, expectations of support and support extended by MoHUA. The state level workshops brought

various city level departments on a single platform to understand and discuss the methodology and components of city liveability assessment.

Nodal agency at state level supported by the City and State Coordinator and city level (Municipality corporation/smart city limited) coordinated with city specific data owners/departments for data gathering, collation, and submission. Nodal persons in each department were appointed for timely data collection and submission. Of 116, 112 cities submitted data as per the timeline on 16th April 2018.

Post submission, the city and state coordinators supported by the central team followed up extensively with the cities to support secondary documents as evidence to substantiate their submissions. Secondary documents such as reports, official orders, copy of office register, signed copy of liveability assessment questionnaire furnished by cities against the submitted data. Documents are verified to map the documents for the reponses provided by city and to check the type data provided by city. The document check outcomes were shared with the cities as a part of data quality check.

For checking consistency of data, logical check of data, verifying data from other public sources were undertaken. Quality check was done to ensure data validity and provide opportunity to cities to review the data provided by them and correct in case of wrong data entry.

For 8 selected indicators namely, percentage of services integrated through command and control center, hotel occupancy rate, percentage of schools with access to digital education, number of CCTV cameras per unit road length, percentage of vendors registered and provided formal spaces, availability of passenger information system, percentage of traffic intersection with pedestrian crossing facility, and extent to which universal accessibility is incorporated in public rights of way. Physical audit was conducted in 110 cities by physical auditors appointed and trained by the consortium. In consultation with ULB nodal person, locations and indicators for physical audit was selected in each city. A mobile based application was developed to capture the physical audit related data.

Primary data collection was done for five indicators such as unemployment rates, mode share of public transport, mode share of non-motorized transport, quality of water supplied, and level of noise pollution. Protocols for water and noise test were prepared in consultation with experts. Water quality test involved physical, chemical and bacteriological test of water as per the CPCB norms. For testing quality of water at consumer end, the auditors worked closely with the ULB and Water department. Samples were collected from consumer end and submitted to the lab suggested by city. For noise pollution, in about 20 cities the state pollution board or city level environment department took the responsibility for providing noise pollution data as per the protocols. In rest of the cities, mobile based application was used to measure noise pollution.

During implementation, MoHUA facilitated the process by conducting video conferences with cities to address any queries, reiterate the importance, and ensure that cities adequately engages in the process and submit their responses in time and respond to requests for clarifications.

In addition to secondary data collection, physical audit and primary data collection, citizen survey was conducted to understand their perception and level of satisfaction on various services such as health, education, water supply, electricity, waste management etc. provided by urban local bodies. Over 60000 citizens participated in the survey across India.

The final scores and ranks have been generated based on the scoring methodology that has been discussed extensively and minor modifications made that are summarized as below:

#	**Challenges**	**Proposed Solutions**
1	Only 23 cities of 111 cities have City Mobility Plan (CMP) or any and hence able to provide data for Mode Share of Public Transport and Non-Motorised Transport. To address the data gap, as advised by the MoHUA, the consortia undertook a sample dipstick across all cities covering a sample of 150 Households. Understandably, the dipstick findings will not match the rigor of a CMP.	We recommend the following: 1) Cities which have provided CMP Data will be evaluated on 100% of the maximum score 2) For the cities where the dipstick data is used, the city receives a 50% discount on the overall score Alternatively, another approach is to assign 0 score to all 88 cities that don't have a CMP
2	Variance was observed on data reported by cities on road network and data presented in the smart city proposals during the verifications.	We recommend taking the data reported by the cities in the Smart City Proposals.
3	There is no secondary source/ organization that provides unemployment data at city level. As a result, most cities do not have the data. Fully cognizance of the challenges of generating this data in a short span of time, it was agreed to collect this data through a dipstick survey on lines of NSSO questions. The data generated needs further scrutiny and triangulation with some inputs from experts. This may not be possible in the short	The indicator on unemployment will be excluded from scores. For final ranking, the cities will be scored on 78 indicators.

#	Challenges	Proposed Solutions
	window.	
4	Many cities did not have data on noise pollution and it was decided that data will be collected using a mobile app for all the 111 cities. However, many cities have expressed reservations with the approach especially with respect to the reliability of using this data. Further, some cities have relied on the SPCB to collect the data as per the approach proposed by the consortia. Thus, noise pollution data is currently from two sources: 1. SPCB- 20 cities 2. Noise-based app- 91 cities	The data collected through the primary survey will be used for scoring the cities. Currently, there is no differential scoring for the data from the SPCB and the data collected through the mobile app. However, a certain higher weightage can be provided to those cities which used the state apparatus to collect noise pollution data.
5	For the indicator on quality of water supplied, the methodology document states that samples should be drawn both at the treatment plant outlet as well as the consumer end. However, the data provided by the cities were predominantly from the distribution point. Hence for consumer end results with MoHUA intervention, consortia coordinated with cities to collect the data at the consumer end. The cities facilitated the testing. The outcome of the process is as below: 1. Sample given- 102 cities 2. Report received- 86 cities 3. Report awaited- 16 cities 4. Tests not completed due to lack of cooperation and other reasons – 9	The maximum score for this indicator will be distributed equally (50%) for results based on samples from the treatment plant and consumer end. Cities that did not complete tests or provide the results will be given a score 0 for against consumer end tests.
6	City level population is not projected annually by most of the cities. So, estimates for 2017 population are not available with the cities.	As recommended by MoHUA, 2011 census population is being used for the ranking purpose.

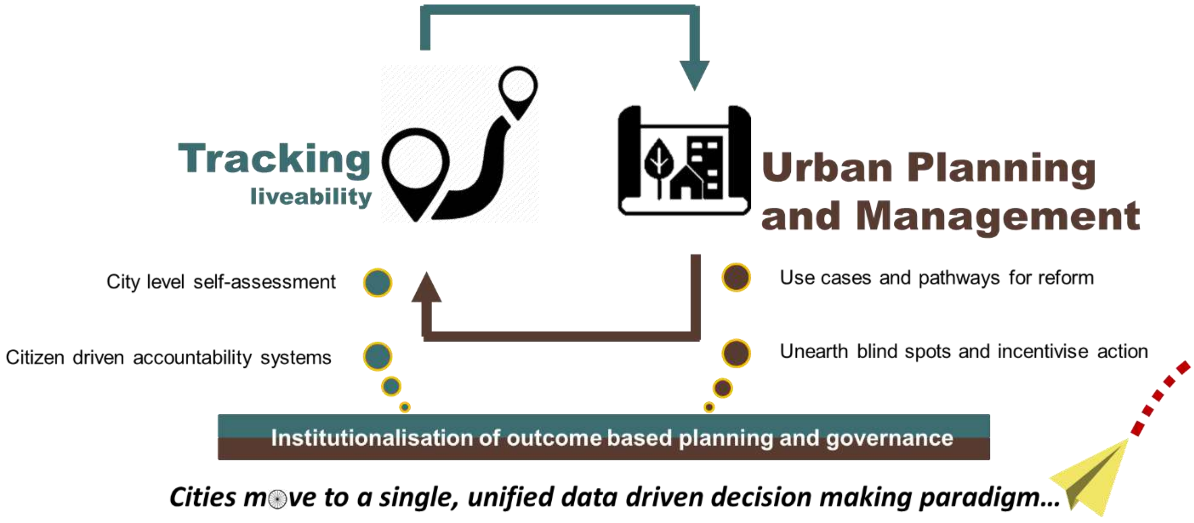
#	Challenges	Proposed Solutions
7	The age category specific data for 9 cities is not available at a city level	The age category specific population data has been taken at a district level for these cities.
8	Indicators on non-motorised transports like- Dedicated bicycle tracks, bicycle parking facilities and mode share of non-motorised transport are not relevant for hilly terrains.	As discussed during the PMC meeting, these indicators have been treated as non-applicable for the hilly cities and the weights have been redistributed among other indicators within the same category.
9	The indicator on increase in professional tax is not relevant to cities which do not levy the professional tax.	As discussed during the PMC meeting, this indicator has been non-applicable to the cities belonging to states where professional tax is not levied, and the weights have been redistributed among other indicators within the same category.
10	The indicator on increase in VAT collection is not applicable to Port Blair and Kavaratti, as there was no provision of VAT collection in these cities.	As discussed during the PMC meeting, these indicatosr has been treated as non-applicable for these two cities and the weights have been redistributed among other indicators within the same category.
11	Indicator on coverage of basic services to slum households does not concern cities with no slums (notified/ non-notified.	As discussed during the PMC meeting, this indicators has been treated as non-applicable for these cities and the weights have been redistributed among other indicators within the same category.

1. Introduction

The Ministry of Housing and Urban Affairs (MoHUA) is implementing several flagship urban missions such as the Smart Cities Mission (SCM), Atal Mission for Urban Rejuvenation and Transformation (AMRUT), Heritage City Development and Augmentation Yojana (HRIDAY), Housing for All (HFA). Theses mission along with other transformative initiatives of the Government including National Water Mission, Power for All, National Health Mission are aimed at making Indian cities more 'liveable.' The overarching goal of these initiatives is to move from an input-based approach to a 'citizen centric-outcome based' assessment of urban liveability.

To develop a common minimum framework for cities to assess their existing status and chart their pathway towards providing a better quality of life to their citizens, the MoHUA developed a set of 'Liveability Standards' relevant to cities to generate a Liveability Index and ranking of cities. These standards were launched in June, 2017. The MoHUA has planned to conduct an 'Annual Assessment of Liveability Standards in Cities – an ambitious national project that will involve yearly submission of data by cities across the various indicators, compilation and analysis, development of indices and ranking of cities. The Liveability Index is envisioned as a 360° tool for tracking, planning and transforming Indian cities. The Liveability Index is aimed at the following objectives:

- Providing strong evidence-based approach for future interventions and investments to deliver liveability outcomes
- Catalysing actions to improve the overall quality of the city's liveability and achieve broader development outcomes including the Sustainable Development Goals
- Assessing the implementation of government policies and schemes governing characteristics of cities that can contribute to creating liveable communities



Tracking
liveability
Urban Planning
and Management
City level self-assessment
Citizen driven accountability systems
Use cases and pathways for reform
Unearth blind spots and incentivise action
Institutionalisation of outcome based planning and governance
Cities move to a single, unified data driven decision making paradigm…

The first round of the assessment commenced in January 2018 covering 116 major cities including smart cities, capital cities and cities with population of above one million each. Implementation of the liveability assessment commenced in January 2018 with a national level orientation workshop for the urban local bodies. The workshop aimed at orienting the states and urban local bodies on the overall framework, indicators, data sources, methodology and key milestones and timelines involved in the liveability assessment. Subsequently, a series of State/ Union Territory level orientation workshops were carried out in 33 states/UTs for a detailed discussion on the framework. Online data collection commenced from 9th March through an online data collection platform that supported both online and offline data submission modes. On the date of closure of the online data entry portal i.e., 16th April, 2018 112 cities submitted their data. Subsequently, comprehensive checks on the submitted data was undertaken that involved checking for outliers, logical inconsistencies etc. post which round-1 of data reconciliation was conducted. This draft report is based on round-1 of reconciled data as on 28th April, 2018.

2. Liveability Framework and Indicators

The Liveability Framework comprises a total of 79 indicators (57 Core Indicators and 22 Supporting Indicators). A core indicator carries 70% weightage and a supporting indicator carries 30% weightage. These indicators are grouped under 15 thematic categories which in turn are part of four pillars of comprehensive development of cities i.e., institutional, social, economic and physical. Based on the performance of cities against the various core and supporting indicators, various 'Category Sub-Indexes' and a composite 'City Liveability Index' will be developed for each city.

2.1 Scoring and Computing Category Indices of Liveability

The set of 79 indicators, associated categories and pillars are presented in the table below:

Table 1 List of Pillars, Categories and Indicators

Pillars of Comprehensive Development	Category	Indicators
Institutional	1. Governance	1.1 Percentage of citizen services available online
		1.2 Percentage of services integrated through Command Centre
		1.3 Percentage of citizens using online services
		1.4 Average delay in grievance redressal
		1.5 Tax collected as percentage of tax billed
		1.6 Extent of cost recovery (O&M) in water supply services
		1.7 Capital spending as percentage of total expenditure
		1.8 Percentage of population covered under Ward Committees/Area *Sabhas*
Social	**2. Identity and Culture**	2.1 Restoration and reuse of historic buildings
		2.2 Percentage of ecologically important areas covered through projects for restoration
		2.3 Hotel occupancy
		2.4 Percentage of budget allocated towards cultural/sports activities
		2.5 Number of cultural/sports events hosted by city
	3. Education	3.1 Percentage of school-aged population enrolled in schools
		3.2 Percentage of female school-aged population enrolled in schools

Pillars of Comprehensive Development	Category	Indicators
		3.3 Primary education student-teacher ratio
		3.4 Percentage of schools with access to digital education
		3.5 Percentage of students completing primary education
		3.6 Percentage of students completing secondary education
	4. Health	4.1 Number of in-patient hospital beds per 10,000 population
		4.2 Healthcare professionals per 10,000 population
		4.3 Average response time in case of health emergencies
		4.4 Period prevalence of water borne diseases
		4.5 Period prevalence of vector borne diseases
	5. Safety and Security	5.1 Number of CCTV Cameras
		5.2 Number of recorded crimes per lakh population
		5.3 Extent of crimes recorded against women, children and elderly per year
		5.4 Transport-related fatality per lakh population
Economic	**6. Economy and Employment**	6.1 Increase in VAT/GST collection
		6.2 Increase in collection of Professional Tax
		6.3 Increase in issuance of Construction permits
		6.4 Unemployment rate
		6.5 Percentage of vendors registered and provided formal spaces
Physical	**7. Housing and Inclusiveness**	7.1 Percentage of Slum/EWS households covered through formal/affordable housing
		7.2 Percentage of slum areas covered through basic services
	8. Public Open Spaces	8.1 Per capita availability of green spaces
		8.2 Per capita availability of public and recreational places
	9. Mixed Land Use and Compactness	9.1 Share of mixed land use area in overall city land use
		9.2 Net Density
	10. Power Supply	10.1 Percentage of city population with authorized electrical services
		10.2 Percentage of electrical connections covered

Pillars of Comprehensive Development	Category	Indicators
		through smart meters
		10.3 Average number of electrical interruptions per year
		10.4 Average length of electrical interruptions per year
		10.5 Percentage of total energy derived from renewable sources
		10.6 Energy consumption per unit - water supply and sewerage
		10.7 Energy consumption per unit - street lighting
		10.8 Percentage of new and redeveloped buildings following green building norms
		10.9 Total energy consumption per capita
	11. Transportation and Mobility	11.1 Geographical coverage of public transport
		11.2 Availability of public transport
		11.3 Mode share of public transport
		11.4 Percentage of road network with dedicated bicycle tracks
		11.5 Percentage of interchanges with bicycle parking facilities
		11.6 Mode share of non-motorized transport
		11.7 Availability of Passenger Information System
		11.8 Extent of signal synchronization
		11.9 Availability of paid parking spaces
		11.10 Percentage coverage of footpaths – wider than 1.2 m
		11.11 Percentage of traffic intersections with pedestrian crossing facilities
		11.12 Extent to which universal accessibility is incorporated in public rights-of-way
	12. Assured Water Supply	12.1 Household level coverage of direct water supply connections
		12.2 Per capita supply of water
		12.3 Quality of water supplied
		12.4 Level of non-revenue water – NRW
		12.5 Percentage of water connections covered through meters
		12.6 Percentage of plots with rainwater harvesting facility
	13. Waste Water	13.1 Coverage of toilets

Pillars of Comprehensive Development	Category	Indicators
	Management	13.2 Coverage of sewerage network and/or septage
		13.3 Collection efficiency of sewerage network
		13.4 Extent of reuse and recycling of waste water
		13.5 Coverage of storm water drains
	14. Solid Waste Management	14.1 Household level coverage of municipal solid waste collection
		14.2 Efficiency of collection of municipal solid waste
		14.3 Extent of municipal solid waste recovered through reuse
	15. Reduced Pollution	15.1 Concentration of SO2- air pollution
		15.2 Concentration of NO2- air pollution
		15.3 Concentration of PM10 - air pollution
		15.4 Level of noise pollution
		15.5 Quality of water in public surface water bodies

2.2 Scoring and Computing Category Indices of Liveability

The performance achieved by cities against 79 indicators, will be assessed against given benchmarks. Where no international/national norms are available, city with the best performance in its group (population range) will be treated as a benchmark. The groups are given in the table below.

Table 2 Details on Population Range

Category	Population range
Category 1	Population ≥ 4 million
Category 2	1 million ≤ Population < 4 million
Category 3	0.5 million ≤ Population < 1 million
Category 4	Population < 0.5 million

2.3 Scoring Approach and Methodology

A city can earn a maximum score of 100 points for 79 indicators across four pillars. The pillar weights are as follows: Institutional (25 points), Social (25 points), Economy and Employment (5 points) and Physical (45 points). Based on the number and nature of indicators i.e., core vs. secondary, indicator wise maximum marks were computed.

100 marks

(Maximum overall score that any city can achieve)

25 marks (Maximum score that any city can achieve under **Institutional** Pillar)	25 marks (Maximum score that any city can achieve under **Social** Pillar)	5 marks (Maximum score that any city can achieve under **Economic** Pillar)	45 marks (Maximum score that any city can achieve under **Physical** Pillar)
1 (Category under Institutional Pillar)	4 (Number of categories under Social Pillar)	1 (Category under Economic Pillar)	9 (Number of categories under Physical Pillar)
8 (Number of indicators under Institutional)	20 (Number of indicators under Social Pillar)	5 (Category under Economic Pillar)	46 (Number of categories under Physical Pillar)
7 Core 1 Supporting	13 Core 7 Supporting	4 Core 1 Supporting	33 Core 13 Supporting

Dimensional Index Methodology (DIM) has been used to compute scores for each indicator with reference to "maximum within the comparison group" or "absolute benchmarks". For indicators where benchmarks are available, cities getting the benchmark score (or above) are given the maximum mark, and the marks awarded to other cities are calculated proportionately. For indicators where benchmarks are not available, the best performing cities in each population group are given the maximum mark, and the marks awarded to other cities (within the population group) are calculated proportionately. For indicators where benchmarks do not exist, the city data has been tested for outliers before scoring.

2.4 Scoring Normalisation:

To construct aggregate scores across cities as well as to make the scores across indicators comparable, indicator values were normalised using a min-max approach. The following formula was used to normalise the indicator values-

$$\frac{indicator\ value\ for\ the\ city - indicator\ value\ for\ the\ worst\ performing\ city}{benchmark - \ indicator\ value\ for\ the\ worst\ performing\ city}$$

This approach would restrict the normalised indicator value between 0 and 1. Cities that met or exceeded the benchmark received a normalised indicator value of 1. Worst performing cities are given a normalised indicator value of 0. After normalisation, the normalised value is weighted according to the category and the indicator being core or supporting.

To illustrate, consider the indicator 12.3 Quality of Water Supplied in the Category 12 for Assured Water Supply. If in City A 50% of the water samples collected qualify the potable water standards specified by the CPHEEO, and only 10% of the samples from worst performing city qualify the standards. Then, the normalised value for the indicator for city A would be 0.44 [(0.5-0.1)/(1-0.1)].

The weight for indicator 12.3 is 1.03, so the final weighted score for City A would come out to 0.45 [1.03*0.44].

3. City Reconnaissance Meetings:

State level workshop was necessary to orient the cities and familairise them about the process of liveability assessment. City did not provide the data post log in on the online portal due to lack of directive at the state level. The team followed up at the state level beginning early March until end of April with senior team members travelling to the state and Ministry's intervention. Below is the summary of follow up meetings with Urban development department and SUDA at state level.

Municipal commissioner, Durgapur Municipal corporation was contacted and log in to smart net portal was done. However, without State level permissions and directive, city officials were not appreciative of follow up and expressed inability to cooperate.

Date	Departments	Key Discussions
07 March 2018 09 March 2018 12 March 2018 13 March 2018	PA to Principal secretary (UD) Joint Secretary Urban Development Department Government of West Bengal	State Workshop schedule
13 March 2018	Additional Director, State Urban Development Agency, West Bengal	State Workshop for liveability Assessment City login
15 March 2018 16 March 2018	PA to Chief Secretary, Office of Chief Secretary	Permission for state workshop Appointing SUDA as nodal agency for liveability assessment
19 March 2018	Director, SUDA, West Bengal	Discussion on whether SUDA has got any intimation from PS/CS office to act as nodal agency
21 March 2018	Principal Secretary (UD) office	Understand the scope of assessment process in WB
22 March 2018	Principal Secretary (UD) Director, SUDA Chief Manager, Planning and Monitoring (SUDA)	Schedule meeting to discuss the Workshop and subsequent requirements for the Liveability Assessment study

Date	Departments	Key Discussions
23 March 2018	Director, Additional Director and Chief Manager, SUDA	SUDA officials shared that March month was not convenient to organise workshop and 4th April 2018 was scheduled as attentive date for workshop. Files forwarded to Principal Secretary to approve list of participants
26 March 2018 27 March 2018 28 March 2018	Director, Additional Director and Chief Manager, SUDA	Follow up to know the Progress on workshop date and assessment process
29 March 2018	Director, SUDA	Inclusion of New Town Kolkata in assessment process
30 March 2018 31 March 2018 2 April 2018	SUDA office	Follow up to initiate assessment process
3 April 2018 (From Consortium Ms. Sujaya Rathi travelled to Kolkata to discuss on liveability assessment process)	Chief Manager, SUDA	Brief note on liveability index was faxed to CS office to expedite the process
4 April 2018 5 April 2018	CS Office , WB PS (UD) office, WB	Follow up to initiate assessment process
6 April 2018	PS Office, WB	SUDA file was marked to Minister of State, Mr Firhad Hakim
7 April 2018 to 15 April 2018	PS (UD) office and SUDA, West Bengal	Follow up to initiate assessment process

Executive Summary

Assessment of liveability indices is an initiative by the Ministry of Housing and Urban Affairs to improve quality of life of citizens and achieve sustainable development goals by encouraging cities to adopt "outcome based" approach for urban planning. Assessment process aimed to provide opportunity to cities to review the development components holistically by involving 79 measurable indicators categorized under governance, health, education, safety, economy, power supply, transportation and mobility, identity, culture, housing, waste management and pollution.

This report highlights the assessment process, key milestones, and the final outcome of the data submitted. Implementation of liveability assessment commenced formally on 19th January 2018. A national level workshop was organized on 13th February 2018 to explain the importance and process of liveability assessment and get feedback on methodology from the city authorities.

This was followed by the next stage of Questionnaire development. The questionnaire was arranged under 12 categories representing 12 data owners namely urban local body, Central and state pollution control board, development authority, DISCOM/Electricity board, State disaster management authority, state education department, state health department, state renewable energy development agency, state sales and commercial taxes department, town and country planning department, traffic and police department and transport authorities.

An online data entry portal was developed to facilitate data submission by the cities. Each city had a unique log in to access the portal and submit the data. Both online and off-line options (download the questionnaire in an excel) to submit the data were available for cities. An email help desk was set up for the cities to raise any queries and seek clarification when responding to the questions.

A team for each state comprising of State Coordinator and City Coordinator (one per city) was deployed that facilitated the process and supported the cities. A total of 6 regional coordinators/ consultants, 29 State Coordinators, and 99 city coordinators were deployed across 116 cities. Training for state coordinators was held from 26th to 28th February 2018 at Chennai to make coordinators understand overall liveability assessment, indicators, data sources, protocols and roles and responsibilities.

City Reconnaissance Meetings were initiated by the state and city coordinators. The discussion began with discussions to finalize the state workshop schedule, mapping of data owners, and assist cities in data collection. The City Coordinators were based in the cities for over 6 weeks and during this time, they liase with ULB and other data owners to explain the liveability framework, online portal, and facilitate the online submission.

A total of 33 state workshops were conducted at the state level. The objective of the workshop was to orient the city stakeholders on liveability assessment, indicators, components of data collection, timelines, expectations of support and support extended by MoHUA. The state level workshops brought

various city level departments on a single platform to understand and discuss the methodology and components of city liveability assessment.

Nodal agency at state level supported by the City and State Coordinator and city level (Municipality corporation/smart city limited) coordinated with city specific data owners/departments for data gathering, collation, and submission. Nodal persons in each department were appointed for timely data collection and submission. Of 116, 112 cities submitted data as per the timeline on 16th April 2018.

Post submission, the city and state coordinators supported by the central team followed up extensively with the cities to support secondary documents as evidence to substantiate their submissions. Secondary documents such as reports, official orders, copy of office register, signed copy of liveability assessment questionnaire furnished by cities against the submitted data. Documents are verified to map the documents for the reponses provided by city and to check the type data provided by city. The document check outcomes were shared with the cities as a part of data quality check.

For checking consistency of data, logical check of data, verifying data from other public sources were undertaken. Quality check was done to ensure data validity and provide opportunity to cities to review the data provided by them and correct in case of wrong data entry.

For 8 selected indicators namely, percentage of services integrated through command and control center, hotel occupancy rate, percentage of schools with access to digital education, number of CCTV cameras per unit road length, percentage of vendors registered and provided formal spaces, availability of passenger information system, percentage of traffic intersection with pedestrian crossing facility, and extent to which universal accessibility is incorporated in public rights of way. Physical audit was conducted in 110 cities by physical auditors appointed and trained by the consortium. In consultation with ULB nodal person, locations and indicators for physical audit was selected in each city. A mobile based application was developed to capture the physical audit related data.

Primary data collection was done for five indicators such as unemployment rates, mode share of public transport, mode share of non-motorized transport, quality of water supplied, and level of noise pollution. Protocols for water and noise test were prepared in consultation with experts. Water quality test involved physical, chemical and bacteriological test of water as per the CPCB norms. For testing quality of water at consumer end, the auditors worked closely with the ULB and Water department. Samples were collected from consumer end and submitted to the lab suggested by city. For noise pollution, in about 20 cities the state pollution board or city level environment department took the responsibility for providing noise pollution data as per the protocols. In rest of the cities, mobile based application was used to measure noise pollution.

During implementation, MoHUA facilitated the process by conducting video conferences with cities to address any queries, reiterate the importance, and ensure that cities adequately engages in the process and submit their responses in time and respond to requests for clarifications.

In addition to secondary data collection, physical audit and primary data collection, citizen survey was conducted to understand their perception and level of satisfaction on various services such as health, education, water supply, electricity, waste management etc. provided by urban local bodies. Over 60000 citizens participated in the survey across India.

The final scores and ranks have been generated based on the scoring methodology that has been discussed extensively and minor modifications made that are summarized as below:

#	Challenges	Proposed Solutions
1	Only 23 cities of 111 cities have City Mobility Plan (CMP) or any and hence able to provide data for Mode Share of Public Transport and Non-Motorised Transport. To address the data gap, as advised by the MoHUA, the consortia undertook a sample dipstick across all cities covering a sample of 150 Households. Understandably, the dipstick findings will not match the rigor of a CMP.	We recommend the following: 1) Cities which have provided CMP Data will be evaluated on 100% of the maximum score 2) For the cities where the dipstick data is used, the city receives a 50% discount on the overall score Alternatively, another approach is to assign 0 score to all 88 cities that don't have a CMP
2	Variance was observed on data reported by cities on road network and data presented in the smart city proposals during the verifications.	We recommend taking the data reported by the cities in the Smart City Proposals.
3	There is no secondary source/ organization that provides unemployment data at city level. As a result, most cities do not have the data. Fully cognizance of the challenges of generating this data in a short span of time, it was agreed to collect this data through a dipstick survey on lines of NSSO questions. The data generated needs further scrutiny and triangulation with some inputs from experts. This may not be possible in the short	The indicator on unemployment will be excluded from scores. For final ranking, the cities will be scored on 78 indicators.

#	Challenges	Proposed Solutions
	window.	
4	Many cities did not have data on noise pollution and it was decided that data will be collected using a mobile app for all the 111 cities. However, many cities have expressed reservations with the approach especially with respect to the reliability of using this data. Further, some cities have relied on the SPCB to collect the data as per the approach proposed by the consortia. Thus, noise pollution data is currently from two sources: 1. SPCB- 20 cities 2. Noise-based app- 91 cities	The data collected through the primary survey will be used for scoring the cities. Currently, there is no differential scoring for the data from the SPCB and the data collected through the mobile app. However, a certain higher weightage can be provided to those cities which used the state apparatus to collect noise pollution data.
5	For the indicator on quality of water supplied, the methodology document states that samples should be drawn both at the treatment plant outlet as well as the consumer end. However, the data provided by the cities were predominantly from the distribution point. Hence for consumer end results with MoHUA intervention, consortia coordinated with cities to collect the data at the consumer end. The cities facilitated the testing. The outcome of the process is as below: 1. Sample given- 102 cities 2. Report received- 86 cities 3. Report awaited- 16 cities 4. Tests not completed due to lack of cooperation and other reasons – 9	The maximum score for this indicator will be distributed equally (50%) for results based on samples from the treatment plant and consumer end. Cities that did not complete tests or provide the results will be given a score 0 for against consumer end tests.
6	City level population is not projected annually by most of the cities. So, estimates for 2017 population are not available with the cities.	As recommended by MoHUA, 2011 census population is being used for the ranking purpose.

#	Challenges	Proposed Solutions
7	The age category specific data for 9 cities is not available at a city level	The age category specific population data has been taken at a district level for these cities.
8	Indicators on non-motorised transports like- Dedicated bicycle tracks, bicycle parking facilities and mode share of non-motorised transport are not relevant for hilly terrains.	As discussed during the PMC meeting, these indicators have been treated as non-applicable for the hilly cities and the weights have been redistributed among other indicators within the same category.
9	The indicator on increase in professional tax is not relevant to cities which do not levy the professional tax.	As discussed during the PMC meeting, this indicator has been non-applicable to the cities belonging to states where professional tax is not levied, and the weights have been redistributed among other indicators within the same category.
10	The indicator on increase in VAT collection is not applicable to Port Blair and Kavaratti, as there was no provision of VAT collection in these cities.	As discussed during the PMC meeting, these indicatosr has been treated as non-applicable for these two cities and the weights have been redistributed among other indicators within the same category.
11	Indicator on coverage of basic services to slum households does not concern cities with no slums (notified/ non-notified.	As discussed during the PMC meeting, this indicators has been treated as non-applicable for these cities and the weights have been redistributed among other indicators within the same category.

1. Introduction

The Ministry of Housing and Urban Affairs (MoHUA) is implementing several flagship urban missions such as the Smart Cities Mission (SCM), Atal Mission for Urban Rejuvenation and Transformation (AMRUT), Heritage City Development and Augmentation Yojana (HRIDAY), Housing for All (HFA). Theses mission along with other transformative initiatives of the Government including National Water Mission, Power for All, National Health Mission are aimed at making Indian cities more 'liveable.' The overarching goal of these initiatives is to move from an input-based approach to a 'citizen centric-outcome based' assessment of urban liveability.

To develop a common minimum framework for cities to assess their existing status and chart their pathway towards providing a better quality of life to their citizens, the MoHUA developed a set of 'Liveability Standards' relevant to cities to generate a Liveability Index and ranking of cities. These standards were launched in June, 2017. The MoHUA has planned to conduct an 'Annual Assessment of Liveability Standards in Cities – an ambitious national project that will involve yearly submission of data by cities across the various indicators, compilation and analysis, development of indices and ranking of cities. The Liveability Index is envisioned as a 360° tool for tracking, planning and transforming Indian cities. The Liveability Index is aimed at the following objectives:

- Providing strong evidence-based approach for future interventions and investments to deliver liveability outcomes
- Catalysing actions to improve the overall quality of the city's liveability and achieve broader development outcomes including the Sustainable Development Goals
- Assessing the implementation of government policies and schemes governing characteristics of cities that can contribute to creating liveable communities

Cities move to a single, unified data driven decision making paradigm…

The first round of the assessment commenced in January 2018 covering 116 major cities including smart cities, capital cities and cities with population of above one million each. Implementation of the liveability assessment commenced in January 2018 with a national level orientation workshop for the urban local bodies. The workshop aimed at orienting the states and urban local bodies on the overall framework, indicators, data sources, methodology and key milestones and timelines involved in the liveability assessment. Subsequently, a series of State/ Union Territory level orientation workshops were carried out in 33 states/UTs for a detailed discussion on the framework. Online data collection commenced from 9th March through an online data collection platform that supported both online and offline data submission modes. On the date of closure of the online data entry portal i.e., 16th April, 2018 112 cities submitted their data. Subsequently, comprehensive checks on the submitted data was undertaken that involved checking for outliers, logical inconsistencies etc. post which round-1 of data reconciliation was conducted. This draft report is based on round-1 of reconciled data as on 28th April, 2018.

2. Liveability Framework and Indicators

The Liveability Framework comprises a total of 79 indicators (57 Core Indicators and 22 Supporting Indicators). A core indicator carries 70% weightage and a supporting indicator carries 30% weightage. These indicators are grouped under 15 thematic categories which in turn are part of four pillars of comprehensive development of cities i.e., institutional, social, economic and physical. Based on the performance of cities against the various core and supporting indicators, various 'Category Sub-Indexes' and a composite 'City Liveability Index' will be developed for each city.

2.1 Scoring and Computing Category Indices of Liveability

The set of 79 indicators, associated categories and pillars are presented in the table below:

Table 1 List of Pillars, Categories and Indicators

Pillars of Comprehensive Development	Category	Indicators
Institutional	1. Governance	1.1 Percentage of citizen services available online
		1.2 Percentage of services integrated through Command Centre
		1.3 Percentage of citizens using online services
		1.4 Average delay in grievance redressal
		1.5 Tax collected as percentage of tax billed
		1.6 Extent of cost recovery (O&M) in water supply services
		1.7 Capital spending as percentage of total expenditure
		1.8 Percentage of population covered under Ward Committees/Area *Sabhas*
Social	**2. Identity and Culture**	2.1 Restoration and reuse of historic buildings
		2.2 Percentage of ecologically important areas covered through projects for restoration
		2.3 Hotel occupancy
		2.4 Percentage of budget allocated towards cultural/sports activities
		2.5 Number of cultural/sports events hosted by city
	3. Education	3.1 Percentage of school-aged population enrolled in schools
		3.2 Percentage of female school-aged population enrolled in schools

Pillars of Comprehensive Development	Category	Indicators
		3.3 Primary education student-teacher ratio
		3.4 Percentage of schools with access to digital education
		3.5 Percentage of students completing primary education
		3.6 Percentage of students completing secondary education
	4. Health	4.1 Number of in-patient hospital beds per 10,000 population
		4.2 Healthcare professionals per 10,000 population
		4.3 Average response time in case of health emergencies
		4.4 Period prevalence of water borne diseases
		4.5 Period prevalence of vector borne diseases
	5. Safety and Security	5.1 Number of CCTV Cameras
		5.2 Number of recorded crimes per lakh population
		5.3 Extent of crimes recorded against women, children and elderly per year
		5.4 Transport-related fatality per lakh population
Economic	**6. Economy and Employment**	6.1 Increase in VAT/GST collection
		6.2 Increase in collection of Professional Tax
		6.3 Increase in issuance of Construction permits
		6.4 Unemployment rate
		6.5 Percentage of vendors registered and provided formal spaces
Physical	**7. Housing and Inclusiveness**	7.1 Percentage of Slum/EWS households covered through formal/affordable housing
		7.2 Percentage of slum areas covered through basic services
	8. Public Open Spaces	8.1 Per capita availability of green spaces
		8.2 Per capita availability of public and recreational places
	9. Mixed Land Use and Compactness	9.1 Share of mixed land use area in overall city land use
		9.2 Net Density
	10. Power Supply	10.1 Percentage of city population with authorized electrical services
		10.2 Percentage of electrical connections covered

Pillars of Comprehensive Development	Category	Indicators
		through smart meters
		10.3 Average number of electrical interruptions per year
		10.4 Average length of electrical interruptions per year
		10.5 Percentage of total energy derived from renewable sources
		10.6 Energy consumption per unit - water supply and sewerage
		10.7 Energy consumption per unit - street lighting
		10.8 Percentage of new and redeveloped buildings following green building norms
		10.9 Total energy consumption per capita
	11. Transportation and Mobility	11.1 Geographical coverage of public transport
		11.2 Availability of public transport
		11.3 Mode share of public transport
		11.4 Percentage of road network with dedicated bicycle tracks
		11.5 Percentage of interchanges with bicycle parking facilities
		11.6 Mode share of non-motorized transport
		11.7 Availability of Passenger Information System
		11.8 Extent of signal synchronization
		11.9 Availability of paid parking spaces
		11.10 Percentage coverage of footpaths – wider than 1.2 m
		11.11 Percentage of traffic intersections with pedestrian crossing facilities
		11.12 Extent to which universal accessibility is incorporated in public rights-of-way
	12. Assured Water Supply	12.1 Household level coverage of direct water supply connections
		12.2 Per capita supply of water
		12.3 Quality of water supplied
		12.4 Level of non-revenue water – NRW
		12.5 Percentage of water connections covered through meters
		12.6 Percentage of plots with rainwater harvesting facility
	13. Waste Water	13.1 Coverage of toilets

Pillars of Comprehensive Development	Category	Indicators
	Management	13.2 Coverage of sewerage network and/or septage
		13.3 Collection efficiency of sewerage network
		13.4 Extent of reuse and recycling of waste water
		13.5 Coverage of storm water drains
	14. Solid Waste Management	14.1 Household level coverage of municipal solid waste collection
		14.2 Efficiency of collection of municipal solid waste
		14.3 Extent of municipal solid waste recovered through reuse
	15. Reduced Pollution	15.1 Concentration of SO2- air pollution
		15.2 Concentration of NO2- air pollution
		15.3 Concentration of PM10 - air pollution
		15.4 Level of noise pollution
		15.5 Quality of water in public surface water bodies

2.2 Scoring and Computing Category Indices of Liveability

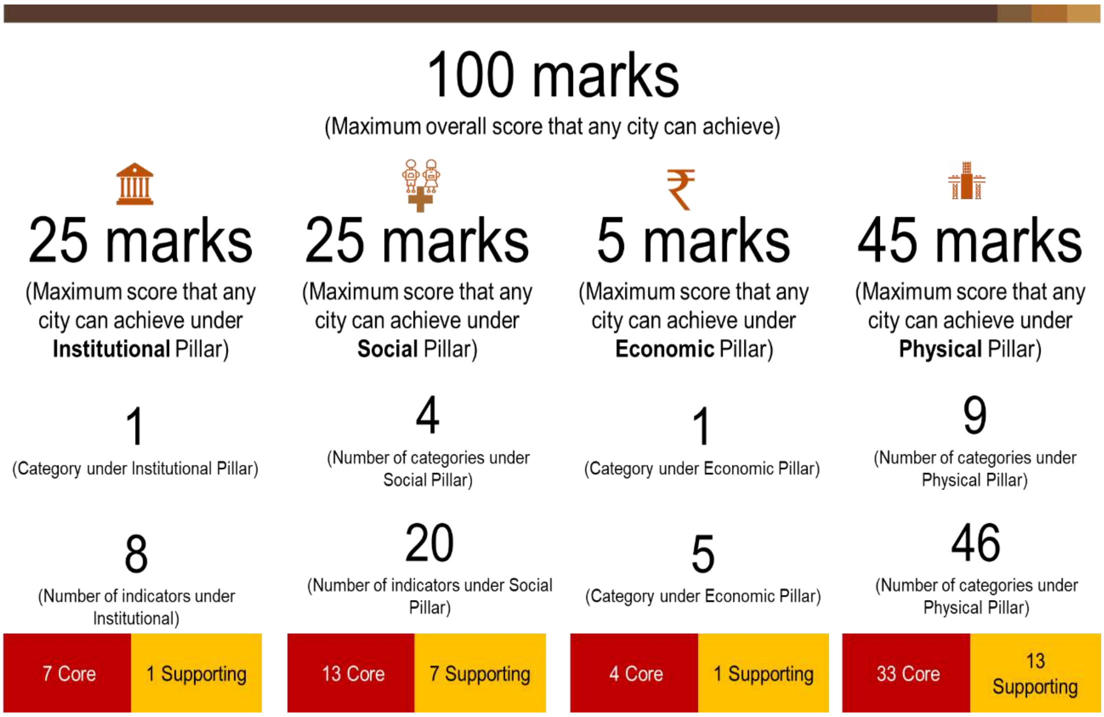
The performance achieved by cities against 79 indicators, will be assessed against given benchmarks. Where no international/national norms are available, city with the best performance in its group (population range) will be treated as a benchmark. The groups are given in the table below.

Table 2 Details on Population Range

Category	Population range
Category 1	Population ≥ 4 million
Category 2	1 million ≤ Population < 4 million
Category 3	0.5 million ≤ Population < 1 million
Category 4	Population < 0.5 million

2.3 Scoring Approach and Methodology

A city can earn a maximum score of 100 points for 79 indicators across four pillars. The pillar weights are as follows: Institutional (25 points), Social (25 points), Economy and Employment (5 points) and Physical (45 points). Based on the number and nature of indicators i.e., core vs. secondary, indicator wise maximum marks were computed.



100 marks

(Maximum overall score that any city can achieve)

25 marks (Maximum score that any city can achieve under **Institutional** Pillar)	25 marks (Maximum score that any city can achieve under **Social** Pillar)	5 marks (Maximum score that any city can achieve under **Economic** Pillar)	45 marks (Maximum score that any city can achieve under **Physical** Pillar)
1 (Category under Institutional Pillar)	4 (Number of categories under Social Pillar)	1 (Category under Economic Pillar)	9 (Number of categories under Physical Pillar)
8 (Number of indicators under Institutional)	20 (Number of indicators under Social Pillar)	5 (Category under Economic Pillar)	46 (Number of categories under Physical Pillar)
7 Core 1 Supporting	13 Core 7 Supporting	4 Core 1 Supporting	33 Core 13 Supporting

Dimensional Index Methodology (DIM) has been used to compute scores for each indicator with reference to “maximum within the comparison group” or “absolute benchmarks”. For indicators where benchmarks are available, cities getting the benchmark score (or above) are given the maximum mark, and the marks awarded to other cities are calculated proportionately. For indicators where benchmarks are not available, the best performing cities in each population group are given the maximum mark, and the marks awarded to other cities (within the population group) are calculated proportionately. For indicators where benchmarks do not exist, the city data has been tested for outliers before scoring.

2.4 Scoring Normalisation:

To construct aggregate scores across cities as well as to make the scores across indicators comparable, indicator values were normalised using a min-max approach. The following formula was used to normalise the indicator values-

$$\frac{indicator\ value\ for\ the\ city - indicator\ value\ for\ the\ worst\ performing\ city}{benchmark - \ indicator\ value\ for\ the\ worst\ performing\ city}$$

This approach would restrict the normalised indicator value between 0 and 1. Cities that met or exceeded the benchmark received a normalised indicator value of 1. Worst performing cities are given a normalised indicator value of 0. After normalisation, the normalised value is weighted according to the category and the indicator being core or supporting.

To illustrate, consider the indicator 12.3 Quality of Water Supplied in the Category 12 for Assured Water Supply. If in City A 50% of the water samples collected qualify the potable water standards specified by the CPHEEO, and only 10% of the samples from worst performing city qualify the standards. Then, the normalised value for the indicator for city A would be 0.44 [(0.5-0.1)/(1-0.1)].

The weight for indicator 12.3 is 1.03, so the final weighted score for City A would come out to 0.45 [1.03*0.44].

3. City Reconnaissance Meetings:

State level workshop was necessary to orient the cities and familairise them about the process of liveability assessment. City did not provide the data post log in on the online portal due to lack of directive at the state level. The team followed up at the state level beginning early March until end of April with senior team members travelling to the state and Ministry's intervention. Below is the summary of follow up meetings with Urban development department and SUDA at state level.

Without State level permissions and directive, city officials were not appreciative of follow up and expressed inability to cooperate.

Date	Departments	Key Discussions
07 March 2018 09 March 2018 12 March 2018 13 March 2018	PA to Principal secretary (UD) Joint Secretary Urban Development Department Government of West Bengal	State Workshop schedule
13 March 2018	Additional Director, State Urban Development Agency, West Bengal	State Workshop for liveability Assessment City login
15 March 2018 16 March 2018	PA to Chief Secretary, Office of Chief Secretary	Permission for state workshop Appointing SUDA as nodal agency for liveability assessment
19 March 2018	Director, SUDA, West Bengal	Discussion on whether SUDA has got any intimation from PS/CS office to act as nodal agency
21 March 2018	Principal Secretary (UD) office	Understand the scope of assessment process in WB
22 March 2018	Principal Secretary (UD) Director, SUDA Chief Manager, Planning and Monitoring (SUDA)	Schedule meeting to discuss the Workshop and subsequent requirements for the Liveability Assessment study
23 March 2018	Director, Additional Director	SUDA officials shared that March

Date	Departments	Key Discussions
	and Chief Manager, SUDA	month was not convenient to organise workshop and 4th April 2018 was scheduled as attentive date for workshop. Files forwarded to Principal Secretary to approve list of participants

Executive Summary

Assessment of liveability indices is an initiative by the Ministry of Housing and Urban Affairs to improve quality of life of citizens and achieve sustainable development goals by encouraging cities to adopt "outcome based" approach for urban planning. Assessment process aimed to provide opportunity to cities to review the development components holistically by involving 79 measurable indicators categorized under governance, health, education, safety, economy, power supply, transportation and mobility, identity, culture, housing, waste management and pollution.

This report highlights the assessment process, key milestones, and the final outcome of the data submitted. Implementation of liveability assessment commenced formally on 19th January 2018. A national level workshop was organized on 13th February 2018 to explain the importance and process of liveability assessment and get feedback on methodology from the city authorities.

This was followed by the next stage of Questionnaire development. The questionnaire was arranged under 12 categories representing 12 data owners namely urban local body, Central and state pollution control board, development authority, DISCOM/Electricity board, State disaster management authority, state education department, state health department, state renewable energy development agency, state sales and commercial taxes department, town and country planning department, traffic and police department and transport authorities.

An online data entry portal was developed to facilitate data submission by the cities. Each city had a unique log in to access the portal and submit the data. Both online and off-line options (download the questionnaire in an excel) to submit the data were available for cities. An email help desk was set up for the cities to raise any queries and seek clarification when responding to the questions.

A team for each state comprising of State Coordinator and City Coordinator (one per city) was deployed that facilitated the process and supported the cities. A total of 6 regional coordinators/ consultants, 29 State Coordinators, and 99 city coordinators were deployed across 116 cities. Training for state coordinators was held from 26th to 28th February 2018 at Chennai to make coordinators understand overall liveability assessment, indicators, data sources, protocols and roles and responsibilities.

City Reconnaissance Meetings were initiated by the state and city coordinators. The discussion began with discussions to finalize the state workshop schedule, mapping of data owners, and assist cities in data collection. The City Coordinators were based in the cities for over 6 weeks and during this time, they liase with ULB and other data owners to explain the liveability framework, online portal, and facilitate the online submission.

A total of 33 state workshops were conducted at the state level. The objective of the workshop was to orient the city stakeholders on liveability assessment, indicators, components of data collection, timelines, expectations of support and support extended by MoHUA. The state level workshops brought

various city level departments on a single platform to understand and discuss the methodology and components of city liveability assessment.

Nodal agency at state level supported by the City and State Coordinator and city level (Municipality corporation/smart city limited) coordinated with city specific data owners/departments for data gathering, collation, and submission. Nodal persons in each department were appointed for timely data collection and submission. Of 116, 112 cities submitted data as per the timeline on 16th April 2018.

Post submission, the city and state coordinators supported by the central team followed up extensively with the cities to support secondary documents as evidence to substantiate their submissions. Secondary documents such as reports, official orders, copy of office register, signed copy of liveability assessment questionnaire furnished by cities against the submitted data. Documents are verified to map the documents for the reponses provided by city and to check the type data provided by city. The document check outcomes were shared with the cities as a part of data quality check.

For checking consistency of data, logical check of data, verifying data from other public sources were undertaken. Quality check was done to ensure data validity and provide opportunity to cities to review the data provided by them and correct in case of wrong data entry.

For 8 selected indicators namely, percentage of services integrated through command and control center, hotel occupancy rate, percentage of schools with access to digital education, number of CCTV cameras per unit road length, percentage of vendors registered and provided formal spaces, availability of passenger information system, percentage of traffic intersection with pedestrian crossing facility, and extent to which universal accessibility is incorporated in public rights of way. Physical audit was conducted in 110 cities by physical auditors appointed and trained by the consortium. In consultation with ULB nodal person, locations and indicators for physical audit was selected in each city. A mobile based application was developed to capture the physical audit related data.

Primary data collection was done for five indicators such as unemployment rates, mode share of public transport, mode share of non-motorized transport, quality of water supplied, and level of noise pollution. Protocols for water and noise test were prepared in consultation with experts. Water quality test involved physical, chemical and bacteriological test of water as per the CPCB norms. For testing quality of water at consumer end, the auditors worked closely with the ULB and Water department. Samples were collected from consumer end and submitted to the lab suggested by city. For noise pollution, in about 20 cities the state pollution board or city level environment department took the responsibility for providing noise pollution data as per the protocols. In rest of the cities, mobile based application was used to measure noise pollution.

During implementation, MoHUA facilitated the process by conducting video conferences with cities to address any queries, reiterate the importance, and ensure that cities adequately engages in the process and submit their responses in time and respond to requests for clarifications.

In addition to secondary data collection, physical audit and primary data collection, citizen survey was conducted to understand their perception and level of satisfaction on various services such as health, education, water supply, electricity, waste management etc. provided by urban local bodies. Over 60000 citizens participated in the survey across India.

The final scores and ranks have been generated based on the scoring methodology that has been discussed extensively and minor modifications made that are summarized as below:

#	Challenges	Proposed Solutions
1	Only 23 cities of 111 cities have City Mobility Plan (CMP) or any and hence able to provide data for Mode Share of Public Transport and Non-Motorised Transport. To address the data gap, as advised by the MoHUA, the consortia undertook a sample dipstick across all cities covering a sample of 150 Households. Understandably, the dipstick findings will not match the rigor of a CMP.	We recommend the following: 1) Cities which have provided CMP Data will be evaluated on 100% of the maximum score 2) For the cities where the dipstick data is used, the city receives a 50% discount on the overall score Alternatively, another approach is to assign 0 score to all 88 cities that don't have a CMP
2	Variance was observed on data reported by cities on road network and data presented in the smart city proposals during the verifications.	We recommend taking the data reported by the cities in the Smart City Proposals.
3	There is no secondary source/ organization that provides unemployment data at city level. As a result, most cities do not have the data. Fully cognizance of the challenges of generating this data in a short span of time, it was agreed to collect this data through a dipstick survey on lines of NSSO questions. The data generated needs further scrutiny and triangulation with some inputs from experts. This may not be possible in the short	The indicator on unemployment will be excluded from scores. For final ranking, the cities will be scored on 78 indicators.

#	Challenges	Proposed Solutions
	window.	
4	Many cities did not have data on noise pollution and it was decided that data will be collected using a mobile app for all the 111 cities. However, many cities have expressed reservations with the approach especially with respect to the reliability of using this data. Further, some cities have relied on the SPCB to collect the data as per the approach proposed by the consortia. Thus, noise pollution data is currently from two sources: 1. SPCB- 20 cities 2. Noise-based app- 91 cities	The data collected through the primary survey will be used for scoring the cities. Currently, there is no differential scoring for the data from the SPCB and the data collected through the mobile app. However, a certain higher weightage can be provided to those cities which used the state apparatus to collect noise pollution data.
5	For the indicator on quality of water supplied, the methodology document states that samples should be drawn both at the treatment plant outlet as well as the consumer end. However, the data provided by the cities were predominantly from the distribution point. Hence for consumer end results with MoHUA intervention, consortia coordinated with cities to collect the data at the consumer end. The cities facilitated the testing. The outcome of the process is as below: 1. Sample given- 102 cities 2. Report received- 86 cities 3. Report awaited- 16 cities 4. Tests not completed due to lack of cooperation and other reasons – 9	The maximum score for this indicator will be distributed equally (50%) for results based on samples from the treatment plant and consumer end. Cities that did not complete tests or provide the results will be given a score 0 for against consumer end tests.
6	City level population is not projected annually by most of the cities. So, estimates for 2017 population are not available with the cities.	As recommended by MoHUA, 2011 census population is being used for the ranking purpose.

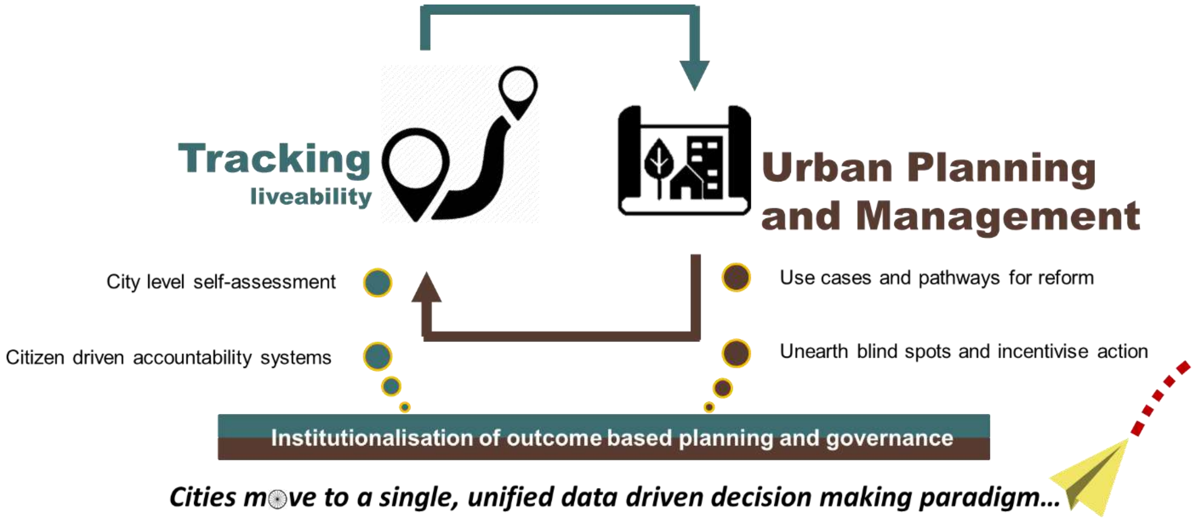
#	Challenges	Proposed Solutions
7	The age category specific data for 9 cities is not available at a city level	The age category specific population data has been taken at a district level for these cities.
8	Indicators on non-motorised transports like- Dedicated bicycle tracks, bicycle parking facilities and mode share of non-motorised transport are not relevant for hilly terrains.	As discussed during the PMC meeting, these indicators have been treated as non-applicable for the hilly cities and the weights have been redistributed among other indicators within the same category.
9	The indicator on increase in professional tax is not relevant to cities which do not levy the professional tax.	As discussed during the PMC meeting, this indicator has been non-applicable to the cities belonging to states where professional tax is not levied, and the weights have been redistributed among other indicators within the same category.
10	The indicator on increase in VAT collection is not applicable to Port Blair and Kavaratti, as there was no provision of VAT collection in these cities.	As discussed during the PMC meeting, these indicatosr has been treated as non-applicable for these two cities and the weights have been redistributed among other indicators within the same category.
11	Indicator on coverage of basic services to slum households does not concern cities with no slums (notified/ non-notified.	As discussed during the PMC meeting, this indicators has been treated as non-applicable for these cities and the weights have been redistributed among other indicators within the same category.

1. Introduction

The Ministry of Housing and Urban Affairs (MoHUA) is implementing several flagship urban missions such as the Smart Cities Mission (SCM), Atal Mission for Urban Rejuvenation and Transformation (AMRUT), Heritage City Development and Augmentation Yojana (HRIDAY), Housing for All (HFA). Theses mission along with other transformative initiatives of the Government including National Water Mission, Power for All, National Health Mission are aimed at making Indian cities more 'liveable.' The overarching goal of these initiatives is to move from an input-based approach to a 'citizen centric-outcome based' assessment of urban liveability.

To develop a common minimum framework for cities to assess their existing status and chart their pathway towards providing a better quality of life to their citizens, the MoHUA developed a set of 'Liveability Standards' relevant to cities to generate a Liveability Index and ranking of cities. These standards were launched in June, 2017. The MoHUA has planned to conduct an 'Annual Assessment of Liveability Standards in Cities – an ambitious national project that will involve yearly submission of data by cities across the various indicators, compilation and analysis, development of indices and ranking of cities. The Liveability Index is envisioned as a 360° tool for tracking, planning and transforming Indian cities. The Liveability Index is aimed at the following objectives:

- Providing strong evidence-based approach for future interventions and investments to deliver liveability outcomes
- Catalysing actions to improve the overall quality of the city's liveability and achieve broader development outcomes including the Sustainable Development Goals
- Assessing the implementation of government policies and schemes governing characteristics of cities that can contribute to creating liveable communities



Tracking
liveability
Urban Planning
and Management
City level self-assessment
Citizen driven accountability systems
Use cases and pathways for reform
Unearth blind spots and incentivise action
Institutionalisation of outcome based planning and governance

Cities move to a single, unified data driven decision making paradigm…

The first round of the assessment commenced in January 2018 covering 116 major cities including smart cities, capital cities and cities with population of above one million each. Implementation of the liveability assessment commenced in January 2018 with a national level orientation workshop for the urban local bodies. The workshop aimed at orienting the states and urban local bodies on the overall framework, indicators, data sources, methodology and key milestones and timelines involved in the liveability assessment. Subsequently, a series of State/ Union Territory level orientation workshops were carried out in 33 states/UTs for a detailed discussion on the framework. Online data collection commenced from 9th March through an online data collection platform that supported both online and offline data submission modes. On the date of closure of the online data entry portal i.e., 16th April, 2018 112 cities submitted their data. Subsequently, comprehensive checks on the submitted data was undertaken that involved checking for outliers, logical inconsistencies etc. post which round-1 of data reconciliation was conducted. This draft report is based on round-1 of reconciled data as on 28th April, 2018.

2. Liveability Framework and Indicators

The Liveability Framework comprises a total of 79 indicators (57 Core Indicators and 22 Supporting Indicators). A core indicator carries 70% weightage and a supporting indicator carries 30% weightage. These indicators are grouped under 15 thematic categories which in turn are part of four pillars of comprehensive development of cities i.e., institutional, social, economic and physical. Based on the performance of cities against the various core and supporting indicators, various 'Category Sub-Indexes' and a composite 'City Liveability Index' will be developed for each city.

2.1 Scoring and Computing Category Indices of Liveability

The set of 79 indicators, associated categories and pillars are presented in the table below:

Table 1 List of Pillars, Categories and Indicators

Pillars of Comprehensive Development	Category	Indicators
Institutional	1. Governance	1.1 Percentage of citizen services available online
		1.2 Percentage of services integrated through Command Centre
		1.3 Percentage of citizens using online services
		1.4 Average delay in grievance redressal
		1.5 Tax collected as percentage of tax billed
		1.6 Extent of cost recovery (O&M) in water supply services
		1.7 Capital spending as percentage of total expenditure
		1.8 Percentage of population covered under Ward Committees/Area *Sabhas*
Social	**2. Identity and Culture**	2.1 Restoration and reuse of historic buildings
		2.2 Percentage of ecologically important areas covered through projects for restoration
		2.3 Hotel occupancy
		2.4 Percentage of budget allocated towards cultural/sports activities
		2.5 Number of cultural/sports events hosted by city
	3. Education	3.1 Percentage of school-aged population enrolled in schools
		3.2 Percentage of female school-aged population enrolled in schools

Pillars of Comprehensive Development	Category	Indicators
		3.3 Primary education student-teacher ratio
		3.4 Percentage of schools with access to digital education
		3.5 Percentage of students completing primary education
		3.6 Percentage of students completing secondary education
	4. Health	4.1 Number of in-patient hospital beds per 10,000 population
		4.2 Healthcare professionals per 10,000 population
		4.3 Average response time in case of health emergencies
		4.4 Period prevalence of water borne diseases
		4.5 Period prevalence of vector borne diseases
	5. Safety and Security	5.1 Number of CCTV Cameras
		5.2 Number of recorded crimes per lakh population
		5.3 Extent of crimes recorded against women, children and elderly per year
		5.4 Transport-related fatality per lakh population
Economic	**6. Economy and Employment**	6.1 Increase in VAT/GST collection
		6.2 Increase in collection of Professional Tax
		6.3 Increase in issuance of Construction permits
		6.4 Unemployment rate
		6.5 Percentage of vendors registered and provided formal spaces
Physical	**7. Housing and Inclusiveness**	7.1 Percentage of Slum/EWS households covered through formal/affordable housing
		7.2 Percentage of slum areas covered through basic services
	8. Public Open Spaces	8.1 Per capita availability of green spaces
		8.2 Per capita availability of public and recreational places
	9. Mixed Land Use and Compactness	9.1 Share of mixed land use area in overall city land use
		9.2 Net Density
	10. Power Supply	10.1 Percentage of city population with authorized electrical services
		10.2 Percentage of electrical connections covered

Pillars of Comprehensive Development	Category	Indicators
		through smart meters
		10.3 Average number of electrical interruptions per year
		10.4 Average length of electrical interruptions per year
		10.5 Percentage of total energy derived from renewable sources
		10.6 Energy consumption per unit - water supply and sewerage
		10.7 Energy consumption per unit - street lighting
		10.8 Percentage of new and redeveloped buildings following green building norms
		10.9 Total energy consumption per capita
	11. Transportation and Mobility	11.1 Geographical coverage of public transport
		11.2 Availability of public transport
		11.3 Mode share of public transport
		11.4 Percentage of road network with dedicated bicycle tracks
		11.5 Percentage of interchanges with bicycle parking facilities
		11.6 Mode share of non-motorized transport
		11.7 Availability of Passenger Information System
		11.8 Extent of signal synchronization
		11.9 Availability of paid parking spaces
		11.10 Percentage coverage of footpaths – wider than 1.2 m
		11.11 Percentage of traffic intersections with pedestrian crossing facilities
		11.12 Extent to which universal accessibility is incorporated in public rights-of-way
	12. Assured Water Supply	12.1 Household level coverage of direct water supply connections
		12.2 Per capita supply of water
		12.3 Quality of water supplied
		12.4 Level of non-revenue water – NRW
		12.5 Percentage of water connections covered through meters
		12.6 Percentage of plots with rainwater harvesting facility
	13. Waste Water	13.1 Coverage of toilets

Pillars of Comprehensive Development	Category	Indicators
	Management	13.2 Coverage of sewerage network and/or septage
		13.3 Collection efficiency of sewerage network
		13.4 Extent of reuse and recycling of waste water
		13.5 Coverage of storm water drains
	14. Solid Waste Management	14.1 Household level coverage of municipal solid waste collection
		14.2 Efficiency of collection of municipal solid waste
		14.3 Extent of municipal solid waste recovered through reuse
	15. Reduced Pollution	15.1 Concentration of SO2- air pollution
		15.2 Concentration of NO2- air pollution
		15.3 Concentration of PM10 - air pollution
		15.4 Level of noise pollution
		15.5 Quality of water in public surface water bodies

2.2 Scoring and Computing Category Indices of Liveability

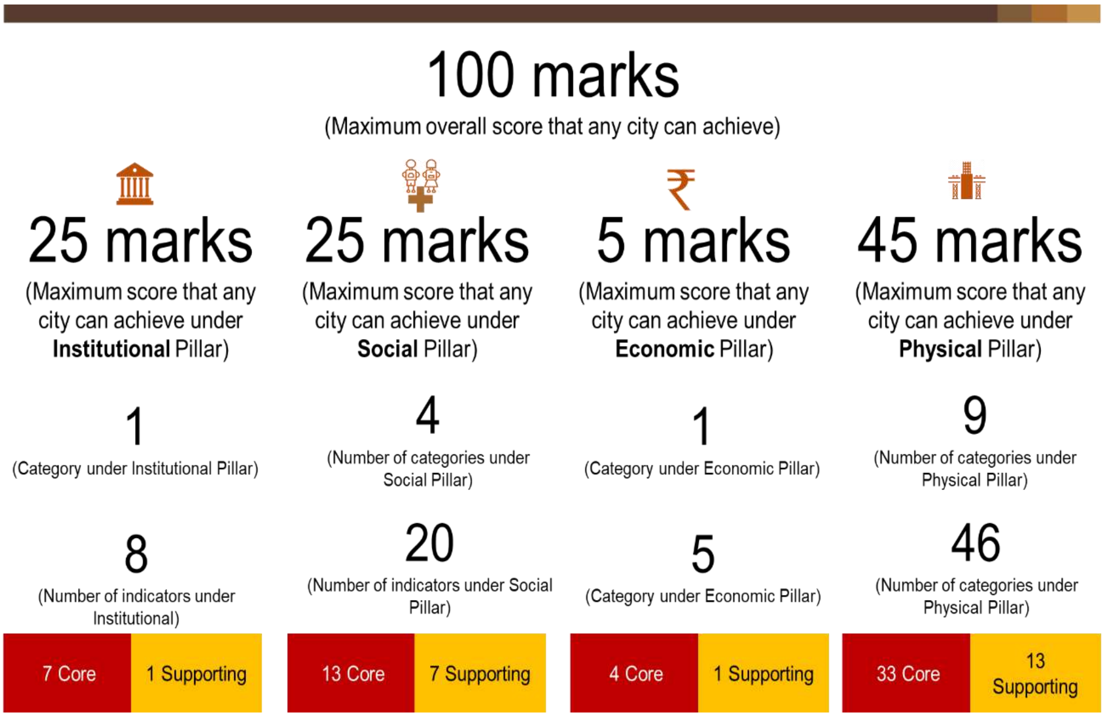
The performance achieved by cities against 79 indicators, will be assessed against given benchmarks. Where no international/national norms are available, city with the best performance in its group (population range) will be treated as a benchmark. The groups are given in the table below.

Table 2 Details on Population Range

Category	Population range
Category 1	Population ≥ 4 million
Category 2	1 million ≤ Population < 4 million
Category 3	0.5 million ≤ Population < 1 million
Category 4	Population < 0.5 million

2.3 Scoring Approach and Methodology

A city can earn a maximum score of 100 points for 79 indicators across four pillars. The pillar weights are as follows: Institutional (25 points), Social (25 points), Economy and Employment (5 points) and Physical (45 points). Based on the number and nature of indicators i.e., core vs. secondary, indicator wise maximum marks were computed.



100 marks

(Maximum overall score that any city can achieve)

25 marks	25 marks	5 marks	45 marks
(Maximum score that any city can achieve under **Institutional** Pillar)	(Maximum score that any city can achieve under **Social** Pillar)	(Maximum score that any city can achieve under **Economic** Pillar)	(Maximum score that any city can achieve under **Physical** Pillar)
1 (Category under Institutional Pillar)	4 (Number of categories under Social Pillar)	1 (Category under Economic Pillar)	9 (Number of categories under Physical Pillar)
8 (Number of indicators under Institutional)	20 (Number of indicators under Social Pillar)	5 (Category under Economic Pillar)	46 (Number of categories under Physical Pillar)
7 Core 1 Supporting	13 Core 7 Supporting	4 Core 1 Supporting	33 Core 13 Supporting

Dimensional Index Methodology (DIM) has been used to compute scores for each indicator with reference to “maximum within the comparison group” or “absolute benchmarks”. For indicators where benchmarks are available, cities getting the benchmark score (or above) are given the maximum mark, and the marks awarded to other cities are calculated proportionately. For indicators where benchmarks are not available, the best performing cities in each population group are given the maximum mark, and the marks awarded to other cities (within the population group) are calculated proportionately. For indicators where benchmarks do not exist, the city data has been tested for outliers before scoring.

2.4 Scoring Normalisation:

To construct aggregate scores across cities as well as to make the scores across indicators comparable, indicator values were normalised using a min-max approach. The following formula was used to normalise the indicator values-

$$\frac{indicator\ value\ for\ the\ city - indicator\ value\ for\ the\ worst\ performing\ city}{benchmark - \ indicator\ value\ for\ the\ worst\ performing\ city}$$

This approach would restrict the normalised indicator value between 0 and 1. Cities that met or exceeded the benchmark received a normalised indicator value of 1. Worst performing cities are given a normalised indicator value of 0. After normalisation, the normalised value is weighted according to the category and the indicator being core or supporting.

To illustrate, consider the indicator 12.3 Quality of Water Supplied in the Category 12 for Assured Water Supply. If in City A 50% of the water samples collected qualify the potable water standards specified by the CPHEEO, and only 10% of the samples from worst performing city qualify the standards. Then, the normalised value for the indicator for city A would be 0.44 [(0.5-0.1)/(1-0.1)].

The weight for indicator 12.3 is 1.03, so the final weighted score for City A would come out to 0.45 [1.03*0.44].

3. City Reconnaissance Meetings:

State level workshop was necessary to orient the cities and familairise them about the process of liveability assessment. City did not provide the data post log in on the online portal due to lack of directive at the state level. The team followed up at the state level beginning early March until end of April with senior team members travelling to the state and Ministry's intervention. Below is the summary of follow up meetings with Urban development department and SUDA at state level.

Date	Departments	Key Discussions
07 March 2018 09 March 2018 12 March 2018 13 March 2018	PA to Principal secretary (UD) Joint Secretary Urban Development Department Government of West Bengal	State Workshop schedule
13 March 2018	Additional Director, State Urban Development Agency, West Bengal	State Workshop for liveability Assessment City login
15 March 2018 16 March 2018	PA to Chief Secretary, Office of Chief Secretary	Permission for state workshop Appointing SUDA as nodal agency for liveability assessment
19 March 2018	Director, SUDA, West Bengal	Discussion on whether SUDA has got any intimation from PS/CS office to act as nodal agency
21 March 2018	Principal Secretary (UD) office	Understand the scope of assessment process in WB
22 March 2018	Principal Secretary (UD) Director, SUDA Chief Manager, Planning and Monitoring (SUDA)	Schedule meeting to discuss the Workshop and subsequent requirements for the Liveability Assessment study

Executive Summary

Assessment of liveability indices is an initiative by the Ministry of Housing and Urban Affairs to improve quality of life of citizens and achieve sustainable development goals by encouraging cities to adopt "outcome based" approach for urban planning. Assessment process aimed to provide opportunity to cities to review the development components holistically by involving 79 measurable indicators categorized under governance, health, education, safety, economy, power supply, transportation and mobility, identity, culture, housing, waste management and pollution.

This report highlights the assessment process, key milestones, and the final outcome of the data submitted. Implementation of liveability assessment commenced formally on 19th January 2018. A national level workshop was organized on 13th February 2018 to explain the importance and process of liveability assessment and get feedback on methodology from the city authorities.

This was followed by the next stage of Questionnaire development. The questionnaire was arranged under 12 categories representing 12 data owners namely urban local body, Central and state pollution control board, development authority, DISCOM/Electricity board, State disaster management authority, state education department, state health department, state renewable energy development agency, state sales and commercial taxes department, town and country planning department, traffic and police department and transport authorities.

An online data entry portal was developed to facilitate data submission by the cities. Each city had a unique log in to access the portal and submit the data. Both online and off-line options (download the questionnaire in an excel) to submit the data were available for cities. An email help desk was set up for the cities to raise any queries and seek clarification when responding to the questions.

A team for each state comprising of State Coordinator and City Coordinator (one per city) was deployed that facilitated the process and supported the cities. A total of 6 regional coordinators/ consultants, 29 State Coordinators, and 99 city coordinators were deployed across 116 cities. Training for state coordinators was held from 26th to 28th February 2018 at Chennai to make coordinators understand overall liveability assessment, indicators, data sources, protocols and roles and responsibilities.

City Reconnaissance Meetings were initiated by the state and city coordinators. The discussion began with discussions to finalize the state workshop schedule, mapping of data owners, and assist cities in data collection. The City Coordinators were based in the cities for over 6 weeks and during this time, they liase with ULB and other data owners to explain the liveability framework, online portal, and facilitate the online submission.

A total of 33 state workshops were conducted at the state level. The objective of the workshop was to orient the city stakeholders on liveability assessment, indicators, components of data collection, timelines, expectations of support and support extended by MoHUA. The state level workshops brought

various city level departments on a single platform to understand and discuss the methodology and components of city liveability assessment.

Nodal agency at state level supported by the City and State Coordinator and city level (Municipality corporation/smart city limited) coordinated with city specific data owners/departments for data gathering, collation, and submission. Nodal persons in each department were appointed for timely data collection and submission. Of 116, 112 cities submitted data as per the timeline on 16th April 2018.

Post submission, the city and state coordinators supported by the central team followed up extensively with the cities to support secondary documents as evidence to substantiate their submissions. Secondary documents such as reports, official orders, copy of office register, signed copy of liveability assessment questionnaire furnished by cities against the submitted data. Documents are verified to map the documents for the reponses provided by city and to check the type data provided by city. The document check outcomes were shared with the cities as a part of data quality check.

For checking consistency of data, logical check of data, verifying data from other public sources were undertaken. Quality check was done to ensure data validity and provide opportunity to cities to review the data provided by them and correct in case of wrong data entry.

For 8 selected indicators namely, percentage of services integrated through command and control center, hotel occupancy rate, percentage of schools with access to digital education, number of CCTV cameras per unit road length, percentage of vendors registered and provided formal spaces, availability of passenger information system, percentage of traffic intersection with pedestrian crossing facility, and extent to which universal accessibility is incorporated in public rights of way. Physical audit was conducted in 110 cities by physical auditors appointed and trained by the consortium. In consultation with ULB nodal person, locations and indicators for physical audit was selected in each city. A mobile based application was developed to capture the physical audit related data.

Primary data collection was done for five indicators such as unemployment rates, mode share of public transport, mode share of non-motorized transport, quality of water supplied, and level of noise pollution. Protocols for water and noise test were prepared in consultation with experts. Water quality test involved physical, chemical and bacteriological test of water as per the CPCB norms. For testing quality of water at consumer end, the auditors worked closely with the ULB and Water department. Samples were collected from consumer end and submitted to the lab suggested by city. For noise pollution, in about 20 cities the state pollution board or city level environment department took the responsibility for providing noise pollution data as per the protocols. In rest of the cities, mobile based application was used to measure noise pollution.

During implementation, MoHUA facilitated the process by conducting video conferences with cities to address any queries, reiterate the importance, and ensure that cities adequately engages in the process and submit their responses in time and respond to requests for clarifications.

In addition to secondary data collection, physical audit and primary data collection, citizen survey was conducted to understand their perception and level of satisfaction on various services such as health, education, water supply, electricity, waste management etc. provided by urban local bodies. Over 60000 citizens participated in the survey across India.

The final scores and ranks have been generated based on the scoring methodology that has been discussed extensively and minor modifications made that are summarized as below:

#	Challenges	Proposed Solutions
1	Only 23 cities of 111 cities have City Mobility Plan (CMP) or any and hence able to provide data for Mode Share of Public Transport and Non-Motorised Transport. To address the data gap, as advised by the MoHUA, the consortia undertook a sample dipstick across all cities covering a sample of 150 Households. Understandably, the dipstick findings will not match the rigor of a CMP.	We recommend the following: 1) Cities which have provided CMP Data will be evaluated on 100% of the maximum score 2) For the cities where the dipstick data is used, the city receives a 50% discount on the overall score Alternatively, another approach is to assign 0 score to all 88 cities that don't have a CMP
2	Variance was observed on data reported by cities on road network and data presented in the smart city proposals during the verifications.	We recommend taking the data reported by the cities in the Smart City Proposals.
3	There is no secondary source/ organization that provides unemployment data at city level. As a result, most cities do not have the data. Fully cognizance of the challenges of generating this data in a short span of time, it was agreed to collect this data through a dipstick survey on lines of NSSO questions. The data generated needs further scrutiny and triangulation with some inputs from experts. This may not be possible in the short	The indicator on unemployment will be excluded from scores. For final ranking, the cities will be scored on 78 indicators.

#	Challenges	Proposed Solutions
	window.	
4	Many cities did not have data on noise pollution and it was decided that data will be collected using a mobile app for all the 111 cities. However, many cities have expressed reservations with the approach especially with respect to the reliability of using this data. Further, some cities have relied on the SPCB to collect the data as per the approach proposed by the consortia. Thus, noise pollution data is currently from two sources: 1. SPCB- 20 cities 2. Noise-based app- 91 cities	The data collected through the primary survey will be used for scoring the cities. Currently, there is no differential scoring for the data from the SPCB and the data collected through the mobile app. However, a certain higher weightage can be provided to those cities which used the state apparatus to collect noise pollution data.
5	For the indicator on quality of water supplied, the methodology document states that samples should be drawn both at the treatment plant outlet as well as the consumer end. However, the data provided by the cities were predominantly from the distribution point. Hence for consumer end results with MoHUA intervention, consortia coordinated with cities to collect the data at the consumer end. The cities facilitated the testing. The outcome of the process is as below: 1. Sample given- 102 cities 2. Report received- 86 cities 3. Report awaited- 16 cities 4. Tests not completed due to lack of cooperation and other reasons – 9	The maximum score for this indicator will be distributed equally (50%) for results based on samples from the treatment plant and consumer end. Cities that did not complete tests or provide the results will be given a score 0 for against consumer end tests.
6	City level population is not projected annually by most of the cities. So, estimates for 2017 population are not available with the cities.	As recommended by MoHUA, 2011 census population is being used for the ranking purpose.

#	Challenges	Proposed Solutions
7	The age category specific data for 9 cities is not available at a city level	The age category specific population data has been taken at a district level for these cities.
8	Indicators on non-motorised transports like- Dedicated bicycle tracks, bicycle parking facilities and mode share of non-motorised transport are not relevant for hilly terrains.	As discussed during the PMC meeting, these indicators have been treated as non-applicable for the hilly cities and the weights have been redistributed among other indicators within the same category.
9	The indicator on increase in professional tax is not relevant to cities which do not levy the professional tax.	As discussed during the PMC meeting, this indicator has been non-applicable to the cities belonging to states where professional tax is not levied, and the weights have been redistributed among other indicators within the same category.
10	The indicator on increase in VAT collection is not applicable to Port Blair and Kavaratti, as there was no provision of VAT collection in these cities.	As discussed during the PMC meeting, these indicatosr has been treated as non-applicable for these two cities and the weights have been redistributed among other indicators within the same category.
11	Indicator on coverage of basic services to slum households does not concern cities with no slums (notified/ non-notified.	As discussed during the PMC meeting, this indicators has been treated as non-applicable for these cities and the weights have been redistributed among other indicators within the same category.

1. Introduction

The Ministry of Housing and Urban Affairs (MoHUA) is implementing several flagship urban missions such as the Smart Cities Mission (SCM), Atal Mission for Urban Rejuvenation and Transformation (AMRUT), Heritage City Development and Augmentation Yojana (HRIDAY), Housing for All (HFA). Theses mission along with other transformative initiatives of the Government including National Water Mission, Power for All, National Health Mission are aimed at making Indian cities more 'liveable.' The overarching goal of these initiatives is to move from an input-based approach to a 'citizen centric-outcome based' assessment of urban liveability.

To develop a common minimum framework for cities to assess their existing status and chart their pathway towards providing a better quality of life to their citizens, the MoHUA developed a set of 'Liveability Standards' relevant to cities to generate a Liveability Index and ranking of cities. These standards were launched in June, 2017. The MoHUA has planned to conduct an 'Annual Assessment of Liveability Standards in Cities – an ambitious national project that will involve yearly submission of data by cities across the various indicators, compilation and analysis, development of indices and ranking of cities. The Liveability Index is envisioned as a 360° tool for tracking, planning and transforming Indian cities. The Liveability Index is aimed at the following objectives:

- Providing strong evidence-based approach for future interventions and investments to deliver liveability outcomes
- Catalysing actions to improve the overall quality of the city's liveability and achieve broader development outcomes including the Sustainable Development Goals
- Assessing the implementation of government policies and schemes governing characteristics of cities that can contribute to creating liveable communities

City level self-assessment
Citizen driven accountability systems
Use cases and pathways for reform
Unearth blind spots and incentivise action
Institutionalisation of outcome based planning and governance

Cities move to a single, unified data driven decision making paradigm...

The first round of the assessment commenced in January 2018 covering 116 major cities including smart cities, capital cities and cities with population of above one million each. Implementation of the liveability assessment commenced in January 2018 with a national level orientation workshop for the urban local bodies. The workshop aimed at orienting the states and urban local bodies on the overall framework, indicators, data sources, methodology and key milestones and timelines involved in the liveability assessment. Subsequently, a series of State/ Union Territory level orientation workshops were carried out in 33 states/UTs for a detailed discussion on the framework. Online data collection commenced from 9th March through an online data collection platform that supported both online and offline data submission modes. On the date of closure of the online data entry portal i.e., 16th April, 2018 112 cities submitted their data. Subsequently, comprehensive checks on the submitted data was undertaken that involved checking for outliers, logical inconsistencies etc. post which round-1 of data reconciliation was conducted. This draft report is based on round-1 of reconciled data as on 28th April, 2018.

2. Liveability Framework and Indicators

The Liveability Framework comprises a total of 79 indicators (57 Core Indicators and 22 Supporting Indicators). A core indicator carries 70% weightage and a supporting indicator carries 30% weightage. These indicators are grouped under 15 thematic categories which in turn are part of four pillars of comprehensive development of cities i.e., institutional, social, economic and physical. Based on the performance of cities against the various core and supporting indicators, various 'Category Sub-Indexes' and a composite 'City Liveability Index' will be developed for each city.

2.1 Scoring and Computing Category Indices of Liveability

The set of 79 indicators, associated categories and pillars are presented in the table below:

Table 1 List of Pillars, Categories and Indicators

Pillars of Comprehensive Development	Category	Indicators
Institutional	1. Governance	1.1 Percentage of citizen services available online
		1.2 Percentage of services integrated through Command Centre
		1.3 Percentage of citizens using online services
		1.4 Average delay in grievance redressal
		1.5 Tax collected as percentage of tax billed
		1.6 Extent of cost recovery (O&M) in water supply services
		1.7 Capital spending as percentage of total expenditure
		1.8 Percentage of population covered under Ward Committees/Area *Sabhas*
Social	**2. Identity and Culture**	2.1 Restoration and reuse of historic buildings
		2.2 Percentage of ecologically important areas covered through projects for restoration
		2.3 Hotel occupancy
		2.4 Percentage of budget allocated towards cultural/sports activities
		2.5 Number of cultural/sports events hosted by city
	3. Education	3.1 Percentage of school-aged population enrolled in schools
		3.2 Percentage of female school-aged population enrolled in schools

Pillars of Comprehensive Development	Category	Indicators
		3.3 Primary education student-teacher ratio
		3.4 Percentage of schools with access to digital education
		3.5 Percentage of students completing primary education
		3.6 Percentage of students completing secondary education
	4. Health	4.1 Number of in-patient hospital beds per 10,000 population
		4.2 Healthcare professionals per 10,000 population
		4.3 Average response time in case of health emergencies
		4.4 Period prevalence of water borne diseases
		4.5 Period prevalence of vector borne diseases
	5. Safety and Security	5.1 Number of CCTV Cameras
		5.2 Number of recorded crimes per lakh population
		5.3 Extent of crimes recorded against women, children and elderly per year
		5.4 Transport-related fatality per lakh population
Economic	**6. Economy and Employment**	6.1 Increase in VAT/GST collection
		6.2 Increase in collection of Professional Tax
		6.3 Increase in issuance of Construction permits
		6.4 Unemployment rate
		6.5 Percentage of vendors registered and provided formal spaces
Physical	**7. Housing and Inclusiveness**	7.1 Percentage of Slum/EWS households covered through formal/affordable housing
		7.2 Percentage of slum areas covered through basic services
	8. Public Open Spaces	8.1 Per capita availability of green spaces
		8.2 Per capita availability of public and recreational places
	9. Mixed Land Use and Compactness	9.1 Share of mixed land use area in overall city land use
		9.2 Net Density
	10. Power Supply	10.1 Percentage of city population with authorized electrical services
		10.2 Percentage of electrical connections covered

Pillars of Comprehensive Development	Category	Indicators
		through smart meters
		10.3 Average number of electrical interruptions per year
		10.4 Average length of electrical interruptions per year
		10.5 Percentage of total energy derived from renewable sources
		10.6 Energy consumption per unit - water supply and sewerage
		10.7 Energy consumption per unit - street lighting
		10.8 Percentage of new and redeveloped buildings following green building norms
		10.9 Total energy consumption per capita
	11. Transportation and Mobility	11.1 Geographical coverage of public transport
		11.2 Availability of public transport
		11.3 Mode share of public transport
		11.4 Percentage of road network with dedicated bicycle tracks
		11.5 Percentage of interchanges with bicycle parking facilities
		11.6 Mode share of non-motorized transport
		11.7 Availability of Passenger Information System
		11.8 Extent of signal synchronization
		11.9 Availability of paid parking spaces
		11.10 Percentage coverage of footpaths – wider than 1.2 m
		11.11 Percentage of traffic intersections with pedestrian crossing facilities
		11.12 Extent to which universal accessibility is incorporated in public rights-of-way
	12. Assured Water Supply	12.1 Household level coverage of direct water supply connections
		12.2 Per capita supply of water
		12.3 Quality of water supplied
		12.4 Level of non-revenue water – NRW
		12.5 Percentage of water connections covered through meters
		12.6 Percentage of plots with rainwater harvesting facility
	13. Waste Water	13.1 Coverage of toilets

Pillars of Comprehensive Development	Category	Indicators
	Management	13.2 Coverage of sewerage network and/or septage
		13.3 Collection efficiency of sewerage network
		13.4 Extent of reuse and recycling of waste water
		13.5 Coverage of storm water drains
	14. Solid Waste Management	14.1 Household level coverage of municipal solid waste collection
		14.2 Efficiency of collection of municipal solid waste
		14.3 Extent of municipal solid waste recovered through reuse
	15. Reduced Pollution	15.1 Concentration of SO2- air pollution
		15.2 Concentration of NO2- air pollution
		15.3 Concentration of PM10 - air pollution
		15.4 Level of noise pollution
		15.5 Quality of water in public surface water bodies

2.2 Scoring and Computing Category Indices of Liveability

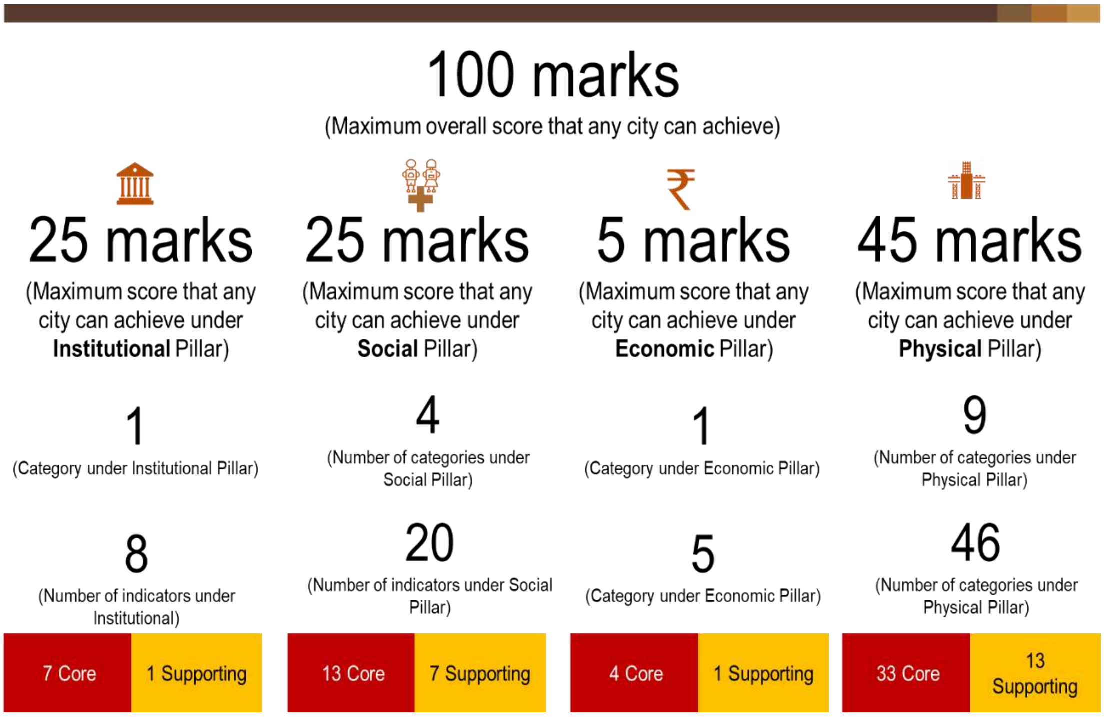
The performance achieved by cities against 79 indicators, will be assessed against given benchmarks. Where no international/national norms are available, city with the best performance in its group (population range) will be treated as a benchmark. The groups are given in the table below.

Table 2 Details on Population Range

Category	Population range
Category 1	Population ≥ 4 million
Category 2	1 million ≤ Population < 4 million
Category 3	0.5 million ≤ Population < 1 million
Category 4	Population < 0.5 million

2.3 Scoring Approach and Methodology

A city can earn a maximum score of 100 points for 79 indicators across four pillars. The pillar weights are as follows: Institutional (25 points), Social (25 points), Economy and Employment (5 points) and Physical (45 points). Based on the number and nature of indicators i.e., core vs. secondary, indicator wise maximum marks were computed.



100 marks

(Maximum overall score that any city can achieve)

25 marks	25 marks	5 marks	45 marks
(Maximum score that any city can achieve under **Institutional** Pillar)	(Maximum score that any city can achieve under **Social** Pillar)	(Maximum score that any city can achieve under **Economic** Pillar)	(Maximum score that any city can achieve under **Physical** Pillar)
1 (Category under Institutional Pillar)	4 (Number of categories under Social Pillar)	1 (Category under Economic Pillar)	9 (Number of categories under Physical Pillar)
8 (Number of indicators under Institutional)	20 (Number of indicators under Social Pillar)	5 (Category under Economic Pillar)	46 (Number of categories under Physical Pillar)
7 Core 1 Supporting	13 Core 7 Supporting	4 Core 1 Supporting	33 Core 13 Supporting

Dimensional Index Methodology (DIM) has been used to compute scores for each indicator with reference to "maximum within the comparison group" or "absolute benchmarks". For indicators where benchmarks are available, cities getting the benchmark score (or above) are given the maximum mark, and the marks awarded to other cities are calculated proportionately. For indicators where benchmarks are not available, the best performing cities in each population group are given the maximum mark, and the marks awarded to other cities (within the population group) are calculated proportionately. For indicators where benchmarks do not exist, the city data has been tested for outliers before scoring.

2.4 Scoring Normalisation:

To construct aggregate scores across cities as well as to make the scores across indicators comparable, indicator values were normalised using a min-max approach. The following formula was used to normalise the indicator values-

$$\frac{indicator\ value\ for\ the\ city - indicator\ value\ for\ the\ worst\ performing\ city}{benchmark - \ indicator\ value\ for\ the\ worst\ performing\ city}$$

This approach would restrict the normalised indicator value between 0 and 1. Cities that met or exceeded the benchmark received a normalised indicator value of 1. Worst performing cities are given a normalised indicator value of 0. After normalisation, the normalised value is weighted according to the category and the indicator being core or supporting.

To illustrate, consider the indicator 12.3 Quality of Water Supplied in the Category 12 for Assured Water Supply. If in City A 50% of the water samples collected qualify the potable water standards specified by the CPHEEO, and only 10% of the samples from worst performing city qualify the standards. Then, the normalised value for the indicator for city A would be 0.44 [(0.5-0.1)/(1-0.1)].

The weight for indicator 12.3 is 1.03, so the final weighted score for City A would come out to 0.45 [1.03*0.44].

3. City Reconnaissance Meetings:

State level workshop was necessary to orient the cities and familairise them about the process of liveability assessment. City did not provide the data post log in on the online portal due to lack of directive at the state level. The team followed up at the state level beginning early March until end of April with senior team members travelling to the state and Ministry's intervention. Below is the summary of follow up meetings with Urban development department and SUDA at state level.

Without State level permissions and directive, city officials were not appreciative of follow up and expressed inability to cooperate.

Date	Departments	Key Discussions
07 March 2018 09 March 2018 12 March 2018 13 March 2018	PA to Principal secretary (UD) Joint Secretary Urban Development Department Government of West Bengal	State Workshop schedule
13 March 2018	Additional Director, State Urban Development Agency, West Bengal	State Workshop for liveability Assessment City login
15 March 2018 16 March 2018	PA to Chief Secretary, Office of Chief Secretary	Permission for state workshop Appointing SUDA as nodal agency for liveability assessment
19 March 2018	Director, SUDA, West Bengal	Discussion on whether SUDA has got any intimation from PS/CS office to act as nodal agency
21 March 2018	Principal Secretary (UD) office	Understand the scope of assessment process in WB
22 March 2018	Principal Secretary (UD) Director, SUDA Chief Manager, Planning and Monitoring (SUDA)	Schedule meeting to discuss the Workshop and subsequent requirements for the Liveability Assessment study

Date	Departments	Key Discussions
23 March 2018	Director, Additional Director and Chief Manager, SUDA	SUDA officials shared that March month was not convenient to organise workshop and 4th April 2018 was scheduled as attentive date for workshop. Files forwarded to Principal Secretary to approve list of participants
26 March 2018 27 March 2018 28 March 2018	Director, Additional Director and Chief Manager, SUDA	Follow up to know the Progress on workshop date and assessment process
29 March 2018	Director, SUDA	Inclusion of New Town Kolkata in assessment process
30 March 2018 31 March 2018 2 April 2018	SUDA office	Follow up to initiate assessment process
3 April 2018 (From Consortium Ms. Sujaya Rathi travelled to Kolkata to discuss on liveability assessment process)	Chief Manager, SUDA	Brief note on liveability index was faxed to CS office to expedite the process
4 April 2018 5 April 2018	CS Office , WB PS (UD) office, WB	Follow up to initiate assessment process
6 April 2018	PS Office, WB	SUDA file was marked to Minister of State, Mr Firhad Hakim
7 April 2018 to 15 April 2018	PS (UD) office and SUDA, West Bengal	Follow up to initiate assessment process

Executive Summary

Assessment of liveability indices is an initiative by the Ministry of Housing and Urban Affairs to improve quality of life of citizens and achieve sustainable development goals by encouraging cities to adopt “outcome based” approach for urban planning. Assessment process aimed to provide opportunity to cities to review the development components holistically by involving 79 measurable indicators categorized under governance, health, education, safety, economy, power supply, transportation and mobility, identity, culture, housing, waste management and pollution.

This report highlights the assessment process, key milestones, and the final outcome of the data submitted. Implementation of liveability assessment commenced formally on 19th January 2018. A national level workshop was organized on 13th February 2018 to explain the importance and process of liveability assessment and get feedback on methodology from the city authorities.

This was followed by the next stage of Questionnaire development. The questionnaire was arranged under 12 categories representing 12 data owners namely urban local body, Central and state pollution control board, development authority, DISCOM/Electricity board, State disaster management authority, state education department, state health department, state renewable energy development agency, state sales and commercial taxes department, town and country planning department, traffic and police department and transport authorities.

An online data entry portal was developed to facilitate data submission by the cities. Each city had a unique log in to access the portal and submit the data. Both online and off-line options (download the questionnaire in an excel) to submit the data were available for cities. An email help desk was set up for the cities to raise any queries and seek clarification when responding to the questions.

A team for each state comprising of State Coordinator and City Coordinator (one per city) was deployed that facilitated the process and supported the cities. A total of 6 regional coordinators/ consultants, 29 State Coordinators, and 99 city coordinators were deployed across 116 cities. Training for state coordinators was held from 26th to 28th February 2018 at Chennai to make coordinators understand overall liveability assessment, indicators, data sources, protocols and roles and responsibilities.

City Reconnaissance Meetings were initiated by the state and city coordinators. The discussion began with discussions to finalize the state workshop schedule, mapping of data owners, and assist cities in data collection. The City Coordinators were based in the cities for over 6 weeks and during this time, they liase with ULB and other data owners to explain the liveability framework, online portal, and facilitate the online submission.

A total of 33 state workshops were conducted at the state level. The objective of the workshop was to orient the city stakeholders on liveability assessment, indicators, components of data collection, timelines, expectations of support and support extended by MoHUA. The state level workshops brought

various city level departments on a single platform to understand and discuss the methodology and components of city liveability assessment.

Nodal agency at state level supported by the City and State Coordinator and city level (Municipality corporation/smart city limited) coordinated with city specific data owners/departments for data gathering, collation, and submission. Nodal persons in each department were appointed for timely data collection and submission. Of 116, 112 cities submitted data as per the timeline on 16th April 2018.

Post submission, the city and state coordinators supported by the central team followed up extensively with the cities to support secondary documents as evidence to substantiate their submissions. Secondary documents such as reports, official orders, copy of office register, signed copy of liveability assessment questionnaire furnished by cities against the submitted data. Documents are verified to map the documents for the reponses provided by city and to check the type data provided by city. The document check outcomes were shared with the cities as a part of data quality check.

For checking consistency of data, logical check of data, verifying data from other public sources were undertaken. Quality check was done to ensure data validity and provide opportunity to cities to review the data provided by them and correct in case of wrong data entry.

For 8 selected indicators namely, percentage of services integrated through command and control center, hotel occupancy rate, percentage of schools with access to digital education, number of CCTV cameras per unit road length, percentage of vendors registered and provided formal spaces, availability of passenger information system, percentage of traffic intersection with pedestrian crossing facility, and extent to which universal accessibility is incorporated in public rights of way. Physical audit was conducted in 110 cities by physical auditors appointed and trained by the consortium. In consultation with ULB nodal person, locations and indicators for physical audit was selected in each city. A mobile based application was developed to capture the physical audit related data.

Primary data collection was done for five indicators such as unemployment rates, mode share of public transport, mode share of non-motorized transport, quality of water supplied, and level of noise pollution. Protocols for water and noise test were prepared in consultation with experts. Water quality test involved physical, chemical and bacteriological test of water as per the CPCB norms. For testing quality of water at consumer end, the auditors worked closely with the ULB and Water department. Samples were collected from consumer end and submitted to the lab suggested by city. For noise pollution, in about 20 cities the state pollution board or city level environment department took the responsibility for providing noise pollution data as per the protocols. In rest of the cities, mobile based application was used to measure noise pollution.

During implementation, MoHUA facilitated the process by conducting video conferences with cities to address any queries, reiterate the importance, and ensure that cities adequately engages in the process and submit their responses in time and respond to requests for clarifications.

In addition to secondary data collection, physical audit and primary data collection, citizen survey was conducted to understand their perception and level of satisfaction on various services such as health, education, water supply, electricity, waste management etc. provided by urban local bodies. Over 60000 citizens participated in the survey across India.

The final scores and ranks have been generated based on the scoring methodology that has been discussed extensively and minor modifications made that are summarized as below:

#	Challenges	Proposed Solutions
1	Only 23 cities of 111 cities have City Mobility Plan (CMP) or any and hence able to provide data for Mode Share of Public Transport and Non-Motorised Transport. To address the data gap, as advised by the MoHUA, the consortia undertook a sample dipstick across all cities covering a sample of 150 Households. Understandably, the dipstick findings will not match the rigor of a CMP.	We recommend the following: 1) Cities which have provided CMP Data will be evaluated on 100% of the maximum score 2) For the cities where the dipstick data is used, the city receives a 50% discount on the overall score Alternatively, another approach is to assign 0 score to all 88 cities that don't have a CMP
2	Variance was observed on data reported by cities on road network and data presented in the smart city proposals during the verifications.	We recommend taking the data reported by the cities in the Smart City Proposals.
3	There is no secondary source/ organization that provides unemployment data at city level. As a result, most cities do not have the data. Fully cognizance of the challenges of generating this data in a short span of time, it was agreed to collect this data through a dipstick survey on lines of NSSO questions. The data generated needs further scrutiny and triangulation with some inputs from experts. This may not be possible in the short	The indicator on unemployment will be excluded from scores. For final ranking, the cities will be scored on 78 indicators.

#	Challenges	Proposed Solutions
	window.	
4	Many cities did not have data on noise pollution and it was decided that data will be collected using a mobile app for all the 111 cities. However, many cities have expressed reservations with the approach especially with respect to the reliability of using this data. Further, some cities have relied on the SPCB to collect the data as per the approach proposed by the consortia. Thus, noise pollution data is currently from two sources: 1. SPCB- 20 cities 2. Noise-based app- 91 cities	The data collected through the primary survey will be used for scoring the cities. Currently, there is no differential scoring for the data from the SPCB and the data collected through the mobile app. However, a certain higher weightage can be provided to those cities which used the state apparatus to collect noise pollution data.
5	For the indicator on quality of water supplied, the methodology document states that samples should be drawn both at the treatment plant outlet as well as the consumer end. However, the data provided by the cities were predominantly from the distribution point. Hence for consumer end results with MoHUA intervention, consortia coordinated with cities to collect the data at the consumer end. The cities facilitated the testing. The outcome of the process is as below: 1. Sample given- 102 cities 2. Report received- 86 cities 3. Report awaited- 16 cities 4. Tests not completed due to lack of cooperation and other reasons – 9	The maximum score for this indicator will be distributed equally (50%) for results based on samples from the treatment plant and consumer end. Cities that did not complete tests or provide the results will be given a score 0 for against consumer end tests.
6	City level population is not projected annually by most of the cities. So, estimates for 2017 population are not available with the cities.	As recommended by MoHUA, 2011 census population is being used for the ranking purpose.

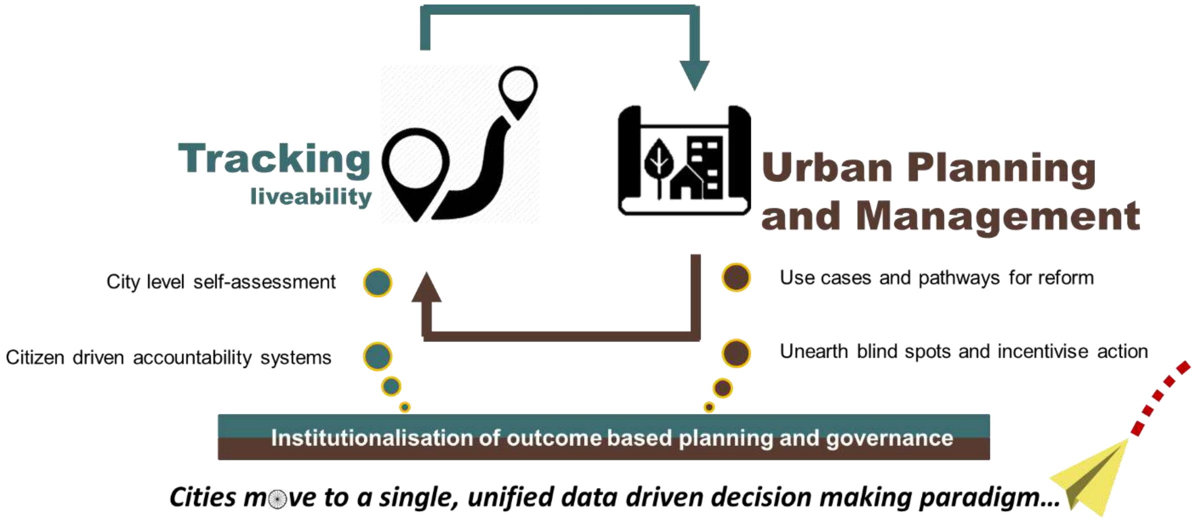
#	Challenges	Proposed Solutions
7	The age category specific data for 9 cities is not available at a city level	The age category specific population data has been taken at a district level for these cities.
8	Indicators on non-motorised transports like- Dedicated bicycle tracks, bicycle parking facilities and mode share of non-motorised transport are not relevant for hilly terrains.	As discussed during the PMC meeting, these indicators have been treated as non-applicable for the hilly cities and the weights have been redistributed among other indicators within the same category.
9	The indicator on increase in professional tax is not relevant to cities which do not levy the professional tax.	As discussed during the PMC meeting, this indicator has been non-applicable to the cities belonging to states where professional tax is not levied, and the weights have been redistributed among other indicators within the same category.
10	The indicator on increase in VAT collection is not applicable to Port Blair and Kavaratti, as there was no provision of VAT collection in these cities.	As discussed during the PMC meeting, these indicatosr has been treated as non-applicable for these two cities and the weights have been redistributed among other indicators within the same category.
11	Indicator on coverage of basic services to slum households does not concern cities with no slums (notified/ non-notified.	As discussed during the PMC meeting, this indicators has been treated as non-applicable for these cities and the weights have been redistributed among other indicators within the same category.

1. Introduction

The Ministry of Housing and Urban Affairs (MoHUA) is implementing several flagship urban missions such as the Smart Cities Mission (SCM), Atal Mission for Urban Rejuvenation and Transformation (AMRUT), Heritage City Development and Augmentation Yojana (HRIDAY), Housing for All (HFA). Theses mission along with other transformative initiatives of the Government including National Water Mission, Power for All, National Health Mission are aimed at making Indian cities more 'liveable.' The overarching goal of these initiatives is to move from an input-based approach to a 'citizen centric-outcome based' assessment of urban liveability.

To develop a common minimum framework for cities to assess their existing status and chart their pathway towards providing a better quality of life to their citizens, the MoHUA developed a set of 'Liveability Standards' relevant to cities to generate a Liveability Index and ranking of cities. These standards were launched in June, 2017. The MoHUA has planned to conduct an 'Annual Assessment of Liveability Standards in Cities – an ambitious national project that will involve yearly submission of data by cities across the various indicators, compilation and analysis, development of indices and ranking of cities. The Liveability Index is envisioned as a 360° tool for tracking, planning and transforming Indian cities. The Liveability Index is aimed at the following objectives:

- Providing strong evidence-based approach for future interventions and investments to deliver liveability outcomes
- Catalysing actions to improve the overall quality of the city's liveability and achieve broader development outcomes including the Sustainable Development Goals
- Assessing the implementation of government policies and schemes governing characteristics of cities that can contribute to creating liveable communities

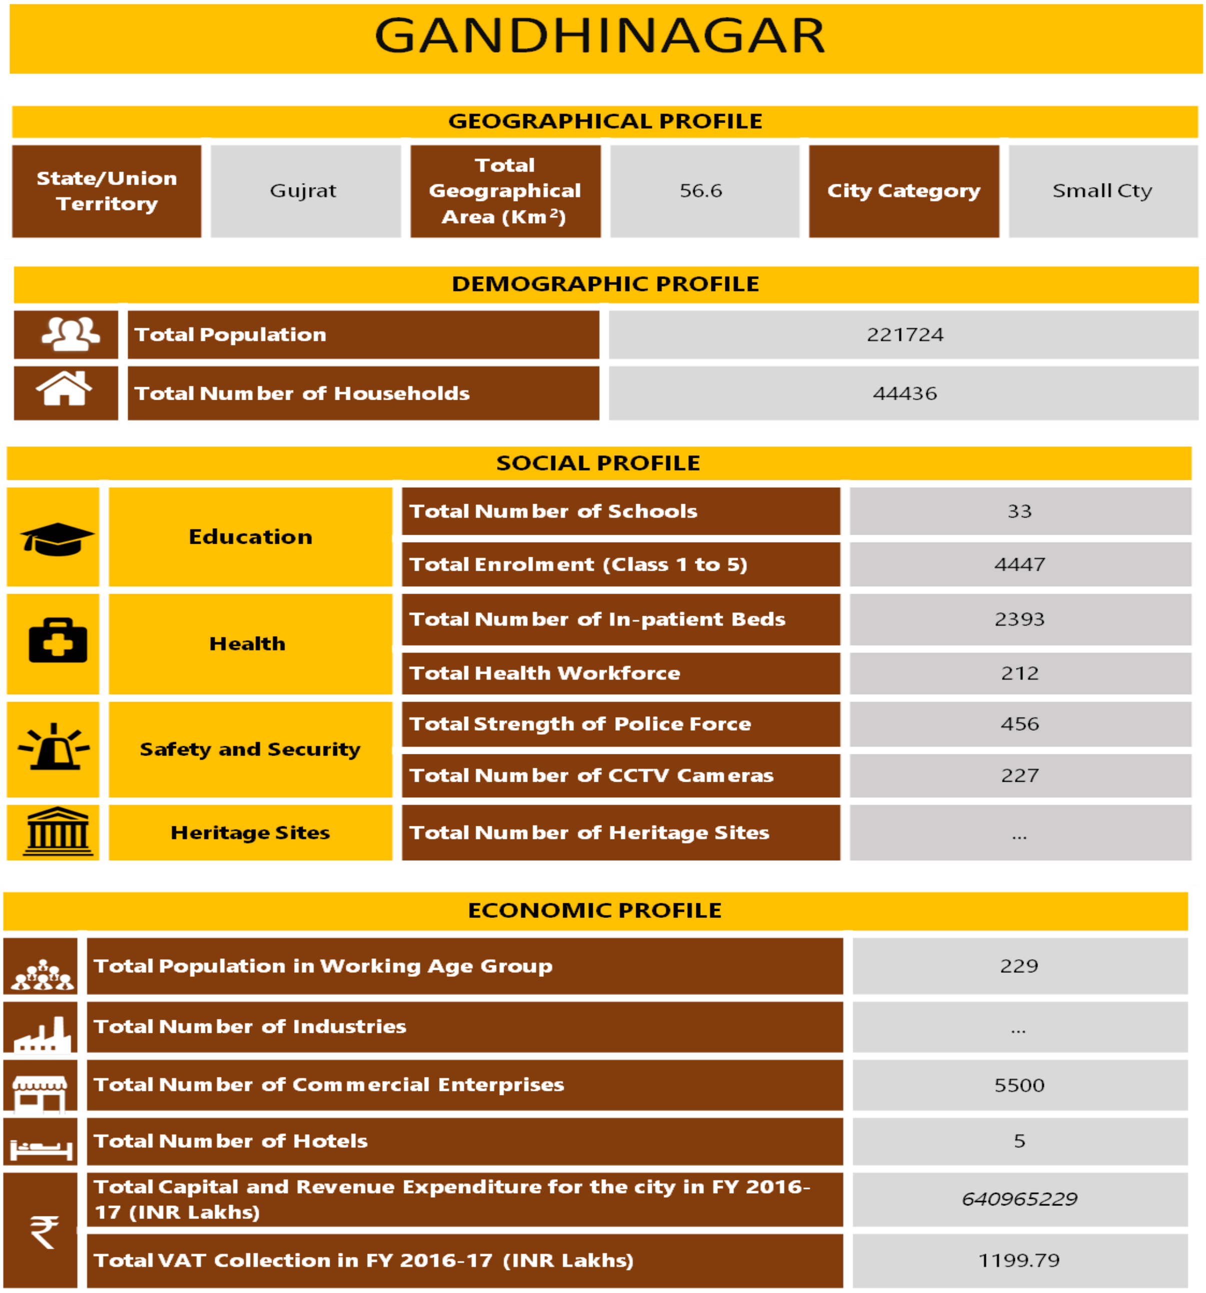


Tracking
liveability
Urban Planning
and Management
City level self-assessment
Citizen driven accountability systems
Use cases and pathways for reform
Unearth blind spots and incentivise action
Institutionalisation of outcome based planning and governance
Cities move to a single, unified data driven decision making paradigm...

The first round of the assessment commenced in January 2018 covering 116 major cities including smart cities, capital cities and cities with population of above one million each. Implementation of the liveability assessment commenced in January 2018 with a national level orientation workshop for the urban local bodies. The workshop aimed at orienting the states and urban local bodies on the overall framework, indicators, data sources, methodology and key milestones and timelines involved in the liveability assessment. Subsequently, a series of State/ Union Territory level orientation workshops were carried out in 33 states/UTs for a detailed discussion on the framework. Online data collection commenced from 9th March through an online data collection platform that supported both online and offline data submission modes. On the date of closure of the online data entry portal i.e., 16th April, 2018 112 cities submitted their data. Subsequently, comprehensive checks on the submitted data was undertaken that involved checking for outliers, logical inconsistencies etc. post which round-1 of data reconciliation was conducted. This draft report is based on round-1 of reconciled data as on 28th April, 2018.

2. City Profile

This chapter presents the city profile -Geographic and Demographic, Social (Education Health, Safety and Security, Heritage), Economic profile, and Physical (Water, sanitation and Waste Management, Electricity, Open space and roads).



GANDHINAGAR

GEOGRAPHICAL PROFILE

State/Union Territory	Gujrat	**Total Geographical Area (Km²)**	56.6	**City Category**	Small Cty

DEMOGRAPHIC PROFILE

Total Population	221724
Total Number of Households	44436

SOCIAL PROFILE

Education	**Total Number of Schools**	33
	Total Enrolment (Class 1 to 5)	4447
Health	**Total Number of In-patient Beds**	2393
	Total Health Workforce	212
Safety and Security	**Total Strength of Police Force**	456
	Total Number of CCTV Cameras	227
Heritage Sites	**Total Number of Heritage Sites**	...

ECONOMIC PROFILE

Total Population in Working Age Group	229
Total Number of Industries	...
Total Number of Commercial Enterprises	5500
Total Number of Hotels	5
Total Capital and Revenue Expenditure for the city in FY 2016-17 (INR Lakhs)	*640965229*
Total VAT Collection in FY 2016-17 (INR Lakhs)	1199.79

PHYSICAL PROFILE

Water	**Average Quantity of Water Supplied (MLD)**	62
	Total Number of Water Connection	43464
Sanitation Facilities	**Total number of households with access to individual toilets in the city**	42781
	Total number of households in the city with access to community toilets in the city	...
Solid Waste Management	**Daily average quantity of municipal solid waste collected in the city (Tonnes/day)**	65
	Total number of households covered through door-to-door collection of solid waste	42000
Waste Water	**Daily Average Quantum of Waste Water Generated in the City (MLD)**	49
	Daily average quantum of waste water treated by STPs in the city (MLD)	49
Electricity	**Total number of authorized electrical connections in the city**	66574
	Total electricity supplied to the city (kWh)	304310000
Public and Open Spaces	**Total area covered by green spaces in the city (m^2)**	2142000
Roads and Transport	**Total Length of Road Network in the City (Km)**	515.59
	Total length of arterial and sub-arterial road network in the city (Km)	515.59
	Total length of footpath (wider than 1.2 metres) in the city along the street network (Km)	70

3. Liveability Framework and Indicators

The Liveability Framework comprises a total of 79 indicators (57 Core Indicators and 22 Supporting Indicators). A core indicator carries 70% weightage and a supporting indicator carries 30% weightage. These indicators are grouped under 15 thematic categories which in turn are part of four pillars of comprehensive development of cities i.e., institutional, social, economic and physical. Based on the performance of cities against the various core and supporting indicators, various 'Category Sub-Indexes' and a composite 'City Liveability Index' will be developed for each city.

3.1 Scoring and Computing Category Indices of Liveability

The set of 79 indicators, associated categories and pillars are presented in the table below:

Table 1 List of Pillars, Categories and Indicators

Pillars of Comprehensive Development	Category	Indicators
Institutional	1. Governance	1.1 Percentage of citizen services available online
		1.2 Percentage of services integrated through Command Centre
		1.3 Percentage of citizens using online services
		1.4 Average delay in grievance redressal
		1.5 Tax collected as percentage of tax billed
		1.6 Extent of cost recovery (O&M) in water supply services
		1.7 Capital spending as percentage of total expenditure
		1.8 Percentage of population covered under Ward Committees/Area *Sabhas*
Social	**2. Identity and Culture**	2.1 Restoration and reuse of historic buildings
		2.2 Percentage of ecologically important areas covered through projects for restoration
		2.3 Hotel occupancy
		2.4 Percentage of budget allocated towards cultural/sports activities
		2.5 Number of cultural/sports events hosted by city
	3. Education	3.1 Percentage of school-aged population enrolled in schools
		3.2 Percentage of female school-aged population enrolled in schools

Pillars of Comprehensive Development	Category	Indicators
		3.3 Primary education student-teacher ratio
		3.4 Percentage of schools with access to digital education
		3.5 Percentage of students completing primary education
		3.6 Percentage of students completing secondary education
	4. Health	4.1 Number of in-patient hospital beds per 10,000 population
		4.2 Healthcare professionals per 10,000 population
		4.3 Average response time in case of health emergencies
		4.4 Period prevalence of water borne diseases
		4.5 Period prevalence of vector borne diseases
	5. Safety and Security	5.1 Number of CCTV Cameras
		5.2 Number of recorded crimes per lakh population
		5.3 Extent of crimes recorded against women, children and elderly per year
		5.4 Transport-related fatality per lakh population
Economic	**6. Economy and Employment**	6.1 Increase in VAT/GST collection
		6.2 Increase in collection of Professional Tax
		6.3 Increase in issuance of Construction permits
		6.4 Unemployment rate
		6.5 Percentage of vendors registered and provided formal spaces
Physical	**7. Housing and Inclusiveness**	7.1 Percentage of Slum/EWS households covered through formal/affordable housing
		7.2 Percentage of slum areas covered through basic services
	8. Public Open Spaces	8.1 Per capita availability of green spaces
		8.2 Per capita availability of public and recreational places
	9. Mixed Land Use and Compactness	9.1 Share of mixed land use area in overall city land use
		9.2 Net Density
	10. Power Supply	10.1 Percentage of city population with authorized electrical services
		10.2 Percentage of electrical connections covered

Pillars of Comprehensive Development	Category	Indicators
		through smart meters
		10.3 Average number of electrical interruptions per year
		10.4 Average length of electrical interruptions per year
		10.5 Percentage of total energy derived from renewable sources
		10.6 Energy consumption per unit - water supply and sewerage
		10.7 Energy consumption per unit - street lighting
		10.8 Percentage of new and redeveloped buildings following green building norms
		10.9 Total energy consumption per capita
	11. Transportation and Mobility	11.1 Geographical coverage of public transport
		11.2 Availability of public transport
		11.3 Mode share of public transport
		11.4 Percentage of road network with dedicated bicycle tracks
		11.5 Percentage of interchanges with bicycle parking facilities
		11.6 Mode share of non-motorized transport
		11.7 Availability of Passenger Information System
		11.8 Extent of signal synchronization
		11.9 Availability of paid parking spaces
		11.10 Percentage coverage of footpaths – wider than 1.2 m
		11.11 Percentage of traffic intersections with pedestrian crossing facilities
		11.12 Extent to which universal accessibility is incorporated in public rights-of-way
	12. Assured Water Supply	12.1 Household level coverage of direct water supply connections
		12.2 Per capita supply of water
		12.3 Quality of water supplied
		12.4 Level of non-revenue water – NRW
		12.5 Percentage of water connections covered through meters
		12.6 Percentage of plots with rainwater harvesting facility
	13. Waste Water	13.1 Coverage of toilets

Pillars of Comprehensive Development	Category	Indicators
	Management	13.2 Coverage of sewerage network and/or septage
		13.3 Collection efficiency of sewerage network
		13.4 Extent of reuse and recycling of waste water
		13.5 Coverage of storm water drains
	14. Solid Waste Management	14.1 Household level coverage of municipal solid waste collection
		14.2 Efficiency of collection of municipal solid waste
		14.3 Extent of municipal solid waste recovered through reuse
	15. Reduced Pollution	15.1 Concentration of SO2- air pollution
		15.2 Concentration of NO2- air pollution
		15.3 Concentration of PM10 - air pollution
		15.4 Level of noise pollution
		15.5 Quality of water in public surface water bodies

3.2 Scoring and Computing Category Indices of Liveability

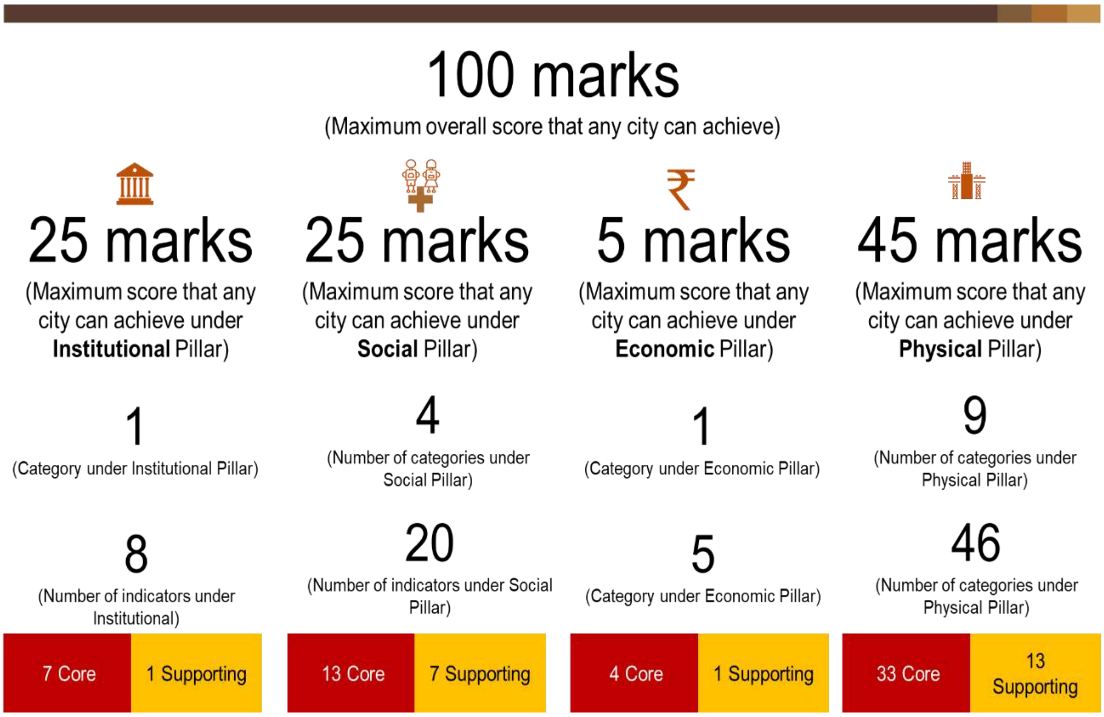
The performance achieved by cities against 79 indicators, will be assessed against given benchmarks. Where no international/national norms are available, city with the best performance in its group (population range) will be treated as a benchmark. The groups are given in the table below.

Table 2 Details on Population Range

Category	Population range
Category 1	Population ≥ 4 million
Category 2	1 million ≤ Population < 4 million
Category 3	0.5 million ≤ Population < 1 million
Category 4	Population < 0.5 million

3.3 Scoring Approach and Methodology

A city can earn a maximum score of 100 points for 79 indicators across four pillars. The pillar weights are as follows: Institutional (25 points), Social (25 points), Economy and Employment (5 points) and Physical (45 points). Based on the number and nature of indicators i.e., core vs. secondary, indicator wise maximum marks were computed.



100 marks
(Maximum overall score that any city can achieve)
25 marks
(Maximum score that any city can achieve under **Institutional** Pillar)
25 marks
(Maximum score that any city can achieve under **Social** Pillar)
5 marks
(Maximum score that any city can achieve under **Economic** Pillar)
45 marks
(Maximum score that any city can achieve under **Physical** Pillar)
1
(Category under Institutional Pillar)
4
(Number of categories under Social Pillar)
1
(Category under Economic Pillar)
9
(Number of categories under Physical Pillar)
8
(Number of indicators under Institutional)
20
(Number of indicators under Social Pillar)
5
(Category under Economic Pillar)
46
(Number of categories under Physical Pillar)
7 Core
1 Supporting
13 Core
7 Supporting
4 Core
1 Supporting
33 Core
13 Supporting

Dimensional Index Methodology (DIM) has been used to compute scores for each indicator with reference to “maximum within the comparison group” or “absolute benchmarks”. For indicators where benchmarks are available, cities getting the benchmark score (or above) are given the maximum mark, and the marks awarded to other cities are calculated proportionately. For indicators where benchmarks are not available, the best performing cities in each population group are given the maximum mark, and the marks awarded to other cities (within the population group) are calculated proportionately. For indicators where benchmarks do not exist, the city data has been tested for outliers before scoring.

3.4 Scoring Normalisation:

To construct aggregate scores across cities as well as to make the scores across indicators comparable, indicator values were normalised using a min-max approach. The following formula was used to normalise the indicator values-

$$\frac{indicator\ value\ for\ the\ city - indicator\ value\ for\ the\ worst\ performing\ city}{benchmark - \ indicator\ value\ for\ the\ worst\ performing\ city}$$

This approach would restrict the normalised indicator value between 0 and 1. Cities that met or exceeded the benchmark received a normalised indicator value of 1. Worst performing cities are given a normalised indicator value of 0. After normalisation, the normalised value is weighted according to the category and the indicator being core or supporting.

To illustrate, consider the indicator 12.3 Quality of Water Supplied in the Category 12 for Assured Water Supply. If in City A 50% of the water samples collected qualify the potable water standards specified by the CPHEEO, and only 10% of the samples from worst performing city qualify the standards. Then, the normalised value for the indicator for city A would be 0.44 [(0.5-0.1)/(1-0.1)].

The weight for indicator 12.3 is 1.03, so the final weighted score for City A would come out to 0.45 [1.03*0.44].

4. Data Collection and Verification

4.1 Submission of Data by the cities

The Liveability Assessment is based on secondary data submitted by the urban local bodies and other concerned government agencies (collectively called as data owners). The 79 indicators were broken down into a set of easy to understand and relatable 553 questions mapped to data owners. Submission of the data was enabled through an online data entry portal on the smartnet platform of the Ministry. The portal also allowed the ULBs to download the liveability assessment questionnaire and upload filled in questionnaire. To familiarise and assist cities in identifying, mapping and collation of data points, a city level nodal person was available during the entire period of data submission process.

4.2 Mapping of Data Owners for the City

For the assessment of liveability indices broadly 12 data owners such as Central/state Pollution control board, Development authority, DISCOM/Electricity Board, State Disaster Management Authority, State Education Department, State Health department, State Renewable energy and development agency, State sales and commercial taxes department, town and country planning department, Traffic and police department, Transport authority, and Urban local body were identified to respond to the questions on the portal. However, during state workshop and subsequent city level discussions, more data owners were mapped to respond to different categories and sub categories. The following table provides the details of city level data owners mapped under the 12 data owner.

Table 3:Details of Data Owners

Designated data owners	Subcategories	Data owners at city level
Urban Local Body	For Accounts Related Questions	Ass.Account
Urban Local Body	For Park and Recreation Related Questions	-
Urban Local Body	For Water Supply and Drainage related questions	City engineer
Urban Local Body	For Heritage sites related data	-
Urban Local Body	For Ecological sites related data	-
Urban Local Body	For Housing related data	-
Urban Local Body	For Building plan related data	Town planing
Urban Local Body	For Roads related data	City engineer
Urban Local Body	For Solid waste management related data	Solid waste department
Urban Local Body	For IT services related data	Tex department
Urban Local Body	For Vendor committee related data	-
Urban Local Body	Any other departments involved in providing data for questions mentioned under Urban Local Body	-
Central / state Pollution control Board	Water Quality, Air Quality, Noise Quality	-
Development Authority	Building Infrastructure	
	Construction planning	
	Green Building	
	Rain water harvesting	
	Universal Design Principle	
DISCOM/Electricity Board	Electrical Connection/ Grievance Redressal/ Power supply	Ugvcl , torrent power

Designated data owners	Subcategories	Data owners at city level
State Disaster management authority		Fire department
State Education Department		Education department
State Health Department	Health care professionals	Health department
	Citizen Services	-
	Disease Prevalence	
	Health Infrastructure	
State Renewable Energy Development Agency		
State Sales / Commercial Taxes Department		Tex department
Town and Country Planning Department	Land Use	City engineer
Traffic and Police Department		Traffic and police department
Transport Authorities	Buses	Tex department
	Registered Vehicles	-
	Sub urban rail transport	-
	Mono Rail Authority	-
	Tramways	-
	Marine Transport Authority	-

4.3 List of secondary documents available as supportive

City has provided supporting documents/evidences against the responses given by city on the online portal. In support of their responses on the portal, city submitted 53 number of documents. Documents submitted includes reports, official orders, copy of data maintained in official register, signed copy of questionnaire, and signed letters/submissions from concern departments. Verification includes mapping of documents against responses given by city, checking the type/category of documents, and validation of data provided.

The following table presents the data owner wise number of documents:

Table 4: Data owner wise number of secondary documents submitted by city

Data Owners	Number of Documents
Sales and Commercial Taxes	1
State Education Department	12
DISCOM/Electricity Department	1
Traffic and Police Department	1
Development Authority	3
Pollution Control Board	1
State Renewable Energy Department	1
Town and Country Planning	1
State Health Department	1
Transport Authority	1
Disaster Management	1
Urban Local Body	29
Total	53*

4.4 Data Verification

A three-stage data quality check comprising verification of data against secondary documents furnished by data owners, logical inconsistency checks including outliers, and physical audit for select indicators (Refer the exhibit below) is being undertaken. The objective of the data quality check is to ensure that data from the source documents are accurate and verifiable. Sources of data included reports, administrative data, survey results and other statistical records, log books among other.

Physical audit of eight indicators – one indicator from the Institutional pillar, one from the Social pillar, one from the Economy pillar and five from the Physical pillar is also being carried out by the field team to ascertain the degree of reliability of data reported by the cities. The list of these eight indicators is presented below:

1.2 | Percentage of services integrated through Command Centre

2.3 | Hotel occupancy

3.4 | Percentage of schools with access to digital education

5.1| Number of streets, public places, junctions covered through surveillance systems

6.5 | Percentage of vendors registered and provided formal spaces

11.7 | Availability of Passenger Information System

11.11 | Percentage of traffic intersections with pedestrian crossing facilities

11.12 | Extent to which universal accessibility is incorporated in public rights-of-way

For a set of five indicators namely, unemployment rate, mode share of public transport, mode share of non-motorised transport, quality of water supplied and level of noise pollution, existing datasets were found to be not available consistently across all cities and/or were inadequate. To help cities that do not have data on these five indicators, dipstick assessments are being carried to fill data gaps.

6.4 | Unemployment Rate

11.3 | Mode share of public transport

11.5 | Mode share of Non Motorized Transport

12.3 | Quality of Water Supplied

15.4 | Level of Noise Pollution

4.5 Physical Audit

The following map presents the indicators audited at city level.

5. City Score on 15 categories of Assessment

Liveability Assessment covered 15 categories and 78 indicators. The below table presents the scores for all 15 indicators namely governance, identity & culture, education, health, safety and security, economy & employment, housing & inclusiveness, public open spaces, mixed land use & compactness, power supply, transport & mobility, assured water supply, waste water management, solid waste management and reduced pollution.

Table 5: Category wise scores

Categories	**Scores in Percentage**
Governance	71.46%
Identity & Culture	49%
Education	68%
Health	71%
Safety & Security	47%
Economy & Employment	16%
Housing & Inclusiveness	26%
Public Open Spaces	7%
Mixed Land Use & Compactness	11%
Power Supply	62%
Transport & Mobility	22%
Assured Water Supply	62%
Waste Water Management	40%
Solid Waste Management	30%
Reduced Pollution	79%

The rank of the city is based on the performance and scores in each of the category. The final city rank is submitted separately.

Executive Summary

Assessment of liveability indices is an initiative by the Ministry of Housing and Urban Affairs to improve quality of life of citizens and achieve sustainable development goals by encouraging cities to adopt "outcome based" approach for urban planning. Assessment process aimed to provide opportunity to cities to review the development components holistically by involving 79 measurable indicators categorized under governance, health, education, safety, economy, power supply, transportation and mobility, identity, culture, housing, waste management and pollution.

This report highlights the assessment process, key milestones, and the final outcome of the data submitted. Implementation of liveability assessment commenced formally on 19th January 2018. A national level workshop was organized on 13th February 2018 to explain the importance and process of liveability assessment and get feedback on methodology from the city authorities.

This was followed by the next stage of Questionnaire development. The questionnaire was arranged under 12 categories representing 12 data owners namely urban local body, Central and state pollution control board, development authority, DISCOM/Electricity board, State disaster management authority, state education department, state health department, state renewable energy development agency, state sales and commercial taxes department, town and country planning department, traffic and police department and transport authorities.

An online data entry portal was developed to facilitate data submission by the cities. Each city had a unique log in to access the portal and submit the data. Both online and off-line options (download the questionnaire in an excel) to submit the data were available for cities. An email help desk was set up for the cities to raise any queries and seek clarification when responding to the questions.

A team for each state comprising of State Coordinator and City Coordinator (one per city) was deployed that facilitated the process and supported the cities. A total of 6 regional coordinators/ consultants, 29 State Coordinators, and 99 city coordinators were deployed across 116 cities. Training for state coordinators was held from 26th to 28th February 2018 at Chennai to make coordinators understand overall liveability assessment, indicators, data sources, protocols and roles and responsibilities.

City Reconnaissance Meetings were initiated by the state and city coordinators. The discussion began with discussions to finalize the state workshop schedule, mapping of data owners, and assist cities in data collection. The City Coordinators were based in the cities for over 6 weeks and during this time, they liase with ULB and other data owners to explain the liveability framework, online portal, and facilitate the online submission.

A total of 33 state workshops were conducted at the state level. The objective of the workshop was to orient the city stakeholders on liveability assessment, indicators, components of data collection, timelines, expectations of support and support extended by MoHUA. The state level workshops brought various city level departments on a single platform to understand and discuss the methodology and components of city liveability assessment.

Nodal agency at state level supported by the City and State Coordinator and city level (Municipality corporation/smart city limited) coordinated with city specific data owners/departments for data gathering, collation, and submission. Nodal persons in each department were appointed for timely data collection and submission. Of 116, 112 cities submitted data as per the timeline on 16th April 2018.

Post submission, the city and state coordinators supported by the central team followed up extensively with the cities to support secondary documents as evidence to substantiate their submissions. Secondary documents such as reports, official orders, copy of office register, signed copy of liveability assessment questionnaire furnished by cities against the submitted data. Documents are verified to map the documents for the reponses provided by city and to check the type data provided by city. The document check outcomes were shared with the cities as a part of data quality check.

For checking consistency of data, logical check of data, verifying data from other public sources were undertaken. Quality check was done to ensure data validity and provide opportunity to cities to review the data provided by them and correct in case of wrong data entry.

For 8 selected indicators namely, percentage of services integrated through command and control center, hotel occupancy rate, percentage of schools with access to digital education, number of CCTV cameras per unit road length, percentage of vendors registered and provided formal spaces, availability of passenger information system, percentage of traffic intersection with pedestrian crossing facility, and extent to which universal accessibility is incorporated in

public rights of way. Physical audit was conducted in 110 cities by physical auditors appointed and trained by the consortium. In consultation with ULB nodal person, locations and indicators for physical audit was selected in each city. A mobile based application was developed to capture the physical audit related data.

Primary data collection was done for five indicators such as unemployment rates, mode share of public transport, mode share of non-motorized transport, quality of water supplied, and level of noise pollution. Protocols for water and noise test were prepared in consultation with experts. Water quality test involved physical, chemical and bacteriological test of water as per the CPCB norms. For testing quality of water at consumer end, the auditors worked closely with the ULB and Water department. Samples were collected from consumer end and submitted to the lab suggested by city. For noise pollution, in about 20 cities the state pollution board or city level environment department took the responsibility for providing noise pollution data as per the protocols. In rest of the cities, mobile based application was used to measure noise pollution.

During implementation, MoHUA facilitated the process by conducting video conferences with cities to address any queries, reiterate the importance, and ensure that cities adequately engages in the process and submit their responses in time and respond to requests for clarifications.

In addition to secondary data collection, physical audit and primary data collection, citizen survey was conducted to understand their perception and level of satisfaction on various services such as health, education, water supply, electricity, waste management etc. provided by urban local bodies. Over 60000 citizens participated in the survey across India.

The final scores and ranks have been generated based on the scoring methodology that has been discussed extensively and minor modifications made that are summarized as below:

#	Challenges	Proposed Solutions
1	Only 23 cities of 111 cities have City Mobility Plan (CMP) or any and hence able to provide data for Mode Share of Public Transport and Non-Motorised Transport. To address the data gap, as advised by the MoHUA, the consortia undertook a sample dipstick across all cities covering a sample of 150 Households. Understandably, the dipstick findings will not match the rigor of a CMP.	We recommend the following: 1) Cities which have provided CMP Data will be evaluated on 100% of the maximum score 2) For the cities where the dipstick data is used, the city receives a 50% discount on the overall score Alternatively, another approach is to assign 0 score to all 88 cities that don't have a CMP
2	Variance was observed on data reported by cities on road network and data presented in the smart city proposals during the verifications.	We recommend taking the data reported by the cities in the Smart City Proposals.
3	There is no secondary source/ organization that provides unemployment data at city level. As a result, most cities do not have the data. Fully cognizance of the challenges of generating this data in a short span of time, it was agreed to collect this data through a dipstick survey on lines of NSSO questions. The data generated needs further scrutiny and triangulation with some inputs from experts. This may not be possible in the short window.	The indicator on unemployment will be excluded from scores. For final ranking, the cities will be scored on 78 indicators.
4	Many cities did not have data on noise pollution and it was decided that data will be collected using a mobile app for all the 111 cities. However, many cities have expressed reservations with the approach especially with respect to the reliability of using this data. Further, some cities have relied on the SPCB to collect the data as per the approach proposed by the consortia. Thus, noise pollution data is currently from two sources: 1. SPCB- 20 cities 2. Noise-based app- 91 cities	The data collected through the primary survey will be used for scoring the cities. Currently, there is no differential scoring for the data from the SPCB and the data collected through the mobile app. However, a certain higher weightage can be provided to those cities which used the state apparatus to collect noise pollution data.

#	Challenges	Proposed Solutions
5	For the indicator on quality of water supplied, the methodology document states that samples should be drawn both at the treatment plant outlet as well as the consumer end. However, the data provided by the cities were predominantly from the distribution point. Hence for consumer end results with MoHUA intervention, consortia coordinated with cities to collect the data at the consumer end. The cities facilitated the testing. The outcome of the process is as below: 1. Sample given- 102 cities 2. Report received- 86 cities 3. Report awaited- 16 cities 4. Tests not completed due to lack of cooperation and other reasons – 9	The maximum score for this indicator will be distributed equally (50%) for results based on samples from the treatment plant and consumer end. Cities that did not complete tests or provide the results will be given a score 0 for against consumer end tests.
6	City level population is not projected annually by most of the cities. So, estimates for 2017 population are not available with the cities.	As recommended by MoHUA, 2011 census population is being used for the ranking purpose.
7	The age category specific data for 9 cities is not available at a city level	The age category specific population data has been taken at a district level for these cities.
8	Indicators on non-motorised transports like- Dedicated bicycle tracks, bicycle parking facilities and mode share of non-motorised transport are not relevant for hilly terrains.	As discussed during the PMC meeting, these indicators have been treated as non-applicable for the hilly cities and the weights have been redistributed among other indicators within the same category.

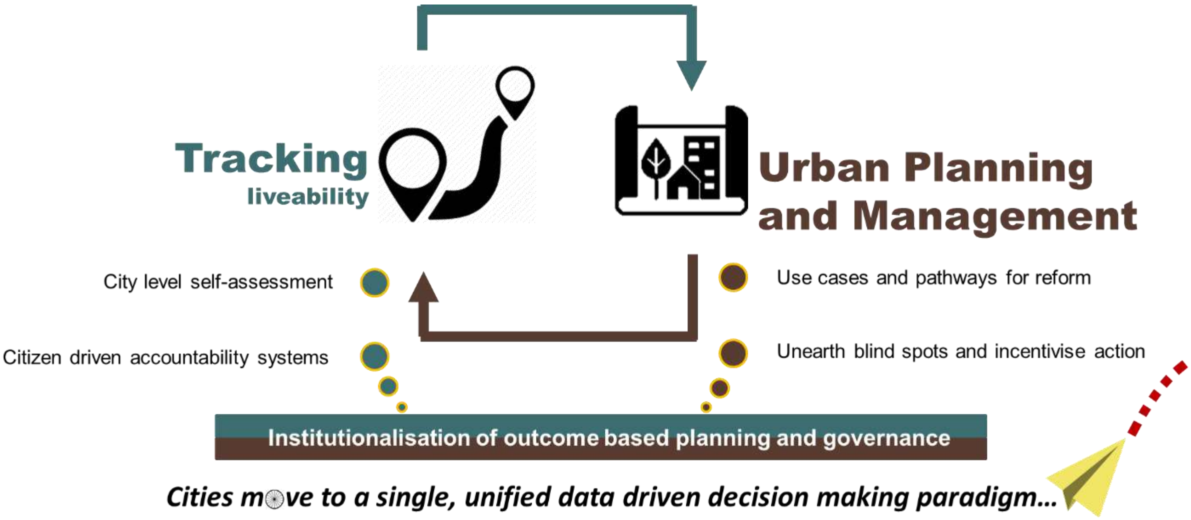
#	Challenges	Proposed Solutions
9	The indicator on increase in professional tax is not relevant to cities which do not levy the professional tax.	As discussed during the PMC meeting, this indicator has been non-applicable to the cities belonging to states where professional tax is not levied, and the weights have been redistributed among other indicators within the same category.
10	The indicator on increase in VAT collection is not applicable to Port Blair and Kavaratti, as there was no provision of VAT collection in these cities.	As discussed during the PMC meeting, these indicatosr has been treated as non-applicable for these two cities and the weights have been redistributed among other indicators within the same category.
11	Indicator on coverage of basic services to slum households does not concern cities with no slums (notified/ non-notified.	As discussed during the PMC meeting, this indicators has been treated as non-applicable for these cities and the weights have been redistributed among other indicators within the same category.

1. Introduction

The Ministry of Housing and Urban Affairs (MoHUA) is implementing several flagship urban missions such as the Smart Cities Mission (SCM), Atal Mission for Urban Rejuvenation and Transformation (AMRUT), Heritage City Development and Augmentation Yojana (HRIDAY), Housing for All (HFA). Theses mission along with other transformative initiatives of the Government including National Water Mission, Power for All, National Health Mission are aimed at making Indian cities more 'liveable.' The overarching goal of these initiatives is to move from an input-based approach to a 'citizen centric-outcome based' assessment of urban liveability.

To develop a common minimum framework for cities to assess their existing status and chart their pathway towards providing a better quality of life to their citizens, the MoHUA developed a set of 'Liveability Standards' relevant to cities to generate a Liveability Index and ranking of cities. These standards were launched in June, 2017. The MoHUA has planned to conduct an 'Annual Assessment of Liveability Standards in Cities – an ambitious national project that will involve yearly submission of data by cities across the various indicators, compilation and analysis, development of indices and ranking of cities. The Liveability Index is envisioned as a 360° tool for tracking, planning and transforming Indian cities. The Liveability Index is aimed at the following objectives:

- Providing strong evidence-based approach for future interventions and investments to deliver liveability outcomes
- Catalysing actions to improve the overall quality of the city's liveability and achieve broader development outcomes including the Sustainable Development Goals
- Assessing the implementation of government policies and schemes governing characteristics of cities that can contribute to creating liveable communities



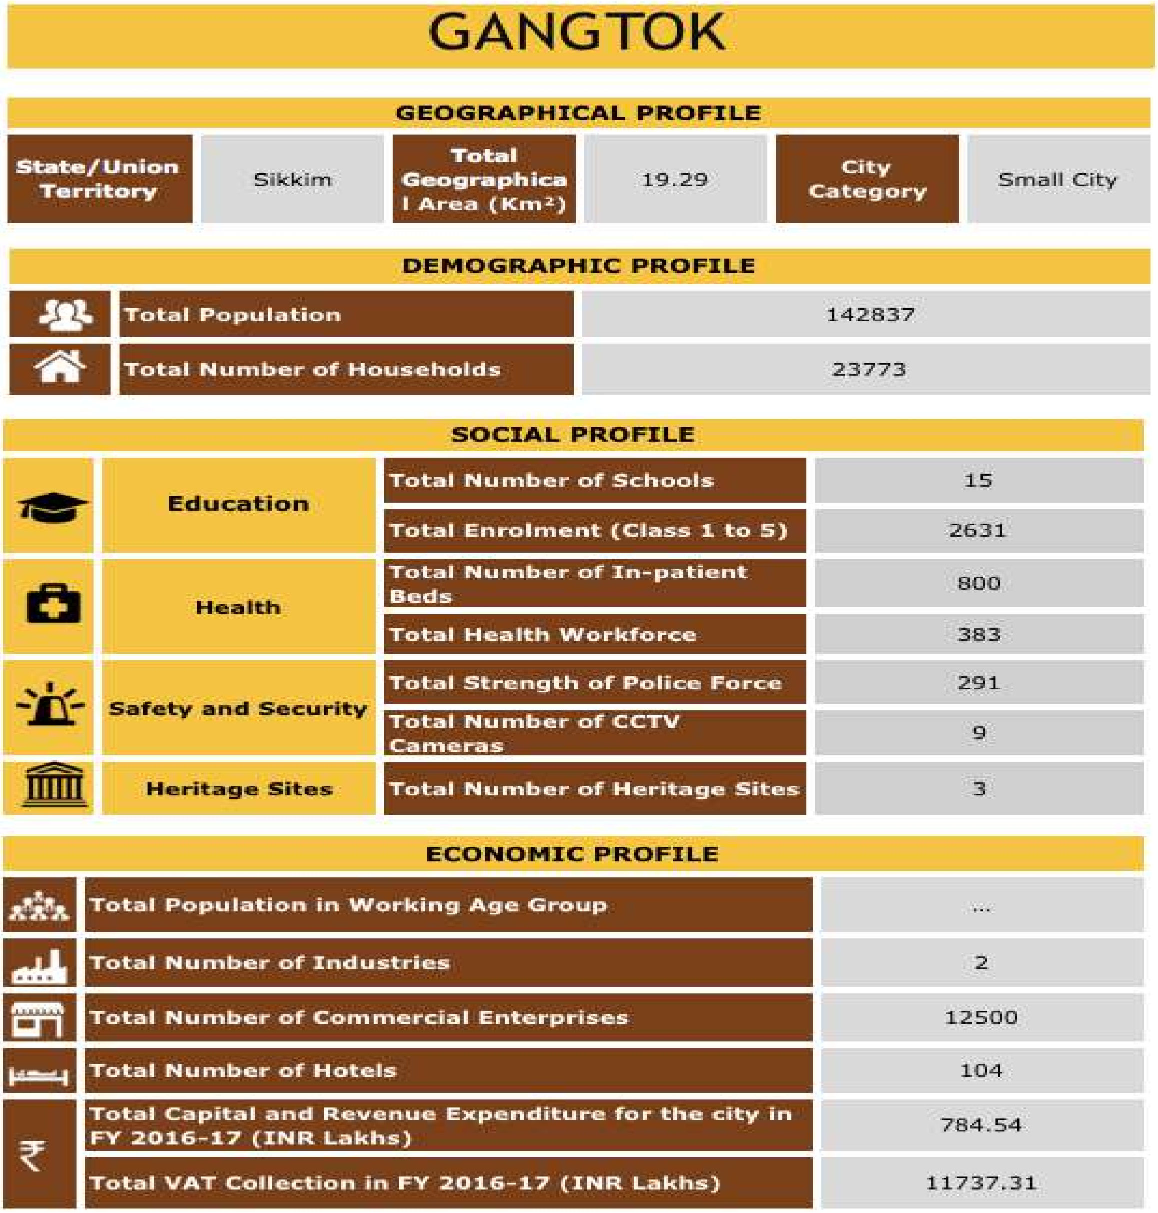
Tracking
liveability
Urban Planning
and Management
City level self-assessment
Citizen driven accountability systems
Use cases and pathways for reform
Unearth blind spots and incentivise action
Institutionalisation of outcome based planning and governance

Cities move to a single, unified data driven decision making paradigm...

The first round of the assessment commenced in January 2018 covering 116 major cities including smart cities, capital cities and cities with population of above one million each. Implementation of the liveability assessment commenced in January 2018 with a national level orientation workshop for the urban local bodies. The workshop aimed at orienting the states and urban local bodies on the overall framework, indicators, data sources, methodology and key milestones and timelines involved in the liveability assessment. Subsequently, a series of State/ Union Territory level orientation workshops were carried out in 33 states/UTs for a detailed discussion on the framework. Online data collection commenced from 9th March through an online data collection platform that supported both online and offline data submission modes. On the date of closure of the online data entry portal i.e., 16th April, 2018 112 cities submitted their data. Subsequently, comprehensive checks on the submitted data was undertaken that involved checking for outliers, logical inconsistencies etc. post which round-1 of data reconciliation was conducted. This draft report is based on round-1 of reconciled data as on 28th April, 2018.

2. City Profile

This chapter presents the city profile -Geographic and Demographic, Social (Education Health, Safety and Security, Heritage), Economic profile, and Physical (Water, sanitation and Waste Management, Electricity, Open space and roads).



GANGTOK

GEOGRAPHICAL PROFILE

State/Union Territory	Sikkim	Total Geographical Area (Km²)	19.29	City Category	Small City

DEMOGRAPHIC PROFILE

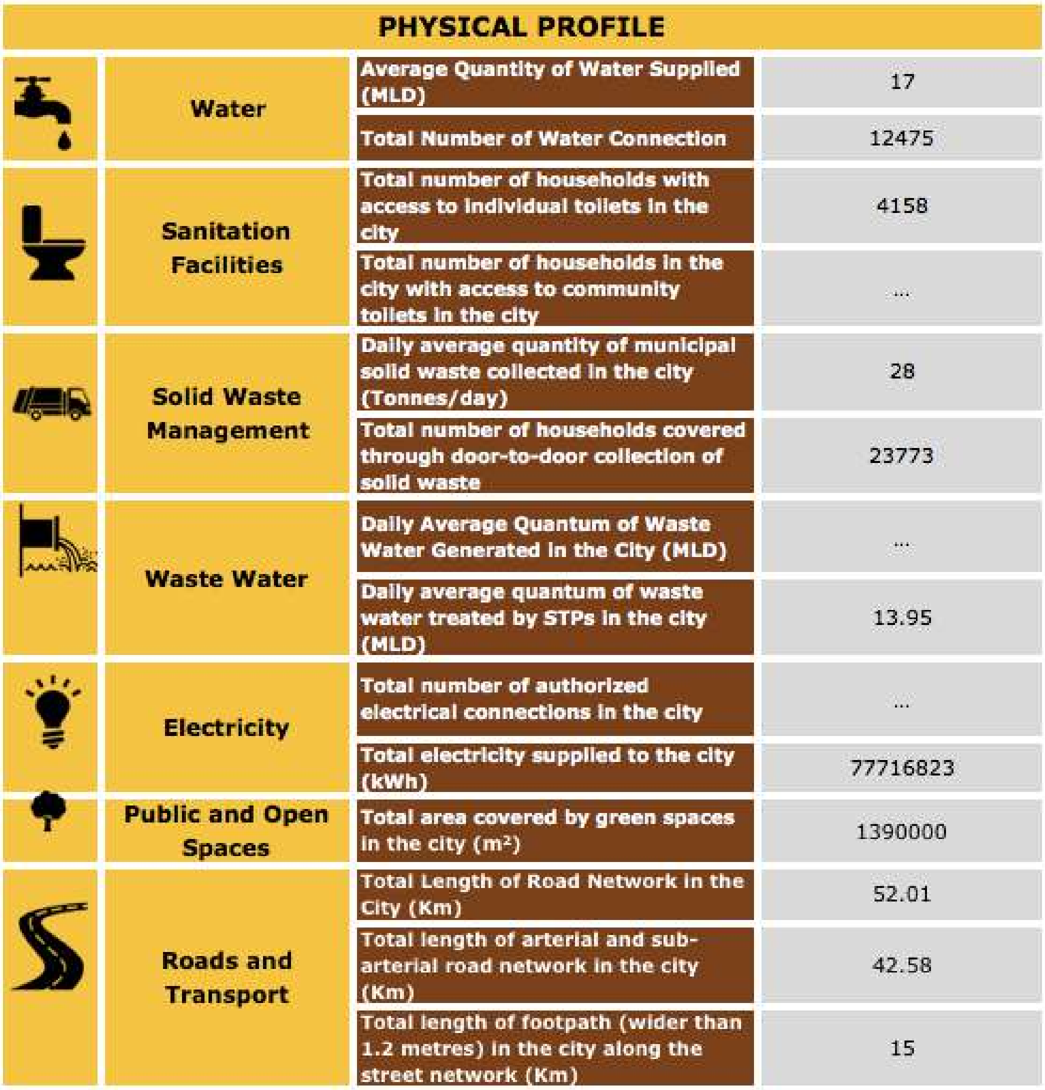
Total Population	142837
Total Number of Households	23773

SOCIAL PROFILE

Education	Total Number of Schools	15
	Total Enrolment (Class 1 to 5)	2631
Health	Total Number of In-patient Beds	800
	Total Health Workforce	383
Safety and Security	Total Strength of Police Force	291
	Total Number of CCTV Cameras	9
Heritage Sites	Total Number of Heritage Sites	3

ECONOMIC PROFILE

Total Population in Working Age Group	...
Total Number of Industries	2
Total Number of Commercial Enterprises	12500
Total Number of Hotels	104
Total Capital and Revenue Expenditure for the city in FY 2016-17 (INR Lakhs)	784.54
Total VAT Collection in FY 2016-17 (INR Lakhs)	11737.31



PHYSICAL PROFILE		
Water	Average Quantity of Water Supplied (MLD)	17
	Total Number of Water Connection	12475
Sanitation Facilities	Total number of households with access to individual toilets in the city	4158
	Total number of households in the city with access to community toilets in the city	...
Solid Waste Management	Daily average quantity of municipal solid waste collected in the city (Tonnes/day)	28
	Total number of households covered through door-to-door collection of solid waste	23773
Waste Water	Daily Average Quantum of Waste Water Generated in the City (MLD)	...
	Daily average quantum of waste water treated by STPs in the city (MLD)	13.95
Electricity	Total number of authorized electrical connections in the city	...
	Total electricity supplied to the city (kWh)	77716823
Public and Open Spaces	Total area covered by green spaces in the city (m^2)	1390000
Roads and Transport	Total Length of Road Network in the City (Km)	52.01
	Total length of arterial and sub-arterial road network in the city (Km)	42.58
	Total length of footpath (wider than 1.2 metres) in the city along the street network (Km)	15

3. Liveability Framework and Indicators

The Liveability Framework comprises a total of 79 indicators (57 Core Indicators and 22 Supporting Indicators). A core indicator carries 70% weightage and a supporting indicator carries 30% weightage. These indicators are grouped under 15 thematic categories which in turn are part of four pillars of comprehensive development of cities i.e., institutional, social, economic and physical. Based on the performance of cities against the various core and supporting indicators, various 'Category Sub-Indexes' and a composite 'City Liveability Index' will be developed for each city.

3.1. Scoring and Computing Category Indices of Liveability

The set of 79 indicators, associated categories and pillars are presented in the table below:

Table 1 List of Pillars, Categories and Indicators

Pillars of Comprehensive Development	Category	Indicators
Institutional	1. Governance	1.1 Percentage of citizen services available online
		1.2 Percentage of services integrated through Command Centre
		1.3 Percentage of citizens using online services
		1.4 Average delay in grievance redressal
		1.5 Tax collected as percentage of tax billed
		1.6 Extent of cost recovery (O&M) in water supply services
		1.7 Capital spending as percentage of total expenditure
		1.8 Percentage of population covered under Ward Committees/Area *Sabhas*
Social	**2. Identity and Culture**	2.1 Restoration and reuse of historic buildings
		2.2 Percentage of ecologically important areas covered through projects for restoration
		2.3 Hotel occupancy
		2.4 Percentage of budget allocated towards cultural/sports activities
		2.5 Number of cultural/sports events hosted by city
	3. Education	3.1 Percentage of school-aged population enrolled in schools
		3.2 Percentage of female school-aged population enrolled in schools
		3.3 Primary education student-teacher ratio
		3.4 Percentage of schools with access to digital educa-

Pillars of Comprehensive Development	Category	Indicators
		tion
		3.5 Percentage of students completing primary education
		3.6 Percentage of students completing secondary education
	4. Health	4.1 Number of in-patient hospital beds per 10,000 population
		4.2 Healthcare professionals per 10,000 population
		4.3 Average response time in case of health emergencies
		4.4 Period prevalence of water borne diseases
		4.5 Period prevalence of vector borne diseases
	5. Safety and Security	5.1 Number of CCTV Cameras
		5.2 Number of recorded crimes per lakh population
		5.3 Extent of crimes recorded against women, children and elderly per year
		5.4 Transport-related fatality per lakh population
Economic	**6. Economy and Employment**	6.1 Increase in VAT/GST collection
		6.2 Increase in collection of Professional Tax
		6.3 Increase in issuance of Construction permits
		6.4 Unemployment rate
		6.5 Percentage of vendors registered and provided formal spaces
Physical	**7. Housing and Inclusiveness**	7.1 Percentage of Slum/EWS households covered through formal/affordable housing
		7.2 Percentage of slum areas covered through basic services

Pillars of Comprehensive Development	Category	Indicators
	8. Public Open Spaces	8.1 Per capita availability of green spaces
		8.2 Per capita availability of public and recreational places
	9. Mixed Land Use and Compactness	9.1 Share of mixed land use area in overall city land use
		9.2 Net Density
	10. Power Supply	10.1 Percentage of city population with authorized electrical services
		10.2 Percentage of electrical connections covered through smart meters
		10.3 Average number of electrical interruptions per year
		10.4 Average length of electrical interruptions per year
		10.5 Percentage of total energy derived from renewable sources
		10.6 Energy consumption per unit - water supply and sewerage
		10.7 Energy consumption per unit - street lighting
		10.8 Percentage of new and redeveloped buildings following green building norms
		10.9 Total energy consumption per capita
	11. Transportation and Mobility	11.1 Geographical coverage of public transport
		11.2 Availability of public transport
		11.3 Mode share of public transport
		11.4 Percentage of road network with dedicated bicycle tracks
		11.5 Percentage of interchanges with bicycle parking facilities

Pillars of Comprehensive Development	Category	Indicators
		11.6 Mode share of non-motorized transport
		11.7 Availability of Passenger Information System
		11.8 Extent of signal synchronization
		11.9 Availability of paid parking spaces
		11.10 Percentage coverage of footpaths – wider than 1.2 m
		11.11 Percentage of traffic intersections with pedestrian crossing facilities
		11.12 Extent to which universal accessibility is incorporated in public rights-of-way
	12. Assured Water Supply	12.1 Household level coverage of direct water supply connections
		12.2 Per capita supply of water
		12.3 Quality of water supplied
		12.4 Level of non-revenue water – NRW
		12.5 Percentage of water connections covered through meters
		12.6 Percentage of plots with rainwater harvesting facility
	13. Waste Water Management	13.1 Coverage of toilets
		13.2 Coverage of sewerage network and/or septage
		13.3 Collection efficiency of sewerage network
		13.4 Extent of reuse and recycling of waste water
		13.5 Coverage of storm water drains
	14. Solid Waste Management	14.1 Household level coverage of municipal solid waste collection

Pillars of Comprehensive Development	Category	Indicators
		14.2 Efficiency of collection of municipal solid waste
		14.3 Extent of municipal solid waste recovered through reuse
	15. Reduced Pollution	15.1 Concentration of SO2- air pollution
		15.2 Concentration of NO2- air pollution
		15.3 Concentration of PM10 - air pollution
		15.4 Level of noise pollution
		15.5 Quality of water in public surface water bodies

3.2. Scoring and Computing Category Indices of Liveability

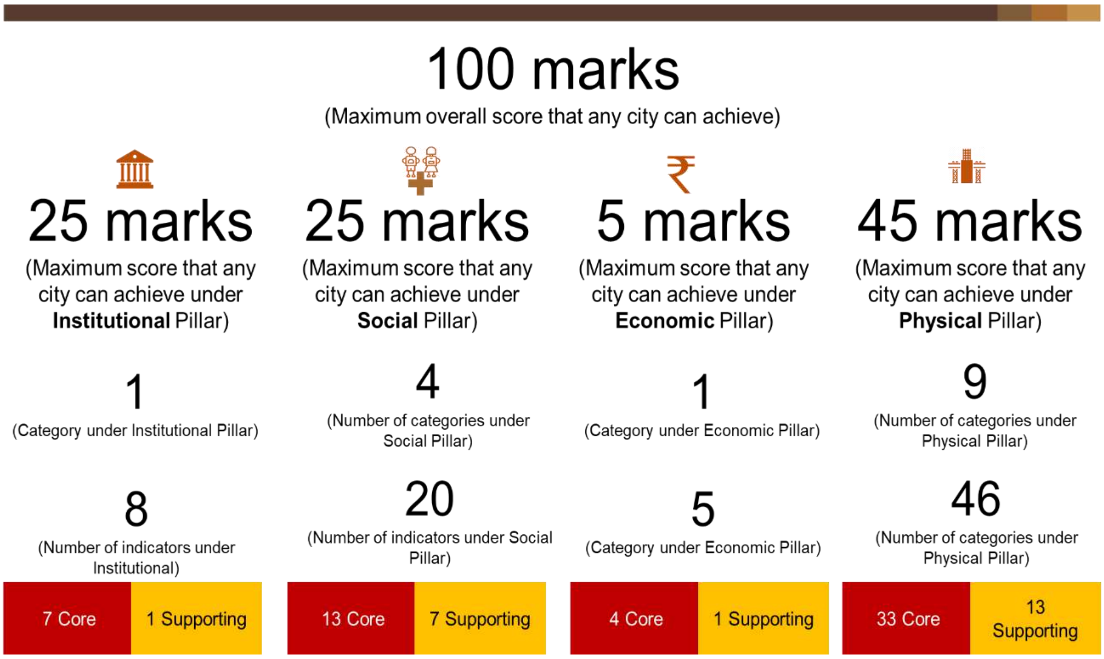
The performance achieved by cities against 79 indicators, will be assessed against given benchmarks. Where no international/national norms are available, city with the best performance in its group (population range) will be treated as a benchmark. The groups are given in the table below.

Table 2 Details on Population Range

Category	Population range
Category 1	Population ≥ 4 million
Category 2	1 million ≤ Population < 4 million
Category 3	0.5 million ≤ Population < 1 million
Category 4	Population < 0.5 million

3.3. Scoring Approach and Methodology

A city can earn a maximum score of 100 points for 79 indicators across four pillars. The pillar weights are as follows: Institutional (25 points), Social (25 points), Economy and Employment (5 points) and Physical (45 points). Based on the number and nature of indicators i.e., core vs. secondary, indicator wise maximum marks were computed.



100 marks

(Maximum overall score that any city can achieve)

25 marks	25 marks	5 marks	45 marks
(Maximum score that any city can achieve under **Institutional** Pillar)	(Maximum score that any city can achieve under **Social** Pillar)	(Maximum score that any city can achieve under **Economic** Pillar)	(Maximum score that any city can achieve under **Physical** Pillar)
1	4	1	9
(Category under Institutional Pillar)	(Number of categories under Social Pillar)	(Category under Economic Pillar)	(Number of categories under Physical Pillar)
8	20	5	46
(Number of indicators under Institutional)	(Number of indicators under Social Pillar)	(Category under Economic Pillar)	(Number of categories under Physical Pillar)
7 Core 1 Supporting	13 Core 7 Supporting	4 Core 1 Supporting	33 Core 13 Supporting

Dimensional Index Methodology (DIM) has been used to compute scores for each indicator with reference to "maximum within the comparison group" or "absolute benchmarks". For indicators where benchmarks are available, cities getting the benchmark score (or above) are given the maximum mark, and the marks awarded to other cities are calculated proportionately. For indicators where benchmarks are not available, the best performing cities in each population group are given the maximum mark, and the marks awarded to other cities (within the population group) are calculated proportionately. For indicators where benchmarks do not exist, the city data has been tested for outliers before scoring.

3.4. Scoring Normalisation:

To construct aggregate scores across cities as well as to make the scores across indicators comparable, indicator values were normalised using a min-max approach. The following formula was used to normalise the indicator values-

This approach would restrict the normalised indicator value between 0 and 1. Cities that met or exceeded the benchmark received a normalised indicator value of 1. Worst performing cities are given a normalised indicator value of 0. After normalisation, the normalised value is weighted according to the category and the indicator being core or supporting.

To illustrate, consider the indicator 12.3 Quality of Water Supplied in the Category 12 for Assured Water Supply. If in City A 50% of the water samples collected qualify the potable water standards specified by the CPHEEO, and only 10% of the samples from worst performing city qualify the standards. Then, the normalised value for the indicator for city A would be 0.44 [(0.5-0.1)/(1-0.1)].

The weight for indicator 12.3 is 1.03, so the final weighted score for City A would come out to 0.45 [1.03*0.44].

4. Data Collection and Verification

4.1. Submission of Data by the cities

The Liveability Assessment is based on secondary data submitted by the urban local bodies and other concerned government agencies (collectively called as data owners). The 79 indicators were broken down into a set of easy to understand and relatable 553 questions mapped to data owners. Submission of the data was enabled through an online data entry portal on the smartnet platform of the Ministry. The portal also allowed the ULBs to download the liveability assessment questionnaire and upload filled in questionnaire. To familiarise and assist cities in identifying, mapping and collation of data points, a city level nodal person was available during the entire period of data submission process.

4.2. Mapping of Data Owners for the City

For the assessment of liveability indices broadly 12 data owners such as Central/state Pollution control board, Development authority, DISCOM/Electricity Board, State Disaster Management Authority, State Education Department, State Health department, State Renewable energy and development agency, State sales and commercial taxes department, town and country planning department, Traffic and police department, Transport authority, and Urban local body were identified to respond to the questions on the portal. However, during state workshop and subsequent city level discussions, more data owners were mapped to respond to different categories and sub categories. The following table provides the details of city level data owners mapped under the 12 data owner.

Table 3: Details of Data Owners

Designated data owners	Subcategories	Data owners at city level
Urban Local Body	For Accounts Related Questions	GANGTOK MUNICIPAL CORPORATION
Urban Local Body	For Park and Recreation Related Questions	GANGTOK MUNICIPAL CORPORATION
Urban Local Body	For Water Supply and Drainage related questions	WATER SECURITY & PUBLIC HEALTH ENGINEERING DEPARTMENT
Urban Local Body	For Heritage sites related data	GANGTOK MUNICIPAL CORPORATION
Urban Local Body	For Ecological sites related data	GANGTOK MUNICIPAL CORPORATION
Urban Local Body	For Housing related data	GANGTOK MUNICIPAL CORPORATION
Urban Local Body	For Building plan related data	GANGTOK MUNICIPAL CORPORATION
Urban Local Body	For Roads related data	GANGTOK MUNICIPAL CORPORATION
Urban Local Body	For Solid waste management related data	GANGTOK MUNICIPAL CORPORATION
Urban Local Body	For IT services related data	GANGTOK MUNICIPAL CORPORATION
Urban Local Body	For Vendor committee related data	GANGTOK MUNICIPAL CORPORATION
Urban Local Body	Any other departments involved in providing data for questions mentioned under Urban Local Body	GANGTOK MUNICIPAL CORPORATION
Central / state Pollution control Board	Water Quality, Air Quality, Noise Quality	STATE POLLUTION CONTROL BOARD
Development Authority	Building Infrastructure	URBAN DEVELOPMENT AND HOUSING DEPARTMENT

Designated data owners	Subcategories	Data owners at city level
	Construction planning	URBAN DEVELOPMENT AND HOUSING DEPARTMENT
	Green Building	URBAN DEVELOPMENT AND HOUSING DEPARTMENT
	Rain water harvesting	URBAN DEVELOPMENT AND HOUSING DEPARTMENT
	Universal Design Principle	URBAN DEVELOPMENT AND HOUSING DEPARTMENT
DISCOM/Electricity Board	Electrical Connection/ Grievance Redressal/ Power supply	ENERGY AND POWER DEPARTMENT
State Disaster management authority		LAND REVENUE DEPARTMENT
State Education Department		HUMAN RESOURCE DEVELOPMENT DEPARTMENT
State Health Department	Health care professionals	HEALTH DEPARTMENT
	Citizen Services	HEALTH DEPARTMENT
	Disease Prevalence	HEALTH DEPARTMENT
	Health Infrastructure	HEALTH DEPARTMENT
State Renewable Energy Development Agency		STATE RENEWABLE ENERGY DEVELOPMENT AGENCY
State Sales / Commercial Taxes Department		COMMERCIAL TAX AND FINANCE DEPARTMENT
Town and Country Planning Department	Land Use	URBAN DEVELOPMENT AND HOUSING DEPARTMENT
Traffic and Police Department		SIKKIM POLICE HEADQUARTER EAST SIKKIM
Transport Author-	Buses	SIKKIM NATIONALISED TRANSPORT

Designated data owners	Subcategories	Data owners at city level
ities	Registered Vehicles	SIKKIM NATIONALISED TRANSPORT
	Sub urban rail transport	-
	Mono Rail Authority	-
	Tramways	-
	Marine Transport Authority	-

4.3. List of secondary documents available as supportive

City has provided supporting documents/evidences against the responses given by city on the online portal. In support of their responses on the portal, city submitted 7 number of documents. Documents submitted includes reports, official orders, copy of data maintained in official register, signed copy of questionnaire, and signed letters/submissions from concern departments. Verification includes mapping of documents against responses given by city, checking the type/category of documents, and validation of data provided.

The following table presents the data owner wise number of documents:

Table 4: Data owner wise number of secondary documents submitted by city

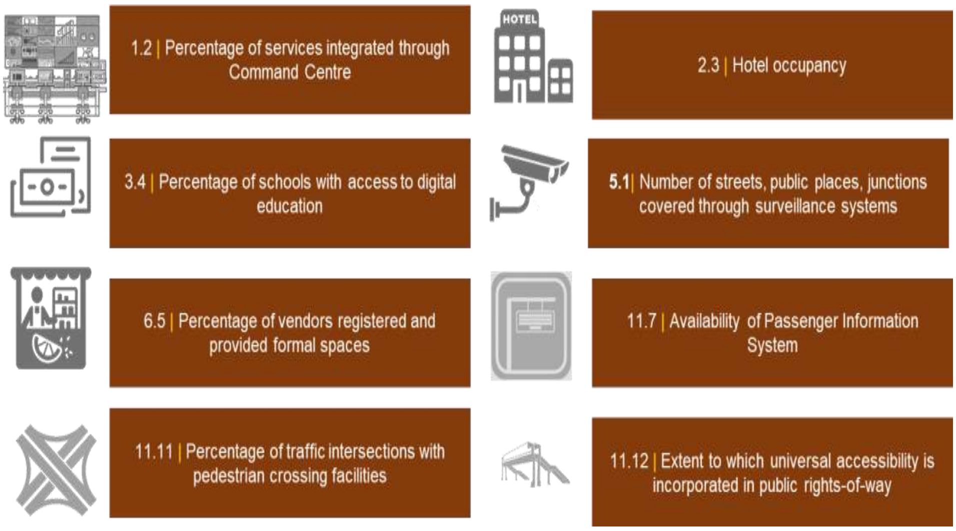
Data Owners	Number of Documents
Sales and Commercial Taxes	**1**
State Education Department	**7**
DISCOM/Electricity Department	**7**
Traffic and Police Department	**2**
Development Authority	**0**
Pollution Control Board	**2**
State Renewable Energy Department	**2**
Town and Country Planning	**0**
State Health Department	**16**

Data Owners	Number of Documents
Transport Authority	**1**
Disaster Management	**0**
Urban Local Body	**24**
Total	**62**

4.4. Data Verification

A three-stage data quality check comprising verification of data against secondary documents furnished by data owners, logical inconsistency checks including outliers, and physical audit for select indicators (Refer the exhibit below) is being undertaken. The objective of the data quality check is to ensure that data from the source documents are accurate and verifiable. Sources of data included reports, administrative data, survey results and other statistical records, log books among other.

Physical audit of eight indicators – one indicator from the Institutional pillar, one from the Social pillar, one from the Economy pillar and five from the Physical pillar is also being carried out by the field team to ascertain the degree of reliability of data reported by the cities. The list of these eight indicators is presented below:



1.2 | Percentage of services integrated through Command Centre

2.3 | Hotel occupancy

3.4 | Percentage of schools with access to digital education

5.1 | Number of streets, public places, junctions covered through surveillance systems

6.5 | Percentage of vendors registered and provided formal spaces

11.7 | Availability of Passenger Information System

11.11 | Percentage of traffic intersections with pedestrian crossing facilities

11.12 | Extent to which universal accessibility is incorporated in public rights-of-way

For a set of five indicators namely, unemployment rate, mode share of public transport, mode share of non-motorised transport, quality of water supplied and level of noise pollution, existing datasets were found to be not available consistently across all cities and/or were inadequate. To help cities that do not have data on these five indicators, dipstick assessments are being carried to fill data gaps.

6.4 | Unemployment Rate

11.3 | Mode share of public transport

11.5 | Mode share of Non Motorized Transport

12.3 | Quality of Water Supplied

15.4 | Level of Noise Pollution

4.5. Physical Audit

The following map presents the indicators audited at city level

5. City Score on 15 categories of assessment

Liveability Assessment covered 15 categories and 78 indicators. The below table presents the scores for all 15 indicators namely governance, identity & culture, education, health, safety and security, economy & employment, housing & inclusiveness, public open spaces, mixed land use & compactness, power supply, transport & mobility, assured water supply, waste water management, solid waste management and reduced pollution.

Table 5: Category wise scores

Categories	Scores in Percentage
Governance	32.66%
Identity & Culture	20%
Education	65%
Health	85%
Safety & Security	53%
Economy & Employment	23%
Housing & Inclusiveness	3%
Public Open Spaces	50%
Mixed Land Use & Compactness	0%
Power Supply	42%
Transport & Mobility	34%
Assured Water Supply	51%
Waste Water Management	8%
Solid Waste Management	41%
Reduced Pollution	79%

The rank of the city is based on the performance and scores in each of the category. The final city rank is submitted separately.

Executive Summary

Assessment of liveability indices is an initiative by the Ministry of Housing and Urban Affairs to improve quality of life of citizens and achieve sustainable development goals by encouraging cities to adopt "outcome based" approach for urban planning. Assessment process aimed to provide opportunity to cities to review the development components holistically by involving 79 measurable indicators categorized under governance, health, education, safety, economy, power supply, transportation and mobility, identity, culture, housing, waste management and pollution.

This report highlights the assessment process, key milestones, and the final outcome of the data submitted. Implementation of liveability assessment commenced formally on 19th January 2018. A national level workshop was organized on 13th February 2018 to explain the importance and process of liveability assessment and get feedback on methodology from the city authorities.

This was followed by the next stage of Questionnaire development. The questionnaire was arranged under 12 categories representing 12 data owners namely urban local body, Central and state pollution control board, development authority, DISCOM/Electricity board, State disaster management authority, state education department, state health department, state renewable energy development agency, state sales and commercial taxes department, town and country planning department, traffic and police department and transport authorities.

An online data entry portal was developed to facilitate data submission by the cities. Each city had a unique log in to access the portal and submit the data. Both online and off-line options (download the questionnaire in an excel) to submit the data were available for cities. An email help desk was set up for the cities to raise any queries and seek clarification when responding to the questions.

A team for each state comprising of State Coordinator and City Coordinator (one per city) was deployed that facilitated the process and supported the cities. A total of 6 regional coordinators/ consultants, 29 State Coordinators, and 99 city coordinators were deployed across 116 cities. Training for state coordinators was held from 26th to 28th February 2018 at Chennai to make coordinators understand overall liveability assessment, indicators, data sources, protocols and roles and responsibilities.

City Reconnaissance Meetings were initiated by the state and city coordinators. The discussion began with discussions to finalize the state workshop schedule, mapping of data owners, and assist cities in data collection. The City Coordinators were based in the cities for over 6 weeks and during this time, they liase with ULB and other data owners to explain the liveability framework, online portal, and facilitate the online submission.

A total of 33 state workshops were conducted at the state level. The objective of the workshop was to orient the city stakeholders on liveability assessment, indicators, components of data collection, timelines, expectations of support and support extended by MoHUA. The state level workshops brought

various city level departments on a single platform to understand and discuss the methodology and components of city liveability assessment.

Nodal agency at state level supported by the City and State Coordinator and city level (Municipality corporation/smart city limited) coordinated with city specific data owners/departments for data gathering, collation, and submission. Nodal persons in each department were appointed for timely data collection and submission. Of 116, 112 cities submitted data as per the timeline on 16th April 2018.

Post submission, the city and state coordinators supported by the central team followed up extensively with the cities to support secondary documents as evidence to substantiate their submissions. Secondary documents such as reports, official orders, copy of office register, signed copy of liveability assessment questionnaire furnished by cities against the submitted data. Documents are verified to map the documents for the reponses provided by city and to check the type data provided by city. The document check outcomes were shared with the cities as a part of data quality check.

For checking consistency of data, logical check of data, verifying data from other public sources were undertaken. Quality check was done to ensure data validity and provide opportunity to cities to review the data provided by them and correct in case of wrong data entry.

For 8 selected indicators namely, percentage of services integrated through command and control center, hotel occupancy rate, percentage of schools with access to digital education, number of CCTV cameras per unit road length, percentage of vendors registered and provided formal spaces, availability of passenger information system, percentage of traffic intersection with pedestrian crossing facility, and extent to which universal accessibility is incorporated in public rights of way. Physical audit was conducted in 110 cities by physical auditors appointed and trained by the consortium. In consultation with ULB nodal person, locations and indicators for physical audit was selected in each city. A mobile based application was developed to capture the physical audit related data.

Primary data collection was done for five indicators such as unemployment rates, mode share of public transport, mode share of non-motorized transport, quality of water supplied, and level of noise pollution. Protocols for water and noise test were prepared in consultation with experts. Water quality test involved physical, chemical and bacteriological test of water as per the CPCB norms. For testing quality of water at consumer end, the auditors worked closely with the ULB and Water department. Samples were collected from consumer end and submitted to the lab suggested by city. For noise pollution, in about 20 cities the state pollution board or city level environment department took the responsibility for providing noise pollution data as per the protocols. In rest of the cities, mobile based application was used to measure noise pollution.

During implementation, MoHUA facilitated the process by conducting video conferences with cities to address any queries, reiterate the importance, and ensure that cities adequately engages in the process and submit their responses in time and respond to requests for clarifications.

In addition to secondary data collection, physical audit and primary data collection, citizen survey was conducted to understand their perception and level of satisfaction on various services such as health, education, water supply, electricity, waste management etc. provided by urban local bodies. Over 60000 citizens participated in the survey across India.

The final scores and ranks have been generated based on the scoring methodology that has been discussed extensively and minor modifications made that are summarized as below:

#	Challenges	Proposed Solutions
1	Only 23 cities of 111 cities have City Mobility Plan (CMP) or any and hence able to provide data for Mode Share of Public Transport and Non-Motorised Transport. To address the data gap, as advised by the MoHUA, the consortia undertook a sample dipstick across all cities covering a sample of 150 Households. Understandably, the dipstick findings will not match the rigor of a CMP.	We recommend the following: 1) Cities which have provided CMP Data will be evaluated on 100% of the maximum score 2) For the cities where the dipstick data is used, the city receives a 50% discount on the overall score Alternatively, another approach is to assign 0 score to all 88 cities that don't have a CMP
2	Variance was observed on data reported by cities on road network and data presented in the smart city proposals during the verifications.	We recommend taking the data reported by the cities in the Smart City Proposals.
3	There is no secondary source/ organization that provides unemployment data at city level. As a result, most cities do not have the data. Fully cognizance of the challenges of generating this data in a short span of time, it was agreed to collect this data through a dipstick survey on lines of NSSO questions. The data generated needs further scrutiny and triangulation with some inputs from experts. This may not be possible in the short	The indicator on unemployment will be excluded from scores. For final ranking, the cities will be scored on 78 indicators.

#	Challenges	Proposed Solutions
	window.	
4	Many cities did not have data on noise pollution and it was decided that data will be collected using a mobile app for all the 111 cities. However, many cities have expressed reservations with the approach especially with respect to the reliability of using this data. Further, some cities have relied on the SPCB to collect the data as per the approach proposed by the consortia. Thus, noise pollution data is currently from two sources: 1. SPCB- 20 cities 2. Noise-based app- 91 cities	The data collected through the primary survey will be used for scoring the cities. Currently, there is no differential scoring for the data from the SPCB and the data collected through the mobile app. However, a certain higher weightage can be provided to those cities which used the state apparatus to collect noise pollution data.
5	For the indicator on quality of water supplied, the methodology document states that samples should be drawn both at the treatment plant outlet as well as the consumer end. However, the data provided by the cities were predominantly from the distribution point. Hence for consumer end results with MoHUA intervention, consortia coordinated with cities to collect the data at the consumer end. The cities facilitated the testing. The outcome of the process is as below: 1. Sample given- 102 cities 2. Report received- 86 cities 3. Report awaited- 16 cities 4. Tests not completed due to lack of cooperation and other reasons – 9	The maximum score for this indicator will be distributed equally (50%) for results based on samples from the treatment plant and consumer end. Cities that did not complete tests or provide the results will be given a score 0 for against consumer end tests.
6	City level population is not projected annually by most of the cities. So, estimates for 2017 population are not available with the cities.	As recommended by MoHUA, 2011 census population is being used for the ranking purpose.

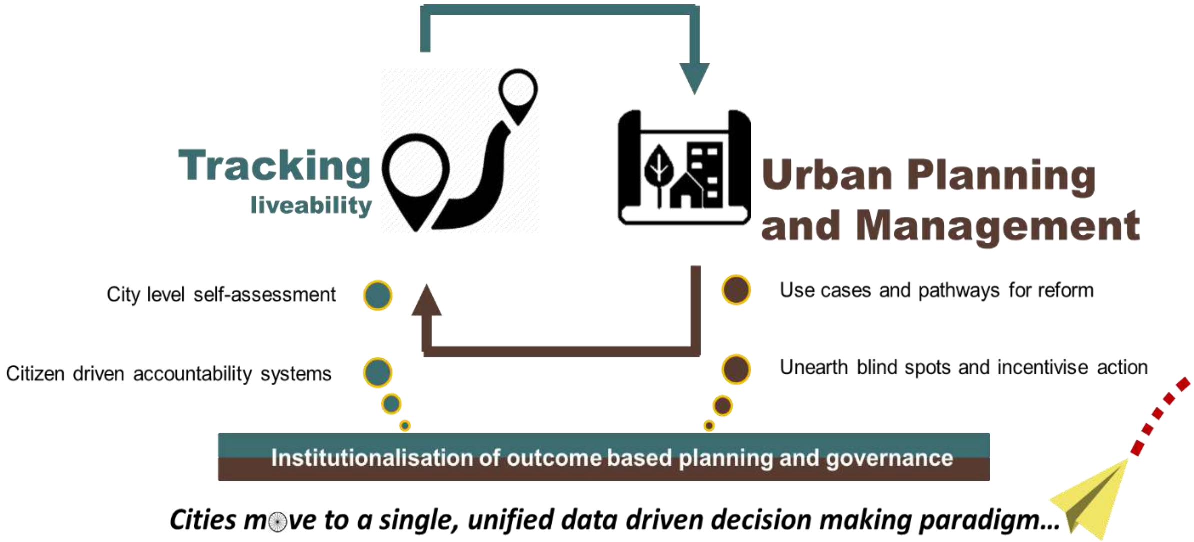
#	Challenges	Proposed Solutions
7	The age category specific data for 9 cities is not available at a city level	The age category specific population data has been taken at a district level for these cities.
8	Indicators on non-motorised transports like- Dedicated bicycle tracks, bicycle parking facilities and mode share of non-motorised transport are not relevant for hilly terrains.	As discussed during the PMC meeting, these indicators have been treated as non-applicable for the hilly cities and the weights have been redistributed among other indicators within the same category.
9	The indicator on increase in professional tax is not relevant to cities which do not levy the professional tax.	As discussed during the PMC meeting, this indicator has been non-applicable to the cities belonging to states where professional tax is not levied, and the weights have been redistributed among other indicators within the same category.
10	The indicator on increase in VAT collection is not applicable to Port Blair and Kavaratti, as there was no provision of VAT collection in these cities.	As discussed during the PMC meeting, these indicatosr has been treated as non-applicable for these two cities and the weights have been redistributed among other indicators within the same category.
11	Indicator on coverage of basic services to slum households does not concern cities with no slums (notified/ non-notified.	As discussed during the PMC meeting, this indicators has been treated as non-applicable for these cities and the weights have been redistributed among other indicators within the same category.

1. Introduction

The Ministry of Housing and Urban Affairs (MoHUA) is implementing several flagship urban missions such as the Smart Cities Mission (SCM), Atal Mission for Urban Rejuvenation and Transformation (AMRUT), Heritage City Development and Augmentation Yojana (HRIDAY), Housing for All (HFA). Theses mission along with other transformative initiatives of the Government including National Water Mission, Power for All, National Health Mission are aimed at making Indian cities more 'liveable.' The overarching goal of these initiatives is to move from an input-based approach to a 'citizen centric-outcome based' assessment of urban liveability.

To develop a common minimum framework for cities to assess their existing status and chart their pathway towards providing a better quality of life to their citizens, the MoHUA developed a set of 'Liveability Standards' relevant to cities to generate a Liveability Index and ranking of cities. These standards were launched in June, 2017. The MoHUA has planned to conduct an 'Annual Assessment of Liveability Standards in Cities – an ambitious national project that will involve yearly submission of data by cities across the various indicators, compilation and analysis, development of indices and ranking of cities. The Liveability Index is envisioned as a 360° tool for tracking, planning and transforming Indian cities. The Liveability Index is aimed at the following objectives:

- Providing strong evidence-based approach for future interventions and investments to deliver liveability outcomes
- Catalysing actions to improve the overall quality of the city's liveability and achieve broader development outcomes including the Sustainable Development Goals
- Assessing the implementation of government policies and schemes governing characteristics of cities that can contribute to creating liveable communities



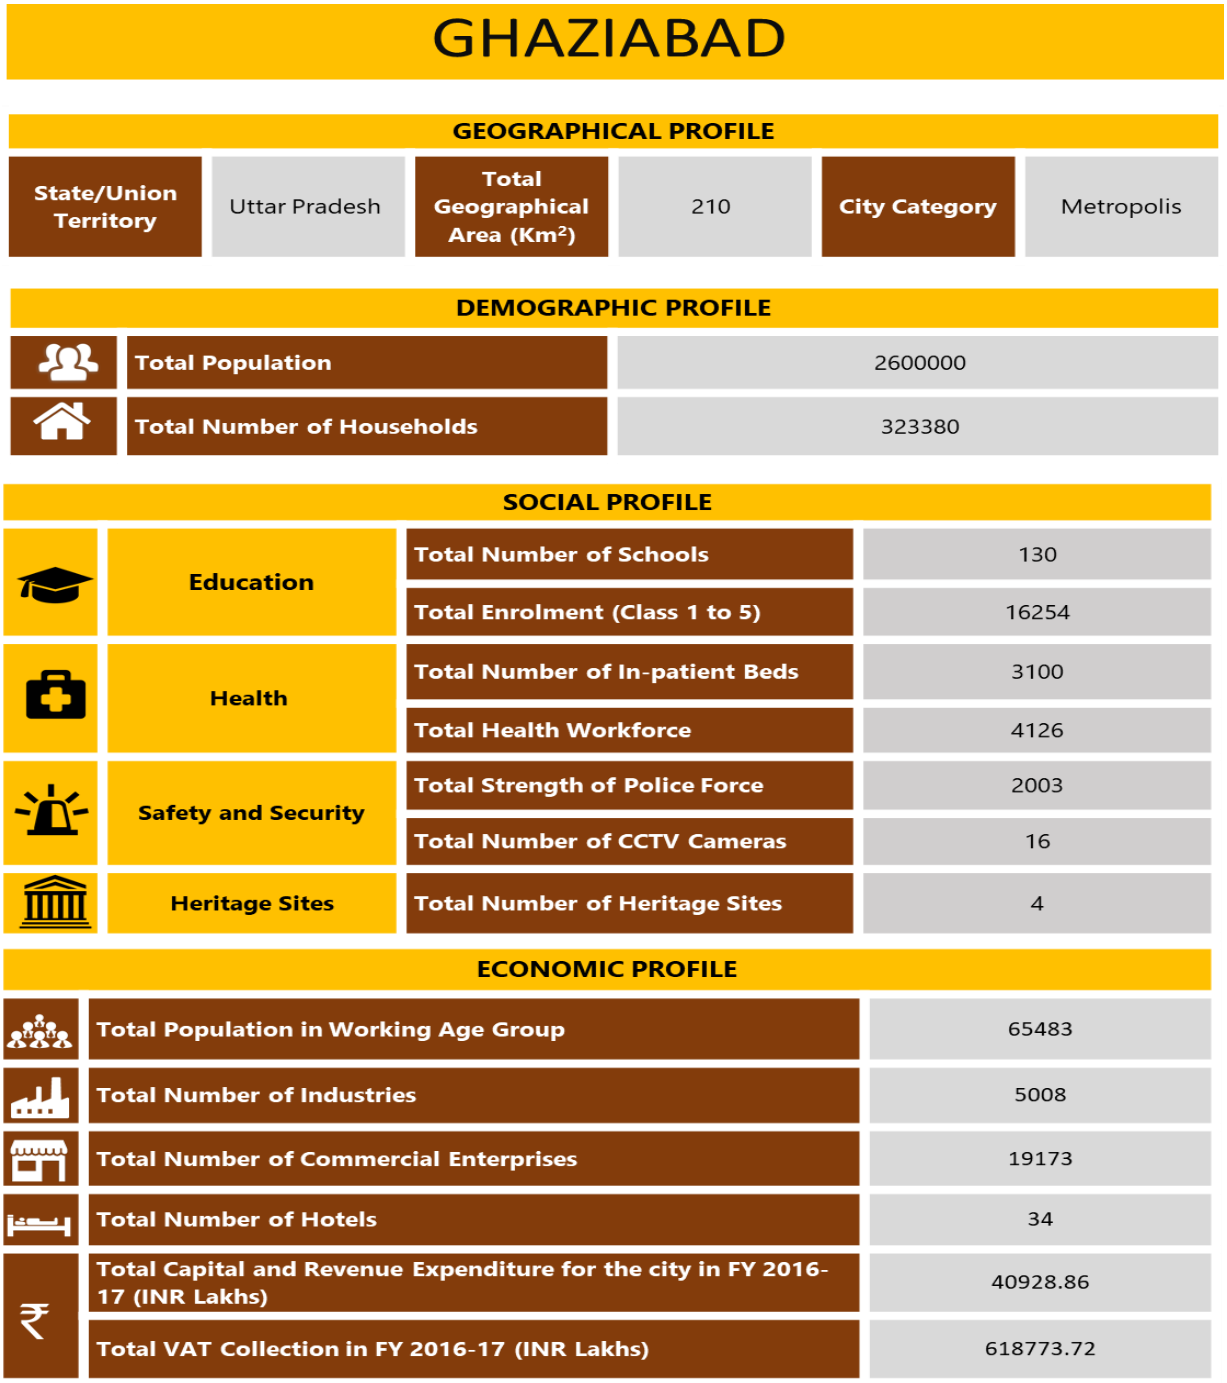
Tracking
liveability
Urban Planning
and Management
City level self-assessment
Citizen driven accountability systems
Use cases and pathways for reform
Unearth blind spots and incentivise action
Institutionalisation of outcome based planning and governance

Cities move to a single, unified data driven decision making paradigm…

The first round of the assessment commenced in January 2018 covering 116 major cities including smart cities, capital cities and cities with population of above one million each. Implementation of the liveability assessment commenced in January 2018 with a national level orientation workshop for the urban local bodies. The workshop aimed at orienting the states and urban local bodies on the overall framework, indicators, data sources, methodology and key milestones and timelines involved in the liveability assessment. Subsequently, a series of State/ Union Territory level orientation workshops were carried out in 33 states/UTs for a detailed discussion on the framework. Online data collection commenced from 9th March through an online data collection platform that supported both online and offline data submission modes. On the date of closure of the online data entry portal i.e., 16th April, 2018 112 cities submitted their data. Subsequently, comprehensive checks on the submitted data was undertaken that involved checking for outliers, logical inconsistencies etc. post which round-1 of data reconciliation was conducted. This draft report is based on round-1 of reconciled data as on 28th April, 2018.

2. City Profile

This chapter presents the city profile -Geographic and Demographic, Social (Education Health, Safety and Security, Heritage), Economic profile, and Physical (Water, sanitation and Waste Management, Electricity, Open space and roads).



GHAZIABAD

GEOGRAPHICAL PROFILE

State/Union Territory	Uttar Pradesh	**Total Geographical Area (Km^2)**	210	**City Category**	Metropolis

DEMOGRAPHIC PROFILE

Total Population	2600000
Total Number of Households	323380

SOCIAL PROFILE

Education	**Total Number of Schools**	130
	Total Enrolment (Class 1 to 5)	16254
Health	**Total Number of In-patient Beds**	3100
	Total Health Workforce	4126
Safety and Security	**Total Strength of Police Force**	2003
	Total Number of CCTV Cameras	16
Heritage Sites	**Total Number of Heritage Sites**	4

ECONOMIC PROFILE

Total Population in Working Age Group	65483
Total Number of Industries	5008
Total Number of Commercial Enterprises	19173
Total Number of Hotels	34
Total Capital and Revenue Expenditure for the city in FY 2016-17 (INR Lakhs)	40928.86
Total VAT Collection in FY 2016-17 (INR Lakhs)	618773.72

PHYSICAL PROFILE		
Water	**Average Quantity of Water Supplied (MLD)**	325
	Total Number of Water Connection	237552
Sanitation Facilities	**Total number of households with access to individual toilets in the city**	292620
	Total number of households in the city with access to community toilets in the city	1990
Solid Waste Management	**Daily average quantity of municipal solid waste collected in the city (Tonnes/day)**	850
	Total number of households covered through door-to-door collection of solid waste	265172
Waste Water	**Daily Average Quantum of Waste Water Generated in the City (MLD)**	260
	Daily average quantum of waste water treated by STPs in the city (MLD)	227
Electricity	**Total number of authorized electrical connections in the city**	463641
	Total electricity supplied to the city (kWh)	3844000000
Public and Open Spaces	**Total area covered by green spaces in the city (m^2)**	…
Roads and Transport	**Total Length of Road Network in the City (Km)**	3258.97
	Total length of arterial and sub-arterial road network in the city (Km)	3076.7
	Total length of footpath (wider than 1.2 metres) in the city along the street network (Km)	2466

3. Liveability Framework and Indicators

The Liveability Framework comprises a total of 79 indicators (57 Core Indicators and 22 Supporting Indicators). A core indicator carries 70% weightage and a supporting indicator carries 30% weightage. These indicators are grouped under 15 thematic categories which in turn are part of four pillars of comprehensive development of cities i.e., institutional, social, economic and physical. Based on the performance of cities against the various core and supporting indicators, various ‘Category Sub-Indexes’ and a composite ‘City Liveability Index’ will be developed for each city.

3.1 Scoring and Computing Category Indices of Liveability

The set of 79 indicators, associated categories and pillars are presented in the table below:

Table 1 List of Pillars, Categories and Indicators

Pillars of Comprehensive Development	Category	Indicators
Institutional	1. Governance	1.1 Percentage of citizen services available online
		1.2 Percentage of services integrated through Command Centre
		1.3 Percentage of citizens using online services
		1.4 Average delay in grievance redressal
		1.5 Tax collected as percentage of tax billed
		1.6 Extent of cost recovery (O&M) in water supply services
		1.7 Capital spending as percentage of total expenditure
		1.8 Percentage of population covered under Ward Committees/Area *Sabhas*
Social	**2. Identity and Culture**	2.1 Restoration and reuse of historic buildings
		2.2 Percentage of ecologically important areas covered through projects for restoration
		2.3 Hotel occupancy
		2.4 Percentage of budget allocated towards cultural/sports activities
		2.5 Number of cultural/sports events hosted by city
	3. Education	3.1 Percentage of school-aged population enrolled in schools
		3.2 Percentage of female school-aged population enrolled in schools
		3.3 Primary education student-teacher ratio
		3.4 Percentage of schools with access to digital education
		3.5 Percentage of students completing primary education
		3.6 Percentage of students completing secondary education
	4. Health	4.1 Number of in-patient hospital beds per 10,000 population
		4.2 Healthcare professionals per 10,000 population
		4.3 Average response time in case of health emergencies

Pillars of Comprehensive Development	Category	Indicators
		4.4 Period prevalence of water borne diseases
		4.5 Period prevalence of vector borne diseases
	5. Safety and Security	5.1 Number of CCTV Cameras
		5.2 Number of recorded crimes per lakh population
		5.3 Extent of crimes recorded against women, children and elderly per year
		5.4 Transport-related fatality per lakh population
Economic	**6. Economy and Employment**	6.1 Increase in VAT/GST collection
		6.2 Increase in collection of Professional Tax
		6.3 Increase in issuance of Construction permits
		6.4 Unemployment rate
		6.5 Percentage of vendors registered and provided formal spaces
Physical	**7. Housing and Inclusiveness**	7.1 Percentage of Slum/EWS households covered through formal/affordable housing
		7.2 Percentage of slum areas covered through basic services
	8. Public Open Spaces	8.1 Per capita availability of green spaces
		8.2 Per capita availability of public and recreational places
	9. Mixed Land Use and Compactness	9.1 Share of mixed land use area in overall city land use
		9.2 Net Density
	10. Power Supply	10.1 Percentage of city population with authorized electrical services
		10.2 Percentage of electrical connections covered through smart meters
		10.3 Average number of electrical interruptions per year
		10.4 Average length of electrical interruptions per year
		10.5 Percentage of total energy derived from renewable sources
		10.6 Energy consumption per unit - water supply and sewerage
		10.7 Energy consumption per unit - street lighting
		10.8 Percentage of new and redeveloped buildings following green building norms
		10.9 Total energy consumption per capita

Pillars of Comprehensive Development	Category	Indicators
	11. Transportation and Mobility	11.1 Geographical coverage of public transport
		11.2 Availability of public transport
		11.3 Mode share of public transport
		11.4 Percentage of road network with dedicated bicycle tracks
		11.5 Percentage of interchanges with bicycle parking facilities
		11.6 Mode share of non-motorized transport
		11.7 Availability of Passenger Information System
		11.8 Extent of signal synchronization
		11.9 Availability of paid parking spaces
		11.10 Percentage coverage of footpaths – wider than 1.2 m
		11.11 Percentage of traffic intersections with pedestrian crossing facilities
		11.12 Extent to which universal accessibility is incorporated in public rights-of-way
	12. Assured Water Supply	12.1 Household level coverage of direct water supply connections
		12.2 Per capita supply of water
		12.3 Quality of water supplied
		12.4 Level of non-revenue water – NRW
		12.5 Percentage of water connections covered through meters
		12.6 Percentage of plots with rainwater harvesting facility
	13. Waste Water Management	13.1 Coverage of toilets
		13.2 Coverage of sewerage network and/or septage
		13.3 Collection efficiency of sewerage network
		13.4 Extent of reuse and recycling of waste water
		13.5 Coverage of storm water drains
	14. Solid Waste Management	14.1 Household level coverage of municipal solid waste collection
		14.2 Efficiency of collection of municipal solid waste
		14.3 Extent of municipal solid waste recovered through reuse
	15. Reduced	15.1 Concentration of SO2- air pollution

Pillars of Comprehensive Development	Category	Indicators
	Pollution	15.2 Concentration of NO2- air pollution
		15.3 Concentration of PM10 - air pollution
		15.4 Level of noise pollution
		15.5 Quality of water in public surface water bodies

3.2 Scoring and Computing Category Indices of Liveability

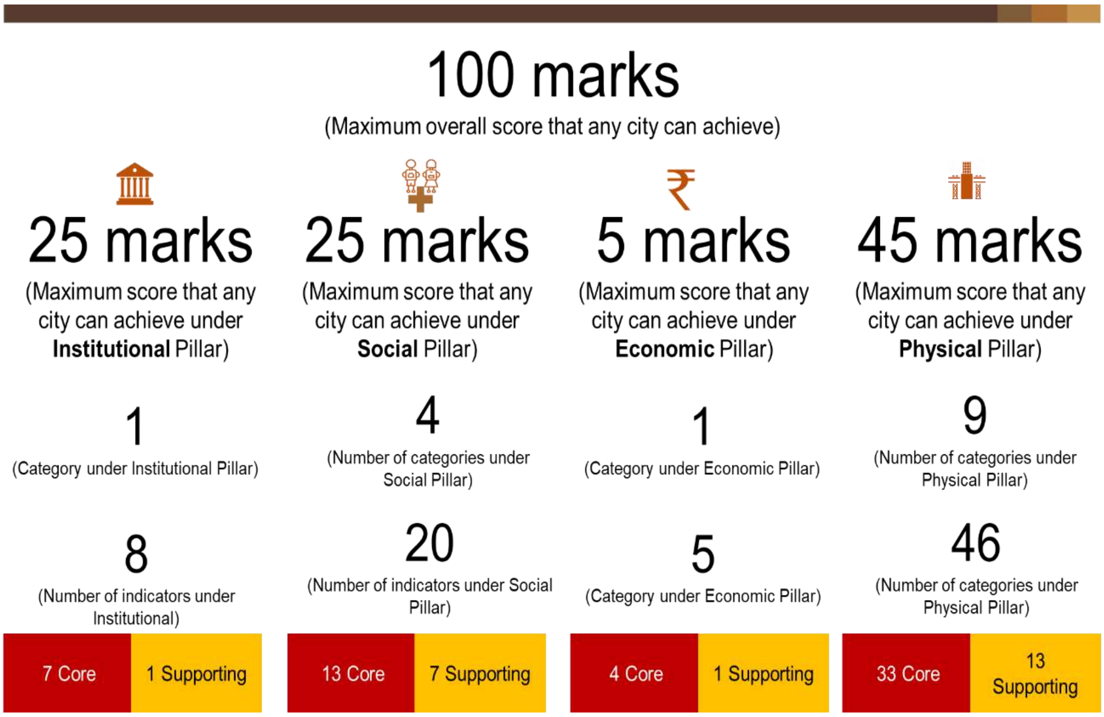
The performance achieved by cities against 79 indicators, will be assessed against given benchmarks. Where no international/national norms are available, city with the best performance in its group (population range) will be treated as a benchmark. The groups are given in the table below.

Table 2 Details on Population Range

Category	Population range
Category 1	Population ≥ 4 million
Category 2	1 million ≤ Population < 4 million
Category 3	0.5 million ≤ Population < 1 million
Category 4	Population < 0.5 million

3.3 Scoring Approach and Methodology

A city can earn a maximum score of 100 points for 79 indicators across four pillars. The pillar weights are as follows: Institutional (25 points), Social (25 points), Economy and Employment (5 points) and Physical (45 points). Based on the number and nature of indicators i.e., core vs. secondary, indicator wise maximum marks were computed.



100 marks

(Maximum overall score that any city can achieve)

25 marks	25 marks	5 marks	45 marks
(Maximum score that any city can achieve under **Institutional** Pillar)	(Maximum score that any city can achieve under **Social** Pillar)	(Maximum score that any city can achieve under **Economic** Pillar)	(Maximum score that any city can achieve under **Physical** Pillar)
1 (Category under Institutional Pillar)	4 (Number of categories under Social Pillar)	1 (Category under Economic Pillar)	9 (Number of categories under Physical Pillar)
8 (Number of indicators under Institutional)	20 (Number of indicators under Social Pillar)	5 (Category under Economic Pillar)	46 (Number of categories under Physical Pillar)
7 Core 1 Supporting	13 Core 7 Supporting	4 Core 1 Supporting	33 Core 13 Supporting

Dimensional Index Methodology (DIM) has been used to compute scores for each indicator with reference to “maximum within the comparison group” or “absolute benchmarks”. For indicators where benchmarks are available, cities getting the benchmark score (or above) are given the maximum mark, and the marks awarded to other cities are calculated proportionately. For indicators where benchmarks are not available, the best performing cities in each population group are given the maximum mark, and the marks awarded to other cities (within the population group) are calculated proportionately. For indicators where benchmarks do not exist, the city data has been tested for outliers before scoring.

3.4 Scoring Normalisation:

To construct aggregate scores across cities as well as to make the scores across indicators comparable, indicator values were normalised using a min-max approach. The following formula was used to normalise the indicator values-

$$\frac{indicator\ value\ for\ the\ city - indicator\ value\ for\ the\ worst\ performing\ city}{benchmark - \ indicator\ value\ for\ the\ worst\ performing\ city}$$

This approach would restrict the normalised indicator value between 0 and 1. Cities that met or exceeded the benchmark received a normalised indicator value of 1. Worst performing cities are given a normalised indicator value of 0. After normalisation, the normalised value is weighted according to the category and the indicator being core or supporting.

To illustrate, consider the indicator 12.3 Quality of Water Supplied in the Category 12 for Assured Water Supply. If in City A 50% of the water samples collected qualify the potable water standards specified by the CPHEEO, and only 10% of the samples from worst performing city qualify the standards. Then, the normalised value for the indicator for city A would be 0.44 [(0.5-0.1)/(1-0.1)].

The weight for indicator 12.3 is 1.03, so the final weighted score for City A would come out to 0.45 [1.03*0.44].

4. Data Collection and Verification

4.1 Submission of Data by the cities

The Liveability Assessment is based on secondary data submitted by the urban local bodies and other concerned government agencies (collectively called as data owners). The 79 indicators were broken down into a set of easy to understand and relatable 553 questions mapped to data owners. Submission of the data was enabled through an online data entry portal on the smartnet platform of the Ministry. The portal also allowed the ULBs to download the liveability assessment questionnaire and upload filled in questionnaire. To familiarise and assist cities in identifying, mapping and collation of data points, a city level nodal person was available during the entire period of data submission process.

4.2 Mapping of Data Owners for the City

For the assessment of liveability indices broadly 12 data owners such as Central/state Pollution control board, Development authority, DISCOM/Electricity Board, State Disaster Management Authority, State Education Department, State Health department, State Renewable energy and development agency, State sales and commercial taxes department, town and country planning department, Traffic and police department, Transport authority, and Urban local body were identified to respond to the questions on the portal. However, during state workshop and subsequent city level discussions, more data owners were mapped to respond to different

categories and sub categories. The following table provides the details of city level data owners mapped under the 12 data owner.

Table 3:Details of Data Owners

Designated data owners	Subcategories	Data owners at city level
Urban Local Body	For Accounts Related Questions	Account
Urban Local Body	For Park and Recreation Related Questions	Zonal officer (Ghaziabad Nagar Nigam)/ GDA website
Urban Local Body	For Water Supply and Drainage related questions	Jal-Kal
Urban Local Body	For Heritage sites related data	Sankhyaki
Urban Local Body	For Ecological sites related data	N/A
Urban Local Body	For Housing related data	Planning Department (Ghaziabad Development Authority) District Urban Development Authority
Urban Local Body	For Building plan related data	National Capital Planning
Urban Local Body	For Roads related data	
Urban Local Body	For Solid waste management related data	Swach Bharat Mission
Urban Local Body	For IT services related data	Information technology Cell
Urban Local Body	For Vendor committee related data	District Urban Development Authority
Urban Local Body	Any other departments involved in providing data for questions mentioned under Urban Local Body	Nirman, prakash, zonal head
Central / state Pollution control Board	Water Quality, Air Quality, Noise Quality	Pollution control board
Development Authority	Building Infrastructure	Zonal officer Ghaziabad Development Authority
	Construction planning	Town Planning Ghaziabad Development Authority

Designated data owners	Subcategories	Data owners at city level
	Green Building	Town Planning Ghaziabad Development Authority
	Rain water harvesting	Town Planning Ghaziabad Development Authority
	Universal Design Principle	Town Planning Ghaziabad Development Authority
DISCOM/Electricity Board	Electrical Connection/ Grievance Redressal/ Power supply	Purvanchal Vidhut Vitran Nigam
State Disaster management authority		District disaster management authority
State Education Department		Basic Shiksha Adhikari
State Health Department	Health care professionals	Additional Medical Officer
	Citizen Services	Additional Medical Officer
	Disease Prevalence	Additional Medical Officer
	Health Infrastructure	Additional Medical Officer
State Renewable Energy Development Agency	Renewable Energy	Uttar Pradesh New & Renewable Energy Development Agency
State Sales / Commercial Taxes Department		
Town and Country Planning Department	Land Use	National Capital Region Planning
Traffic and Police Department		Office of Superintendent of police
Transport Authorities	Buses	Uttar Pradesh State Road Transport corporation
	Registered Vehicles	Regional Transport office
	Sub urban rail transport	Delhi Metro Authority
	Mono Rail Authority	NA
	Tramways	NA
	Marine Transport Authority	NA

4.3 List of secondary documents available as supportive

City has provided supporting documents/evidences against the responses given by city on the online portal. In support of their responses on the portal, city submitted 54 number of documents. Documents submitted includes reports, official orders, copy of data maintained in official register, signed copy of questionnaire, and signed letters/submissions from concern departments. Verification includes mapping of documents against responses given by city, checking the type/category of documents, and validation of data provided.

The following table presents the data owner wise number of documents:

Table 4: Data owner wise number of secondary documents submitted by city

Data Owners	Number of Documents
Sales and Commercial Taxes	**3**
State Education Department	**5**
DISCOM/Electricity Department	**0**
Traffic and Police Department	**1**
Development Authority	**0**
Pollution Control Board	**4**
State Renewable Energy Department	**1**
Town and Country Planning	**0**
State Health Department	**1**
Transport Authority	**2**
Disaster Management	**0**
Urban Local Body	**37**
Total	**54***

4.4 Data Verification

A three-stage data quality check comprising verification of data against secondary documents furnished by data owners, logical inconsistency checks including outliers, and physical audit for select indicators (Refer the exhibit below) is being undertaken. The objective of the data quality check is to ensure that data from the source documents are accurate and verifiable. Sources of data included reports, administrative data, survey results and other statistical records, log books among other.

Physical audit of eight indicators – one indicator from the Institutional pillar, one from the Social pillar, one from the Economy pillar and five from the Physical pillar is also being carried out by the field team to ascertain the degree of reliability of data reported by the cities. The list of these eight indicators is presented below:

1.2 | Percentage of services integrated through Command Centre

2.3 | Hotel occupancy

3.4 | Percentage of schools with access to digital education

5.1 | Number of streets, public places, junctions covered through surveillance systems

6.5 | Percentage of vendors registered and provided formal spaces

11.7 | Availability of Passenger Information System

11.11 | Percentage of traffic intersections with pedestrian crossing facilities

11.12 | Extent to which universal accessibility is incorporated in public rights-of-way

For a set of five indicators namely, unemployment rate, mode share of public transport, mode share of non-motorised transport, quality of water supplied and level of noise pollution, existing datasets were found to be not available consistently across all cities and/or were inadequate. To help cities that do not have data on these five indicators, dipstick assessments are being carried to fill data gaps.

6.4 | Unemployment Rate

11.3 | Mode share of public transport

11.5 | Mode share of Non Motorized Transport

12.3 | Quality of Water Supplied

15.4 | Level of Noise Pollution

4.5 Physical Audit

The following map presents the indicators audited at city level.

5. City Score on 15 categories of Assessment

Liveability Assessment covered 15 categories and 78 indicators. The below table presents the scores for all 15 indicators namely governance, identity & culture, education, health, safety and security, economy & employment, housing & inclusiveness, public open spaces, mixed land use & compactness, power supply, transport & mobility, assured water supply, waste water management, solid waste management and reduced pollution.

Table 5: Category wise scores

Categories	Scores in Percentage
Governance	62.83%
Identity & Culture	17%
Education	21%
Health	83%
Safety & Security	76%
Economy & Employment	11%
Housing & Inclusiveness	85%
Public Open Spaces	9%
Mixed Land Use & Compactness	0%
Power Supply	45%
Transport & Mobility	21%
Assured Water Supply	75%
Waste Water Management	67%
Solid Waste Management	65%
Reduced Pollution	74%

The rank of the city is based on the performance and scores in each of the category. The final city rank is submitted separately.

Executive Summary

Assessment of liveability indices is an initiative by the Ministry of Housing and Urban Affairs to improve quality of life of citizens and achieve sustainable development goals by encouraging cities to adopt "outcome based" approach for urban planning. Assessment process aimed to provide opportunity to cities to review the development components holistically by involving 79 measurable indicators categorized under governance, health, education, safety, economy, power supply, transportation and mobility, identity, culture, housing, waste management and pollution.

This report highlights the assessment process, key milestones, and the final outcome of the data submitted. Implementation of liveability assessment commenced formally on 19th January 2018. A national level workshop was organized on 13th February 2018 to explain the importance and process of liveability assessment and get feedback on methodology from the city authorities.

This was followed by the next stage of Questionnaire development. The questionnaire was arranged under 12 categories representing 12 data owners namely urban local body, Central and state pollution control board, development authority, DISCOM/Electricity board, State disaster management authority, state education department, state health department, state renewable energy development agency, state sales and commercial taxes department, town and country planning department, traffic and police department and transport authorities.

An online data entry portal was developed to facilitate data submission by the cities. Each city had a unique log in to access the portal and submit the data. Both online and off-line options (download the questionnaire in an excel) to submit the data were available for cities. An email help desk was set up for the cities to raise any queries and seek clarification when responding to the questions.

A team for each state comprising of State Coordinator and City Coordinator (one per city) was deployed that facilitated the process and supported the cities. A total of 6 regional coordinators/ consultants, 29 State Coordinators, and 99 city coordinators were deployed across 116 cities. Training for state coordinators was held from 26th to 28th February 2018 at Chennai to make coordinators understand overall liveability assessment, indicators, data sources, protocols and roles and responsibilities.

City Reconnaissance Meetings were initiated by the state and city coordinators. The discussion began with discussions to finalize the state workshop schedule, mapping of data owners, and assist cities in data collection. The City Coordinators were based in the cities for over 6 weeks and during this time, they liase with ULB and other data owners to explain the liveability framework, online portal, and facilitate the online submission.

A total of 33 state workshops were conducted at the state level. The objective of the workshop was to orient the city stakeholders on liveability assessment, indicators, components of data collection,

timelines, expectations of support and support extended by MoHUA. The state level workshops brought various city level departments on a single platform to understand and discuss the methodology and components of city liveability assessment.

Nodal agency at state level supported by the City and State Coordinator and city level (Municipality corporation/smart city limited) coordinated with city specific data owners/departments for data gathering, collation, and submission. Nodal persons in each department were appointed for timely data collection and submission. Of 116, 112 cities submitted data as per the timeline on 16th April 2018.

Post submission, the city and state coordinators supported by the central team followed up extensively with the cities to support secondary documents as evidence to substantiate their submissions. Secondary documents such as reports, official orders, copy of office register, signed copy of liveability assessment questionnaire furnished by cities against the submitted data. Documents are verified to map the documents for the reponses provided by city and to check the type data provided by city. The document check outcomes were shared with the cities as a part of data quality check.

For checking consistency of data, logical check of data, verifying data from other public sources were undertaken. Quality check was done to ensure data validity and provide opportunity to cities to review the data provided by them and correct in case of wrong data entry.

For 8 selected indicators namely, percentage of services integrated through command and control center, hotel occupancy rate, percentage of schools with access to digital education, number of CCTV cameras per unit road length, percentage of vendors registered and provided formal spaces, availability of passenger information system, percentage of traffic intersection with pedestrian crossing facility, and extent to which universal accessibility is incorporated in public rights of way. Physical audit was conducted in 110 cities by physical auditors appointed and trained by the consortium. In consultation with ULB nodal person, locations and indicators for physical audit was selected in each city. A mobile based application was developed to capture the physical audit related data.

Primary data collection was done for five indicators such as unemployment rates, mode share of public transport, mode share of non-motorized transport, quality of water supplied, and level of noise pollution. Protocols for water and noise test were prepared in consultation with experts. Water quality test involved physical, chemical and bacteriological test of water as per the CPCB norms. For testing quality of water at consumer end, the auditors worked closely with the ULB and Water department. Samples were collected from consumer end and submitted to the lab suggested by city. For noise pollution, in about 20 cities the state pollution board or city level environment department took the responsibility for providing noise pollution data as per the protocols. In rest of the cities, mobile based application was used to measure noise pollution.

During implementation, MoHUA facilitated the process by conducting video conferences with cities to address any queries, reiterate the importance, and ensure that cities adequately engages in the process and submit their responses in time and respond to requests for clarifications.

In addition to secondary data collection, physical audit and primary data collection, citizen survey was conducted to understand their perception and level of satisfaction on various services such as health, education, water supply, electricity, waste management etc. provided by urban local bodies. Over 60000 citizens participated in the survey across India.

The final scores and ranks have been generated based on the scoring methodology that has been discussed extensively and minor modifications made that are summarized as below:

#	Challenges	Proposed Solutions
1	Only 23 cities of 111 cities have City Mobility Plan (CMP) or any and hence able to provide data for Mode Share of Public Transport and Non-Motorised Transport. To address the data gap, as advised by the MoHUA, the consortia undertook a sample dipstick across all cities covering a sample of 150 Households. Understandably, the dipstick findings will not match the rigor of a CMP.	We recommend the following: 1) Cities which have provided CMP Data will be evaluated on 100% of the maximum score 2) For the cities where the dipstick data is used, the city receives a 50% discount on the overall score Alternatively, another approach is to assign 0 score to all 88 cities that don't have a CMP
2	Variance was observed on data reported by cities on road network and data presented in the smart city proposals during the verifications.	We recommend taking the data reported by the cities in the Smart City Proposals.
3	There is no secondary source/ organization that provides unemployment data at city level. As a result, most cities do not have the data. Fully cognizance of the challenges of generating this data in a short span of time, it was agreed to collect this	The indicator on unemployment will be excluded from scores. For final ranking, the cities will

#	Challenges	Proposed Solutions
	data through a dipstick survey on lines of NSSO questions. The data generated needs further scrutiny and triangulation with some inputs from experts. This may not be possible in the short window.	be scored on 78 indicators.
4	Many cities did not have data on noise pollution and it was decided that data will be collected using a mobile app for all the 111 cities. However, many cities have expressed reservations with the approach especially with respect to the reliability of using this data. Further, some cities have relied on the SPCB to collect the data as per the approach proposed by the consortia. Thus, noise pollution data is currently from two sources: 1. SPCB- 20 cities 2. Noise-based app- 91 cities	The data collected through the primary survey will be used for scoring the cities. Currently, there is no differential scoring for the data from the SPCB and the data collected through the mobile app. However, a certain higher weightage can be provided to those cities which used the state apparatus to collect noise pollution data.
5	For the indicator on quality of water supplied, the methodology document states that samples should be drawn both at the treatment plant outlet as well as the consumer end. However, the data provided by the cities were predominantly from the distribution point. Hence for consumer end results with MoHUA intervention, consortia coordinated with cities to collect the data at the consumer end. The cities facilitated the testing. The outcome of the process is as below: 1. Sample given- 102 cities 2. Report received- 86 cities 3. Report awaited- 16 cities 4. Tests not completed due to lack of cooperation and other reasons – 9	The maximum score for this indicator will be distributed equally (50%) for results based on samples from the treatment plant and consumer end. Cities that did not complete tests or provide the results will be given a score 0 for against consumer end tests.
6	City level population is not projected annually by most of the cities. So, estimates for 2017 population are not available with the cities.	As recommended by MoHUA, 2011 census population is being used for the ranking purpose.

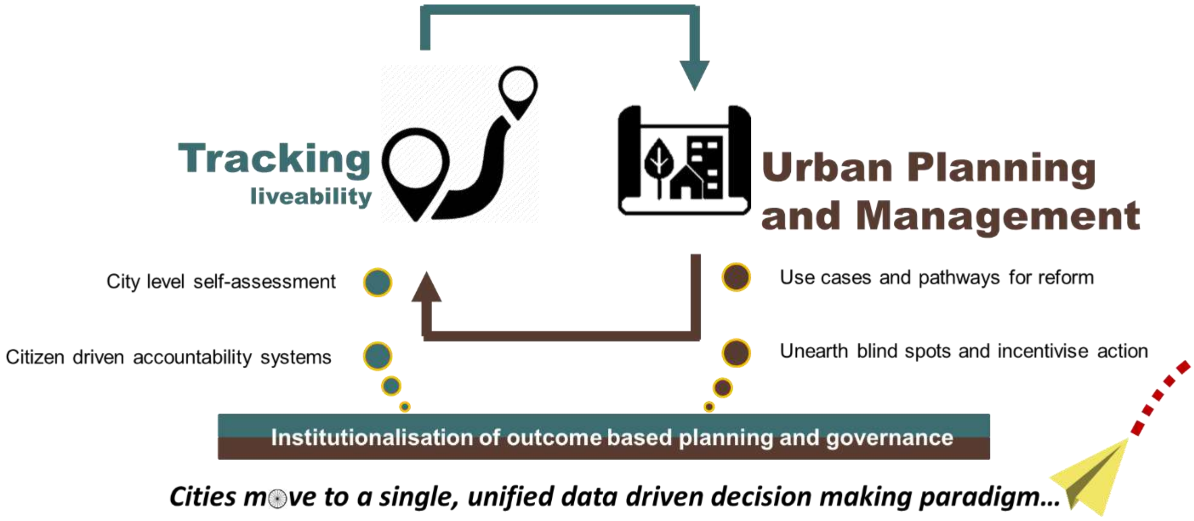
#	Challenges	Proposed Solutions
7	The age category specific data for 9 cities is not available at a city level	The age category specific population data has been taken at a district level for these cities.
8	Indicators on non-motorised transports like- Dedicated bicycle tracks, bicycle parking facilities and mode share of non-motorised transport are not relevant for hilly terrains.	As discussed during the PMC meeting, these indicators have been treated as non-applicable for the hilly cities and the weights have been redistributed among other indicators within the same category.
9	The indicator on increase in professional tax is not relevant to cities which do not levy the professional tax.	As discussed during the PMC meeting, this indicator has been non-applicable to the cities belonging to states where professional tax is not levied, and the weights have been redistributed among other indicators within the same category.
10	The indicator on increase in VAT collection is not applicable to Port Blair and Kavaratti, as there was no provision of VAT collection in these cities.	As discussed during the PMC meeting, these indicatosr has been treated as non-applicable for these two cities and the weights have been redistributed among other indicators within the same category.
11	Indicator on coverage of basic services to slum households does not concern cities with no slums (notified/ non-notified.	As discussed during the PMC meeting, this indicators has been treated as non-applicable for these cities and the weights have been redistributed among other indicators within the same category.

1. Introduction

The Ministry of Housing and Urban Affairs (MoHUA) is implementing several flagship urban missions such as the Smart Cities Mission (SCM), Atal Mission for Urban Rejuvenation and Transformation (AMRUT), Heritage City Development and Augmentation Yojana (HRIDAY), Housing for All (HFA). Theses mission along with other transformative initiatives of the Government including National Water Mission, Power for All, National Health Mission are aimed at making Indian cities more 'liveable.' The overarching goal of these initiatives is to move from an input-based approach to a 'citizen centric-outcome based' assessment of urban liveability.

To develop a common minimum framework for cities to assess their existing status and chart their pathway towards providing a better quality of life to their citizens, the MoHUA developed a set of 'Liveability Standards' relevant to cities to generate a Liveability Index and ranking of cities. These standards were launched in June, 2017. The MoHUA has planned to conduct an 'Annual Assessment of Liveability Standards in Cities – an ambitious national project that will involve yearly submission of data by cities across the various indicators, compilation and analysis, development of indices and ranking of cities. The Liveability Index is envisioned as a 360° tool for tracking, planning and transforming Indian cities. The Liveability Index is aimed at the following objectives:

- Providing strong evidence-based approach for future interventions and investments to deliver liveability outcomes
- Catalysing actions to improve the overall quality of the city's liveability and achieve broader development outcomes including the Sustainable Development Goals
- Assessing the implementation of government policies and schemes governing characteristics of cities that can contribute to creating liveable communities

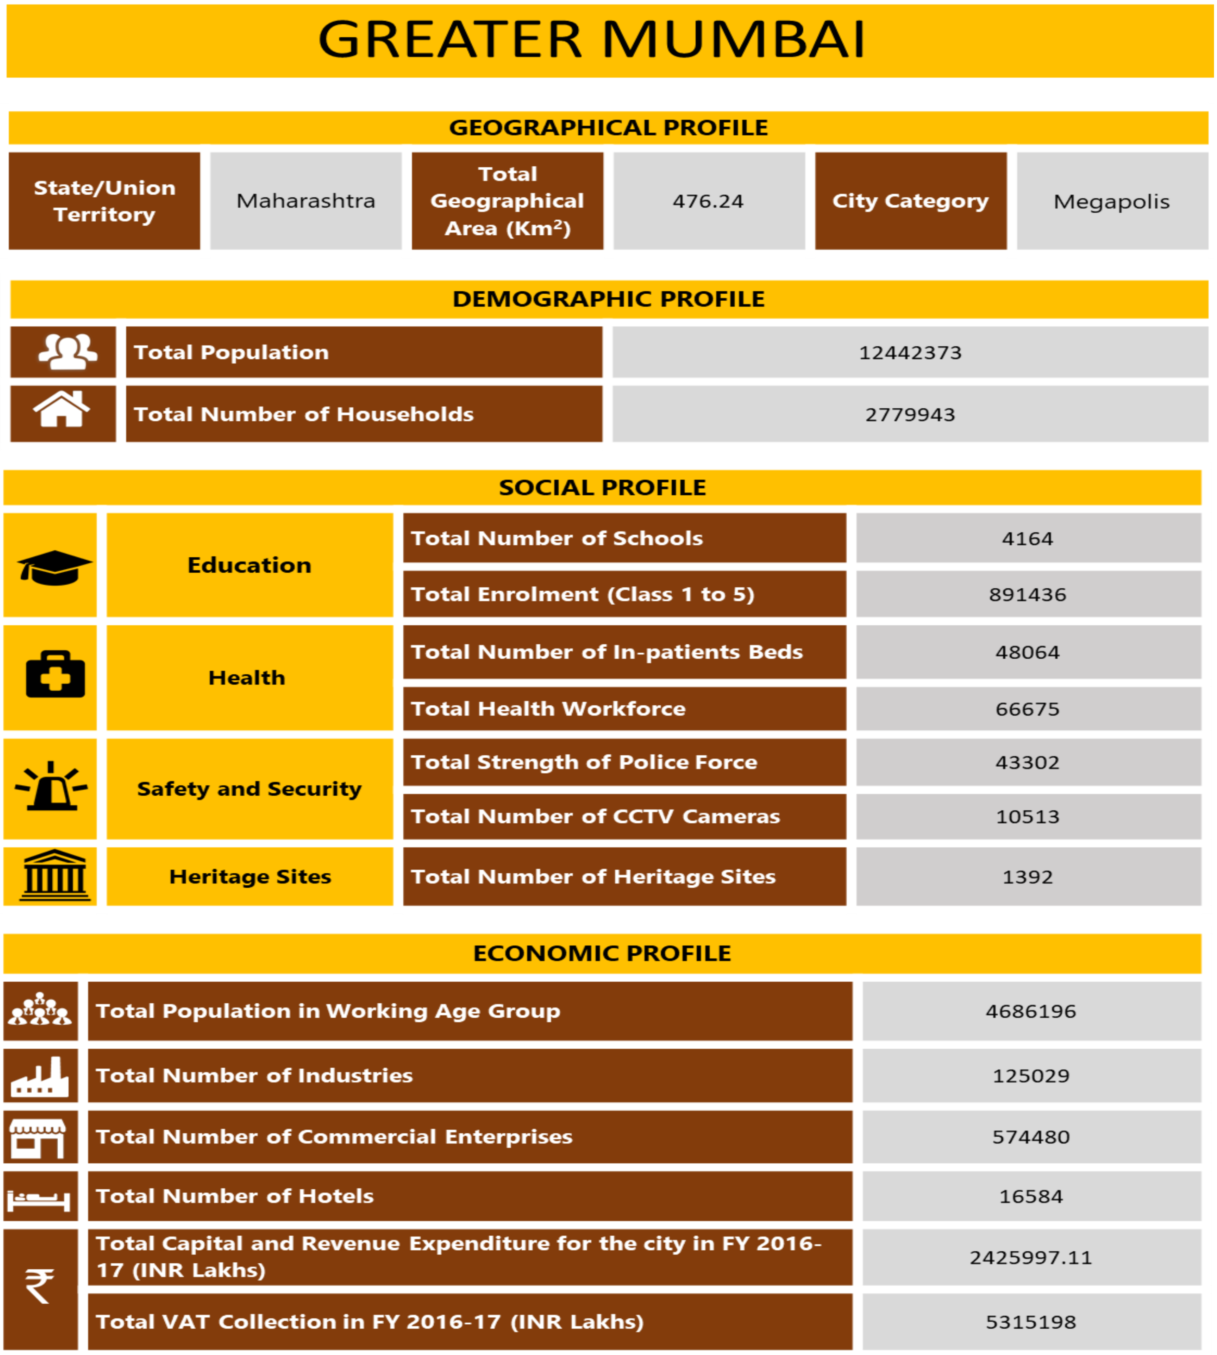


Tracking
liveability
Urban Planning
and Management
City level self-assessment
Citizen driven accountability systems
Use cases and pathways for reform
Unearth blind spots and incentivise action
Institutionalisation of outcome based planning and governance
Cities move to a single, unified data driven decision making paradigm...

The first round of the assessment commenced in January 2018 covering 116 major cities including smart cities, capital cities and cities with population of above one million each. Implementation of the liveability assessment commenced in January 2018 with a national level orientation workshop for the urban local bodies. The workshop aimed at orienting the states and urban local bodies on the overall framework, indicators, data sources, methodology and key milestones and timelines involved in the liveability assessment. Subsequently, a series of State/ Union Territory level orientation workshops were carried out in 33 states/UTs for a detailed discussion on the framework. Online data collection commenced from 9th March through an online data collection platform that supported both online and offline data submission modes. On the date of closure of the online data entry portal i.e., 16th April, 2018 112 cities submitted their data. Subsequently, comprehensive checks on the submitted data was undertaken that involved checking for outliers, logical inconsistencies etc. post which round-1 of data reconciliation was conducted. This draft report is based on round-1 of reconciled data as on 28th April, 2018.

2. City Profile

This chapter presents the city profile -Geographic and Demographic, Social (Education Health, Safety and Security, Heritage), Economic profile, and Physical (Water, sanitation and Waste Management, Electricity, Open space and roads).



GREATER MUMBAI

GEOGRAPHICAL PROFILE

State/Union Territory	Maharashtra	**Total Geographical Area (Km²)**	476.24	**City Category**	Megapolis

DEMOGRAPHIC PROFILE

Total Population	12442373
Total Number of Households	2779943

SOCIAL PROFILE

Education	**Total Number of Schools**	4164
	Total Enrolment (Class 1 to 5)	891436
Health	**Total Number of In-patients Beds**	48064
	Total Health Workforce	66675
Safety and Security	**Total Strength of Police Force**	43302
	Total Number of CCTV Cameras	10513
Heritage Sites	**Total Number of Heritage Sites**	1392

ECONOMIC PROFILE

Total Population in Working Age Group	4686196
Total Number of Industries	125029
Total Number of Commercial Enterprises	574480
Total Number of Hotels	16584
Total Capital and Revenue Expenditure for the city in FY 2016-17 (INR Lakhs)	2425997.11
Total VAT Collection in FY 2016-17 (INR Lakhs)	5315198

PHYSICAL PROFILE

	Water	**Average Quantity of Water Supplied (MLD)**	3615
		Total Number of Water Connections	510559
	Sanitation Facilities	**Total number of households with access to individual toilets in the city**	1541000
		Total number of households in the city with access to community toilets in the city	1071417
	Solid Waste Management	**Daily average quantity of municipal solid waste collected in the city (Tonnes/day)**	7970.7
		Total number of households covered through door-to-door collection of solid waste	3484278
	Waste Water	**Daily Average Quantum of Waste Water Generated in the City (MLD)**	2290
		Daily average quantum of waste water treated by STPs in the city (MLD)	1769
	Electricity	**Total number of authorized electrical connections in the city**	4315021
		Total electricity supplied to the city (kWh)	17830049797
	Public and Open Spaces	**Total area covered by green spaces in the city (m^2)**	128416000
	Roads and Transport	**Total Length of Road Network in the City (Km)**	2260.062
		Total length of arterial and sub-arterial road network in the city (Km)	1941
		Total length of footpath (wider than 1.2 metres) in the city along the street network (Km)	2300

3. Liveability Framework and Indicators

The Liveability Framework comprises a total of 79 indicators (57 Core Indicators and 22 Supporting Indicators). A core indicator carries 70% weightage and a supporting indicator carries 30% weightage. These indicators are grouped under 15 thematic categories which in turn are part of four pillars of comprehensive development of cities i.e., institutional, social, economic and physical. Based on the performance of cities against the various core and supporting indicators, various 'Category Sub-Indexes' and a composite 'City Liveability Index' will be developed for each city.

3.1 Scoring and Computing Category Indices of Liveability

The set of 79 indicators, associated categories and pillars are presented in the table below:

Table 1 List of Pillars, Categories and Indicators

Pillars of Comprehensive Development	Category	Indicators
Institutional	1. Governance	1.1 Percentage of citizen services available online
		1.2 Percentage of services integrated through Command Centre
		1.3 Percentage of citizens using online services
		1.4 Average delay in grievance redressal
		1.5 Tax collected as percentage of tax billed
		1.6 Extent of cost recovery (O&M) in water supply services
		1.7 Capital spending as percentage of total expenditure
		1.8 Percentage of population covered under Ward Committees/Area *Sabhas*
Social	**2. Identity and Culture**	2.1 Restoration and reuse of historic buildings
		2.2 Percentage of ecologically important areas covered through projects for restoration
		2.3 Hotel occupancy
		2.4 Percentage of budget allocated towards cultural/sports activities
		2.5 Number of cultural/sports events hosted by city
	3. Education	3.1 Percentage of school-aged population enrolled in schools
		3.2 Percentage of female school-aged population enrolled in schools

Pillars of Comprehensive Development	Category	Indicators
		3.3 Primary education student-teacher ratio
		3.4 Percentage of schools with access to digital education
		3.5 Percentage of students completing primary education
		3.6 Percentage of students completing secondary education
	4. Health	4.1 Number of in-patient hospital beds per 10,000 population
		4.2 Healthcare professionals per 10,000 population
		4.3 Average response time in case of health emergencies
		4.4 Period prevalence of water borne diseases
		4.5 Period prevalence of vector borne diseases
	5. Safety and Security	5.1 Number of CCTV Cameras
		5.2 Number of recorded crimes per lakh population
		5.3 Extent of crimes recorded against women, children and elderly per year
		5.4 Transport-related fatality per lakh population
Economic	**6. Economy and Employment**	6.1 Increase in VAT/GST collection
		6.2 Increase in collection of Professional Tax
		6.3 Increase in issuance of Construction permits
		6.4 Unemployment rate
		6.5 Percentage of vendors registered and provided formal spaces
Physical	**7. Housing and Inclusiveness**	7.1 Percentage of Slum/EWS households covered through formal/affordable housing
		7.2 Percentage of slum areas covered through basic services
	8. Public Open Spaces	8.1 Per capita availability of green spaces
		8.2 Per capita availability of public and recreational places
	9. Mixed Land Use and Compactness	9.1 Share of mixed land use area in overall city land use
		9.2 Net Density
	10. Power Supply	10.1 Percentage of city population with authorized electrical services
		10.2 Percentage of electrical connections covered through smart meters
		10.3 Average number of electrical interruptions per year
		10.4 Average length of electrical interruptions per year

Pillars of Comprehensive Development	Category	Indicators
		10.5 Percentage of total energy derived from renewable sources
		10.6 Energy consumption per unit - water supply and sewerage
		10.7 Energy consumption per unit - street lighting
		10.8 Percentage of new and redeveloped buildings following green building norms
		10.9 Total energy consumption per capita
	11. Transportation and Mobility	11.1 Geographical coverage of public transport
		11.2 Availability of public transport
		11.3 Mode share of public transport
		11.4 Percentage of road network with dedicated bicycle tracks
		11.5 Percentage of interchanges with bicycle parking facilities
		11.6 Mode share of non-motorized transport
		11.7 Availability of Passenger Information System
		11.8 Extent of signal synchronization
		11.9 Availability of paid parking spaces
		11.10 Percentage coverage of footpaths – wider than 1.2 m
		11.11 Percentage of traffic intersections with pedestrian crossing facilities
		11.12 Extent to which universal accessibility is incorporated in public rights-of-way
	12. Assured Water Supply	12.1 Household level coverage of direct water supply connections
		12.2 Per capita supply of water
		12.3 Quality of water supplied
		12.4 Level of non-revenue water – NRW
		12.5 Percentage of water connections covered through meters
		12.6 Percentage of plots with rainwater harvesting facility
	13. Waste Water Management	13.1 Coverage of toilets
		13.2 Coverage of sewerage network and/or septage
		13.3 Collection efficiency of sewerage network
		13.4 Extent of reuse and recycling of waste water

Pillars of Comprehensive Development	Category	Indicators
		13.5 Coverage of storm water drains
	14. Solid Waste Management	14.1 Household level coverage of municipal solid waste collection
		14.2 Efficiency of collection of municipal solid waste
		14.3 Extent of municipal solid waste recovered through reuse
	15. Reduced Pollution	15.1 Concentration of SO2- air pollution
		15.2 Concentration of NO2- air pollution
		15.3 Concentration of PM10 - air pollution
		15.4 Level of noise pollution
		15.5 Quality of water in public surface water bodies

3.2 Scoring and Computing Category Indices of Liveability

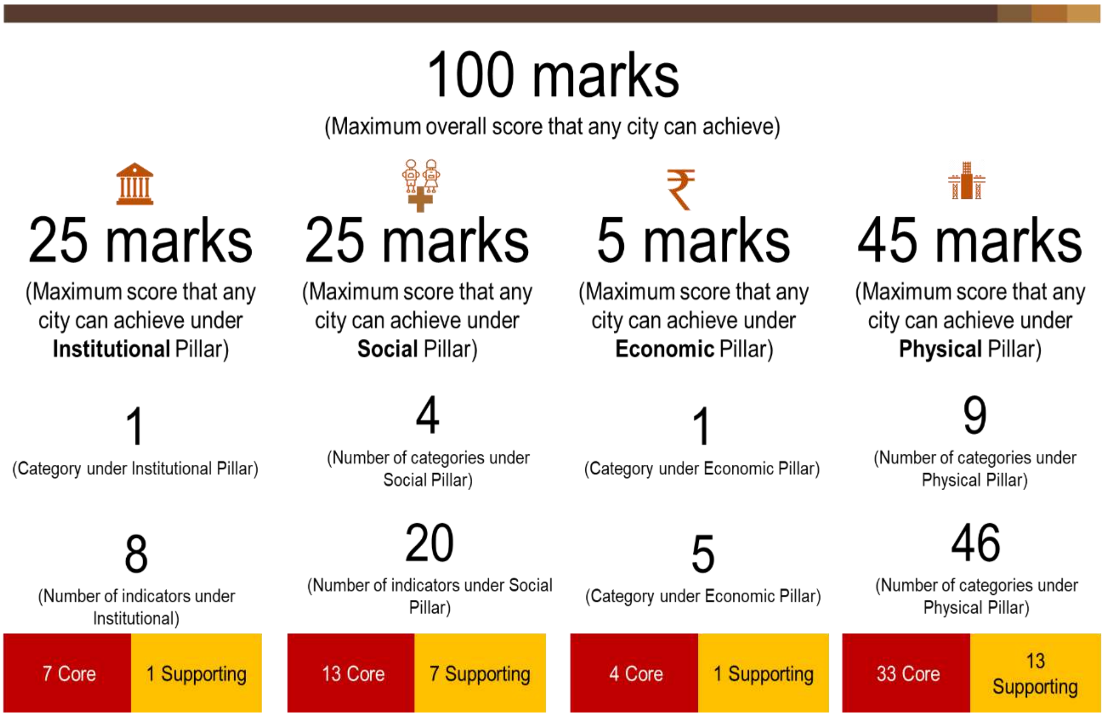
The performance achieved by cities against 79 indicators, will be assessed against given benchmarks. Where no international/national norms are available, city with the best performance in its group (population range) will be treated as a benchmark. The groups are given in the table below.

Table 2 Details on Population Range

Category	Population range
Category 1	Population ≥ 4 million
Category 2	1 million ≤ Population < 4 million
Category 3	0.5 million ≤ Population < 1 million
Category 4	Population < 0.5 million

3.3 Scoring Approach and Methodology

A city can earn a maximum score of 100 points for 79 indicators across four pillars. The pillar weights are as follows: Institutional (25 points), Social (25 points), Economy and Employment (5 points) and Physical (45 points). Based on the number and nature of indicators i.e., core vs. secondary, indicator wise maximum marks were computed.



100 marks

(Maximum overall score that any city can achieve)

25 marks (Maximum score that any city can achieve under **Institutional** Pillar)	25 marks (Maximum score that any city can achieve under **Social** Pillar)	5 marks (Maximum score that any city can achieve under **Economic** Pillar)	45 marks (Maximum score that any city can achieve under **Physical** Pillar)
1 (Category under Institutional Pillar)	4 (Number of categories under Social Pillar)	1 (Category under Economic Pillar)	9 (Number of categories under Physical Pillar)
8 (Number of indicators under Institutional)	20 (Number of indicators under Social Pillar)	5 (Category under Economic Pillar)	46 (Number of categories under Physical Pillar)
7 Core 1 Supporting	13 Core 7 Supporting	4 Core 1 Supporting	33 Core 13 Supporting

Dimensional Index Methodology (DIM) has been used to compute scores for each indicator with reference to “maximum within the comparison group” or “absolute benchmarks”. For indicators where benchmarks are available, cities getting the benchmark score (or above) are given the maximum mark, and the marks awarded to other cities are calculated proportionately. For indicators where benchmarks are not available, the best performing cities in each population group are given the maximum mark, and the marks awarded to other cities (within the population group) are calculated proportionately. For indicators where benchmarks do not exist, the city data has been tested for outliers before scoring.

3.4 Scoring Normalisation:

To construct aggregate scores across cities as well as to make the scores across indicators comparable, indicator values were normalised using a min-max approach. The following formula was used to normalise the indicator values-

$$\frac{indicator\ value\ for\ the\ city - indicator\ value\ for\ the\ worst\ performing\ city}{benchmark - \ indicator\ value\ for\ the\ worst\ performing\ city}$$

This approach would restrict the normalised indicator value between 0 and 1. Cities that met or exceeded the benchmark received a normalised indicator value of 1. Worst performing cities are given a normalised indicator value of 0. After normalisation, the normalised value is weighted according to the category and the indicator being core or supporting.

To illustrate, consider the indicator 12.3 Quality of Water Supplied in the Category 12 for Assured Water Supply. If in City A 50% of the water samples collected qualify the potable water standards specified by the CPHEEO, and only 10% of the samples from worst performing city qualify the standards. Then, the normalised value for the indicator for city A would be 0.44 [(0.5-0.1)/(1-0.1)].

The weight for indicator 12.3 is 1.03, so the final weighted score for City A would come out to 0.45 [1.03*0.44].

4. Data Collection and Verification

4.1 Submission of Data by the cities

The Liveability Assessment is based on secondary data submitted by the urban local bodies and other concerned government agencies (collectively called as data owners). The 79 indicators were broken down into a set of easy to understand and relatable 553 questions mapped to data owners. Submission of the data was enabled through an online data entry portal on the smartnet platform of the Ministry. The portal also allowed the ULBs to download the liveability assessment questionnaire and upload filled in questionnaire. To familiarise and assist cities in identifying, mapping and collation of data points, a city level nodal person was available during the entire period of data submission process.

4.2 Mapping of Data Owners for the City

For the assessment of liveability indices broadly 12 data owners such as Central/state Pollution control board, Development authority, DISCOM/Electricity Board, State Disaster Management Authority, State Education Department, State Health department, State Renewable energy and development agency, State sales and commercial taxes department, town and country planning department, Traffic and police department, Transport authority, and Urban local body were

identified to respond to the questions on the portal. However, during state workshop and subsequent city level discussions, more data owners were mapped to respond to different categories and sub categories. The following table provides the details of city level data owners mapped under the 12 data owner.

Table 3:Details of Data Owners

Designated data owners	Subcategories	Data owners at city level
Urban Local Body	For Accounts Related Questions	Accounts Department, MCGM
Urban Local Body	For Park and Recreation Related Questions	Garden Department, MCGM Development and Planning Department, MCGM
Urban Local Body	For Water Supply and Drainage related questions	Hydraulic Department, MCGM
Urban Local Body	For Heritage sites related data	Development and Planning, MCGM Archaeological Survey of India
Urban Local Body	For Ecological sites related data	Environment and Forest Department
Urban Local Body	For Housing related data	Development and Planning, MCGM
Urban Local Body	For Building plan related data	Development and Planning, MCGM
Urban Local Body	For Roads related data	Department of Roads and Traffic, MCGM
Urban Local Body	For Solid waste management related data	Solid waste management Department, MCGM
Urban Local Body	For IT services related data	IT Department, MCGM
Urban Local Body	For Vendor committee related data	Licence and Establishment, MCGM
Urban Local Body	Any other departments involved in providing data for questions mentioned under Urban Local Body	
Central / state Pollution control Board	Water Quality, Air Quality, Noise Quality	Maharashtra Pollution Control Board Environment Department, MCGM
Development Authority	Building Infrastructure	Development and Planning, MCGM
	Construction planning	Development and Planning, MCGM

Designated data owners	Subcategories	Data owners at city level
	Green Building	Development and Planning, MCGM
	Rain water harvesting	Development and Planning, MCGM
	Universal Design Principle	Development and Planning, MCGM
DISCOM/Electricity Board	Electrical Connection/ Grievance Redressal/ Power supply	Bombay Electricity Supply and Transport, MCGM Maharashtra State Electricity Development Corporation
State Disaster management authority		District Disaster management Office
State Education Department		State Education Department Education Department, MCMG
State Health Department	Health care professionals	Health Department, MCMG
	Citizen Services	State Health Department
	Disease Prevalence	State Health Department
	Health Infrastructure	State Health Department
State Renewable Energy Development Agency		Maharashtra Renewable Energy Development Agency
State Sales / Commercial Taxes Department		Sales and commercial Taxes department
Town and Country Planning Department	Land Use	Development and Planning, MCMG
Traffic and Police Department		State Police Department
Transport Authorities	Buses	Road and Transport Office
	Registered Vehicles	Bombay Electricity Supply and Transport
	Sub urban rail transport	Western Railways, central Railways and Harbour Railways
	Mono Rail Authority	MMRDA
	Tramways	NA
	Marine Transport Authority	Mumbai Maritime Board

4.3 List of secondary documents available as supportive

City has provided supporting documents/evidences against the responses given by city on the online portal. In support of their responses on the portal, city submitted 97 number of documents. Documents submitted includes reports, official orders, copy of data maintained in official register, signed copy of questionnaire, and signed letters/submissions from concern departments. Verification includes mapping of documents against responses given by city, checking the type/category of documents, and validation of data provided.

The following table presents the data owner wise number of documents:

Table 4: Data owner wise number of secondary documents submitted by city

Data Owners	Number of Documents
Sales and Commercial Taxes	12
State Education Department	1
DISCOM/Electricity Department	14
Traffic and Police Department	2
Development Authority	0
Pollution Control Board	2
State Renewable Energy Department	3
Town and Country Planning	0
State Health Department	0
Transport Authority	4
Disaster Management	0
Urban Local Body	59
Total	97*

4.4 Data Verification

A three-stage data quality check comprising verification of data against secondary documents furnished by data owners, logical inconsistency checks including outliers, and physical audit for select indicators (Refer the exhibit below) is being undertaken. The objective of the data quality check is to ensure that data from the source documents are accurate and verifiable. Sources of data included reports, administrative data, survey results and other statistical records, log books among other.

Physical audit of eight indicators – one indicator from the Institutional pillar, one from the Social pillar, one from the Economy pillar and five from the Physical pillar is also being carried out by the field team to ascertain the degree of reliability of data reported by the cities. The list of these eight indicators is presented below:

1.2 | Percentage of services integrated through Command Centre

2.3 | Hotel occupancy

3.4 | Percentage of schools with access to digital education

5.1| Number of streets, public places, junctions covered through surveillance systems

6.5 | Percentage of vendors registered and provided formal spaces

11.7 | Availability of Passenger Information System

11.11 | Percentage of traffic intersections with pedestrian crossing facilities

11.12 | Extent to which universal accessibility is incorporated in public rights-of-way

For a set of five indicators namely, unemployment rate, mode share of public transport, mode share of non-motorised transport, quality of water supplied and level of noise pollution, existing datasets were found to be not available consistently across all cities and/or were inadequate. To help cities that do not have data on these five indicators, dipstick assessments are being carried to fill data gaps.

6.4 | Unemployment Rate

11.3 | Mode share of public transport

11.5 | Mode share of Non Motorized Transport

12.3 | Quality of Water Supplied

15.4 | Level of Noise Pollution

4.5 Physical Audit

The following map presents the indicators audited at city level.

5. City Score on 15 categories of Assessment

Liveability Assessment covered 15 categories and 78 indicators. The below table presents the scores for all 15 indicators namely governance, identity & culture, education, health, safety and security, economy & employment, housing & inclusiveness, public open spaces, mixed land use & compactness, power supply, transport & mobility, assured water supply, waste water management, solid waste management and reduced pollution.

Table 5: Category wise scores

Categories	Scores in Percentage
Governance	55.47%
Identity & Culture	69%
Education	82%
Health	90%
Safety & Security	64%
Economy & Employment	54%
Housing & Inclusiveness	47%
Public Open Spaces	93%
Mixed Land Use & Compactness	50%
Power Supply	44%
Transport & Mobility	59%
Assured Water Supply	83%
Waste Water Management	74%
Solid Waste Management	68%
Reduced Pollution	85%

The rank of the city is based on the performance and scores in each of the category. The final city rank is submitted separately.

Executive Summary

Assessment of liveability indices is an initiative by the Ministry of Housing and Urban Affairs to improve quality of life of citizens and achieve sustainable development goals by encouraging cities to adopt "outcome based" approach for urban planning. Assessment process aimed to provide opportunity to cities to review the development components holistically by involving 79 measurable indicators categorized under governance, health, education, safety, economy, power supply, transportation and mobility, identity, culture, housing, waste management and pollution.

This report highlights the assessment process, key milestones, and the final outcome of the data submitted. Implementation of liveability assessment commenced formally on 19th January 2018. A national level workshop was organized on 13th February 2018 to explain the importance and process of liveability assessment and get feedback on methodology from the city authorities.

This was followed by the next stage of Questionnaire development. The questionnaire was arranged under 12 categories representing 12 data owners namely urban local body, Central and state pollution control board, development authority, DISCOM/Electricity board, State disaster management authority, state education department, state health department, state renewable energy development agency, state sales and commercial taxes department, town and country planning department, traffic and police department and transport authorities.

An online data entry portal was developed to facilitate data submission by the cities. Each city had a unique log in to access the portal and submit the data. Both online and off-line options (download the questionnaire in an excel) to submit the data were available for cities. An email help desk was set up for the cities to raise any queries and seek clarification when responding to the questions.

A team for each state comprising of State Coordinator and City Coordinator (one per city) was deployed that facilitated the process and supported the cities. A total of 6 regional coordinators/ consultants, 29 State Coordinators, and 99 city coordinators were deployed across 116 cities. Training for state coordinators was held from 26th to 28th February 2018 at Chennai to make coordinators understand overall liveability assessment, indicators, data sources, protocols and roles and responsibilities.

City Reconnaissance Meetings were initiated by the state and city coordinators. The discussion began with discussions to finalize the state workshop schedule, mapping of data owners, and assist cities in data collection. The City Coordinators were based in the cities for over 6 weeks and during this time, they liase with ULB and other data owners to explain the liveability framework, online portal, and facilitate the online submission.

A total of 33 state workshops were conducted at the state level. The objective of the workshop was to orient the city stakeholders on liveability assessment, indicators, components of data collection, timelines, expectations of support and support extended by MoHUA. The state level workshops brought

various city level departments on a single platform to understand and discuss the methodology and components of city liveability assessment.

Nodal agency at state level supported by the City and State Coordinator and city level (Municipality corporation/smart city limited) coordinated with city specific data owners/departments for data gathering, collation, and submission. Nodal persons in each department were appointed for timely data collection and submission. Of 116, 112 cities submitted data as per the timeline on 16th April 2018.

Post submission, the city and state coordinators supported by the central team followed up extensively with the cities to support secondary documents as evidence to substantiate their submissions. Secondary documents such as reports, official orders, copy of office register, signed copy of liveability assessment questionnaire furnished by cities against the submitted data. Documents are verified to map the documents for the reponses provided by city and to check the type data provided by city. The document check outcomes were shared with the cities as a part of data quality check.

For checking consistency of data, logical check of data, verifying data from other public sources were undertaken. Quality check was done to ensure data validity and provide opportunity to cities to review the data provided by them and correct in case of wrong data entry.

For 8 selected indicators namely, percentage of services integrated through command and control center, hotel occupancy rate, percentage of schools with access to digital education, number of CCTV cameras per unit road length, percentage of vendors registered and provided formal spaces, availability of passenger information system, percentage of traffic intersection with pedestrian crossing facility, and extent to which universal accessibility is incorporated in public rights of way. Physical audit was conducted in 110 cities by physical auditors appointed and trained by the consortium. In consultation with ULB nodal person, locations and indicators for physical audit was selected in each city. A mobile based application was developed to capture the physical audit related data.

Primary data collection was done for five indicators such as unemployment rates, mode share of public transport, mode share of non-motorized transport, quality of water supplied, and level of noise pollution. Protocols for water and noise test were prepared in consultation with experts. Water quality test involved physical, chemical and bacteriological test of water as per the CPCB norms. For testing quality of water at consumer end, the auditors worked closely with the ULB and Water department. Samples were collected from consumer end and submitted to the lab suggested by city. For noise pollution, in about 20 cities the state pollution board or city level environment department took the responsibility for providing noise pollution data as per the protocols. In rest of the cities, mobile based application was used to measure noise pollution.

During implementation, MoHUA facilitated the process by conducting video conferences with cities to address any queries, reiterate the importance, and ensure that cities adequately engages in the process and submit their responses in time and respond to requests for clarifications.

In addition to secondary data collection, physical audit and primary data collection, citizen survey was conducted to understand their perception and level of satisfaction on various services such as health, education, water supply, electricity, waste management etc. provided by urban local bodies. Over 60000 citizens participated in the survey across India.

The final scores and ranks have been generated based on the scoring methodology that has been discussed extensively and minor modifications made that are summarized as below:

#	Challenges	Proposed Solutions
1	Only 23 cities of 111 cities have City Mobility Plan (CMP) or any and hence able to provide data for Mode Share of Public Transport and Non-Motorised Transport. To address the data gap, as advised by the MoHUA, the consortia undertook a sample dipstick across all cities covering a sample of 150 Households. Understandably, the dipstick findings will not match the rigor of a CMP.	We recommend the following: 1) Cities which have provided CMP Data will be evaluated on 100% of the maximum score 2) For the cities where the dipstick data is used, the city receives a 50% discount on the overall score Alternatively, another approach is to assign 0 score to all 88 cities that don't have a CMP
2	Variance was observed on data reported by cities on road network and data presented in the smart city proposals during the verifications.	We recommend taking the data reported by the cities in the Smart City Proposals.
3	There is no secondary source/ organization that provides unemployment data at city level. As a result, most cities do not have the data. Fully cognizance of the challenges of generating this data in a short span of time, it was agreed to collect this data through a dipstick survey on lines of NSSO questions. The data generated needs further scrutiny and triangulation with some inputs from experts. This may not be possible in the short	The indicator on unemployment will be excluded from scores. For final ranking, the cities will be scored on 78 indicators.

#	Challenges	Proposed Solutions
	window.	
4	Many cities did not have data on noise pollution and it was decided that data will be collected using a mobile app for all the 111 cities. However, many cities have expressed reservations with the approach especially with respect to the reliability of using this data. Further, some cities have relied on the SPCB to collect the data as per the approach proposed by the consortia. Thus, noise pollution data is currently from two sources: 1. SPCB- 20 cities 2. Noise-based app- 91 cities	The data collected through the primary survey will be used for scoring the cities. Currently, there is no differential scoring for the data from the SPCB and the data collected through the mobile app. However, a certain higher weightage can be provided to those cities which used the state apparatus to collect noise pollution data.
5	For the indicator on quality of water supplied, the methodology document states that samples should be drawn both at the treatment plant outlet as well as the consumer end. However, the data provided by the cities were predominantly from the distribution point. Hence for consumer end results with MoHUA intervention, consortia coordinated with cities to collect the data at the consumer end. The cities facilitated the testing. The outcome of the process is as below: 1. Sample given- 102 cities 2. Report received- 86 cities 3. Report awaited- 16 cities 4. Tests not completed due to lack of cooperation and other reasons – 9	The maximum score for this indicator will be distributed equally (50%) for results based on samples from the treatment plant and consumer end. Cities that did not complete tests or provide the results will be given a score 0 for against consumer end tests.
6	City level population is not projected annually by most of the cities. So, estimates for 2017 population are not available with the cities.	As recommended by MoHUA, 2011 census population is being used for the ranking purpose.

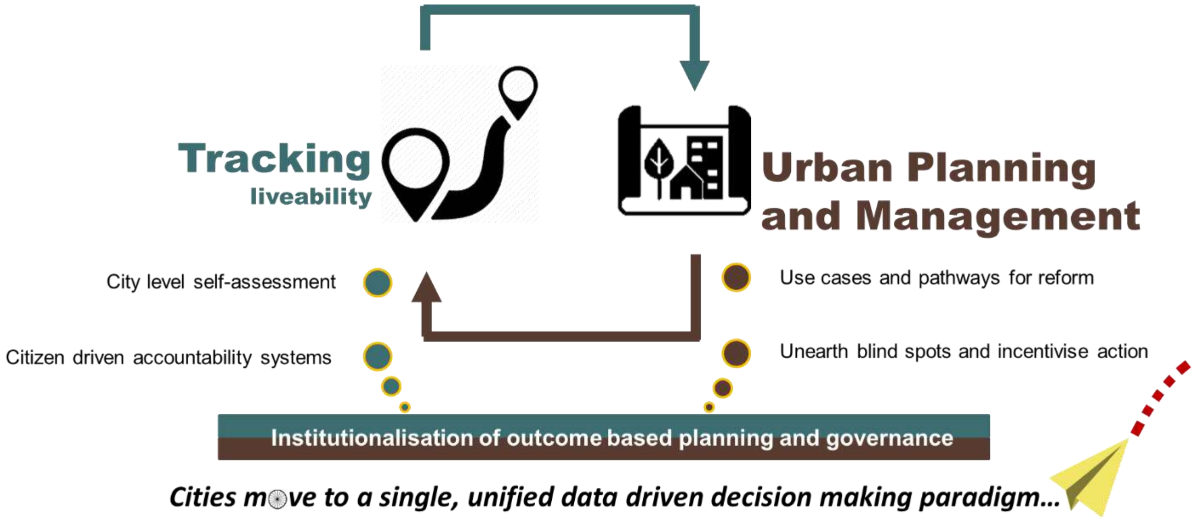
#	**Challenges**	**Proposed Solutions**
7	The age category specific data for 9 cities is not available at a city level	The age category specific population data has been taken at a district level for these cities.
8	Indicators on non-motorised transports like- Dedicated bicycle tracks, bicycle parking facilities and mode share of non-motorised transport are not relevant for hilly terrains.	As discussed during the PMC meeting, these indicators have been treated as non-applicable for the hilly cities and the weights have been redistributed among other indicators within the same category.
9	The indicator on increase in professional tax is not relevant to cities which do not levy the professional tax.	As discussed during the PMC meeting, this indicator has been non-applicable to the cities belonging to states where professional tax is not levied, and the weights have been redistributed among other indicators within the same category.
10	The indicator on increase in VAT collection is not applicable to Port Blair and Kavaratti, as there was no provision of VAT collection in these cities.	As discussed during the PMC meeting, these indicatosr has been treated as non-applicable for these two cities and the weights have been redistributed among other indicators within the same category.
11	Indicator on coverage of basic services to slum households does not concern cities with no slums (notified/ non-notified.	As discussed during the PMC meeting, this indicators has been treated as non-applicable for these cities and the weights have been redistributed among other indicators within the same category.

1. Introduction

The Ministry of Housing and Urban Affairs (MoHUA) is implementing several flagship urban missions such as the Smart Cities Mission (SCM), Atal Mission for Urban Rejuvenation and Transformation (AMRUT), Heritage City Development and Augmentation Yojana (HRIDAY), Housing for All (HFA). Theses mission along with other transformative initiatives of the Government including National Water Mission, Power for All, National Health Mission are aimed at making Indian cities more 'liveable.' The overarching goal of these initiatives is to move from an input-based approach to a 'citizen centric-outcome based' assessment of urban liveability.

To develop a common minimum framework for cities to assess their existing status and chart their pathway towards providing a better quality of life to their citizens, the MoHUA developed a set of 'Liveability Standards' relevant to cities to generate a Liveability Index and ranking of cities. These standards were launched in June, 2017. The MoHUA has planned to conduct an 'Annual Assessment of Liveability Standards in Cities – an ambitious national project that will involve yearly submission of data by cities across the various indicators, compilation and analysis, development of indices and ranking of cities. The Liveability Index is envisioned as a 360° tool for tracking, planning and transforming Indian cities. The Liveability Index is aimed at the following objectives:

- Providing strong evidence-based approach for future interventions and investments to deliver liveability outcomes
- Catalysing actions to improve the overall quality of the city's liveability and achieve broader development outcomes including the Sustainable Development Goals
- Assessing the implementation of government policies and schemes governing characteristics of cities that can contribute to creating liveable communities



Tracking
liveability
Urban Planning
and Management
City level self-assessment
Citizen driven accountability systems
Use cases and pathways for reform
Unearth blind spots and incentivise action
Institutionalisation of outcome based planning and governance
Cities move to a single, unified data driven decision making paradigm...

The first round of the assessment commenced in January 2018 covering 116 major cities including smart cities, capital cities and cities with population of above one million each. Implementation of the liveability assessment commenced in January 2018 with a national level orientation workshop for the urban local bodies. The workshop aimed at orienting the states and urban local bodies on the overall framework, indicators, data sources, methodology and key milestones and timelines involved in the liveability assessment. Subsequently, a series of State/ Union Territory level orientation workshops were carried out in 33 states/UTs for a detailed discussion on the framework. Online data collection commenced from 9th March through an online data collection platform that supported both online and offline data submission modes. On the date of closure of the online data entry portal i.e., 16th April, 2018 112 cities submitted their data. Subsequently, comprehensive checks on the submitted data was undertaken that involved checking for outliers, logical inconsistencies etc. post which round-1 of data reconciliation was conducted. This draft report is based on round-1 of reconciled data as on 28th April, 2018.

2. City Profile

This chapter presents the city profile -Geographic and Demographic, Social (Education Health, Safety and Security, Heritage), Economic profile, and Physical (Water, sanitation and Waste Management, Electricity, Open space and roads).

GURGAON

GEOGRAPHICAL PROFILE

State/Union Territory	Haryana	Total Geographical Area (Km²)	232	City Category	Large City

DEMOGRAPHIC PROFILE

Total Population	876000
Total Number of Households	380000

SOCIAL PROFILE

Education	Total Number of Schools	1067
	Total Enrolment (Class 1 to 5)	178809
Health	Total Number of In-patient Beds	5744
	Total Health Workforce	870
Safety and Security	Total Strength of Police Force	4777
	Total Number of CCTV Cameras	56911
Heritage Sites	Total Number of Heritage Sites	12

ECONOMIC PROFILE

Total Population in Working Age Group	...
Total Number of Industries	3957
Total Number of Commercial Enterprises	49779
Total Number of Hotels	5474
Total Capital and Revenue Expenditure for the city in FY 2016-17 (INR Lakhs)	34533.18
Total VAT Collection in FY 2016-17 (INR Lakhs)	569842

PHYSICAL PROFILE

Water	**Average Quantity of Water Supplied (MLD)**	181.6
	Total Number of Water Connection	268241
Sanitation Facilities	**Total number of households with access to individual toilets in the city**	30826
	Total number of households in the city with access to community toilets in the city	3187
Solid Waste Management	**Daily average quantity of municipal solid waste collected in the city (Tonnes/day)**	784
	Total number of households covered through door-to-door collection of solid waste	312589
Waste Water	**Daily Average Quantum of Waste Water Generated in the City (MLD)**	40
	Daily average quantum of waste water treated by STPs in the city (MLD)	40
Electricity	**Total number of authorized electrical connections in the city**	259086
	Total electricity supplied to the city (kWh)	4129224000
Public and Open Spaces	**Total area covered by green spaces in the city (m^2)**	10.04
Roads and Transport	**Total Length of Road Network in the City (Km)**	3400
	Total length of arterial and sub-arterial road network in the city (Km)	28.04
	Total length of footpath (wider than 1.2 metres) in the city along the street network (Km)	500

3. Liveability Framework and Indicators

The Liveability Framework comprises a total of 79 indicators (57 Core Indicators and 22 Supporting Indicators). A core indicator carries 70% weightage and a supporting indicator carries 30% weightage. These indicators are grouped under 15 thematic categories which in turn are part of four pillars of comprehensive development of cities i.e., institutional, social, economic and physical. Based on the performance of cities against the various core and supporting indicators, various 'Category Sub-Indexes' and a composite 'City Liveability Index' will be developed for each city.

3.1 Scoring and Computing Category Indices of Liveability

The set of 79 indicators, associated categories and pillars are presented in the table below:

Table 1 List of Pillars, Categories and Indicators

Pillars of Comprehensive Development	Category	Indicators
Institutional	1. Governance	1.1 Percentage of citizen services available online
		1.2 Percentage of services integrated through Command Centre
		1.3 Percentage of citizens using online services
		1.4 Average delay in grievance redressal
		1.5 Tax collected as percentage of tax billed
		1.6 Extent of cost recovery (O&M) in water supply services
		1.7 Capital spending as percentage of total expenditure
		1.8 Percentage of population covered under Ward Committees/Area *Sabhas*
Social	**2. Identity and Culture**	2.1 Restoration and reuse of historic buildings
		2.2 Percentage of ecologically important areas covered through projects for restoration
		2.3 Hotel occupancy
		2.4 Percentage of budget allocated towards cultural/sports activities
		2.5 Number of cultural/sports events hosted by city
	3. Education	3.1 Percentage of school-aged population enrolled in schools
		3.2 Percentage of female school-aged population

Pillars of Comprehensive Development	Category	Indicators
		enrolled in schools
		3.3 Primary education student-teacher ratio
		3.4 Percentage of schools with access to digital education
		3.5 Percentage of students completing primary education
		3.6 Percentage of students completing secondary education
	4. Health	4.1 Number of in-patient hospital beds per 10,000 population
		4.2 Healthcare professionals per 10,000 population
		4.3 Average response time in case of health emergencies
		4.4 Period prevalence of water borne diseases
		4.5 Period prevalence of vector borne diseases
	5. Safety and Security	5.1 Number of CCTV Cameras
		5.2 Number of recorded crimes per lakh population
		5.3 Extent of crimes recorded against women, children and elderly per year
		5.4 Transport-related fatality per lakh population
Economic	**6. Economy and Employment**	6.1 Increase in VAT/GST collection
		6.2 Increase in collection of Professional Tax
		6.3 Increase in issuance of Construction permits
		6.4 Unemployment rate
		6.5 Percentage of vendors registered and provided formal spaces
Physical	**7. Housing and Inclusiveness**	7.1 Percentage of Slum/EWS households covered through formal/affordable housing
		7.2 Percentage of slum areas covered through basic services
	8. Public Open Spaces	8.1 Per capita availability of green spaces
		8.2 Per capita availability of public and recreational places
	9. Mixed Land Use and Compactness	9.1 Share of mixed land use area in overall city land use
		9.2 Net Density
	10. Power Supply	10.1 Percentage of city population with authorized electrical services

Pillars of Comprehensive Development	Category	Indicators
		10.2 Percentage of electrical connections covered through smart meters
		10.3 Average number of electrical interruptions per year
		10.4 Average length of electrical interruptions per year
		10.5 Percentage of total energy derived from renewable sources
		10.6 Energy consumption per unit - water supply and sewerage
		10.7 Energy consumption per unit - street lighting
		10.8 Percentage of new and redeveloped buildings following green building norms
		10.9 Total energy consumption per capita
	11. Transportation and Mobility	11.1 Geographical coverage of public transport
		11.2 Availability of public transport
		11.3 Mode share of public transport
		11.4 Percentage of road network with dedicated bicycle tracks
		11.5 Percentage of interchanges with bicycle parking facilities
		11.6 Mode share of non-motorized transport
		11.7 Availability of Passenger Information System
		11.8 Extent of signal synchronization
		11.9 Availability of paid parking spaces
		11.10 Percentage coverage of footpaths – wider than 1.2 m
		11.11 Percentage of traffic intersections with pedestrian crossing facilities
		11.12 Extent to which universal accessibility is incorporated in public rights-of-way
	12. Assured Water Supply	12.1 Household level coverage of direct water supply connections
		12.2 Per capita supply of water
		12.3 Quality of water supplied
		12.4 Level of non-revenue water – NRW
		12.5 Percentage of water connections covered through meters
		12.6 Percentage of plots with rainwater harvesting

Pillars of Comprehensive Development	Category	Indicators
		facility
	13. Waste Water Management	13.1 Coverage of toilets
		13.2 Coverage of sewerage network and/or septage
		13.3 Collection efficiency of sewerage network
		13.4 Extent of reuse and recycling of waste water
		13.5 Coverage of storm water drains
	14. Solid Waste Management	14.1 Household level coverage of municipal solid waste collection
		14.2 Efficiency of collection of municipal solid waste
		14.3 Extent of municipal solid waste recovered through reuse
	15. Reduced Pollution	15.1 Concentration of SO2- air pollution
		15.2 Concentration of NO2- air pollution
		15.3 Concentration of PM10 - air pollution
		15.4 Level of noise pollution
		15.5 Quality of water in public surface water bodies

3.2 Scoring and Computing Category Indices of Liveability

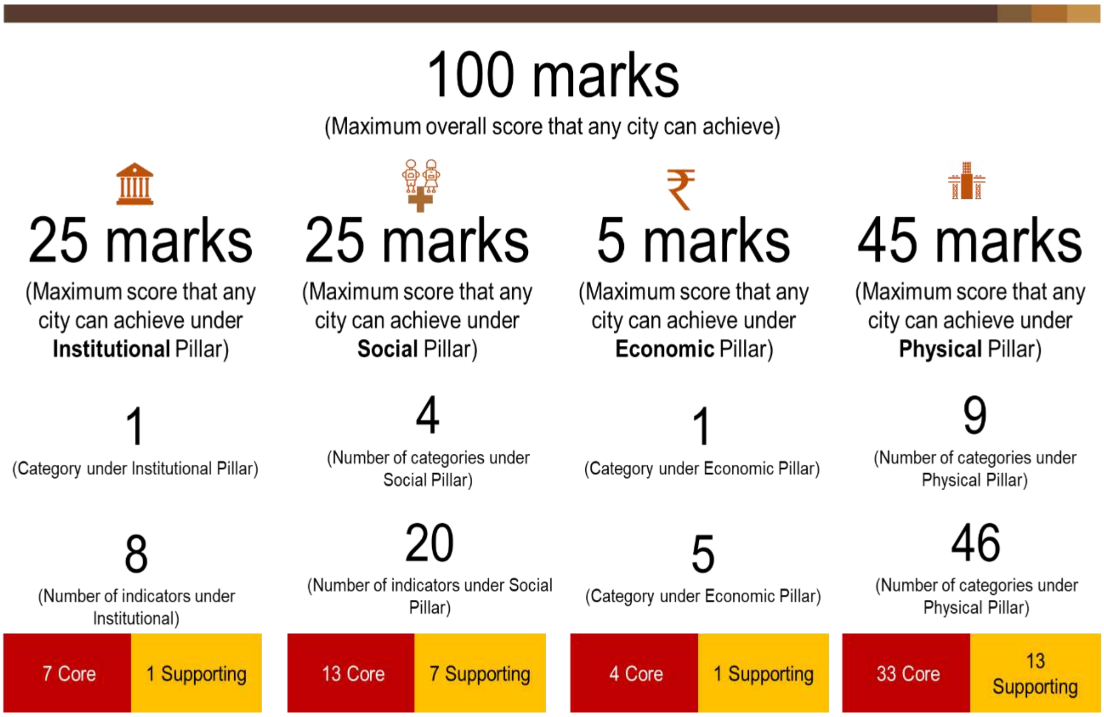
The performance achieved by cities against 79 indicators, will be assessed against given benchmarks. Where no international/national norms are available, city with the best performance in its group (population range) will be treated as a benchmark. The groups are given in the table below.

Table 2 Details on Population Range

Category	Population range
Category 1	Population ≥ 4 million
Category 2	1 million ≤ Population < 4 million
Category 3	0.5 million ≤ Population < 1 million
Category 4	Population < 0.5 million

3.3 Scoring Approach and Methodology

A city can earn a maximum score of 100 points for 79 indicators across four pillars. The pillar weights are as follows: Institutional (25 points), Social (25 points), Economy and Employment (5 points) and Physical (45 points). Based on the number and nature of indicators i.e., core vs. secondary, indicator wise maximum marks were computed.



100 marks

(Maximum overall score that any city can achieve)

25 marks

(Maximum score that any city can achieve under **Institutional** Pillar)

1

(Category under Institutional Pillar)

8

(Number of indicators under Institutional)

7 Core | 1 Supporting

25 marks

(Maximum score that any city can achieve under **Social** Pillar)

4

(Number of categories under Social Pillar)

20

(Number of indicators under Social Pillar)

13 Core | 7 Supporting

5 marks

(Maximum score that any city can achieve under **Economic** Pillar)

1

(Category under Economic Pillar)

5

(Category under Economic Pillar)

4 Core | 1 Supporting

45 marks

(Maximum score that any city can achieve under **Physical** Pillar)

9

(Number of categories under Physical Pillar)

46

(Number of categories under Physical Pillar)

33 Core | 13 Supporting

Dimensional Index Methodology (DIM) has been used to compute scores for each indicator with reference to “maximum within the comparison group” or “absolute benchmarks”. For indicators where benchmarks are available, cities getting the benchmark score (or above) are given the maximum mark, and the marks awarded to other cities are calculated proportionately. For indicators where benchmarks are not available, the best performing cities in each population group are given the maximum mark, and the marks awarded to other cities (within the population group) are calculated proportionately. For indicators where benchmarks do not exist, the city data has been tested for outliers before scoring.

3.4 Scoring Normalisation:

To construct aggregate scores across cities as well as to make the scores across indicators comparable, indicator values were normalised using a min-max approach. The following formula was used to normalise the indicator values-

$$\frac{indicator\ value\ for\ the\ city - indicator\ value\ for\ the\ worst\ performing\ city}{benchmark - \ indicator\ value\ for\ the\ worst\ performing\ city}$$

This approach would restrict the normalised indicator value between 0 and 1. Cities that met or exceeded the benchmark received a normalised indicator value of 1. Worst performing cities are given a normalised indicator value of 0. After normalisation, the normalised value is weighted according to the category and the indicator being core or supporting.

To illustrate, consider the indicator 12.3 Quality of Water Supplied in the Category 12 for Assured Water Supply. If in City A 50% of the water samples collected qualify the potable water standards specified by the CPHEEO, and only 10% of the samples from worst performing city qualify the standards. Then, the normalised value for the indicator for city A would be 0.44 [(0.5-0.1)/(1-0.1)].

The weight for indicator 12.3 is 1.03, so the final weighted score for City A would come out to 0.45 [1.03*0.44].

4. Data Collection and Verification

4.1 Submission of Data by the cities

The Liveability Assessment is based on secondary data submitted by the urban local bodies and other concerned government agencies (collectively called as data owners). The 79 indicators were broken down into a set of easy to understand and relatable 553 questions mapped to data owners. Submission of the data was enabled through an online data entry portal on the smartnet platform of the Ministry. The portal also allowed the ULBs to download the liveability assessment questionnaire and upload filled in questionnaire. To familiarise and assist cities in identifying, mapping and collation of data points, a city level nodal person was available during the entire period of data submission process.

4.2 Mapping of Data Owners for the City

For the assessment of liveability indices broadly 12 data owners such as Central/state Pollution control board, Development authority, DISCOM/Electricity Board, State Disaster Management Authority, State Education Department, State Health department, State Renewable energy and development agency, State sales and commercial taxes department, town and country planning department, Traffic and police department, Transport authority, and Urban local body were identified to respond to the questions on the portal. However, during state workshop and subsequent city level discussions, more data owners were mapped to respond to different categories and sub categories. The following table provides the details of city level data owners mapped under the 12 data owner.

Table 3:Details of Data Owners

Designated data owners	Subcategories	Data owners at city level
Urban Local Body	For Accounts Related Questions	Municipal Corporation Gurgaon
Urban Local Body	For Park and Recreation Related Questions	Municipal Corporation Gurgaon
Urban Local Body	For Water Supply and Drainage related questions	Municipal Corporation Gurgaon
Urban Local Body	For Heritage sites related data	Municipal Corporation Gurgaon
Urban Local Body	For Ecological sites related data	Municipal Corporation Gurgaon
Urban Local Body	For Housing related data	Municipal Corporation Gurgaon
Urban Local Body	For Building plan related data	Municipal Corporation Gurgaon
Urban Local Body	For Roads related data	Municipal Corporation Gurgaon
Urban Local Body	For Solid waste management related data	Municipal Corporation Gurgaon
Urban Local Body	For IT services related data	Municipal Corporation Gurgaon
Urban Local Body	For Vendor committee related data	Municipal Corporation Gurgaon
Urban Local Body	Any other departments involved in providing data for questions mentioned under Urban	Municipal Corporation Gurgaon

Designated data owners	Subcategories	Data owners at city level
	Local Body	
Central / state Pollution control Board	Water Quality, Air Quality, Noise Quality	Haryana State Pollution Control Board
Development Authority	Building Infrastructure	Haryana Urban Development Authority
	Construction planning	Haryana Urban Development Authority

4.3 List of secondary documents available as supportive

City has provided supporting documents/evidences against the responses given by city on the online portal. In support of their responses on the portal, city submitted 7 number of documents. Documents submitted includes reports, official orders, copy of data maintained in official register, signed copy of questionnaire, and signed letters/submissions from concern departments. Verification includes mapping of documents against responses given by city, checking the type/category of documents, and validation of data provided.

The following table presents the data owner wise number of documents:

Table 4: Data owner wise number of secondary documents submitted by city

Data Owners	Number of Documents
Sales and Commercial Taxes	**0**
State Education Department	**0**
DISCOM/Electricity Department	**1**
Traffic and Police Department	**1**
Development Authority	**0**
Pollution Control Board	**1**
State Renewable Energy Department	**1**
Town and Country Planning	**0**
State Health Department	**0**
Transport Authority	**0**
Disaster Management	**0**
Urban Local Body	**3**
Total	**7***

4.4 Data Verification

A three-stage data quality check comprising verification of data against secondary documents furnished by data owners, logical inconsistency checks including outliers, and physical audit for select indicators (Refer the exhibit below) is being undertaken. The objective of the data quality check is to ensure that data from the source documents are accurate and verifiable. Sources of data included reports, administrative data, survey results and other statistical records, log books among other.

Physical audit of eight indicators – one indicator from the Institutional pillar, one from the Social pillar, one from the Economy pillar and five from the Physical pillar is also being carried out by the field team to ascertain the degree of reliability of data reported by the cities. The list of these eight indicators is presented below:

1.2 | Percentage of services integrated through Command Centre

2.3 | Hotel occupancy

3.4 | Percentage of schools with access to digital education

5.1 | Number of streets, public places, junctions covered through surveillance systems

6.5 | Percentage of vendors registered and provided formal spaces

11.7 | Availability of Passenger Information System

11.11 | Percentage of traffic intersections with pedestrian crossing facilities

11.12 | Extent to which universal accessibility is incorporated in public rights-of-way

For a set of five indicators namely, unemployment rate, mode share of public transport, mode share of non-motorised transport, quality of water supplied and level of noise pollution, existing datasets were found to be not available consistently across all cities and/or were inadequate. To help cities that do not have data on these five indicators, dipstick assessments are being carried to fill data gaps.

6.4 | Unemployment Rate

11.3 | Mode share of public transport

11.5 | Mode share of Non Motorized Transport

12.3 | Quality of Water Supplied

15.4 | Level of Noise Pollution

4.5 Physical Audit

The following map presents the indicators audited at city level.

5. City Score on 15 categories of Assessment

Liveability Assessment covered 15 categories and 78 indicators. The below table presents the scores for all 15 indicators namely governance, identity & culture, education, health, safety and security, economy & employment, housing & inclusiveness, public open spaces, mixed land use & compactness, power supply, transport & mobility, assured water supply, waste water management, solid waste management and reduced pollution.

Table 5: Category wise scores

Categories	Scores in Percentage
Governance	51.00%
Identity & Culture	9%
Education	90%
Health	79%
Safety & Security	62%
Economy & Employment	19%
Housing & Inclusiveness	50%
Public Open Spaces	5%
Mixed Land Use & Compactness	0%
Power Supply	40%
Transport & Mobility	34%
Assured Water Supply	54%
Waste Water Management	49%
Solid Waste Management	81%
Reduced Pollution	82%

The rank of the city is based on the performance and scores in each of the category. The final city rank is submitted separately.

Executive Summary

Assessment of liveability indices is an initiative by the Ministry of Housing and Urban Affairs to improve quality of life of citizens and achieve sustainable development goals by encouraging cities to adopt "outcome based" approach for urban planning. Assessment process aimed to provide opportunity to cities to review the development components holistically by involving 79 measurable indicators categorized under governance, health, education, safety, economy, power supply, transportation and mobility, identity, culture, housing, waste management and pollution.

This report highlights the assessment process, key milestones, and the final outcome of the data submitted. Implementation of liveability assessment commenced formally on 19th January 2018. A national level workshop was organized on 13th February 2018 to explain the importance and process of liveability assessment and get feedback on methodology from the city authorities.

This was followed by the next stage of Questionnaire development. The questionnaire was arranged under 12 categories representing 12 data owners namely urban local body, Central and state pollution control board, development authority, DISCOM/Electricity board, State disaster management authority, state education department, state health department, state renewable energy development agency, state sales and commercial taxes department, town and country planning department, traffic and police department and transport authorities.

An online data entry portal was developed to facilitate data submission by the cities. Each city had a unique log in to access the portal and submit the data. Both online and off-line options (download the questionnaire in an excel) to submit the data were available for cities. An email help desk was set up for the cities to raise any queries and seek clarification when responding to the questions.

A team for each state comprising of State Coordinator and City Coordinator (one per city) was deployed that facilitated the process and supported the cities. A total of 6 regional coordinators/ consultants, 29 State Coordinators, and 99 city coordinators were deployed across 116 cities. Training for state coordinators was held from 26th to 28th February 2018 at Chennai to make coordinators understand overall liveability assessment, indicators, data sources, protocols and roles and responsibilities.

City Reconnaissance Meetings were initiated by the state and city coordinators. The discussion began with discussions to finalize the state workshop schedule, mapping of data owners, and assist cities in data collection. The City Coordinators were based in the cities for over 6 weeks and during this time, they liase with ULB and other data owners to explain the liveability framework, online portal, and facilitate the online submission.

A total of 33 state workshops were conducted at the state level. The objective of the workshop was to orient the city stakeholders on liveability assessment, indicators, components of data collection, timelines, expectations of support and support extended by MoHUA. The state level workshops brought various city level departments on a single platform to understand and discuss the methodology and components of city liveability assessment.

Nodal agency at state level supported by the City and State Coordinator and city level (Municipality corporation/smart city limited) coordinated with city specific data owners/departments for data gathering, collation, and submission. Nodal persons in each department were appointed for timely data collection and submission. Of 116, 112 cities submitted data as per the timeline on 16th April 2018.

Post submission, the city and state coordinators supported by the central team followed up extensively with the cities to support secondary documents as evidence to substantiate their submissions. Secondary documents such as reports, official orders, copy of office register, signed copy of liveability assessment questionnaire furnished by cities against the submitted data. Documents are verified to map the documents for the reponses provided by city and to check the type data provided by city. The document check outcomes were shared with the cities as a part of data quality check.

For checking consistency of data, logical check of data, verifying data from other public sources were undertaken. Quality check was done to ensure data validity and provide opportunity to cities to review the data provided by them and correct in case of wrong data entry.

For 8 selected indicators namely, percentage of services integrated through command and control center, hotel occupancy rate, percentage of schools with access to digital education, number of CCTV cameras per unit road length, percentage of vendors registered and provided formal spaces, availability of passenger information system, percentage of traffic intersection with pedestrian crossing facility, and extent to which universal accessibility is incorporated in public rights of way. Physical audit was conducted in 110 cities by physical auditors appointed and trained by the consortium. In consultation with ULB nodal person, locations and indicators for physical audit was selected in each city. A mobile based application was developed to capture the physical audit related data.

Primary data collection was done for five indicators such as unemployment rates, mode share of public transport, mode share of non-motorized transport, quality of water supplied, and level of noise pollution. Protocols for water and noise test were prepared in consultation with experts. Water quality test involved physical, chemical and bacteriological test of water as per the CPCB norms. For testing quality of water at consumer end, the auditors worked closely with the ULB and Water department. Samples were collected from consumer end and submitted to the lab suggested by city. For noise pollution, in about 20 cities the state pollution board or city level environment department took the responsibility for providing noise pollution data as per the protocols. In rest of the cities, mobile based application was used to measure noise pollution.

During implementation, MoHUA facilitated the process by conducting video conferences with cities to address any queries, reiterate the importance, and ensure that cities adequately engages in the process and submit their responses in time and respond to requests for clarifications.

In addition to secondary data collection, physical audit and primary data collection, citizen survey was conducted to understand their perception and level of satisfaction on various services such as health, education, water supply, electricity, waste management etc. provided by urban local bodies. Over 60000 citizens participated in the survey across India.

The final scores and ranks have been generated based on the scoring methodology that has been discussed extensively and minor modifications made that are summarized as below:

#	**Challenges**	**Proposed Solutions**
1	Only 23 cities of 111 cities have City Mobility Plan (CMP) or any and hence able to provide data for Mode Share of Public Transport and Non-Motorised Transport. To address the data gap, as advised by the MoHUA, the consortia undertook a sample dipstick across all cities covering a sample of 150 Households. Understandably, the dipstick findings will not match the rigor of a CMP.	We recommend the following: 1) Cities which have provided CMP Data will be evaluated on 100% of the maximum score 2) For the cities where the dipstick data is used, the city receives a 50% discount on the overall score Alternatively, another approach is to assign 0 score to all 88 cities that don't have a CMP

#	Challenges	Proposed Solutions
2	Variance was observed on data reported by cities on road network and data presented in the smart city proposals during the verifications.	We recommend taking the data reported by the cities in the Smart City Proposals.
3	There is no secondary source/ organization that provides unemployment data at city level. As a result, most cities do not have the data. Fully cognizance of the challenges of generating this data in a short span of time, it was agreed to collect this data through a dipstick survey on lines of NSSO questions. The data generated needs further scrutiny and triangulation with some inputs from experts. This may not be possible in the short window.	The indicator on unemployment will be excluded from scores. For final ranking, the cities will be scored on 78 indicators.
4	Many cities did not have data on noise pollution and it was decided that data will be collected using a mobile app for all the 111 cities. However, many cities have expressed reservations with the approach especially with respect to the reliability of using this data. Further, some cities have relied on the SPCB to collect the data as per the approach proposed by the consortia. Thus, noise pollution data is currently from two sources: 1. SPCB- 20 cities 2. Noise-based app- 91 cities	The data collected through the primary survey will be used for scoring the cities. Currently, there is no differential scoring for the data from the SPCB and the data collected through the mobile app. However, a certain higher weightage can be provided to those cities which used the state apparatus to collect noise pollution data.
5	For the indicator on quality of water supplied, the methodology document states that samples should be drawn both at the treatment plant outlet as well as the consumer end. However, the data provided by the cities were predominantly from the distribution point. Hence for consumer end results with MoHUA intervention, consortia coordinated with cities to collect the data at the consumer end. The cities facilitated the testing. The outcome of the process is as below: 1. Sample given- 102 cities 2. Report received- 86 cities 3. Report awaited- 16 cities 4. Tests not completed due to lack of cooperation and other reasons – 9	The maximum score for this indicator will be distributed equally (50%) for results based on samples from the treatment plant and consumer end. Cities that did not complete tests or provide the results will be given a score 0 for against consumer end tests.
6	City level population is not projected annually by most of the cities. So, estimates for 2017 population are not available with the cities.	As recommended by MoHUA, 2011 census population is being used for the ranking purpose.

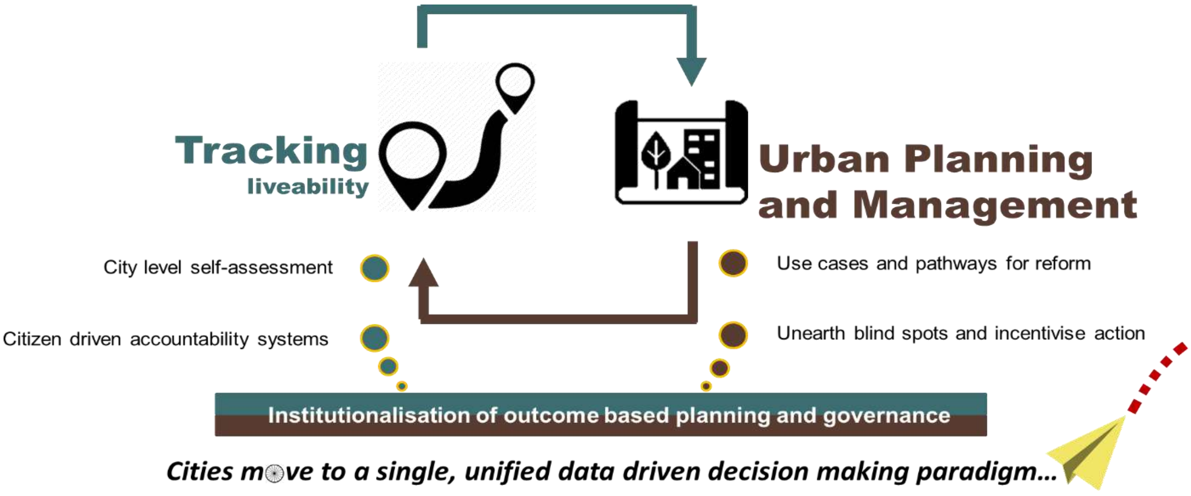
#	Challenges	Proposed Solutions
7	The age category specific data for 9 cities is not available at a city level	The age category specific population data has been taken at a district level for these cities.
8	Indicators on non-motorised transports like- Dedicated bicycle tracks, bicycle parking facilities and mode share of non-motorised transport are not relevant for hilly terrains.	As discussed during the PMC meeting, these indicators have been treated as non-applicable for the hilly cities and the weights have been redistributed among other indicators within the same category.
9	The indicator on increase in professional tax is not relevant to cities which do not levy the professional tax.	As discussed during the PMC meeting, this indicator has been non-applicable to the cities belonging to states where professional tax is not levied, and the weights have been redistributed among other indicators within the same category.
10	The indicator on increase in VAT collection is not applicable to Port Blair and Kavaratti, as there was no provision of VAT collection in these cities.	As discussed during the PMC meeting, these indicatosr has been treated as non-applicable for these two cities and the weights have been redistributed among other indicators within the same category.
11	Indicator on coverage of basic services to slum households does not concern cities with no slums (notified/ non-notified.	As discussed during the PMC meeting, this indicators has been treated as non-applicable for these cities and the weights have been redistributed among other indicators within the same category.

1. Introduction

The Ministry of Housing and Urban Affairs (MoHUA) is implementing several flagship urban missions such as the Smart Cities Mission (SCM), Atal Mission for Urban Rejuvenation and Transformation (AMRUT), Heritage City Development and Augmentation Yojana (HRIDAY), Housing for All (HFA). Theses mission along with other transformative initiatives of the Government including National Water Mission, Power for All, National Health Mission are aimed at making Indian cities more 'liveable.' The overarching goal of these initiatives is to move from an input-based approach to a 'citizen centric-outcome based' assessment of urban liveability.

To develop a common minimum framework for cities to assess their existing status and chart their pathway towards providing a better quality of life to their citizens, the MoHUA developed a set of 'Liveability Standards' relevant to cities to generate a Liveability Index and ranking of cities. These standards were launched in June, 2017. The MoHUA has planned to conduct an 'Annual Assessment of Liveability Standards in Cities – an ambitious national project that will involve yearly submission of data by cities across the various indicators, compilation and analysis, development of indices and ranking of cities. The Liveability Index is envisioned as a 360° tool for tracking, planning and transforming Indian cities. The Liveability Index is aimed at the following objectives:

- Providing strong evidence-based approach for future interventions and investments to deliver liveability outcomes
- Catalysing actions to improve the overall quality of the city's liveability and achieve broader development outcomes including the Sustainable Development Goals
- Assessing the implementation of government policies and schemes governing characteristics of cities that can contribute to creating liveable communities

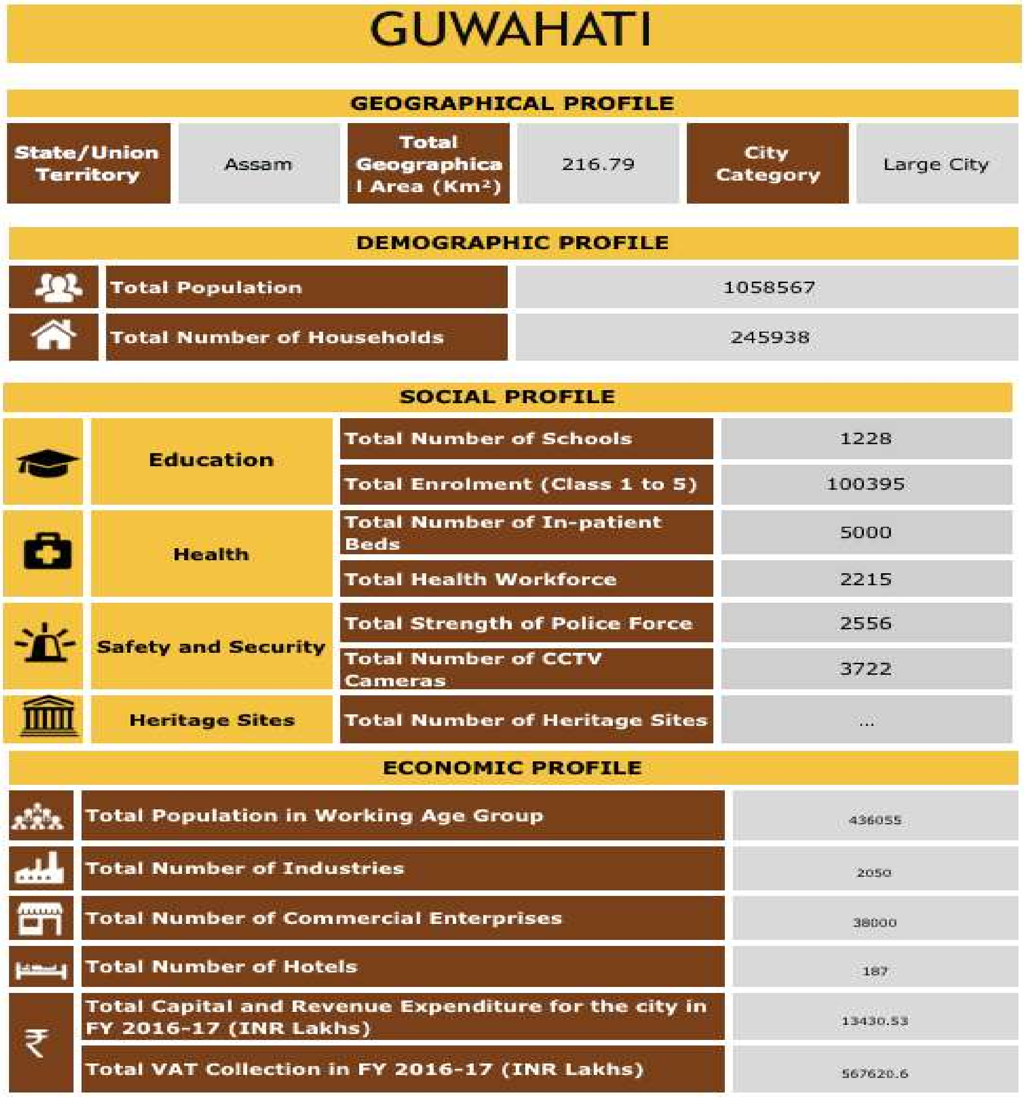


Tracking
liveability
Urban Planning
and Management
City level self-assessment
Citizen driven accountability systems
Use cases and pathways for reform
Unearth blind spots and incentivise action
Institutionalisation of outcome based planning and governance
Cities move to a single, unified data driven decision making paradigm...

The first round of the assessment commenced in January 2018 covering 116 major cities including smart cities, capital cities and cities with population of above one million each. Implementation of the liveability assessment commenced in January 2018 with a national level orientation workshop for the urban local bodies. The workshop aimed at orienting the states and urban local bodies on the overall framework, indicators, data sources, methodology and key milestones and timelines involved in the liveability assessment. Subsequently, a series of State/ Union Territory level orientation workshops were carried out in 33 states/UTs for a detailed discussion on the framework. Online data collection commenced from 9th March through an online data collection platform that supported both online and offline data submission modes. On the date of closure of the online data entry portal i.e., 16th April, 2018 112 cities submitted their data. Subsequently, comprehensive checks on the submitted data was undertaken that involved checking for outliers, logical inconsistencies etc. post which round-1 of data reconciliation was conducted. This draft report is based on round-1 of reconciled data as on 28th April, 2018.

2. City Profile

This chapter presents the city profile -Geographic and Demographic, Social (Education Health, Safety and Security, Heritage), Economic profile, and Physical (Water, sanitation and Waste Management, Electricity, Open space and roads).



GUWAHATI

GEOGRAPHICAL PROFILE

State/Union Territory	Assam	Total Geographical Area (Km^2)	216.79	City Category	Large City

DEMOGRAPHIC PROFILE

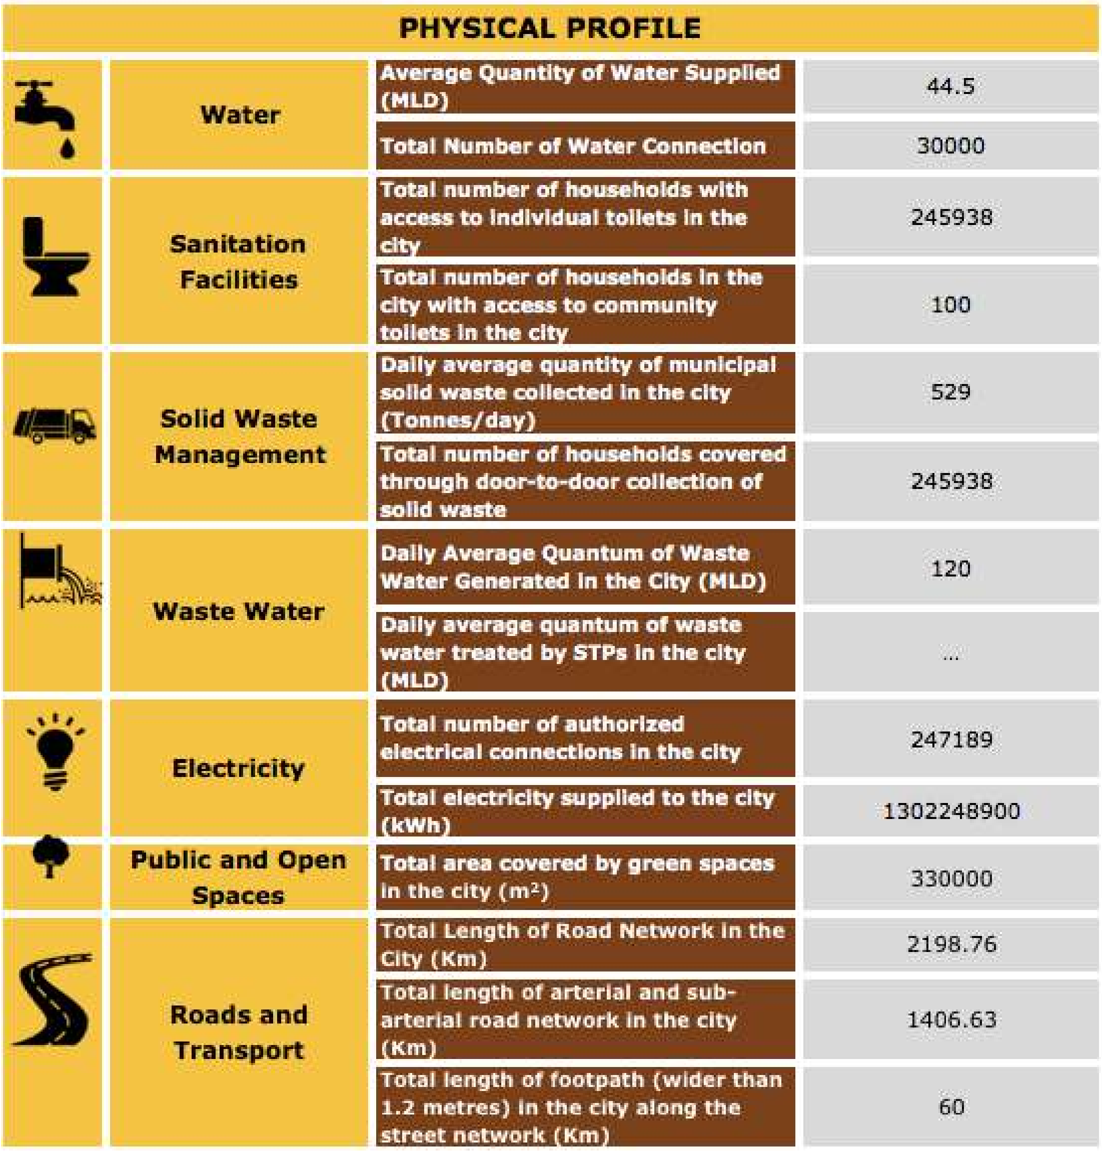
Total Population	1058567
Total Number of Households	245938

SOCIAL PROFILE

Education	Total Number of Schools	1228
	Total Enrolment (Class 1 to 5)	100395
Health	Total Number of In-patient Beds	5000
	Total Health Workforce	2215
Safety and Security	Total Strength of Police Force	2556
	Total Number of CCTV Cameras	3722
Heritage Sites	Total Number of Heritage Sites	...

ECONOMIC PROFILE

Total Population in Working Age Group	436055
Total Number of Industries	2050
Total Number of Commercial Enterprises	38000
Total Number of Hotels	187
Total Capital and Revenue Expenditure for the city in FY 2016-17 (INR Lakhs)	13430.53
Total VAT Collection in FY 2016-17 (INR Lakhs)	567620.6



PHYSICAL PROFILE

Water	Average Quantity of Water Supplied (MLD)	44.5
	Total Number of Water Connection	30000
Sanitation Facilities	Total number of households with access to individual toilets in the city	245938
	Total number of households in the city with access to community toilets in the city	100
Solid Waste Management	Daily average quantity of municipal solid waste collected in the city (Tonnes/day)	529
	Total number of households covered through door-to-door collection of solid waste	245938
Waste Water	Daily Average Quantum of Waste Water Generated in the City (MLD)	120
	Daily average quantum of waste water treated by STPs in the city (MLD)	...
Electricity	Total number of authorized electrical connections in the city	247189
	Total electricity supplied to the city (kWh)	1302248900
Public and Open Spaces	Total area covered by green spaces in the city (m^2)	330000
Roads and Transport	Total Length of Road Network in the City (Km)	2198.76
	Total length of arterial and sub-arterial road network in the city (Km)	1406.63
	Total length of footpath (wider than 1.2 metres) in the city along the street network (Km)	60

3. Liveability Framework and Indicators

The Liveability Framework comprises a total of 79 indicators (57 Core Indicators and 22 Supporting Indicators). A core indicator carries 70% weightage and a supporting indicator carries 30% weightage. These indicators are grouped under 15 thematic categories which in turn are part of four pillars of comprehensive development of cities i.e., institutional, social, economic and physical. Based on the performance of cities against the various core and supporting indicators, various 'Category Sub-Indexes' and a composite 'City Liveability Index' will be developed for each city.

3.1. Scoring and Computing Category Indices of Liveability

The set of 79 indicators, associated categories and pillars are presented in the table below:

Table 1 List of Pillars, Categories and Indicators

Pillars of Comprehensive Development	Category	Indicators
Institutional	1. Governance	1.1 Percentage of citizen services available online
		1.2 Percentage of services integrated through Command Centre
		1.3 Percentage of citizens using online services
		1.4 Average delay in grievance redressal
		1.5 Tax collected as percentage of tax billed
		1.6 Extent of cost recovery (O&M) in water supply services
		1.7 Capital spending as percentage of total expenditure
		1.8 Percentage of population covered under Ward Committees/Area *Sabhas*
Social	2. Identity and Culture	2.1 Restoration and reuse of historic buildings
		2.2 Percentage of ecologically important areas covered through projects for restoration
		2.3 Hotel occupancy
		2.4 Percentage of budget allocated towards cultural/sports activities
		2.5 Number of cultural/sports events hosted by city
	3. Education	3.1 Percentage of school-aged population enrolled in schools
		3.2 Percentage of female school-aged population enrolled in schools
		3.3 Primary education student-teacher ratio
		3.4 Percentage of schools with access to digital education

Pillars of Comprehensive Development	Category	Indicators
		3.5 Percentage of students completing primary education
		3.6 Percentage of students completing secondary education
	4. Health	4.1 Number of in-patient hospital beds per 10,000 population
		4.2 Healthcare professionals per 10,000 population
		4.3 Average response time in case of health emergencies
		4.4 Period prevalence of water borne diseases
		4.5 Period prevalence of vector borne diseases
	5. Safety and Security	5.1 Number of CCTV Cameras
		5.2 Number of recorded crimes per lakh population
		5.3 Extent of crimes recorded against women, children and elderly per year
		5.4 Transport-related fatality per lakh population
Economic	6. Economy and Employment	6.1 Increase in VAT/GST collection
		6.2 Increase in collection of Professional Tax
		6.3 Increase in issuance of Construction permits
		6.4 Unemployment rate
		6.5 Percentage of vendors registered and provided formal spaces
Physical	7. Housing and Inclusiveness	7.1 Percentage of Slum/EWS households covered through formal/affordable housing
		7.2 Percentage of slum areas covered through basic services
	8. Public Open Spaces	8.1 Per capita availability of green spaces
		8.2 Per capita availability of public and recreational places

Pillars of Comprehensive Development	Category	Indicators
	9. Mixed Land Use and Compactness	9.1 Share of mixed land use area in overall city land use
		9.2 Net Density
	10. Power Supply	10.1 Percentage of city population with authorized electrical services
		10.2 Percentage of electrical connections covered through smart meters
		10.3 Average number of electrical interruptions per year
		10.4 Average length of electrical interruptions per year
		10.5 Percentage of total energy derived from renewable sources
		10.6 Energy consumption per unit - water supply and sewerage
		10.7 Energy consumption per unit - street lighting
		10.8 Percentage of new and redeveloped buildings following green building norms
		10.9 Total energy consumption per capita
	11. Transportation and Mobility	11.1 Geographical coverage of public transport
		11.2 Availability of public transport
		11.3 Mode share of public transport
		11.4 Percentage of road network with dedicated bicycle tracks
		11.5 Percentage of interchanges with bicycle parking facilities
		11.6 Mode share of non-motorized transport
		11.7 Availability of Passenger Information System
		11.8 Extent of signal synchronization

Pillars of Comprehensive Development	Category	Indicators
		11.9 Availability of paid parking spaces
		11.10 Percentage coverage of footpaths – wider than 1.2 m
		11.11 Percentage of traffic intersections with pedestrian crossing facilities
		11.12 Extent to which universal accessibility is incorporated in public rights-of-way
	12. Assured Water Supply	12.1 Household level coverage of direct water supply connections
		12.2 Per capita supply of water
		12.3 Quality of water supplied
		12.4 Level of non-revenue water – NRW
		12.5 Percentage of water connections covered through meters
		12.6 Percentage of plots with rainwater harvesting facility
	13. Waste Water Management	13.1 Coverage of toilets
		13.2 Coverage of sewerage network and/or septage
		13.3 Collection efficiency of sewerage network
		13.4 Extent of reuse and recycling of waste water
		13.5 Coverage of storm water drains
	14. Solid Waste Management	14.1 Household level coverage of municipal solid waste collection
		14.2 Efficiency of collection of municipal solid waste
		14.3 Extent of municipal solid waste recovered through reuse
	15. Reduced Pollu-	15.1 Concentration of SO2- air pollution

Pillars of Comprehensive Development	Category	Indicators
	tion	15.2 Concentration of NO2- air pollution
		15.3 Concentration of PM10 - air pollution
		15.4 Level of noise pollution
		15.5 Quality of water in public surface water bodies

3.2. Scoring and Computing Category Indices of Liveability

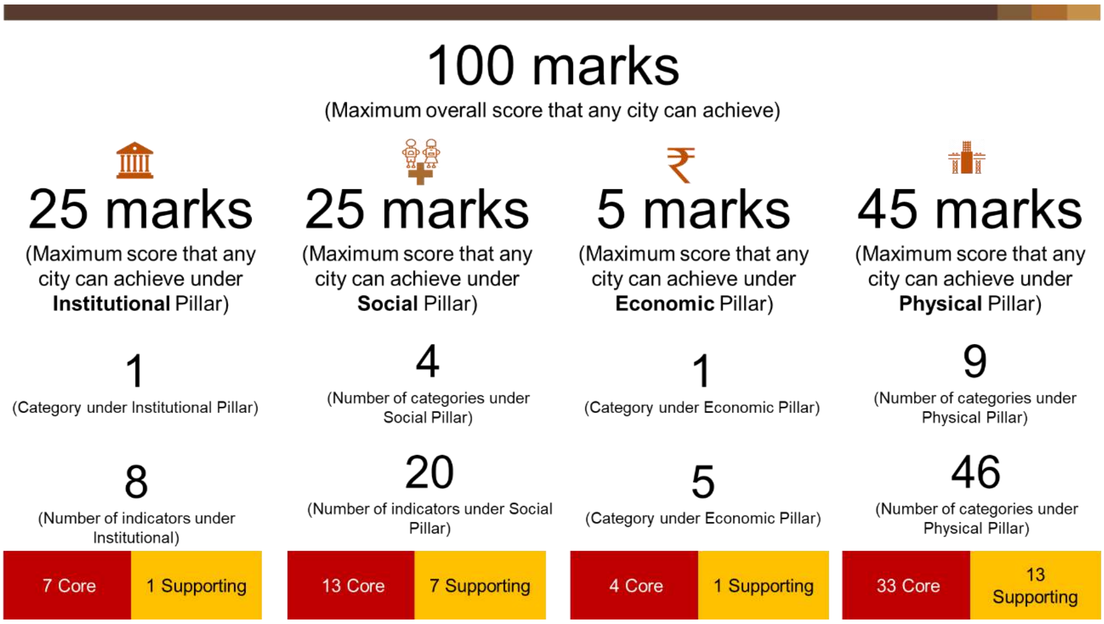
The performance achieved by cities against 79 indicators, will be assessed against given benchmarks. Where no international/national norms are available, city with the best performance in its group (population range) will be treated as a benchmark. The groups are given in the table below.

Table 2 Details on Population Range

Category	Population range
Category 1	Population ≥ 4 million
Category 2	1 million ≤ Population < 4 million
Category 3	0.5 million ≤ Population < 1 million
Category 4	Population < 0.5 million

3.3. Scoring Approach and Methodology

A city can earn a maximum score of 100 points for 79 indicators across four pillars. The pillar weights are as follows: Institutional (25 points), Social (25 points), Economy and Employment (5 points) and Physical (45 points). Based on the number and nature of indicators i.e., core vs. secondary, indicator wise maximum marks were computed.



100 marks
(Maximum overall score that any city can achieve)

25 marks (Maximum score that any city can achieve under **Institutional** Pillar)	25 marks (Maximum score that any city can achieve under **Social** Pillar)	5 marks (Maximum score that any city can achieve under **Economic** Pillar)	45 marks (Maximum score that any city can achieve under **Physical** Pillar)
1 (Category under Institutional Pillar)	4 (Number of categories under Social Pillar)	1 (Category under Economic Pillar)	9 (Number of categories under Physical Pillar)
8 (Number of indicators under Institutional)	20 (Number of indicators under Social Pillar)	5 (Category under Economic Pillar)	46 (Number of categories under Physical Pillar)
7 Core 1 Supporting	13 Core 7 Supporting	4 Core 1 Supporting	33 Core 13 Supporting

Dimensional Index Methodology (DIM) has been used to compute scores for each indicator with reference to "maximum within the comparison group" or "absolute benchmarks". For indicators where benchmarks are available, cities getting the benchmark score (or above) are given the maximum mark, and the marks awarded to other cities are calculated proportionately. For indicators where benchmarks are not available, the best performing cities in each population group are given the maximum mark, and the marks awarded to other cities (within the population group) are calculated proportionately. For indicators where benchmarks do not exist, the city data has been tested for outliers before scoring.

3.4. Scoring Normalisation:

To construct aggregate scores across cities as well as to make the scores across indicators comparable, indicator values were normalised using a min-max approach. The following formula was used to normalise the indicator values-

$$\frac{indicatorvalueforthecity - indicatorvaluefortheworstperformingcity}{benchmark - indicatorvaluefortheworstperformingcity}$$

This approach would restrict the normalised indicator value between 0 and 1. Cities that met or exceeded the benchmark received a normalised indicator value of 1. Worst performing cities are given a normalised indicator value of 0. After normalisation, the normalised value is weighted according to the category and the indicator being core or supporting.

To illustrate, consider the indicator 12.3 Quality of Water Supplied in the Category 12 for Assured Water Supply. If in City A 50% of the water samples collected qualify the potable water standards specified by

the CPHEEO, and only 10% of the samples from worst performing city qualify the standards. Then, the normalised value for the indicator for city A would be 0.44 [(0.5-0.1)/(1-0.1)].

The weight for indicator 12.3 is 1.03, so the final weighted score for City A would come out to 0.45 [1.03*0.44].

4. Data Collection and Verification

4.1. Submission of Data by the cities

The Liveability Assessment is based on secondary data submitted by the urban local bodies and other concerned government agencies (collectively called as data owners). The 79 indicators were broken down into a set of easy to understand and relatable 553 questions mapped to data owners. Submission of the data was enabled through an online data entry portal on the smartnet platform of the Ministry. The portal also allowed the ULBs to download the liveability assessment questionnaire and upload filled in questionnaire. To familiarise and assist cities in identifying, mapping and collation of data points, a city level nodal person was available during the entire period of data submission process.

4.2. Mapping of Data Owners for the City

For the assessment of liveability indices broadly 12 data owners such as Central/state Pollution control board, Development authority, DISCOM/Electricity Board, State Disaster Management Authority, State Education Department, State Health department, State Renewable energy and development agency, State sales and commercial taxes department, town and country planning department, Traffic and police department, Transport authority, and Urban local body were identified to respond to the questions on the portal. However, during state workshop and subsequent city level discussions, more data owners were mapped to respond to different categories and sub categories. The following table provides the details of city level data owners mapped under the 12 data owner.

Table 3:Details of Data Owners

Designated data owners	Subcategories	Data owners at city level
Urban Local Body	For Accounts Related Questions	Accounts Department, Guwahati Municipal Corporation
Urban Local Body	For Park and Recreation Related Questions	Guwahati Municipal Corporation
Urban Local Body	For Water Supply and Drainage related questions	Water Division, Guwahati Municipal Corporation

Urban Local Body	For Heritage sites related data	Department of Culture, Guwahati
Urban Local Body	For Ecological sites related data	Department of Environment and Forest, Guwahati
Urban Local Body	For Housing related data	Guwahati Metropolitan Development authority, Guwahati
Urban Local Body	For Building plan related data	Guwahati Metropolitan Development authority, Guwahati
Urban Local Body	For Roads related data	Guwahati Municipal Corporation
Urban Local Body	For Solid waste management related data	Solid waste management Department, Guwahati Municipal Corporation
Urban Local Body	For IT services related data	Directorate of Information and Technology IT section, Guwahati Municipal Corporation
Urban Local Body	For Vendor committee related data	Guwahati Municipal Corporation
Urban Local Body	Any other departments involved in providing data for questions mentioned under Urban Local Body	
Central / state Pollution control Board	Water Quality, Air Quality, Noise Quality	Assam Pollution Control Board
Development Authority	Building Infrastructure	Guwahati Metropolitan Development authority, Guwahati
	Construction planning	Guwahati Metropolitan Development authority, Guwahati
	Green Building	Guwahati Metropolitan Development authority, Guwahati
	Rain water harvesting	Guwahati Metropolitan Development authority, Guwahati
	Universal Design Principle	Guwahati Metropolitan Development authority, Guwahati
DISCOM/Electricity Board	Electrical Connection/ Grievance Redressal/ Power supply	Assam Power Distribution
State Disaster management authority		District Disaster management Office

State Education Department		Office of Inspector of School, Guwahati
State Health Department	Health care professionals	State Health Department
	Citizen Services	State Health Department
	Disease Prevalence	State Health Department
	Health Infrastructure	State Health Department
State Renewable Energy Development Agency		Assam Renewable Energy Development Agency
State Sales / Commercial Taxes Department		Sales and commercial Taxes department
Town and Country Planning Department	Land Use	Guwahati Metropolitan Development authority, Guwahati
Traffic and Police Department		Office of Commissioner of Police, Guwahati Department of Home Affaires
Transport Authorities	Buses	District Transport Office
	Registered Vehicles	District Transport Office
	Sub urban rail transport	NA
	Mono Rail Authority	NA
	Tramways	NA
	Marine Transport Authority	State transport authority

4.3. List of secondary documents available as supportive

City has provided supporting documents/evidences against the responses given by city on the online portal. In support of their responses on the portal, city submitted 39 number of documents. Documents submitted includes reports, official orders, copy of data maintained in official register, signed copy of questionnaire, and signed letters/submissions from concern departments. Verification includes mapping of documents against responses given by city, checking the type/category of documents, and validation of data provided.

The following table presents the data owner wise number of documents:

Table 4: Data owner wise number of secondary documents submitted by city

Data Owners	Number of Documents
Sales and Commercial Taxes	3
State Education Department	1
DISCOM/Electricity Department	11
Traffic and Police Department	1
Development Authority	6
Pollution Control Board	6
State Renewable Energy Department	4
Town and Country Planning	0
State Health Department	1
Transport Authority	5
Disaster Management	1
Urban Local Body	0
Total	39

4.4. Data Verification

A three-stage data quality check comprising verification of data against secondary documents furnished by data owners, logical inconsistency checks including outliers, and physical audit for select indicators (Refer the exhibit below) is being undertaken. The objective of the data quality check is to ensure that data from the source documents are accurate and verifiable. Sources of data included reports, administrative data, survey results and other statistical records, log books among other.

Physical audit of eight indicators – one indicator from the Institutional pillar, one from the Social pillar, one from the Economy pillar and five from the Physical pillar is also being carried out by the field team to ascertain the degree of reliability of data reported by the cities. The list of these eight indicators is presented below:

1.2 | Percentage of services integrated through Command Centre

2.3 | Hotel occupancy

3.4 | Percentage of schools with access to digital education

5.1| Number of streets, public places, junctions covered through surveillance systems

6.5 | Percentage of vendors registered and provided formal spaces

11.7 | Availability of Passenger Information System

11.11 | Percentage of traffic intersections with pedestrian crossing facilities

11.12 | Extent to which universal accessibility is incorporated in public rights-of-way

For a set of five indicators namely, unemployment rate, mode share of public transport, mode share of non-motorised transport, quality of water supplied and level of noise pollution, existing datasets were found to be not available consistently across all cities and/or were inadequate. To help cities that do not have data on these five indicators, dipstick assessments are being carried to fill data gaps.

6.4 | Unemployment Rate

11.3 | Mode share of public transport

11.5 | Mode share of Non Motorized Transport

12.3 | Quality of Water Supplied

15.4 | Level of Noise Pollution

4.5. Physical Audit

The following map presents the indicators audited at city level.

5. LA - Surveillance Camera
6. LA - Passenger Information Systems

5. City score on 15 categories of assessment:

Liveability Assessment covered 15 categories and 78 indicators. The below table presents the scores for all 15 indicators namely governance, identity & culture, education, health, safety and security, economy & employment, housing & inclusiveness, public open spaces, mixed land use & compactness, power supply, transport & mobility, assured water supply, waste water management, solid waste management and reduced pollution.

Table 5: Category wise scores

Categories	Scores in Percentage
Governance	58.19%
Identity & Culture	17%
Education	83%
Health	89%
Safety & Security	65%
Economy & Employment	23%
Housing & Inclusiveness	4%
Public Open Spaces	8%
Mixed Land Use & Compactness	3%
Power Supply	48%
Transport & Mobility	53%
Assured Water Supply	18%
Waste Water Management	41%
Solid Waste Management	71%
Reduced Pollution	75%

The rank of the city is based on the performance and scores in each of the category. The final city rank is submitted separately.

Executive Summary

Assessment of liveability indices is an initiative by the Ministry of Housing and Urban Affairs to improve quality of life of citizens and achieve sustainable development goals by encouraging cities to adopt "outcome based" approach for urban planning. Assessment process aimed to provide opportunity to cities to review the development components holistically by involving 79 measurable indicators categorized under governance, health, education, safety, economy, power supply, transportation and mobility, identity, culture, housing, waste management and pollution.

This report highlights the assessment process, key milestones, and the final outcome of the data submitted. Implementation of liveability assessment commenced formally on 19th January 2018. A national level workshop was organized on 13th February 2018 to explain the importance and process of liveability assessment and get feedback on methodology from the city authorities.

This was followed by the next stage of Questionnaire development. The questionnaire was arranged under 12 categories representing 12 data owners namely urban local body, Central and state pollution control board, development authority, DISCOM/Electricity board, State disaster management authority, state education department, state health department, state renewable energy development agency, state sales and commercial taxes department, town and country planning department, traffic and police department and transport authorities.

An online data entry portal was developed to facilitate data submission by the cities. Each city had a unique log in to access the portal and submit the data. Both online and off-line options (download the questionnaire in an excel) to submit the data were available for cities. An email help desk was set up for the cities to raise any queries and seek clarification when responding to the questions.

A team for each state comprising of State Coordinator and City Coordinator (one per city) was deployed that facilitated the process and supported the cities. A total of 6 regional coordinators/ consultants, 29 State Coordinators, and 99 city coordinators were deployed across 116 cities. Training for state coordinators was held from 26th to 28th February 2018 at Chennai to make coordinators understand overall liveability assessment, indicators, data sources, protocols and roles and responsibilities.

City Reconnaissance Meetings were initiated by the state and city coordinators. The discussion began with discussions to finalize the state workshop schedule, mapping of data owners, and assist cities in data collection. The City Coordinators were based in the cities for over 6 weeks and during this time, they liase with ULB and other data owners to explain the liveability framework, online portal, and facilitate the online submission.

A total of 33 state workshops were conducted at the state level. The objective of the workshop was to orient the city stakeholders on liveability assessment, indicators, components of data collection, timelines, expectations of support and support extended by MoHUA. The state level workshops brought

various city level departments on a single platform to understand and discuss the methodology and components of city liveability assessment.

Nodal agency at state level supported by the City and State Coordinator and city level (Municipality corporation/smart city limited) coordinated with city specific data owners/departments for data gathering, collation, and submission. Nodal persons in each department were appointed for timely data collection and submission. Of 116, 112 cities submitted data as per the timeline on 16th April 2018.

Post submission, the city and state coordinators supported by the central team followed up extensively with the cities to support secondary documents as evidence to substantiate their submissions. Secondary documents such as reports, official orders, copy of office register, signed copy of liveability assessment questionnaire furnished by cities against the submitted data. Documents are verified to map the documents for the reponses provided by city and to check the type data provided by city. The document check outcomes were shared with the cities as a part of data quality check.

For checking consistency of data, logical check of data, verifying data from other public sources were undertaken. Quality check was done to ensure data validity and provide opportunity to cities to review the data provided by them and correct in case of wrong data entry.

For 8 selected indicators namely, percentage of services integrated through command and control center, hotel occupancy rate, percentage of schools with access to digital education, number of CCTV cameras per unit road length, percentage of vendors registered and provided formal spaces, availability of passenger information system, percentage of traffic intersection with pedestrian crossing facility, and extent to which universal accessibility is incorporated in public rights of way. Physical audit was conducted in 110 cities by physical auditors appointed and trained by the consortium. In consultation with ULB nodal person, locations and indicators for physical audit was selected in each city. A mobile based application was developed to capture the physical audit related data.

Primary data collection was done for five indicators such as unemployment rates, mode share of public transport, mode share of non-motorized transport, quality of water supplied, and level of noise pollution. Protocols for water and noise test were prepared in consultation with experts. Water quality test involved physical, chemical and bacteriological test of water as per the CPCB norms. For testing quality of water at consumer end, the auditors worked closely with the ULB and Water department. Samples were collected from consumer end and submitted to the lab suggested by city. For noise pollution, in about 20 cities the state pollution board or city level environment department took the responsibility for providing noise pollution data as per the protocols. In rest of the cities, mobile based application was used to measure noise pollution.

During implementation, MoHUA facilitated the process by conducting video conferences with cities to address any queries, reiterate the importance, and ensure that cities adequately engages in the process and submit their responses in time and respond to requests for clarifications.

In addition to secondary data collection, physical audit and primary data collection, citizen survey was conducted to understand their perception and level of satisfaction on various services such as health, education, water supply, electricity, waste management etc. provided by urban local bodies. Over 60000 citizens participated in the survey across India.

The final scores and ranks have been generated based on the scoring methodology that has been discussed extensively and minor modifications made that are summarized as below:

#	Challenges	Proposed Solutions
1	Only 23 cities of 111 cities have City Mobility Plan (CMP) or any and hence able to provide data for Mode Share of Public Transport and Non-Motorised Transport. To address the data gap, as advised by the MoHUA, the consortia undertook a sample dipstick across all cities covering a sample of 150 Households. Understandably, the dipstick findings will not match the rigor of a CMP.	We recommend the following: 1) Cities which have provided CMP Data will be evaluated on 100% of the maximum score 2) For the cities where the dipstick data is used, the city receives a 50% discount on the overall score Alternatively, another approach is to assign 0 score to all 88 cities that don't have a CMP
2	Variance was observed on data reported by cities on road network and data presented in the smart city proposals during the verifications.	We recommend taking the data reported by the cities in the Smart City Proposals.
3	There is no secondary source/ organization that provides unemployment data at city level. As a result, most cities do not have the data. Fully cognizance of the challenges of generating this data in a short span of time, it was agreed to collect this data through a dipstick survey on lines of NSSO questions. The data generated needs further scrutiny and triangulation with some inputs from experts. This may not be possible in the short	The indicator on unemployment will be excluded from scores. For final ranking, the cities will be scored on 78 indicators.

#	Challenges	Proposed Solutions
	window.	
4	Many cities did not have data on noise pollution and it was decided that data will be collected using a mobile app for all the 111 cities. However, many cities have expressed reservations with the approach especially with respect to the reliability of using this data. Further, some cities have relied on the SPCB to collect the data as per the approach proposed by the consortia. Thus, noise pollution data is currently from two sources: 1. SPCB- 20 cities 2. Noise-based app- 91 cities	The data collected through the primary survey will be used for scoring the cities. Currently, there is no differential scoring for the data from the SPCB and the data collected through the mobile app. However, a certain higher weightage can be provided to those cities which used the state apparatus to collect noise pollution data.
5	For the indicator on quality of water supplied, the methodology document states that samples should be drawn both at the treatment plant outlet as well as the consumer end. However, the data provided by the cities were predominantly from the distribution point. Hence for consumer end results with MoHUA intervention, consortia coordinated with cities to collect the data at the consumer end. The cities facilitated the testing. The outcome of the process is as below: 1. Sample given- 102 cities 2. Report received- 86 cities 3. Report awaited- 16 cities 4. Tests not completed due to lack of cooperation and other reasons – 9	The maximum score for this indicator will be distributed equally (50%) for results based on samples from the treatment plant and consumer end. Cities that did not complete tests or provide the results will be given a score 0 for against consumer end tests.
6	City level population is not projected annually by most of the cities. So, estimates for 2017 population are not available with the cities.	As recommended by MoHUA, 2011 census population is being used for the ranking purpose.

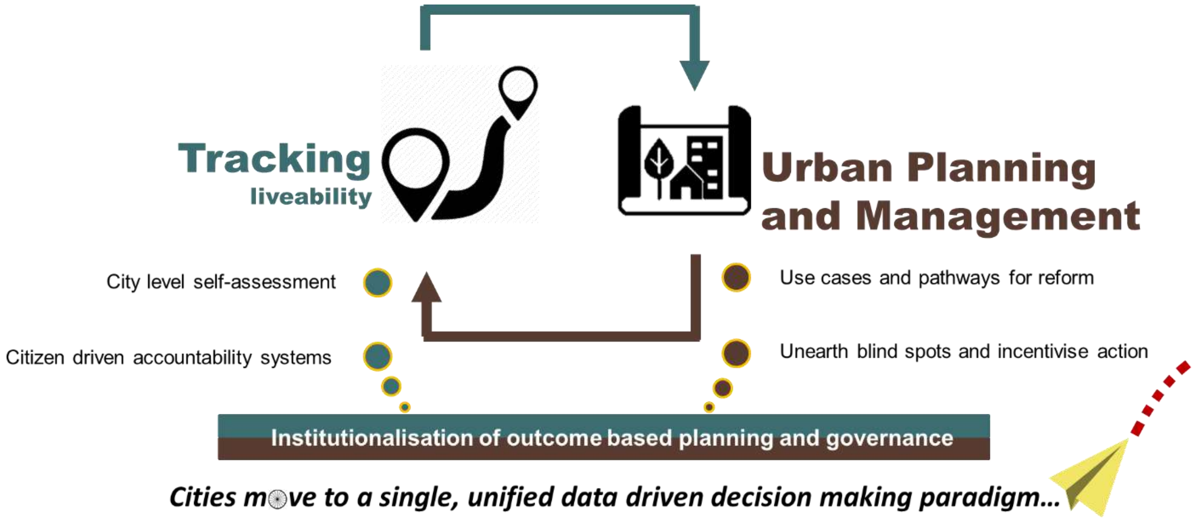
#	Challenges	Proposed Solutions
7	The age category specific data for 9 cities is not available at a city level	The age category specific population data has been taken at a district level for these cities.
8	Indicators on non-motorised transports like- Dedicated bicycle tracks, bicycle parking facilities and mode share of non-motorised transport are not relevant for hilly terrains.	As discussed during the PMC meeting, these indicators have been treated as non-applicable for the hilly cities and the weights have been redistributed among other indicators within the same category.
9	The indicator on increase in professional tax is not relevant to cities which do not levy the professional tax.	As discussed during the PMC meeting, this indicator has been non-applicable to the cities belonging to states where professional tax is not levied, and the weights have been redistributed among other indicators within the same category.
10	The indicator on increase in VAT collection is not applicable to Port Blair and Kavaratti, as there was no provision of VAT collection in these cities.	As discussed during the PMC meeting, these indicatosr has been treated as non-applicable for these two cities and the weights have been redistributed among other indicators within the same category.
11	Indicator on coverage of basic services to slum households does not concern cities with no slums (notified/ non-notified.	As discussed during the PMC meeting, this indicators has been treated as non-applicable for these cities and the weights have been redistributed among other indicators within the same category.

1. Introduction

The Ministry of Housing and Urban Affairs (MoHUA) is implementing several flagship urban missions such as the Smart Cities Mission (SCM), Atal Mission for Urban Rejuvenation and Transformation (AMRUT), Heritage City Development and Augmentation Yojana (HRIDAY), Housing for All (HFA). Theses mission along with other transformative initiatives of the Government including National Water Mission, Power for All, National Health Mission are aimed at making Indian cities more 'liveable.' The overarching goal of these initiatives is to move from an input-based approach to a 'citizen centric-outcome based' assessment of urban liveability.

To develop a common minimum framework for cities to assess their existing status and chart their pathway towards providing a better quality of life to their citizens, the MoHUA developed a set of 'Liveability Standards' relevant to cities to generate a Liveability Index and ranking of cities. These standards were launched in June, 2017. The MoHUA has planned to conduct an 'Annual Assessment of Liveability Standards in Cities – an ambitious national project that will involve yearly submission of data by cities across the various indicators, compilation and analysis, development of indices and ranking of cities. The Liveability Index is envisioned as a 360° tool for tracking, planning and transforming Indian cities. The Liveability Index is aimed at the following objectives:

- Providing strong evidence-based approach for future interventions and investments to deliver liveability outcomes
- Catalysing actions to improve the overall quality of the city's liveability and achieve broader development outcomes including the Sustainable Development Goals
- Assessing the implementation of government policies and schemes governing characteristics of cities that can contribute to creating liveable communities

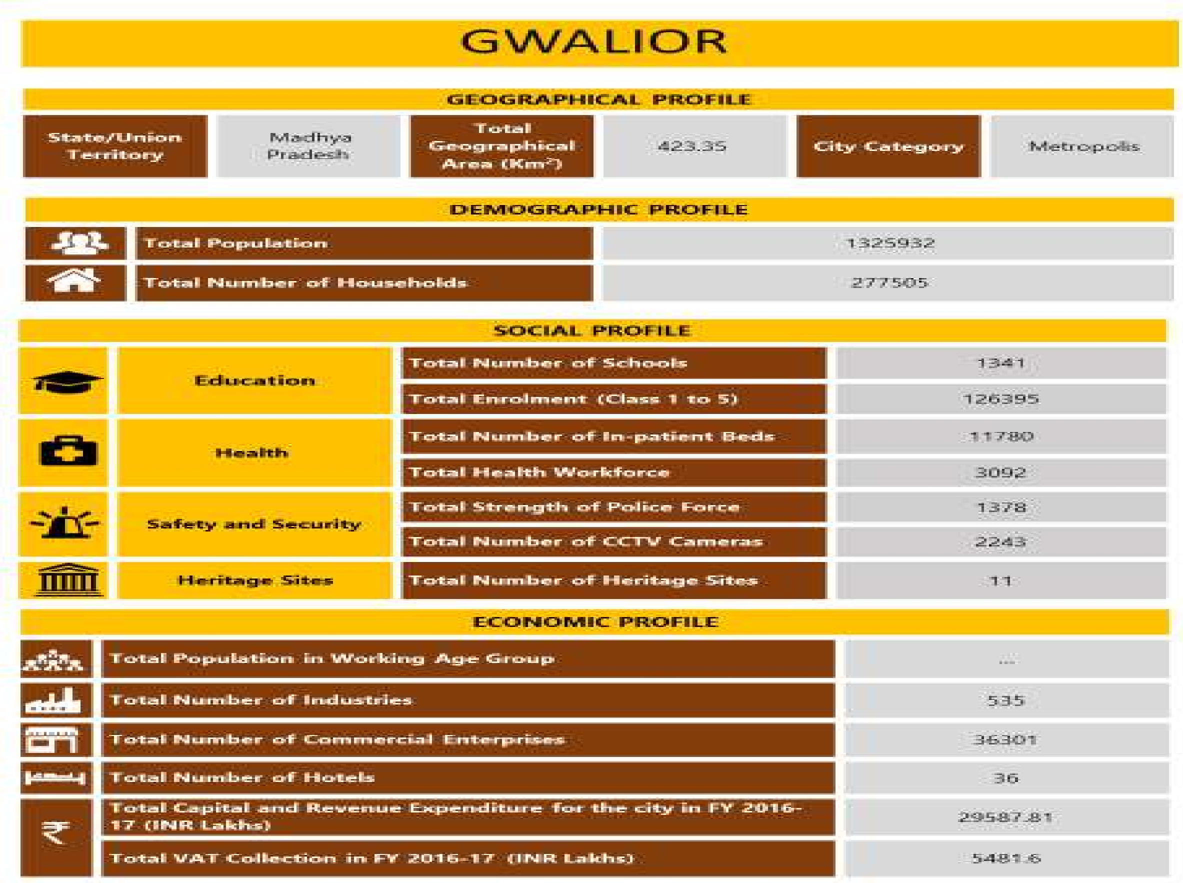


Tracking
liveability
Urban Planning
and Management
City level self-assessment
Citizen driven accountability systems
Use cases and pathways for reform
Unearth blind spots and incentivise action
Institutionalisation of outcome based planning and governance
Cities move to a single, unified data driven decision making paradigm...

The first round of the assessment commenced in January 2018 covering 116 major cities including smart cities, capital cities and cities with population of above one million each. Implementation of the liveability assessment commenced in January 2018 with a national level orientation workshop for the urban local bodies. The workshop aimed at orienting the states and urban local bodies on the overall framework, indicators, data sources, methodology and key milestones and timelines involved in the liveability assessment. Subsequently, a series of State/ Union Territory level orientation workshops were carried out in 33 states/UTs for a detailed discussion on the framework. Online data collection commenced from 9th March through an online data collection platform that supported both online and offline data submission modes. On the date of closure of the online data entry portal i.e., 16th April, 2018 112 cities submitted their data. Subsequently, comprehensive checks on the submitted data was undertaken that involved checking for outliers, logical inconsistencies etc. post which round-1 of data reconciliation was conducted. This draft report is based on round-1 of reconciled data as on 28th April, 2018.

2. City Profile

This chapter presents the city profile -Geographic and Demographic, Social (Education Health, Safety and Security, Heritage), Economic profile, and Physical (Water, sanitation and Waste Management, Electricity, Open space and roads).



GWALIOR

GEOGRAPHICAL PROFILE

State/Union Territory	Madhya Pradesh	Total Geographical Area (Km^2)	423.35	City Category	Metropolis

DEMOGRAPHIC PROFILE

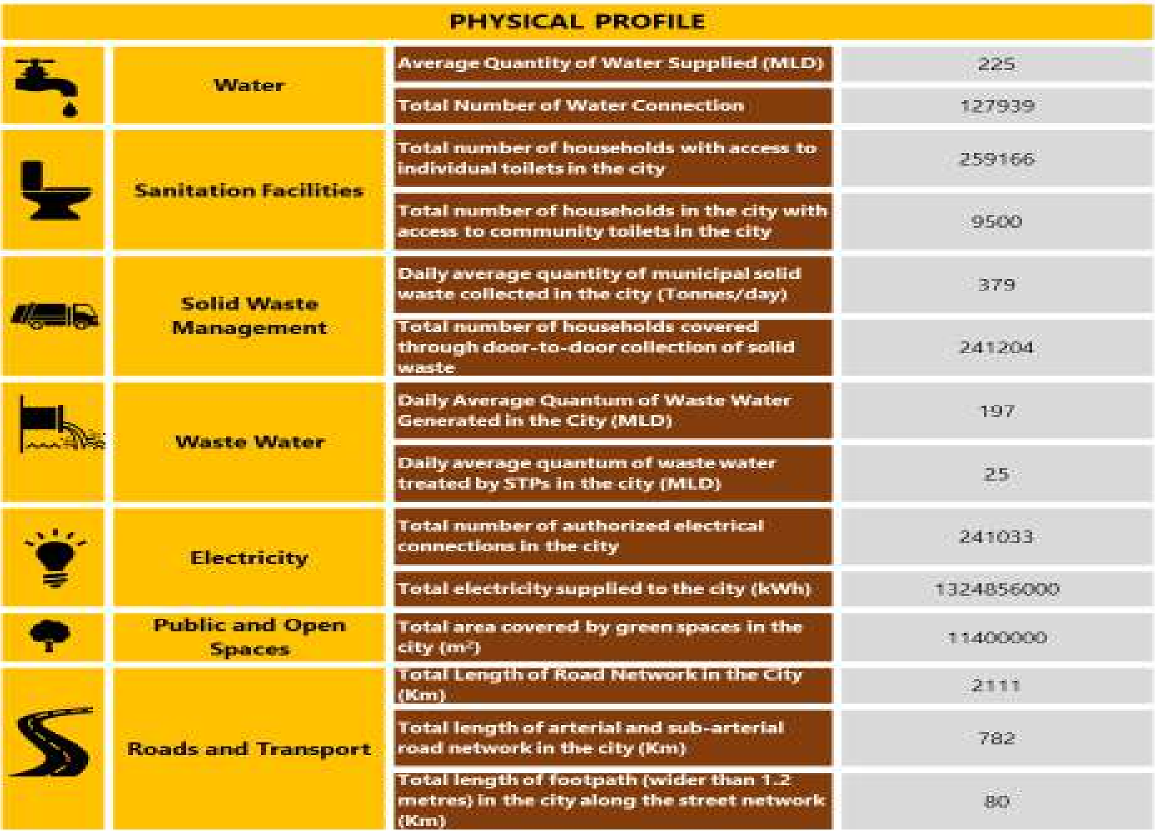
Total Population	1325932
Total Number of Households	277505

SOCIAL PROFILE

Education	Total Number of Schools	1341
	Total Enrolment (Class 1 to 5)	126395
Health	Total Number of In-patient Beds	11780
	Total Health Workforce	3092
Safety and Security	Total Strength of Police Force	1378
	Total Number of CCTV Cameras	2243
Heritage Sites	Total Number of Heritage Sites	11

ECONOMIC PROFILE

Total Population in Working Age Group	...
Total Number of Industries	535
Total Number of Commercial Enterprises	36301
Total Number of Hotels	36
Total Capital and Revenue Expenditure for the city in FY 2016-17 (INR Lakhs)	29587.81
Total VAT Collection in FY 2016-17 (INR Lakhs)	5481.6



PHYSICAL PROFILE		
Water	Average Quantity of Water Supplied (MLD)	225
	Total Number of Water Connection	127939
Sanitation Facilities	Total number of households with access to individual toilets in the city	259166
	Total number of households in the city with access to community toilets in the city	9500
Solid Waste Management	Daily average quantity of municipal solid waste collected in the city (Tonnes/day)	379
	Total number of households covered through door-to-door collection of solid waste	241204
Waste Water	Daily Average Quantum of Waste Water Generated in the City (MLD)	197
	Daily average quantum of waste water treated by STPs in the city (MLD)	25
Electricity	Total number of authorized electrical connections in the city	241033
	Total electricity supplied to the city (kWh)	1324856000
Public and Open Spaces	Total area covered by green spaces in the city (m^2)	11400000
Roads and Transport	Total Length of Road Network in the City (Km)	2111
	Total length of arterial and sub-arterial road network in the city (Km)	782
	Total length of footpath (wider than 1.2 metres) in the city along the street network (Km)	80

3. Liveability Framework and Indicators

The Liveability Framework comprises a total of 79 indicators (57 Core Indicators and 22 Supporting Indicators). A core indicator carries 70% weightage and a supporting indicator carries 30% weightage. These indicators are grouped under 15 thematic categories which in turn are part of four pillars of comprehensive development of cities i.e., institutional, social, economic and physical. Based on the performance of cities against the various core and supporting indicators, various 'Category Sub-Indexes' and a composite 'City Liveability Index' will be developed for each city.

3.1 Scoring and Computing Category Indices of Liveability

The set of 79 indicators, associated categories and pillars are presented in the table below:

Table 1 List of Pillars, Categories and Indicators

Pillars of Comprehensive Development	Category	Indicators
Institutional	1. Governance	1.1 Percentage of citizen services available online
		1.2 Percentage of services integrated through Command Centre
		1.3 Percentage of citizens using online services
		1.4 Average delay in grievance redressal
		1.5 Tax collected as percentage of tax billed
		1.6 Extent of cost recovery (O&M) in water supply services
		1.7 Capital spending as percentage of total expenditure
		1.8 Percentage of population covered under Ward Committees/Area *Sabhas*
Social	**2. Identity and Culture**	2.1 Restoration and reuse of historic buildings
		2.2 Percentage of ecologically important areas covered through projects for restoration
		2.3 Hotel occupancy
		2.4 Percentage of budget allocated towards cultural/sports activities
		2.5 Number of cultural/sports events hosted by city
	3. Education	3.1 Percentage of school-aged population enrolled in schools
		3.2 Percentage of female school-aged population enrolled in schools
		3.3 Primary education student-teacher ratio
		3.4 Percentage of schools with access to digital education
		3.5 Percentage of students completing primary education
		3.6 Percentage of students completing secondary education
	4. Health	4.1 Number of in-patient hospital beds per 10,000 population
		4.2 Healthcare professionals per 10,000 population
		4.3 Average response time in case of health emergencies
		4.4 Period prevalence of water borne diseases
		4.5 Period prevalence of vector borne diseases

Pillars of Comprehensive Development	Category	Indicators
	5. Safety and Security	5.1 Number of CCTV Cameras
		5.2 Number of recorded crimes per lakh population
		5.3 Extent of crimes recorded against women, children and elderly per year
		5.4 Transport-related fatality per lakh population
Economic	**6. Economy and Employment**	6.1 Increase in VAT/GST collection
		6.2 Increase in collection of Professional Tax
		6.3 Increase in issuance of Construction permits
		6.4 Unemployment rate
		6.5 Percentage of vendors registered and provided formal spaces
Physical	**7. Housing and Inclusiveness**	7.1 Percentage of Slum/EWS households covered through formal/affordable housing
		7.2 Percentage of slum areas covered through basic services
	8. Public Open Spaces	8.1 Per capita availability of green spaces
		8.2 Per capita availability of public and recreational places
	9. Mixed Land Use and Compactness	9.1 Share of mixed land use area in overall city land use
		9.2 Net Density
	10. Power Supply	10.1 Percentage of city population with authorized electrical services
		10.2 Percentage of electrical connections covered through smart meters
		10.3 Average number of electrical interruptions per year
		10.4 Average length of electrical interruptions per year
		10.5 Percentage of total energy derived from renewable sources
		10.6 Energy consumption per unit - water supply and sewerage
		10.7 Energy consumption per unit - street lighting
		10.8 Percentage of new and redeveloped buildings following green building norms
		10.9 Total energy consumption per capita
	11. Transportation and Mobility	11.1 Geographical coverage of public transport
		11.2 Availability of public transport
		11.3 Mode share of public transport
		11.4 Percentage of road network with dedicated bicycle

Pillars of Comprehensive Development	Category	Indicators
		tracks
		11.5 Percentage of interchanges with bicycle parking facilities
		11.6 Mode share of non-motorized transport
		11.7 Availability of Passenger Information System
		11.8 Extent of signal synchronization
		11.9 Availability of paid parking spaces
		11.10 Percentage coverage of footpaths – wider than 1.2 m
		11.11 Percentage of traffic intersections with pedestrian crossing facilities
		11.12 Extent to which universal accessibility is incorporated in public rights-of-way
	12. Assured Water Supply	12.1 Household level coverage of direct water supply connections
		12.2 Per capita supply of water
		12.3 Quality of water supplied
		12.4 Level of non-revenue water – NRW
		12.5 Percentage of water connections covered through meters
		12.6 Percentage of plots with rainwater harvesting facility
	13. Waste Water Management	13.1 Coverage of toilets
		13.2 Coverage of sewerage network and/or septage
		13.3 Collection efficiency of sewerage network
		13.4 Extent of reuse and recycling of waste water
		13.5 Coverage of storm water drains
	14. Solid Waste Management	14.1 Household level coverage of municipal solid waste collection
		14.2 Efficiency of collection of municipal solid waste
		14.3 Extent of municipal solid waste recovered through reuse
	15. Reduced Pollution	15.1 Concentration of SO2- air pollution
		15.2 Concentration of NO2- air pollution
		15.3 Concentration of PM10 - air pollution
		15.4 Level of noise pollution
		15.5 Quality of water in public surface water bodies

3.2 Scoring and Computing Category Indices of Liveability

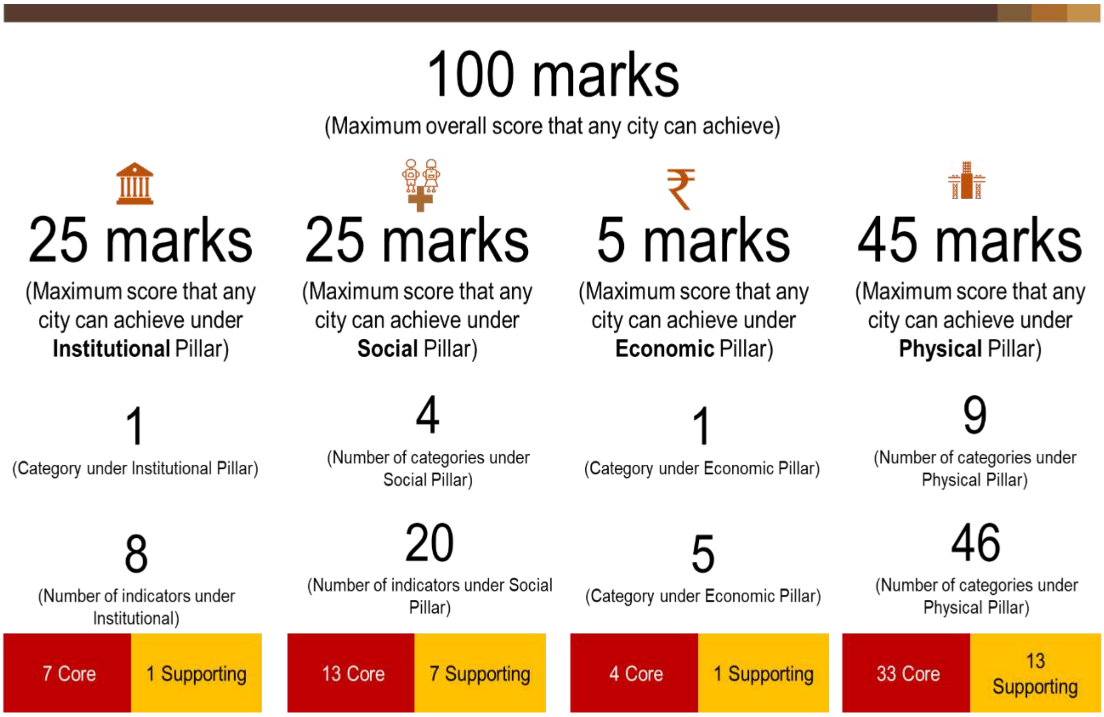
The performance achieved by cities against 79 indicators, will be assessed against given benchmarks. Where no international/national norms are available, city with the best performance in its group (population range) will be treated as a benchmark. The groups are given in the table below.

Table 2 Details on Population Range

Category	Population range
Category 1	Population ≥ 4 million
Category 2	1 million ≤ Population < 4 million
Category 3	0.5 million ≤ Population < 1 million
Category 4	Population < 0.5 million

3.3 Scoring Approach and Methodology

A city can earn a maximum score of 100 points for 79 indicators across four pillars. The pillar weights are as follows: Institutional (25 points), Social (25 points), Economy and Employment (5 points) and Physical (45 points). Based on the number and nature of indicators i.e., core vs. secondary, indicator wise maximum marks were computed.



100 marks
(Maximum overall score that any city can achieve)

25 marks (Maximum score that any city can achieve under **Institutional** Pillar)	25 marks (Maximum score that any city can achieve under **Social** Pillar)	5 marks (Maximum score that any city can achieve under **Economic** Pillar)	45 marks (Maximum score that any city can achieve under **Physical** Pillar)
1 (Category under Institutional Pillar)	4 (Number of categories under Social Pillar)	1 (Category under Economic Pillar)	9 (Number of categories under Physical Pillar)
8 (Number of indicators under Institutional)	20 (Number of indicators under Social Pillar)	5 (Category under Economic Pillar)	46 (Number of categories under Physical Pillar)
7 Core | 1 Supporting	13 Core | 7 Supporting	4 Core | 1 Supporting	33 Core | 13 Supporting

Dimensional Index Methodology (DIM) has been used to compute scores for each indicator with reference to "maximum within the comparison group" or "absolute benchmarks". For indicators where benchmarks are available, cities getting the benchmark score (or above) are given the maximum mark, and the marks awarded to other cities are calculated proportionately. For indicators where benchmarks are not available, the best performing cities in each population group are given the maximum mark, and the marks awarded to other cities (within the population group) are calculated proportionately. For indicators where benchmarks do not exist, the city data has been tested for outliers before scoring.

3.4 Scoring Normalisation:

To construct aggregate scores across cities as well as to make the scores across indicators comparable, indicator values were normalised using a min-max approach. The following formula was used to normalise the indicator values-

$$\frac{indicator\ value\ for\ the\ city - indicator\ value\ for\ the\ worst\ performing\ city}{benchmark - \ indicator\ value\ for\ the\ worst\ performing\ city}$$

This approach would restrict the normalised indicator value between 0 and 1. Cities that met or exceeded the benchmark received a normalised indicator value of 1. Worst performing cities are given a normalised indicator value of 0. After normalisation, the normalised value is weighted according to the category and the indicator being core or supporting.

To illustrate, consider the indicator 12.3 Quality of Water Supplied in the Category 12 for Assured Water Supply. If in City A 50% of the water samples collected qualify the potable water standards specified by the CPHEEO, and only 10% of the samples from worst performing city qualify the standards. Then, the normalised value for the indicator for city A would be 0.44 [(0.5-0.1)/(1-0.1)].

The weight for indicator 12.3 is 1.03, so the final weighted score for City A would come out to 0.45 [1.03*0.44].

4. Data Collection and Verification

4.1 Submission of Data by the cities

The Liveability Assessment is based on secondary data submitted by the urban local bodies and other concerned government agencies (collectively called as data owners). The 79 indicators were broken down into a set of easy to understand and relatable 553 questions mapped to data owners. Submission of the data was enabled through an online data entry portal on the smartnet platform of the Ministry. The portal also allowed the ULBs to download the liveability assessment questionnaire and upload filled in questionnaire. To familiarise and assist cities in identifying, mapping and collation of data points, a city level nodal person was available during the entire period of data submission process.

4.2 Mapping of Data Owners for the City

For the assessment of liveability indices broadly 12 data owners such as Central/state Pollution control board, Development authority, DISCOM/Electricity Board, State Disaster Management Authority, State Education Department, State Health department, State Renewable energy and development agency, State sales and commercial taxes department, town and country planning department, Traffic and police department, Transport authority, and Urban local body were identified to respond to the questions on the portal. However, during state workshop and subsequent city level discussions, more data owners were mapped to respond to different categories and sub categories. The following table provides the details of city level data owners mapped under the 12 data owner.

Table 3:Details of Data Owners

Designated data owners	Sub categories	Data owners at city level
Urban Local Body	Accounts	Accounts Section, Gwalior Municipal Corporation
	Park and Recreation	Garden Section, Gwalior Municipal Corporation
	Water Supply and Drainage	Public Health and Engineering Department
	Heritage sites	Gwalior Municipal Corporation
	Ecological sites	Zoo section, Gwalior Municipal Corporation
	Housing	Gwalior Municipal Corporation
	Building plan	Building Permission Section, Gwalior Municipal Corporation
	Roads	Roads section, Gwalior Municipal Corporation
	Solid waste management	Gwalior Municipal Corporation
	IT services	IT Section, Satna Municipal Corporation
	Vendor committee	Dukan Sansthan, Gwalior Municipal Corporation
	Any other departments involved in providing data for questions mentioned under Urban Local Body	
Central / state Pollution control Board	Water Quality, Air Quality, Noise Quality	Madhya Pradesh Pollution Control Board

Designated data owners	Sub categories	Data owners at city level
Development Authority	Building Infrastructure	Gwalior Development Authority
	Construction planning	Gwalior Development Authority
	Green Building	Gwalior Development Authority
	Rain water harvesting	Gwalior Development Authority
	Universal Design Principle	Gwalior Development Authority
DISCOM/Electricity Board	Electrical Connection/ Grievance Redressal/ Power supply	Madhya Pradesh Madhya Kshetra Vidyut Vitaran Company limited
State Disaster management authority		District Disaster management Office
State Education Department		District Education Department
State Health Department	Health care professionals	Health Department
	Citizen Services	Health Department
	Disease Prevalence	Health Department
	Health Infrastructure	Health Department
State Renewable Energy Development Agency		Madhya Pradesh New and Renewable Energy Department
State Sales / Commercial Taxes Department		Department of Commercial Taxes
Town and Country Planning Department	Land Use	Town and country planning
Traffic and Police Department		Traffic and Police Department, Gwalior
Transport Authorities	Buses	Regional Transport Office
	Registered Vehicles	Madhya Pradesh Transport Department
	Sub urban rail transport	NA
	Mono Rail Authority	NA
	Tramways	NA
	Marine Transport Authority	NA

4.3 List of secondary documents available as supportive

City has provided supporting documents/evidences against the responses given by city on the online portal. In support of their responses on the portal, city submitted 117 number of documents. Documents submitted includes reports, official orders, copy of data maintained in official register, signed copy of questionnaire, and signed letters/submissions from concern departments. Verification includes mapping of documents against responses given by city, checking the type/category of documents, and validation of data provided.

The following table presents the data owner wise number of documents:

Table 4: Data owner wise number of secondary documents submitted by city

Data Owners	Number of Documents
Sales and Commercial Taxes	7
State Education Department	4
DISCOM/Electricity Department	7
Traffic and Police Department	8
Development Authority	8
Pollution Control Board	10
State Renewable Energy Department	1
Town and Country Planning	4
State Health Department	4
Transport Authority	7
Disaster Management	0
Urban Local Body	57
Total	117

4.4 Data Verification

A three-stage data quality check comprising verification of data against secondary documents furnished by data owners, logical inconsistency checks including outliers, and physical audit for select indicators (Refer the exhibit below) is being undertaken. The objective of the data quality check is to ensure that data from the source documents are accurate and verifiable. Sources of data included reports, administrative data, survey results and other statistical records, log books among other.

Physical audit of eight indicators – one indicator from the Institutional pillar, one from the Social pillar, one from the Economy pillar and five from the Physical pillar is also being carried out by the field team to ascertain the degree of reliability of data reported by the cities. The list of these eight indicators is presented below:

1.2 | Percentage of services integrated through Command Centre

2.3 | Hotel occupancy

3.4 | Percentage of schools with access to digital education

5.1 | Number of streets, public places, junctions covered through surveillance systems

6.5 | Percentage of vendors registered and provided formal spaces

11.7 | Availability of Passenger Information System

11.11 | Percentage of traffic intersections with pedestrian crossing facilities

11.12 | Extent to which universal accessibility is incorporated in public rights-of-way

For a set of five indicators namely, unemployment rate, mode share of public transport, mode share of non-motorised transport, quality of water supplied and level of noise pollution, existing datasets were found to be not available consistently across all cities and/or were inadequate. To help cities that do not have data on these five indicators, dipstick assessments are being carried to fill data gaps.

6.4 | Unemployment Rate

11.3 | Mode share of public transport

11.5 | Mode share of Non Motorized Transport

12.3 | Quality of Water Supplied

15.4 | Level of Noise Pollution

4.5 Physical Audit

The following map presents the indicators audited at city level.

5. City Score on 15 categories of Assessment

Liveability Assessment covered 15 categories and 78 indicators. The below table presents the scores for all 15 indicators namely governance, identity & culture, education, health, safety and security, economy & employment, housing & inclusiveness, public open spaces, mixed land use & compactness, power supply, transport & mobility, assured water supply, waste water management, solid waste management and reduced pollution.

Table 5: Category wise scores

Categories	Scores in Percentage
Governance	54.36%
Identity & Culture	31%
Education	86%
Health	87%
Safety & Security	63%
Economy & Employment	18%
Housing & Inclusiveness	2%
Public Open Spaces	46%
Mixed Land Use & Compactness	0%
Power Supply	46%
Transport & Mobility	34%
Assured Water Supply	74%
Waste Water Management	65%
Solid Waste Management	73%
Reduced Pollution	78%

The rank of the city is based on the performance and scores in each of the category. The final city rank is submitted separately.

Executive Summary

Assessment of liveability indices is an initiative by the Ministry of Housing and Urban Affairs to improve quality of life of citizens and achieve sustainable development goals by encouraging cities to adopt "outcome based" approach for urban planning. Assessment process aimed to provide opportunity to cities to review the development components holistically by involving 79 measurable indicators categorized under governance, health, education, safety, economy, power supply, transportation and mobility, identity, culture, housing, waste management and pollution.

This report highlights the assessment process, key milestones, and the final outcome of the data submitted. Implementation of liveability assessment commenced formally on 19th January 2018. A national level workshop was organized on 13th February 2018 to explain the importance and process of liveability assessment and get feedback on methodology from the city authorities.

This was followed by the next stage of Questionnaire development. The questionnaire was arranged under 12 categories representing 12 data owners namely urban local body, Central and state pollution control board, development authority, DISCOM/Electricity board, State disaster management authority, state education department, state health department, state renewable energy development agency, state sales and commercial taxes department, town and country planning department, traffic and police department and transport authorities.

An online data entry portal was developed to facilitate data submission by the cities. Each city had a unique log in to access the portal and submit the data. Both online and off-line options (download the questionnaire in an excel) to submit the data were available for cities. An email help desk was set up for the cities to raise any queries and seek clarification when responding to the questions.

A team for each state comprising of State Coordinator and City Coordinator (one per city) was deployed that facilitated the process and supported the cities. A total of 6 regional coordinators/ consultants, 29 State Coordinators, and 99 city coordinators were deployed across 116 cities. Training for state coordinators was held from 26th to 28th February 2018 at Chennai to make coordinators understand overall liveability assessment, indicators, data sources, protocols and roles and responsibilities.

City Reconnaissance Meetings were initiated by the state and city coordinators. The discussion began with discussions to finalize the state workshop schedule, mapping of data owners, and assist cities in data collection. The City Coordinators were based in the cities for over 6 weeks and during this time, they liase with ULB and other data owners to explain the liveability framework, online portal, and facilitate the online submission.

A total of 33 state workshops were conducted at the state level. The objective of the workshop was to orient the city stakeholders on liveability assessment, indicators, components of data collection, timelines, expectations of support and support extended by MoHUA. The state level workshops brought

various city level departments on a single platform to understand and discuss the methodology and components of city liveability assessment.

Nodal agency at state level supported by the City and State Coordinator and city level (Municipality corporation/smart city limited) coordinated with city specific data owners/departments for data gathering, collation, and submission. Nodal persons in each department were appointed for timely data collection and submission. Of 116, 112 cities submitted data as per the timeline on 16th April 2018.

Post submission, the city and state coordinators supported by the central team followed up extensively with the cities to support secondary documents as evidence to substantiate their submissions. Secondary documents such as reports, official orders, copy of office register, signed copy of liveability assessment questionnaire furnished by cities against the submitted data. Documents are verified to map the documents for the reponses provided by city and to check the type data provided by city. The document check outcomes were shared with the cities as a part of data quality check.

For checking consistency of data, logical check of data, verifying data from other public sources were undertaken. Quality check was done to ensure data validity and provide opportunity to cities to review the data provided by them and correct in case of wrong data entry.

For 8 selected indicators namely, percentage of services integrated through command and control center, hotel occupancy rate, percentage of schools with access to digital education, number of CCTV cameras per unit road length, percentage of vendors registered and provided formal spaces, availability of passenger information system, percentage of traffic intersection with pedestrian crossing facility, and extent to which universal accessibility is incorporated in public rights of way. Physical audit was conducted in 110 cities by physical auditors appointed and trained by the consortium. In consultation with ULB nodal person, locations and indicators for physical audit was selected in each city. A mobile based application was developed to capture the physical audit related data.

Primary data collection was done for five indicators such as unemployment rates, mode share of public transport, mode share of non-motorized transport, quality of water supplied, and level of noise pollution. Protocols for water and noise test were prepared in consultation with experts. Water quality test involved physical, chemical and bacteriological test of water as per the CPCB norms. For testing quality of water at consumer end, the auditors worked closely with the ULB and Water department. Samples were collected from consumer end and submitted to the lab suggested by city. For noise pollution, in about 20 cities the state pollution board or city level environment department took the responsibility for providing noise pollution data as per the protocols. In rest of the cities, mobile based application was used to measure noise pollution.

During implementation, MoHUA facilitated the process by conducting video conferences with cities to address any queries, reiterate the importance, and ensure that cities adequately engages in the process and submit their responses in time and respond to requests for clarifications.

In addition to secondary data collection, physical audit and primary data collection, citizen survey was conducted to understand their perception and level of satisfaction on various services such as health, education, water supply, electricity, waste management etc. provided by urban local bodies. Over 60000 citizens participated in the survey across India.

The final scores and ranks have been generated based on the scoring methodology that has been discussed extensively and minor modifications made that are summarized as below:

#	Challenges	Proposed Solutions
1	Only 23 cities of 111 cities have City Mobility Plan (CMP) or any and hence able to provide data for Mode Share of Public Transport and Non-Motorised Transport. To address the data gap, as advised by the MoHUA, the consortia undertook a sample dipstick across all cities covering a sample of 150 Households. Understandably, the dipstick findings will not match the rigor of a CMP.	We recommend the following: 1) Cities which have provided CMP Data will be evaluated on 100% of the maximum score 2) For the cities where the dipstick data is used, the city receives a 50% discount on the overall score Alternatively, another approach is to assign 0 score to all 88 cities that don't have a CMP
2	Variance was observed on data reported by cities on road network and data presented in the smart city proposals during the verifications.	We recommend taking the data reported by the cities in the Smart City Proposals.
3	There is no secondary source/ organization that provides unemployment data at city level. As a result, most cities do not have the data. Fully cognizance of the challenges of generating this data in a short span of time, it was agreed to collect this data through a dipstick survey on lines of NSSO questions. The data generated needs further scrutiny and triangulation with some inputs from experts. This may not be possible in the short	The indicator on unemployment will be excluded from scores. For final ranking, the cities will be scored on 78 indicators.

#	Challenges	Proposed Solutions
	window.	
4	Many cities did not have data on noise pollution and it was decided that data will be collected using a mobile app for all the 111 cities. However, many cities have expressed reservations with the approach especially with respect to the reliability of using this data. Further, some cities have relied on the SPCB to collect the data as per the approach proposed by the consortia. Thus, noise pollution data is currently from two sources: 1. SPCB- 20 cities 2. Noise-based app- 91 cities	The data collected through the primary survey will be used for scoring the cities. Currently, there is no differential scoring for the data from the SPCB and the data collected through the mobile app. However, a certain higher weightage can be provided to those cities which used the state apparatus to collect noise pollution data.
5	For the indicator on quality of water supplied, the methodology document states that samples should be drawn both at the treatment plant outlet as well as the consumer end. However, the data provided by the cities were predominantly from the distribution point. Hence for consumer end results with MoHUA intervention, consortia coordinated with cities to collect the data at the consumer end. The cities facilitated the testing. The outcome of the process is as below: 1. Sample given- 102 cities 2. Report received- 86 cities 3. Report awaited- 16 cities 4. Tests not completed due to lack of cooperation and other reasons – 9	The maximum score for this indicator will be distributed equally (50%) for results based on samples from the treatment plant and consumer end. Cities that did not complete tests or provide the results will be given a score 0 for against consumer end tests.
6	City level population is not projected annually by most of the cities. So, estimates for 2017 population are not available with the cities.	As recommended by MoHUA, 2011 census population is being used for the ranking purpose.

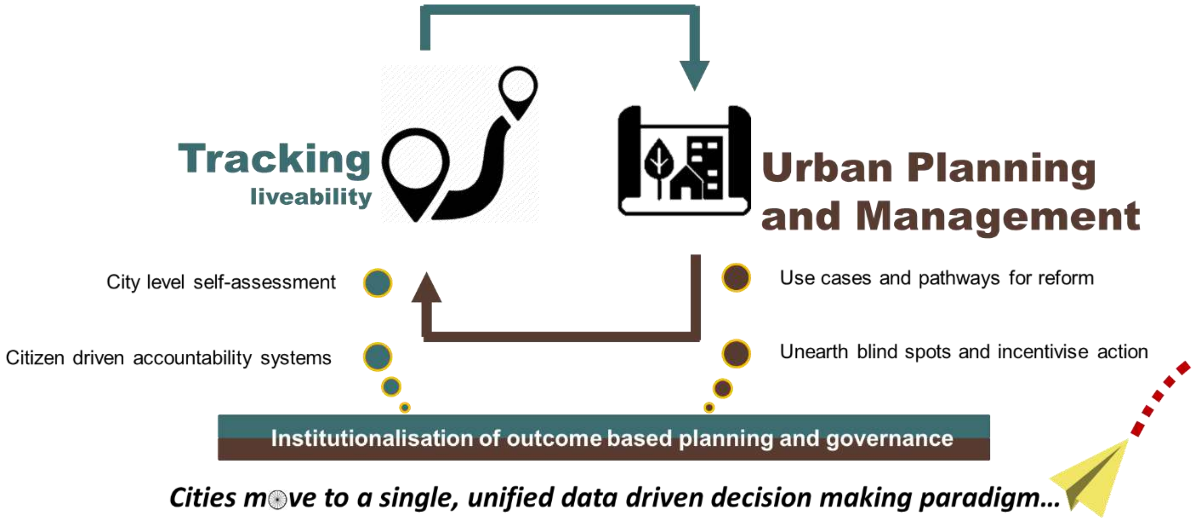
#	**Challenges**	**Proposed Solutions**
7	The age category specific data for 9 cities is not available at a city level	The age category specific population data has been taken at a district level for these cities.
8	Indicators on non-motorised transports like- Dedicated bicycle tracks, bicycle parking facilities and mode share of non-motorised transport are not relevant for hilly terrains.	As discussed during the PMC meeting, these indicators have been treated as non-applicable for the hilly cities and the weights have been redistributed among other indicators within the same category.
9	The indicator on increase in professional tax is not relevant to cities which do not levy the professional tax.	As discussed during the PMC meeting, this indicator has been non-applicable to the cities belonging to states where professional tax is not levied, and the weights have been redistributed among other indicators within the same category.
10	The indicator on increase in VAT collection is not applicable to Port Blair and Kavaratti, as there was no provision of VAT collection in these cities.	As discussed during the PMC meeting, these indicatosr has been treated as non-applicable for these two cities and the weights have been redistributed among other indicators within the same category.
11	Indicator on coverage of basic services to slum households does not concern cities with no slums (notified/ non-notified.	As discussed during the PMC meeting, this indicators has been treated as non-applicable for these cities and the weights have been redistributed among other indicators within the same category.

1. Introduction

The Ministry of Housing and Urban Affairs (MoHUA) is implementing several flagship urban missions such as the Smart Cities Mission (SCM), Atal Mission for Urban Rejuvenation and Transformation (AMRUT), Heritage City Development and Augmentation Yojana (HRIDAY), Housing for All (HFA). Theses mission along with other transformative initiatives of the Government including National Water Mission, Power for All, National Health Mission are aimed at making Indian cities more 'liveable.' The overarching goal of these initiatives is to move from an input-based approach to a 'citizen centric-outcome based' assessment of urban liveability.

To develop a common minimum framework for cities to assess their existing status and chart their pathway towards providing a better quality of life to their citizens, the MoHUA developed a set of 'Liveability Standards' relevant to cities to generate a Liveability Index and ranking of cities. These standards were launched in June, 2017. The MoHUA has planned to conduct an 'Annual Assessment of Liveability Standards in Cities – an ambitious national project that will involve yearly submission of data by cities across the various indicators, compilation and analysis, development of indices and ranking of cities. The Liveability Index is envisioned as a 360° tool for tracking, planning and transforming Indian cities. The Liveability Index is aimed at the following objectives:

- Providing strong evidence-based approach for future interventions and investments to deliver liveability outcomes
- Catalysing actions to improve the overall quality of the city's liveability and achieve broader development outcomes including the Sustainable Development Goals
- Assessing the implementation of government policies and schemes governing characteristics of cities that can contribute to creating liveable communities



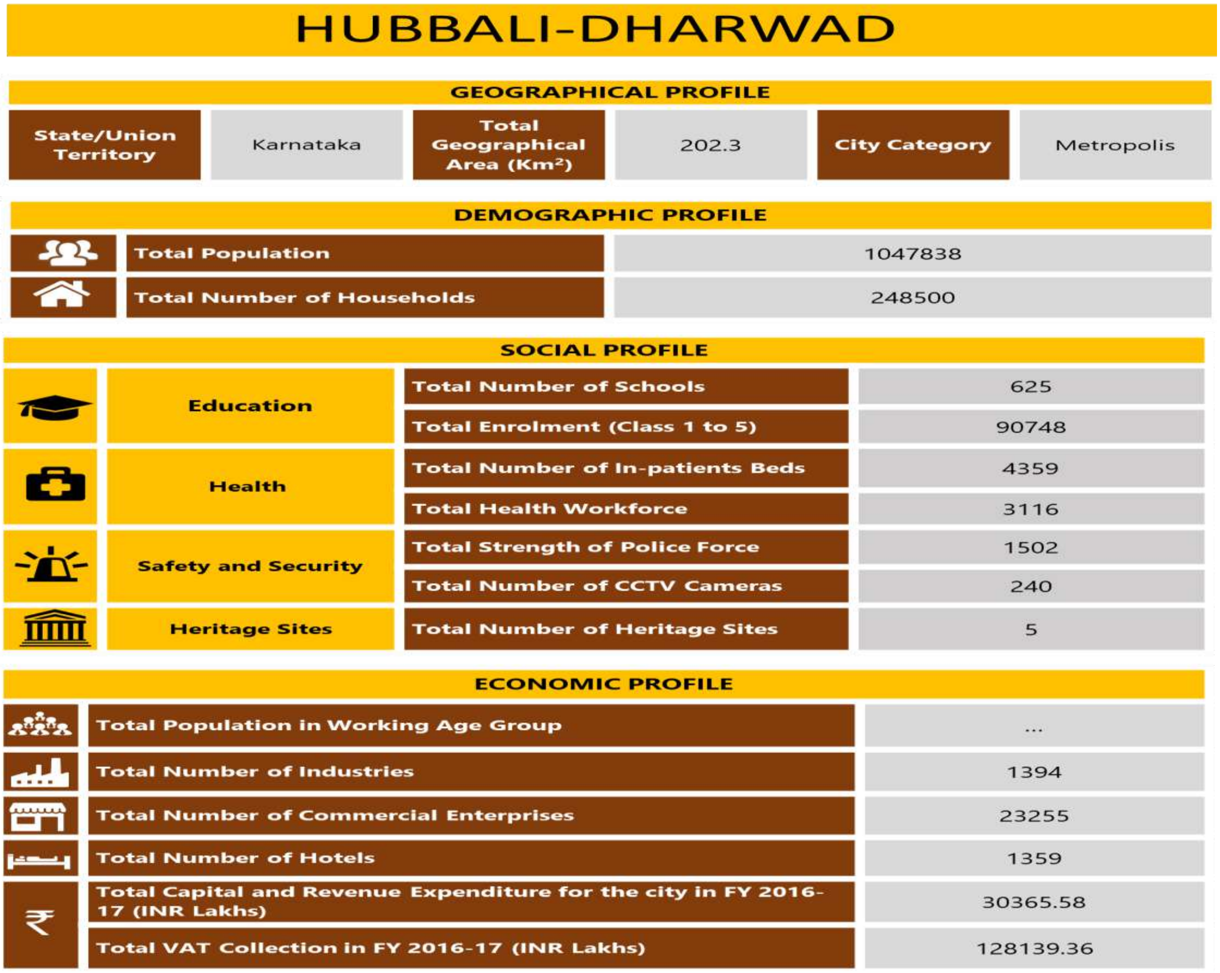
Tracking
liveability
Urban Planning and Management
City level self-assessment
Citizen driven accountability systems
Use cases and pathways for reform
Unearth blind spots and incentivise action
Institutionalisation of outcome based planning and governance

Cities move to a single, unified data driven decision making paradigm...

The first round of the assessment commenced in January 2018 covering 116 major cities including smart cities, capital cities and cities with population of above one million each. Implementation of the liveability assessment commenced in January 2018 with a national level orientation workshop for the urban local bodies. The workshop aimed at orienting the states and urban local bodies on the overall framework, indicators, data sources, methodology and key milestones and timelines involved in the liveability assessment. Subsequently, a series of State/ Union Territory level orientation workshops were carried out in 33 states/UTs for a detailed discussion on the framework. Online data collection commenced from 9th March through an online data collection platform that supported both online and offline data submission modes. On the date of closure of the online data entry portal i.e., 16th April, 2018 112 cities submitted their data. Subsequently, comprehensive checks on the submitted data was undertaken that involved checking for outliers, logical inconsistencies etc. post which round-1 of data reconciliation was conducted. This draft report is based on round-1 of reconciled data as on 28th April, 2018.

2. City Profile

This chapter presents the city profile -Geographic and Demographic, Social (Education Health, Safety and Security, Heritage), Economic profile, and Physical (Water, sanitation and Waste Management, Electricity, Open space and roads).



HUBBALI-DHARWAD

GEOGRAPHICAL PROFILE

State/Union Territory	Karnataka	Total Geographical Area (Km^2)	202.3	City Category	Metropolis

DEMOGRAPHIC PROFILE

Total Population	1047838
Total Number of Households	248500

SOCIAL PROFILE

Education	Total Number of Schools	625
	Total Enrolment (Class 1 to 5)	90748
Health	Total Number of In-patients Beds	4359
	Total Health Workforce	3116
Safety and Security	Total Strength of Police Force	1502
	Total Number of CCTV Cameras	240
Heritage Sites	Total Number of Heritage Sites	5

ECONOMIC PROFILE

Total Population in Working Age Group	...
Total Number of Industries	1394
Total Number of Commercial Enterprises	23255
Total Number of Hotels	1359
Total Capital and Revenue Expenditure for the city in FY 2016-17 (INR Lakhs)	30365.58
Total VAT Collection in FY 2016-17 (INR Lakhs)	128139.36

PHYSICAL PROFILE		
Water	Average Quantity of Water Supplied (MLD)	63.64
	Total Number of Water Connections	58416
Sanitation Facilities	Total number of households with access to individual toilets in the city	199000
	Total number of households in the city with access to community toilets in the city	21200
Solid Waste Management	Daily average quantity of municipal solid waste collected in the city (Tonnes/day)	360
	Total number of households covered through door-to-door collection of solid waste	175000
Waste Water	Daily Average Quantum of Waste Water Generated in the City (MLD)	60
	Daily average quantum of waste water treated by STPs in the city (MLD)	40
Electricity	Total number of authorized electrical connections in the city	351955
	Total electricity supplied to the city (kWh)	492491861
Public and Open Spaces	Total area covered by green spaces in the city (m^2)	218477.66
Roads and Transport	Total Length of Road Network in the City (Km)	2223.86
	Total length of arterial and sub-arterial road network in the city (Km)	1621
	Total length of footpath (wider than 1.2 metres) in the city along the street network (Km)	12.5

3. Liveability Framework and Indicators

The Liveability Framework comprises a total of 79 indicators (57 Core Indicators and 22 Supporting Indicators). A core indicator carries 70% weightage and a supporting indicator carries 30% weightage. These indicators are grouped under 15 thematic categories which in turn are part of four pillars of comprehensive development of cities i.e., institutional, social, economic and physical. Based on the performance of cities against the various core and supporting indicators, various 'Category Sub-Indexes' and a composite 'City Liveability Index' will be developed for each city.

3.1 Scoring and Computing Category Indices of Liveability

The set of 79 indicators, associated categories and pillars are presented in the table below:

Table 1 List of Pillars, Categories and Indicators

Pillars of Comprehensive Development	Category	Indicators
Institutional	1. Governance	1.1 Percentage of citizen services available online
		1.2 Percentage of services integrated through Command Centre
		1.3 Percentage of citizens using online services
		1.4 Average delay in grievance redressal
		1.5 Tax collected as percentage of tax billed
		1.6 Extent of cost recovery (O&M) in water supply services
		1.7 Capital spending as percentage of total expenditure
		1.8 Percentage of population covered under Ward Committees/Area *Sabhas*
Social	**2. Identity and Culture**	2.1 Restoration and reuse of historic buildings
		2.2 Percentage of ecologically important areas covered through projects for restoration
		2.3 Hotel occupancy
		2.4 Percentage of budget allocated towards cultural/sports activities
		2.5 Number of cultural/sports events hosted by city
	3. Education	3.1 Percentage of school-aged population enrolled in schools
		3.2 Percentage of female school-aged population enrolled in schools
		3.3 Primary education student-teacher ratio
		3.4 Percentage of schools with access to digital education
		3.5 Percentage of students completing primary education
		3.6 Percentage of students completing secondary education
	4. Health	4.1 Number of in-patient hospital beds per 10,000 population
		4.2 Healthcare professionals per 10,000 population
		4.3 Average response time in case of health emergencies
		4.4 Period prevalence of water borne diseases

Pillars of Comprehensive Development	Category	Indicators
		4.5 Period prevalence of vector borne diseases
	5. Safety and Security	5.1 Number of CCTV Cameras
		5.2 Number of recorded crimes per lakh population
		5.3 Extent of crimes recorded against women, children and elderly per year
		5.4 Transport-related fatality per lakh population
Economic	**6. Economy and Employment**	6.1 Increase in VAT/GST collection
		6.2 Increase in collection of Professional Tax
		6.3 Increase in issuance of Construction permits
		6.4 Unemployment rate
		6.5 Percentage of vendors registered and provided formal spaces
Physical	**7. Housing and Inclusiveness**	7.1 Percentage of Slum/EWS households covered through formal/affordable housing
		7.2 Percentage of slum areas covered through basic services
	8. Public Open Spaces	8.1 Per capita availability of green spaces
		8.2 Per capita availability of public and recreational places
	9. Mixed Land Use and Compactness	9.1 Share of mixed land use area in overall city land use
		9.2 Net Density
	10. Power Supply	10.1 Percentage of city population with authorized electrical services
		10.2 Percentage of electrical connections covered through smart meters
		10.3 Average number of electrical interruptions per year
		10.4 Average length of electrical interruptions per year
		10.5 Percentage of total energy derived from renewable sources
		10.6 Energy consumption per unit - water supply and sewerage
		10.7 Energy consumption per unit - street lighting
		10.8 Percentage of new and redeveloped buildings following green building norms
		10.9 Total energy consumption per capita
	11. Transportation	11.1 Geographical coverage of public transport
		11.2 Availability of public transport

Pillars of Comprehensive Development	Category	Indicators
	and Mobility	11.3 Mode share of public transport
		11.4 Percentage of road network with dedicated bicycle tracks
		11.5 Percentage of interchanges with bicycle parking facilities
		11.6 Mode share of non-motorized transport
		11.7 Availability of Passenger Information System
		11.8 Extent of signal synchronization
		11.9 Availability of paid parking spaces
		11.10 Percentage coverage of footpaths – wider than 1.2 m
		11.11 Percentage of traffic intersections with pedestrian crossing facilities
		11.12 Extent to which universal accessibility is incorporated in public rights-of-way
	12. Assured Water Supply	12.1 Household level coverage of direct water supply connections
		12.2 Per capita supply of water
		12.3 Quality of water supplied
		12.4 Level of non-revenue water – NRW
		12.5 Percentage of water connections covered through meters
		12.6 Percentage of plots with rainwater harvesting facility
	13. Waste Water Management	13.1 Coverage of toilets
		13.2 Coverage of sewerage network and/or septage
		13.3 Collection efficiency of sewerage network
		13.4 Extent of reuse and recycling of waste water
		13.5 Coverage of storm water drains
	14. Solid Waste Management	14.1 Household level coverage of municipal solid waste collection
		14.2 Efficiency of collection of municipal solid waste
		14.3 Extent of municipal solid waste recovered through reuse
	15. Reduced Pollution	15.1 Concentration of SO2- air pollution
		15.2 Concentration of NO2- air pollution
		15.3 Concentration of PM10 - air pollution
		15.4 Level of noise pollution
		15.5 Quality of water in public surface water bodies

3.2 Scoring and Computing Category Indices of Liveability

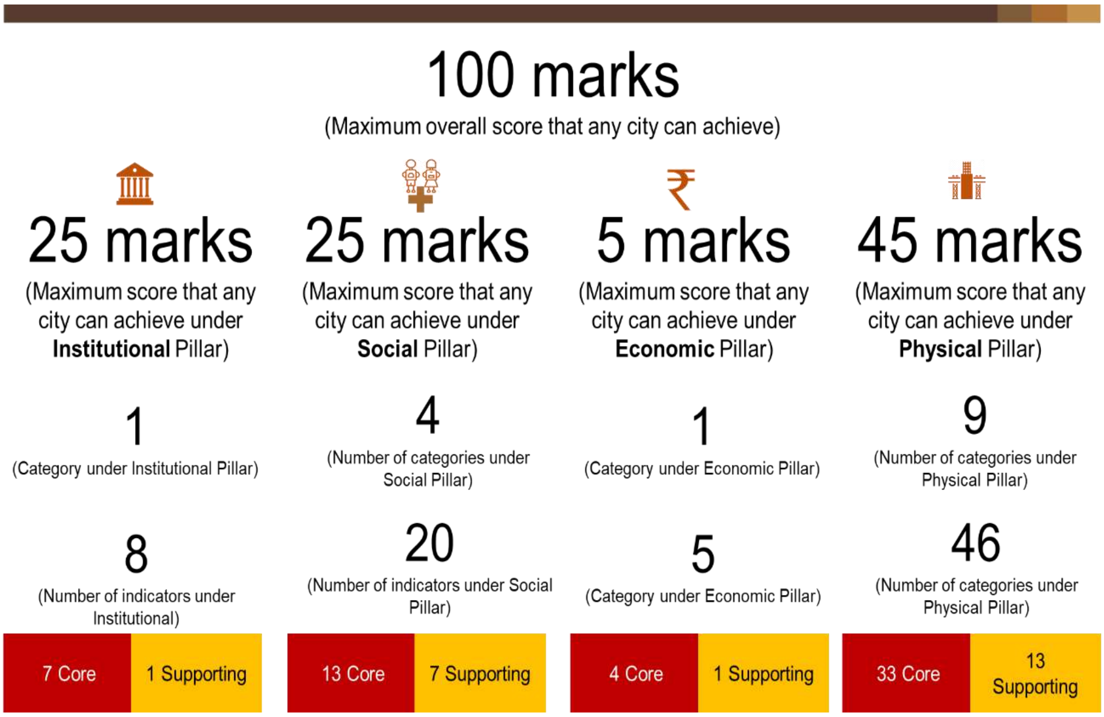
The performance achieved by cities against 79 indicators, will be assessed against given benchmarks. Where no international/national norms are available, city with the best performance in its group (population range) will be treated as a benchmark. The groups are given in the table below.

Table 2 Details on Population Range

Category	Population range
Category 1	Population ≥ 4 million
Category 2	1 million ≤ Population < 4 million
Category 3	0.5 million ≤ Population < 1 million
Category 4	Population < 0.5 million

3.3 Scoring Approach and Methodology

A city can earn a maximum score of 100 points for 79 indicators across four pillars. The pillar weights are as follows: Institutional (25 points), Social (25 points), Economy and Employment (5 points) and Physical (45 points). Based on the number and nature of indicators i.e., core vs. secondary, indicator wise maximum marks were computed.



100 marks

(Maximum overall score that any city can achieve)

25 marks

(Maximum score that any city can achieve under **Institutional** Pillar)

1

(Category under Institutional Pillar)

8

(Number of indicators under Institutional)

7 Core	1 Supporting

25 marks

(Maximum score that any city can achieve under **Social** Pillar)

4

(Number of categories under Social Pillar)

20

(Number of indicators under Social Pillar)

13 Core	7 Supporting

5 marks

(Maximum score that any city can achieve under **Economic** Pillar)

1

(Category under Economic Pillar)

5

(Category under Economic Pillar)

4 Core	1 Supporting

45 marks

(Maximum score that any city can achieve under **Physical** Pillar)

9

(Number of categories under Physical Pillar)

46

(Number of categories under Physical Pillar)

33 Core	13 Supporting

Dimensional Index Methodology (DIM) has been used to compute scores for each indicator with reference to “maximum within the comparison group” or “absolute benchmarks”. For indicators where benchmarks are available, cities getting the benchmark score (or above) are given the maximum mark, and the marks awarded to other cities are calculated proportionately. For indicators where benchmarks are not available, the best performing cities in each population group are given the maximum mark, and the marks awarded to other cities (within the population group) are calculated proportionately. For indicators where benchmarks do not exist, the city data has been tested for outliers before scoring.

3.4 Scoring Normalisation:

To construct aggregate scores across cities as well as to make the scores across indicators comparable, indicator values were normalised using a min-max approach. The following formula was used to normalise the indicator values-

$$\frac{indicator\ value\ for\ the\ city - indicator\ value\ for\ the\ worst\ performing\ city}{benchmark - \ indicator\ value\ for\ the\ worst\ performing\ city}$$

This approach would restrict the normalised indicator value between 0 and 1. Cities that met or exceeded the benchmark received a normalised indicator value of 1. Worst performing cities are given a normalised indicator value of 0. After normalisation, the normalised value is weighted according to the category and the indicator being core or supporting.

To illustrate, consider the indicator 12.3 Quality of Water Supplied in the Category 12 for Assured Water Supply. If in City A 50% of the water samples collected qualify the potable water standards specified by the CPHEEO, and only 10% of the samples from worst performing city qualify the standards. Then, the normalised value for the indicator for city A would be 0.44 [(0.5-0.1)/(1-0.1)].

The weight for indicator 12.3 is 1.03, so the final weighted score for City A would come out to 0.45 [1.03*0.44].

4. Data Collection and Verification

4.1 Submission of Data by the cities

The Liveability Assessment is based on secondary data submitted by the urban local bodies and other concerned government agencies (collectively called as data owners). The 79 indicators were broken down into a set of easy to understand and relatable 553 questions mapped to data owners. Submission of the data was enabled through an online data entry portal on the smartnet platform of the Ministry. The portal also allowed the ULBs to download the liveability assessment questionnaire and upload filled in questionnaire. To familiarise and assist cities in identifying, mapping and collation of data points, a city level nodal person was available during the entire period of data submission process.

4.2 Mapping of Data Owners for the City

For the assessment of liveability indices broadly 12 data owners such as Central/state Pollution control board, Development authority, DISCOM/Electricity Board, State Disaster Management Authority, State Education Department, State Health department, State Renewable energy and development agency, State sales and commercial taxes department, town and country planning department, Traffic and police department, Transport authority, and Urban local body were identified to respond to the questions on the portal. However, during state workshop and subsequent city level discussions, more data owners were mapped to respond to different categories and sub categories. The following table provides the details of city level data owners mapped under the 12 data owner.

Table 3:Details of Data Owners

Designated data owners	Subcategories	Data owners at city level
Urban Local Body	For Accounts Related Questions	Accounts Department, HDMC
Urban Local Body	For Park and Recreation Related Questions	Town Planning Department, HDMC
Urban Local Body	For Water Supply and Drainage related questions	KUWSDB, Hubballi Office (Water Board) & Engineering Department, HDMC
Urban Local Body	For Heritage sites related data	Town Planning Department, HDMC
Urban Local Body	For Ecological sites related data	Town Planning Department, HDMC
Urban Local Body	For Housing related data	Housing - Engineering Department, HDMC
Urban Local Body	For Building plan related data	Town Planning Department, HDMC
Urban Local Body	For Roads related data	Engineering Department, HDMC
Urban Local Body	For Solid waste management related data	SWM – Engineering Department, HDMC
Urban Local Body	For IT services related data	Information Technology Department, HDMC
Urban Local Body	For Vendor committee related data	Town Vending Committee, HDMC
Urban Local Body	Any other departments involved in providing data for questions mentioned under Urban Local Body	Professional Tax Department

Designated data owners	Subcategories	Data owners at city level
Central / state Pollution control Board	Water Quality, Air Quality, Noise Quality	State Pollution Control Board, Dharwad District Office.
Development Authority	Building Infrastructure	Town Planning Department, HDMC
	Construction planning	Town Planning Department, HDMC
	Green Building	Town Planning Department, HDMC
	Rain water harvesting	Town Planning Department, HDMC
	Universal Design Principle	Town Planning Department, HDMC
DISCOM/Electricity Board	Electrical Connection/ Grievance Redressal/ Power supply	Hubli Electricity Supply Company Limited
State Disaster management authority		Engineering Department, HDMC
State Education Department		Education Department, Dharwad District Office.
State Health Department	Health care professionals	Health Department, Dharwad District Office.
	Citizen Services	Health Department, Dharwad District Office.
	Disease Prevalence	Health Department, Dharwad District Office.
	Health Infrastructure	Health Department, Dharwad District Office.
State Renewable Energy Development Agency	Renewable Energy	Hubli Electricity Supply Company Limited
State Sales / Commercial Taxes Department		Sales & Commercial Taxes Department, Dharwad District Office.
Town and Country Planning Department	Land Use	Hubballi Dharwad Urban Development Authority
Traffic and Police Department		Hubballi Dharwad Police Department.
Transport Authorities	Buses	North Western Karnataka Road Transport Corporation (NWKRTC), Hubli Division.
	Registered Vehicles	Regional Transport Office (RTO) – Navanagar Hubli Office KA 25 & Gabbur cross Hbl KA 63 Office.

Designated data owners	Subcategories	Data owners at city level
	Sub urban rail transport	Not Applicable
	Mono Rail Authority	Not Applicable
	Tramways	Not Applicable
	Marine Transport Authority	Not Applicable

4.3 List of secondary documents available as supportive

City has provided supporting documents/evidences against the responses given by city on the online portal. In support of their responses on the portal, city submitted 11 number of documents. Documents submitted includes reports, official orders, copy of data maintained in official register, signed copy of questionnaire, and signed letters/submissions from concern departments. Verification includes mapping of documents against responses given by city, checking the type/category of documents, and validation of data provided.

The following table presents the data owner wise number of documents:

Table 4: Data owner wise number of secondary documents submitted by city

Data Owners	Number of Documents
Sales and Commercial Taxes	0
State Education Department	2
DISCOM/Electricity Department	0
Traffic and Police Department	1
Development Authority	1
Pollution Control Board	1
State Renewable Energy Department	0
Town and Country Planning	1
State Health Department	2
Transport Authority	1
Disaster Management	0
Urban Local Body	2
Total	11*

.

4.4 Data Verification

A three-stage data quality check comprising verification of data against secondary documents furnished by data owners, logical inconsistency checks including outliers, and physical audit for select indicators (Refer the exhibit below) is being undertaken. The objective of the data quality check is to ensure that data from the source documents are accurate and verifiable. Sources of data included reports, administrative data, survey results and other statistical records, log books among other.

Physical audit of eight indicators – one indicator from the Institutional pillar, one from the Social pillar, one from the Economy pillar and five from the Physical pillar is also being carried out by the field team to ascertain the degree of reliability of data reported by the cities. The list of these eight indicators is presented below:

1.2 | Percentage of services integrated through Command Centre

2.3 | Hotel occupancy

3.4 | Percentage of schools with access to digital education

5.1 | Number of streets, public places, junctions covered through surveillance systems

6.5 | Percentage of vendors registered and provided formal spaces

11.7 | Availability of Passenger Information System

11.11 | Percentage of traffic intersections with pedestrian crossing facilities

11.12 | Extent to which universal accessibility is incorporated in public rights-of-way

For a set of five indicators namely, unemployment rate, mode share of public transport, mode share of non-motorised transport, quality of water supplied and level of noise pollution, existing datasets were found to be not available consistently across all cities and/or were inadequate. To help cities that do not have data on these five indicators, dipstick assessments are being carried to fill data gaps.

6.4 | Unemployment Rate

11.3 | Mode share of public transport

11.5 | Mode share of Non Motorized Transport

12.3 | Quality of Water Supplied

15.4 | Level of Noise Pollution

4.5 Physical Audit

The following map presents the indicators audited at city level.

8. LA - Universal Design Principles

5. City Score on 15 categories of Assessment

Liveability Assessment covered 15 categories and 78 indicators. The below table presents the scores for all 15 indicators namely governance, identity & culture, education, health, safety and security, economy & employment, housing & inclusiveness, public open spaces, mixed land use & compactness, power supply, transport & mobility, assured water supply, waste water management, solid waste management and reduced pollution.

Table 5: Category wise scores

Categories	**Scores in Percentage**
Governance	69.57%
Identity & Culture	28%
Education	86%
Health	97%
Safety & Security	68%
Economy & Employment	17%
Housing & Inclusiveness	3%
Public Open Spaces	1%
Mixed Land Use & Compactness	0%
Power Supply	57%
Transport & Mobility	40%
Assured Water Supply	63%
Waste Water Management	65%
Solid Waste Management	59%
Reduced Pollution	76%

The rank of the city is based on the performance and scores in each of the category. The final city rank is submitted separately.

Executive Summary

Assessment of liveability indices is an initiative by the Ministry of Housing and Urban Affairs to improve quality of life of citizens and achieve sustainable development goals by encouraging cities to adopt "outcome based" approach for urban planning. Assessment process aimed to provide opportunity to cities to review the development components holistically by involving 79 measurable indicators categorized under governance, health, education, safety, economy, power supply, transportation and mobility, identity, culture, housing, waste management and pollution.

This report highlights the assessment process, key milestones, and the final outcome of the data submitted. Implementation of liveability assessment commenced formally on 19th January 2018. A national level workshop was organized on 13th February 2018 to explain the importance and process of liveability assessment and get feedback on methodology from the city authorities.

This was followed by the next stage of Questionnaire development. The questionnaire was arranged under 12 categories representing 12 data owners namely urban local body, Central and state pollution control board, development authority, DISCOM/Electricity board, State disaster management authority, state education department, state health department, state renewable energy development agency, state sales and commercial taxes department, town and country planning department, traffic and police department and transport authorities.

An online data entry portal was developed to facilitate data submission by the cities. Each city had a unique log in to access the portal and submit the data. Both online and off-line options (download the questionnaire in an excel) to submit the data were available for cities. An email help desk was set up for the cities to raise any queries and seek clarification when responding to the questions.

A team for each state comprising of State Coordinator and City Coordinator (one per city) was deployed that facilitated the process and supported the cities. A total of 6 regional coordinators/ consultants, 29 State Coordinators, and 99 city coordinators were deployed across 116 cities. Training for state coordinators was held from 26th to 28th February 2018 at Chennai to make coordinators understand overall liveability assessment, indicators, data sources, protocols and roles and responsibilities.

City Reconnaissance Meetings were initiated by the state and city coordinators. The discussion began with discussions to finalize the state workshop schedule, mapping of data owners, and assist cities in data collection. The City Coordinators were based in the cities for over 6 weeks and during this time, they liase with ULB and other data owners to explain the liveability framework, online portal, and facilitate the online submission.

A total of 33 state workshops were conducted at the state level. The objective of the workshop was to orient the city stakeholders on liveability assessment, indicators, components of data collection,

timelines, expectations of support and support extended by MoHUA. The state level workshops brought various city level departments on a single platform to understand and discuss the methodology and components of city liveability assessment.

Nodal agency at state level supported by the City and State Coordinator and city level (Municipality corporation/smart city limited) coordinated with city specific data owners/departments for data gathering, collation, and submission. Nodal persons in each department were appointed for timely data collection and submission. Of 116, 112 cities submitted data as per the timeline on 16th April 2018.

Post submission, the city and state coordinators supported by the central team followed up extensively with the cities to support secondary documents as evidence to substantiate their submissions. Secondary documents such as reports, official orders, copy of office register, signed copy of liveability assessment questionnaire furnished by cities against the submitted data. Documents are verified to map the documents for the reponses provided by city and to check the type data provided by city. The document check outcomes were shared with the cities as a part of data quality check.

For checking consistency of data, logical check of data, verifying data from other public sources were undertaken. Quality check was done to ensure data validity and provide opportunity to cities to review the data provided by them and correct in case of wrong data entry.

For 8 selected indicators namely, percentage of services integrated through command and control center, hotel occupancy rate, percentage of schools with access to digital education, number of CCTV cameras per unit road length, percentage of vendors registered and provided formal spaces, availability of passenger information system, percentage of traffic intersection with pedestrian crossing facility, and extent to which universal accessibility is incorporated in public rights of way. Physical audit was conducted in 110 cities by physical auditors appointed and trained by the consortium. In consultation with ULB nodal person, locations and indicators for physical audit was selected in each city. A mobile based application was developed to capture the physical audit related data.

Primary data collection was done for five indicators such as unemployment rates, mode share of public transport, mode share of non-motorized transport, quality of water supplied, and level of noise pollution. Protocols for water and noise test were prepared in consultation with experts. Water quality test involved physical, chemical and bacteriological test of water as per the CPCB norms. For testing quality of water at consumer end, the auditors worked closely with the ULB and Water department. Samples were collected from consumer end and submitted to the lab suggested by city. For noise pollution, in about 20 cities the state pollution board or city level environment department took the responsibility for providing noise pollution data as per the protocols. In rest of the cities, mobile based application was used to measure noise pollution.

During implementation, MoHUA facilitated the process by conducting video conferences with cities to address any queries, reiterate the importance, and ensure that cities adequately engages in the process and submit their responses in time and respond to requests for clarifications.

In addition to secondary data collection, physical audit and primary data collection, citizen survey was conducted to understand their perception and level of satisfaction on various services such as health, education, water supply, electricity, waste management etc. provided by urban local bodies. Over 60000 citizens participated in the survey across India.

The final scores and ranks have been generated based on the scoring methodology that has been discussed extensively and minor modifications made that are summarized as below:

#	Challenges	Proposed Solutions
1	Only 23 cities of 111 cities have City Mobility Plan (CMP) or any and hence able to provide data for Mode Share of Public Transport and Non-Motorised Transport. To address the data gap, as advised by the MoHUA, the consortia undertook a sample dipstick across all cities covering a sample of 150 Households. Understandably, the dipstick findings will not match the rigor of a CMP.	We recommend the following: 1) Cities which have provided CMP Data will be evaluated on 100% of the maximum score 2) For the cities where the dipstick data is used, the city receives a 50% discount on the overall score Alternatively, another approach is to assign 0 score to all 88 cities that don't have a CMP
2	Variance was observed on data reported by cities on road network and data presented in the smart city proposals during the verifications.	We recommend taking the data reported by the cities in the Smart City Proposals.
3	There is no secondary source/ organization that provides unemployment data at city level. As a result, most cities do not have the data. Fully cognizance of the challenges of generating this data in a short span of time, it was agreed to collect this	The indicator on unemployment will be excluded from scores. For final ranking, the cities will

#	Challenges	Proposed Solutions
	data through a dipstick survey on lines of NSSO questions. The data generated needs further scrutiny and triangulation with some inputs from experts. This may not be possible in the short window.	be scored on 78 indicators.
4	Many cities did not have data on noise pollution and it was decided that data will be collected using a mobile app for all the 111 cities. However, many cities have expressed reservations with the approach especially with respect to the reliability of using this data. Further, some cities have relied on the SPCB to collect the data as per the approach proposed by the consortia. Thus, noise pollution data is currently from two sources: 1. SPCB- 20 cities 2. Noise-based app- 91 cities	The data collected through the primary survey will be used for scoring the cities. Currently, there is no differential scoring for the data from the SPCB and the data collected through the mobile app. However, a certain higher weightage can be provided to those cities which used the state apparatus to collect noise pollution data.
5	For the indicator on quality of water supplied, the methodology document states that samples should be drawn both at the treatment plant outlet as well as the consumer end. However, the data provided by the cities were predominantly from the distribution point. Hence for consumer end results with MoHUA intervention, consortia coordinated with cities to collect the data at the consumer end. The cities facilitated the testing. The outcome of the process is as below: 1. Sample given- 102 cities 2. Report received- 86 cities 3. Report awaited- 16 cities 4. Tests not completed due to lack of cooperation and other reasons – 9	The maximum score for this indicator will be distributed equally (50%) for results based on samples from the treatment plant and consumer end. Cities that did not complete tests or provide the results will be given a score 0 for against consumer end tests.
6	City level population is not projected annually by most of the cities. So, estimates for 2017 population are not available with the cities.	As recommended by MoHUA, 2011 census population is being used for the ranking purpose.

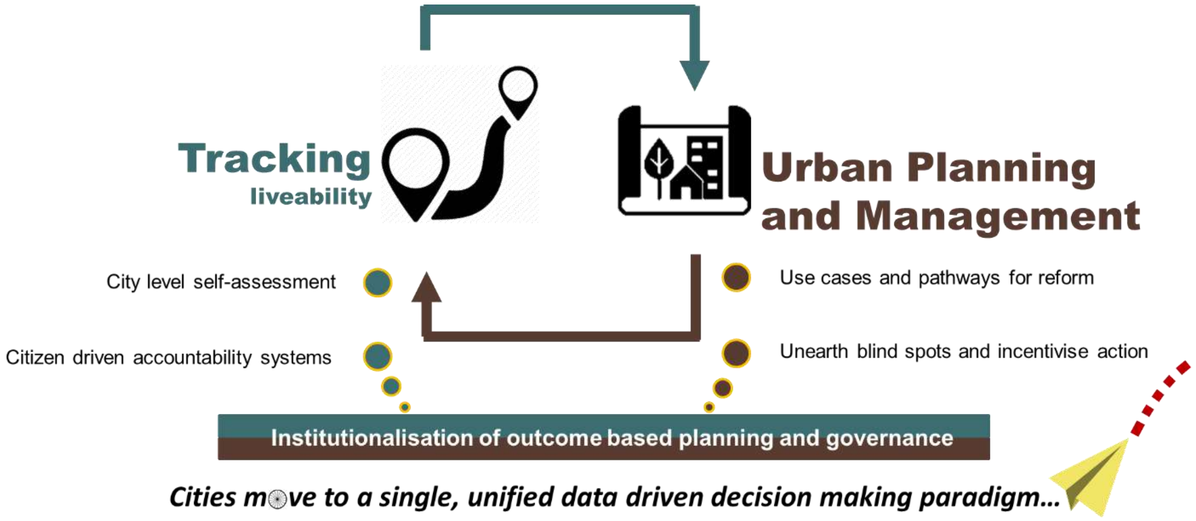
#	Challenges	Proposed Solutions
7	The age category specific data for 9 cities is not available at a city level	The age category specific population data has been taken at a district level for these cities.
8	Indicators on non-motorised transports like- Dedicated bicycle tracks, bicycle parking facilities and mode share of non-motorised transport are not relevant for hilly terrains.	As discussed during the PMC meeting, these indicators have been treated as non-applicable for the hilly cities and the weights have been redistributed among other indicators within the same category.
9	The indicator on increase in professional tax is not relevant to cities which do not levy the professional tax.	As discussed during the PMC meeting, this indicator has been non-applicable to the cities belonging to states where professional tax is not levied, and the weights have been redistributed among other indicators within the same category.
10	The indicator on increase in VAT collection is not applicable to Port Blair and Kavaratti, as there was no provision of VAT collection in these cities.	As discussed during the PMC meeting, these indicatosr has been treated as non-applicable for these two cities and the weights have been redistributed among other indicators within the same category.
11	Indicator on coverage of basic services to slum households does not concern cities with no slums (notified/ non-notified.	As discussed during the PMC meeting, this indicators has been treated as non-applicable for these cities and the weights have been redistributed among other indicators within the same category.

1. Introduction

The Ministry of Housing and Urban Affairs (MoHUA) is implementing several flagship urban missions such as the Smart Cities Mission (SCM), Atal Mission for Urban Rejuvenation and Transformation (AMRUT), Heritage City Development and Augmentation Yojana (HRIDAY), Housing for All (HFA). Theses mission along with other transformative initiatives of the Government including National Water Mission, Power for All, National Health Mission are aimed at making Indian cities more 'liveable.' The overarching goal of these initiatives is to move from an input-based approach to a 'citizen centric-outcome based' assessment of urban liveability.

To develop a common minimum framework for cities to assess their existing status and chart their pathway towards providing a better quality of life to their citizens, the MoHUA developed a set of 'Liveability Standards' relevant to cities to generate a Liveability Index and ranking of cities. These standards were launched in June, 2017. The MoHUA has planned to conduct an 'Annual Assessment of Liveability Standards in Cities – an ambitious national project that will involve yearly submission of data by cities across the various indicators, compilation and analysis, development of indices and ranking of cities. The Liveability Index is envisioned as a 360° tool for tracking, planning and transforming Indian cities. The Liveability Index is aimed at the following objectives:

- Providing strong evidence-based approach for future interventions and investments to deliver liveability outcomes
- Catalysing actions to improve the overall quality of the city's liveability and achieve broader development outcomes including the Sustainable Development Goals
- Assessing the implementation of government policies and schemes governing characteristics of cities that can contribute to creating liveable communities



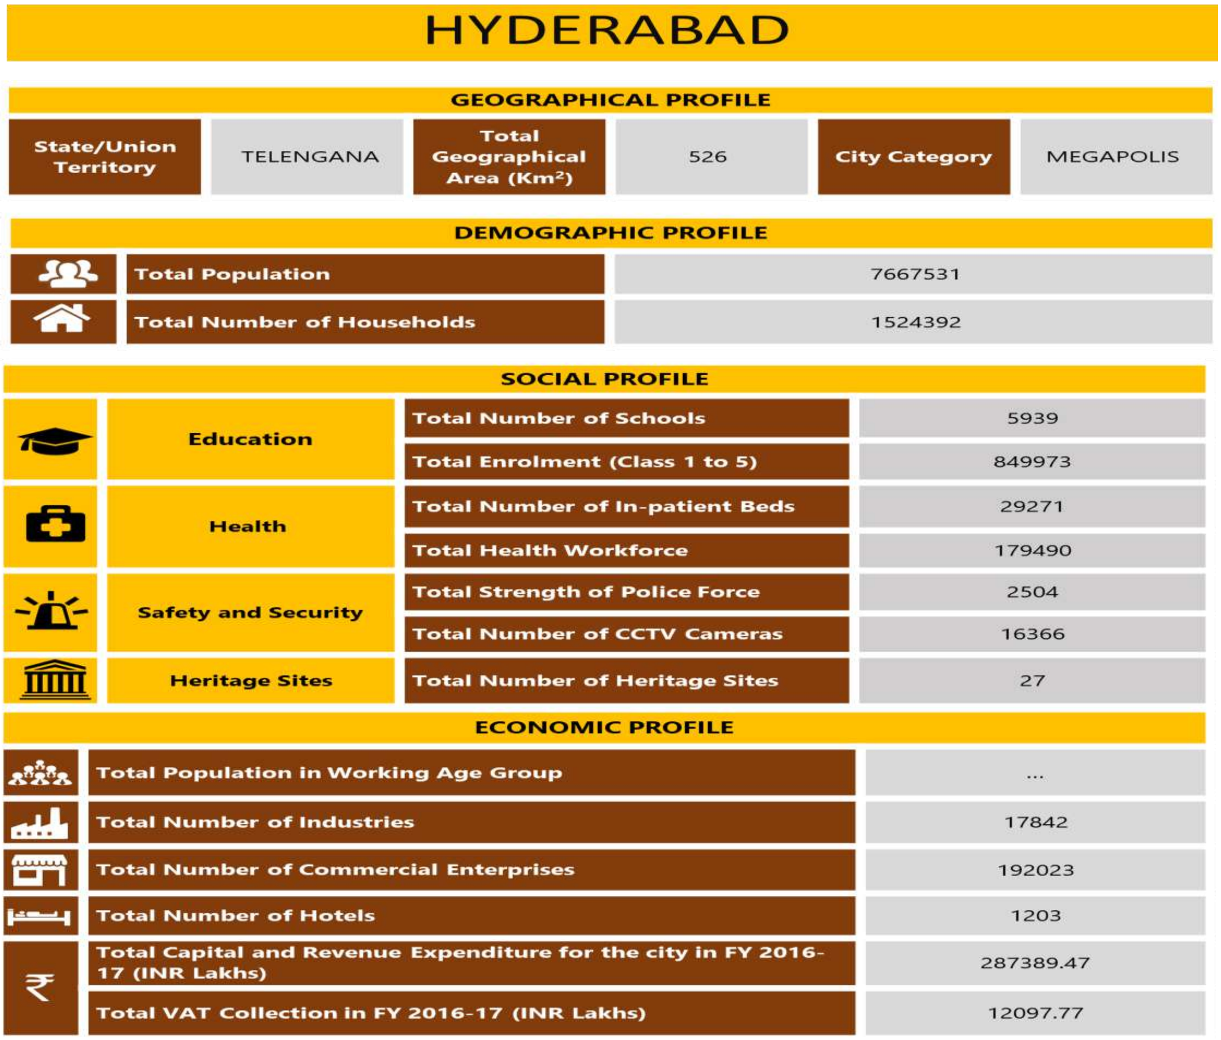
Tracking
liveability
Urban Planning and Management
City level self-assessment
Citizen driven accountability systems
Use cases and pathways for reform
Unearth blind spots and incentivise action
Institutionalisation of outcome based planning and governance

Cities move to a single, unified data driven decision making paradigm...

The first round of the assessment commenced in January 2018 covering 116 major cities including smart cities, capital cities and cities with population of above one million each. Implementation of the liveability assessment commenced in January 2018 with a national level orientation workshop for the urban local bodies. The workshop aimed at orienting the states and urban local bodies on the overall framework, indicators, data sources, methodology and key milestones and timelines involved in the liveability assessment. Subsequently, a series of State/ Union Territory level orientation workshops were carried out in 33 states/UTs for a detailed discussion on the framework. Online data collection commenced from 9th March through an online data collection platform that supported both online and offline data submission modes. On the date of closure of the online data entry portal i.e., 16th April, 2018 112 cities submitted their data. Subsequently, comprehensive checks on the submitted data was undertaken that involved checking for outliers, logical inconsistencies etc. post which round-1 of data reconciliation was conducted. This draft report is based on round-1 of reconciled data as on 28th April, 2018.

2. City Profile

This chapter presents the city profile -Geographic and Demographic, Social (Education Health, Safety and Security, Heritage), Economic profile, and Physical (Water, sanitation and Waste Management, Electricity, Open space and roads).



HYDERABAD

GEOGRAPHICAL PROFILE

State/Union Territory	TELENGANA	Total Geographical Area (Km^2)	526	City Category	MEGAPOLIS

DEMOGRAPHIC PROFILE

Total Population	7667531
Total Number of Households	1524392

SOCIAL PROFILE

Education	Total Number of Schools	5939
	Total Enrolment (Class 1 to 5)	849973
Health	Total Number of In-patient Beds	29271
	Total Health Workforce	179490
Safety and Security	Total Strength of Police Force	2504
	Total Number of CCTV Cameras	16366
Heritage Sites	Total Number of Heritage Sites	27

ECONOMIC PROFILE

Total Population in Working Age Group	...
Total Number of Industries	17842
Total Number of Commercial Enterprises	192023
Total Number of Hotels	1203
Total Capital and Revenue Expenditure for the city in FY 2016-17 (INR Lakhs)	287389.47
Total VAT Collection in FY 2016-17 (INR Lakhs)	12097.77

PHYSICAL PROFILE

Water	**Average Quantity of Water Supplied (MLD)**	1780
	Total Number of Water Connection	945453
Sanitation Facilities	**Total number of households with access to individual toilets in the city**	...
	Total number of households in the city with access to community toilets in the city	...
Solid Waste Management	**Daily average quantity of municipal solid waste collected in the city (Tonnes/day)**	4800
	Total number of households covered through door-to-door collection of solid waste	19.57
Waste Water	**Daily Average Quantum of Waste Water Generated in the City (MLD)**	1350
	Daily average quantum of waste water treated by STPs in the city (MLD)	700
Electricity	**Total number of authorized electrical connections in the city**	1912994
	Total electricity supplied to the city (kWh)	6612.52
Public and Open Spaces	**Total area covered by green spaces in the city (m^2)**	2662268
Roads and Transport	**Total Length of Road Network in the City (Km)**	9103.35
	Total length of arterial and sub-arterial road network in the city (Km)	345
	Total length of footpath (wider than 1.2 metres) in the city along the street network (Km)	335

3. Liveability Framework and Indicators

The Liveability Framework comprises a total of 79 indicators (57 Core Indicators and 22 Supporting Indicators). A core indicator carries 70% weightage and a supporting indicator carries 30% weightage. These indicators are grouped under 15 thematic categories which in turn are part of four pillars of comprehensive development of cities i.e., institutional, social, economic and physical. Based on the performance of cities against the various core and supporting indicators, various 'Category Sub-Indexes' and a composite 'City Liveability Index' will be developed for each city.

3.1 Scoring and Computing Category Indices of Liveability

The set of 79 indicators, associated categories and pillars are presented in the table below:

Table 1 List of Pillars, Categories and Indicators

Pillars of Comprehensive Development	Category	Indicators
Institutional	1. Governance	1.1 Percentage of citizen services available online
		1.2 Percentage of services integrated through Command Centre
		1.3 Percentage of citizens using online services
		1.4 Average delay in grievance redressal
		1.5 Tax collected as percentage of tax billed
		1.6 Extent of cost recovery (O&M) in water supply services
		1.7 Capital spending as percentage of total expenditure
		1.8 Percentage of population covered under Ward Committees/Area *Sabhas*
Social	**2. Identity and Culture**	2.1 Restoration and reuse of historic buildings
		2.2 Percentage of ecologically important areas covered through projects for restoration
		2.3 Hotel occupancy
		2.4 Percentage of budget allocated towards cultural/sports activities
		2.5 Number of cultural/sports events hosted by city
	3. Education	3.1 Percentage of school-aged population enrolled in schools
		3.2 Percentage of female school-aged population enrolled in schools
		3.3 Primary education student-teacher ratio
		3.4 Percentage of schools with access to digital

Pillars of Comprehensive Development	Category	Indicators
		education
		3.5 Percentage of students completing primary education
		3.6 Percentage of students completing secondary education
	4. Health	4.1 Number of in-patient hospital beds per 10,000 population
		4.2 Healthcare professionals per 10,000 population
		4.3 Average response time in case of health emergencies
		4.4 Period prevalence of water borne diseases
		4.5 Period prevalence of vector borne diseases
	5. Safety and Security	5.1 Number of CCTV Cameras
		5.2 Number of recorded crimes per lakh population
		5.3 Extent of crimes recorded against women, children and elderly per year
		5.4 Transport-related fatality per lakh population
Economic	**6. Economy and Employment**	6.1 Increase in VAT/GST collection
		6.2 Increase in collection of Professional Tax
		6.3 Increase in issuance of Construction permits
		6.4 Unemployment rate
		6.5 Percentage of vendors registered and provided formal spaces
Physical	**7. Housing and Inclusiveness**	7.1 Percentage of Slum/EWS households covered through formal/affordable housing
		7.2 Percentage of slum areas covered through basic services

Pillars of Comprehensive Development	Category	Indicators
	8. Public Open Spaces	8.1 Per capita availability of green spaces
		8.2 Per capita availability of public and recreational places
	9. Mixed Land Use and Compactness	9.1 Share of mixed land use area in overall city land use
		9.2 Net Density
	10. Power Supply	10.1 Percentage of city population with authorized electrical services
		10.2 Percentage of electrical connections covered through smart meters
		10.3 Average number of electrical interruptions per year
		10.4 Average length of electrical interruptions per year
		10.5 Percentage of total energy derived from renewable sources
		10.6 Energy consumption per unit - water supply and sewerage
		10.7 Energy consumption per unit - street lighting
		10.8 Percentage of new and redeveloped buildings following green building norms
		10.9 Total energy consumption per capita
	11. Transportation and Mobility	11.1 Geographical coverage of public transport
		11.2 Availability of public transport
		11.3 Mode share of public transport
		11.4 Percentage of road network with dedicated bicycle tracks
		11.5 Percentage of interchanges with bicycle parking facilities

Pillars of Comprehensive Development	Category	Indicators
		11.6 Mode share of non-motorized transport
		11.7 Availability of Passenger Information System
		11.8 Extent of signal synchronization
		11.9 Availability of paid parking spaces
		11.10 Percentage coverage of footpaths – wider than 1.2 m
		11.11 Percentage of traffic intersections with pedestrian crossing facilities
		11.12 Extent to which universal accessibility is incorporated in public rights-of-way
	12. Assured Water Supply	12.1 Household level coverage of direct water supply connections
		12.2 Per capita supply of water
		12.3 Quality of water supplied
		12.4 Level of non-revenue water – NRW
		12.5 Percentage of water connections covered through meters
		12.6 Percentage of plots with rainwater harvesting facility
	13. Waste Water Management	13.1 Coverage of toilets
		13.2 Coverage of sewerage network and/or septage
		13.3 Collection efficiency of sewerage network
		13.4 Extent of reuse and recycling of waste water
		13.5 Coverage of storm water drains
	14. Solid Waste Management	14.1 Household level coverage of municipal solid waste collection

Pillars of Comprehensive Development	Category	Indicators
		14.2 Efficiency of collection of municipal solid waste
		14.3 Extent of municipal solid waste recovered through reuse
	15. Reduced Pollution	15.1 Concentration of SO2- air pollution
		15.2 Concentration of NO2- air pollution
		15.3 Concentration of PM10 - air pollution
		15.4 Level of noise pollution
		15.5 Quality of water in public surface water bodies

3.2 Scoring and Computing Category Indices of Liveability

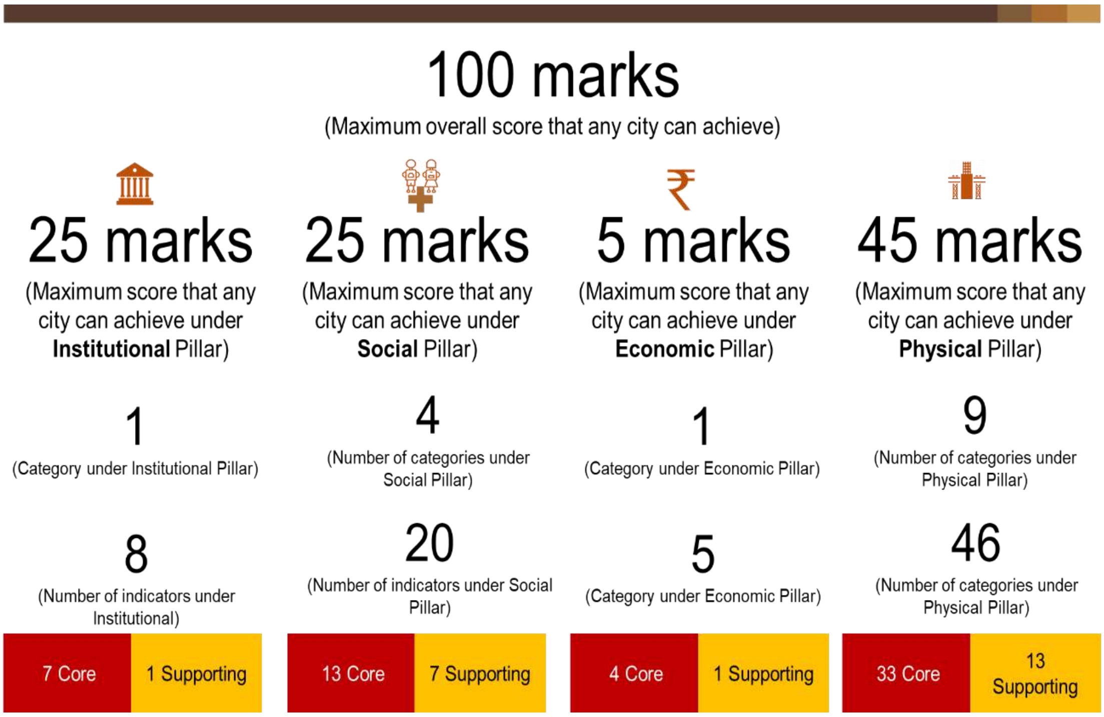
The performance achieved by cities against 79 indicators, will be assessed against given benchmarks. Where no international/national norms are available, city with the best performance in its group (population range) will be treated as a benchmark. The groups are given in the table below.

Table 2 Details on Population Range

Category	Population range
Category 1	Population ≥ 4 million
Category 2	1 million ≤ Population < 4 million
Category 3	0.5 million ≤ Population < 1 million
Category 4	Population < 0.5 million

3.3 Scoring Approach and Methodology

A city can earn a maximum score of 100 points for 79 indicators across four pillars. The pillar weights are as follows: Institutional (25 points), Social (25 points), Economy and Employment (5 points) and Physical (45 points). Based on the number and nature of indicators i.e., core vs. secondary, indicator wise maximum marks were computed.



100 marks
(Maximum overall score that any city can achieve)

25 marks	25 marks	5 marks	45 marks
(Maximum score that any city can achieve under **Institutional** Pillar)	(Maximum score that any city can achieve under **Social** Pillar)	(Maximum score that any city can achieve under **Economic** Pillar)	(Maximum score that any city can achieve under **Physical** Pillar)
1 (Category under Institutional Pillar)	4 (Number of categories under Social Pillar)	1 (Category under Economic Pillar)	9 (Number of categories under Physical Pillar)
8 (Number of indicators under Institutional)	20 (Number of indicators under Social Pillar)	5 (Category under Economic Pillar)	46 (Number of categories under Physical Pillar)
7 Core 1 Supporting	13 Core 7 Supporting	4 Core 1 Supporting	33 Core 13 Supporting

Dimensional Index Methodology (DIM) has been used to compute scores for each indicator with reference to “maximum within the comparison group” or “absolute benchmarks”. For indicators where benchmarks are available, cities getting the benchmark score (or above) are given the maximum mark, and the marks awarded to other cities are calculated proportionately. For indicators where benchmarks are not available, the best performing cities in each population group are given the maximum mark, and the marks awarded to other cities (within the population group) are calculated proportionately. For indicators where benchmarks do not exist, the city data has been tested for outliers before scoring.

3.4 Scoring Normalisation:

To construct aggregate scores across cities as well as to make the scores across indicators comparable, indicator values were normalised using a min-max approach. The following formula was used to normalise the indicator values-

$$\frac{indicator\ value\ for\ the\ city - indicator\ value\ for\ the\ worst\ performing\ city}{benchmark - \ indicator\ value\ for\ the\ worst\ performing\ city}$$

This approach would restrict the normalised indicator value between 0 and 1. Cities that met or exceeded the benchmark received a normalised indicator value of 1. Worst performing cities are given a normalised indicator value of 0. After normalisation, the normalised value is weighted according to the category and the indicator being core or supporting.

To illustrate, consider the indicator 12.3 Quality of Water Supplied in the Category 12 for Assured Water Supply. If in City A 50% of the water samples collected qualify the potable water standards specified by the CPHEEO, and only 10% of the samples from worst performing city qualify the standards. Then, the normalised value for the indicator for city A would be 0.44 [(0.5-0.1)/(1-0.1)].

The weight for indicator 12.3 is 1.03, so the final weighted score for City A would come out to 0.45 [1.03*0.44].

4. Data Collection and Verification

4.1 Submission of Data by the cities

The Liveability Assessment is based on secondary data submitted by the urban local bodies and other concerned government agencies (collectively called as data owners). The 79 indicators were broken down into a set of easy to understand and relatable 553 questions mapped to data owners. Submission of the data was enabled through an online data entry portal on the smartnet platform of the Ministry. The portal also allowed the ULBs to download the liveability assessment questionnaire and upload filled in questionnaire. To familiarise and assist cities in identifying, mapping and collation of data points, a city level nodal person was available during the entire period of data submission process.

4.2 Mapping of Data Owners for the City

For the assessment of liveability indices broadly 12 data owners such as Central/state Pollution control board, Development authority, DISCOM/Electricity Board, State Disaster Management Authority, State Education Department, State Health department, State Renewable energy and development agency, State sales and commercial taxes department, town and country planning

department, Traffic and police department, Transport authority, and Urban local body were identified to respond to the questions on the portal. However, during state workshop and subsequent city level discussions, more data owners were mapped to respond to different categories and sub categories. The following table provides the details of city level data owners mapped under the 12 data owner.

Table 3:Details of Data Owners

Designated data owners	Subcategories	Data owners at city level
Urban Local Body	For Accounts Related Questions	Finance Wing, Greater Hyderabad Municipal Corporation and Commercial Tax Department, Govt. of Telangana
Urban Local Body	For Park and Recreation Related Questions	Urban Biodiversity Wing, Greater Hyderabad Municipal Corporation
Urban Local Body	For Water Supply and Drainage related questions	Hyderabad Metro Water Supply and Sewage Board
Urban Local Body	For Heritage sites related data	Department of Archaeology, Telangana
Urban Local Body	For Ecological sites related data	Department of Archaeology, Telangana
Urban Local Body	For Housing related data	Housing Wing, Greater Hyderabad Municipal Corporation
Urban Local Body	For Building plan related data	Town Planning Wings of Greater Hyderabad Municipal Corporation and Hyderabad Metropolitan Development Authority
Urban Local Body	For Roads related data	Projects and Maintenance Wings of Greater Hyderabad Municipal Corporation
Urban Local Body	For Solid waste management related data	Solid Waste Management (SWM) Wing, Greater Hyderabad Municipal Corporation
Urban Local Body	For IT services related data	IT Wing, Greater Hyderabad Municipal Corporation and Information Technology, Electronics and Communications Department, Govt of Telangana
Urban Local Body	For Vendor committee related data	Urban Community Development, Greater Hyderabad Municipal Corporation
Urban Local Body	Any other departments involved in providing data for questions mentioned under Urban Local Body	Sports Authority of Telangana,

Designated data owners	Subcategories	Data owners at city level
Central / state Pollution control Board	Water Quality, Air Quality, Noise Quality	Telangana State Pollution Control Board
Development Authority	Building Infrastructure	Town Planning Wings of Greater Hyderabad Municipal Corporation and Hyderabad Metropolitan Development Authority
	Construction planning	Town Planning Wings of Greater Hyderabad Municipal Corporation and Hyderabad Metropolitan Development Authority
	Green Building	Town Planning Wings of Greater Hyderabad Municipal Corporation and Hyderabad Metropolitan Development Authority
	Rain water harvesting	Town Planning Wings of Greater Hyderabad Municipal Corporation and Hyderabad Metropolitan Development Authority
	Universal Design Principle	Town Planning Wings of Greater Hyderabad Municipal Corporation and Hyderabad
DISCOM/Electricity Board	Electrical Connection/ Grievance Redressal/ Power supply	Telangana Southern power distribution Company Limited
State Disaster management authority		State Disaster Management, Greater Hyderabad Municipal Corporation, tank Bund Hyderabad.
State Education Department		Commissioner and Directorate of school Education, Telangana
State Health Department	Health care professionals	NHM/health Department Telagana
	Citizen Services	NHM/health Department Telagana
	Disease Prevalence	Telangana State Health Department
	Health Infrastructure	Telangana State Health Department
State Renewable Energy Development Agency	Renewable Energy	Telangana state renewable energy department
State Sales / Commercial Taxes Department		Government of Telangana Commercial Taxes Department

Designated data owners	Subcategories	Data owners at city level
Town and Country Planning Department	Land Use	Town and country planning, GHMC, Telangana
Traffic and Police Department		Department of police, Telangana
Transport Authorities	Buses	Telangana State Road Transport Corporation
	Registered Vehicles	Road Transport Authority Telangana
	Sub urban rail transport	Indian railways
	Mono Rail Authority	Not applicable
	Tramways	Not applicable
	Marine Transport Authority	Not applicable

4.3 List of secondary documents available as supportive

City has provided supporting documents/evidences against the responses given by city on the online portal. In support of their responses on the portal, city submitted 213 number of documents. Documents submitted includes reports, official orders, copy of data maintained in official register, signed copy of questionnaire, and signed letters/submissions from concern departments. Verification includes mapping of documents against responses given by city, checking the type/category of documents, and validation of data provided.

The following table presents the data owner wise number of documents:

Table 4: Data owner wise number of secondary documents submitted by city

Data Owners	Number of Documents
Sales and Commercial Taxes	7
State Education Department	0
DISCOM/Electricity Department	1
Traffic and Police Department	6
Development Authority	8
Pollution Control Board	1
State Renewable Energy Department	1
Town and Country Planning	3
State Health Department	0
Transport Authority	24

Data Owners	Number of Documents
Disaster Management	1
Urban Local Body	161
Total	213*

4.4 Data Verification

A three-stage data quality check comprising verification of data against secondary documents furnished by data owners, logical inconsistency checks including outliers, and physical audit for select indicators (Refer the exhibit below) is being undertaken. The objective of the data quality check is to ensure that data from the source documents are accurate and verifiable. Sources of data included reports, administrative data, survey results and other statistical records, log books among other.

Physical audit of eight indicators – one indicator from the Institutional pillar, one from the Social pillar, one from the Economy pillar and five from the Physical pillar is also being carried out by the field team to ascertain the degree of reliability of data reported by the cities. The list of these eight indicators is presented below:

1.2 | Percentage of services integrated through Command Centre

2.3 | Hotel occupancy

3.4 | Percentage of schools with access to digital education

5.1 | Number of streets, public places, junctions covered through surveillance systems

6.5 | Percentage of vendors registered and provided formal spaces

11.7 | Availability of Passenger Information System

11.11 | Percentage of traffic intersections with pedestrian crossing facilities

11.12 | Extent to which universal accessibility is incorporated in public rights-of-way

For a set of five indicators namely, unemployment rate, mode share of public transport, mode share of non-motorised transport, quality of water supplied and level of noise pollution, existing datasets were found to be not available consistently across all cities and/or were inadequate. To help cities that do not have data on these five indicators, dipstick assessments are being carried to fill data gaps.

6.4 | Unemployment Rate

11.3 | Mode share of public transport

11.5 | Mode share of Non Motorized Transport

12.3 | Quality of Water Supplied

15.4 | Level of Noise Pollution

4.5 Physical Audit

The following map presents the indicators audited at city level.

5 City score on 15 categories of Assessment

Liveability Assessment covered 15 categories and 78 indicators. The below table presents the scores for all 15 indicators namely governance, identity & culture, education, health, safety and security, economy & employment, housing & inclusiveness, public open spaces, mixed land use & compactness, power supply, transport & mobility, assured water supply, waste water management, solid waste management and reduced pollution.

Table 5: Category wise scores

Categories	Scores in Percentage
Governance	80.20%
Identity & Culture	19%
Education	92%
Health	97%
Safety & Security	55%
Economy & Employment	56%
Housing & Inclusiveness	21%
Public Open Spaces	2%
Mixed Land Use & Compactness	50%
Power Supply	59%
Transport & Mobility	43%
Assured Water Supply	57%
Waste Water Management	33%
Solid Waste Management	36%
Reduced Pollution	64%

The rank of the city is based on the performance and scores in each of the category. The final city rank is submitted separately.

Assessment of liveability indices is an initiative by the Ministry of Housing and Urban Affairs to improve quality of life of citizens and achieve sustainable development goals by encouraging cities to adopt "outcome based" approach for urban planning. Assessment process aimed to provide opportunity to cities to review the development components holistically by involving 79 measurable indicators categorized under governance, health, education, safety, economy, power supply, transportation and mobility, identity, culture, housing, waste management and pollution.

This report highlights the assessment process, key milestones, and the final outcome of the data submitted. Implementation of liveability assessment commenced formally on 19th January 2018. A national level workshop was organized on 13th February 2018 to explain the importance and process of liveability assessment and get feedback on methodology from the city authorities.

This was followed by the next stage of Questionnaire development. The questionnaire was arranged under 12 categories representing 12 data owners namely urban local body, Central and state pollution control board, development authority, DISCOM/Electricity board, State disaster management authority, state education department, state health department, state renewable energy development agency, state sales and commercial taxes department, town and country planning department, traffic and police department and transport authorities.

An online data entry portal was developed to facilitate data submission by the cities. Each city had a unique log in to access the portal and submit the data. Both online and off-line options (download the questionnaire in an excel) to submit the data were available for cities. An email help desk was set up for the cities to raise any queries and seek clarification when responding to the questions.

A team for each state comprising of State Coordinator and City Coordinator (one per city) was deployed that facilitated the process and supported the cities. A total of 6 regional coordinators/ consultants, 29 State Coordinators, and 99 city coordinators were deployed across 116 cities. Training for state coordinators was held from 26th to 28th February 2018 at Chennai to make coordinators understand overall liveability assessment, indicators, data sources, protocols and roles and responsibilities.

City Reconnaissance Meetings were initiated by the state and city coordinators. The discussion began with discussions to finalize the state workshop schedule, mapping of data owners, and assist cities in data collection. The City Coordinators were based in the cities for over 6 weeks and during this time, they liase with ULB and other data owners to explain the liveability framework, online portal, and facilitate the online submission.

A total of 33 state workshops were conducted at the state level. The objective of the workshop was to orient the city stakeholders on liveability assessment, indicators, components of data collection,

pport extended by MoHUA. The state level workshops brought le platform to understand and discuss the methodology and components of city liveability assessment.

Nodal agency at state level supported by the City and State Coordinator and city level (Municipality corporation/smart city limited) coordinated with city specific data owners/departments for data gathering, collation, and submission. Nodal persons in each department were appointed for timely data collection and submission. Of 116, 112 cities submitted data as per the timeline on 16th April 2018.

Post submission, the city and state coordinators supported by the central team followed up extensively with the cities to support secondary documents as evidence to substantiate their submissions. Secondary documents such as reports, official orders, copy of office register, signed copy of liveability assessment questionnaire furnished by cities against the submitted data. Documents are verified to map the documents for the reponses provided by city and to check the type data provided by city. The document check outcomes were shared with the cities as a part of data quality check.

For checking consistency of data, logical check of data, verifying data from other public sources were undertaken. Quality check was done to ensure data validity and provide opportunity to cities to review the data provided by them and correct in case of wrong data entry.

For 8 selected indicators namely, percentage of services integrated through command and control center, hotel occupancy rate, percentage of schools with access to digital education, number of CCTV cameras per unit road length, percentage of vendors registered and provided formal spaces, availability of passenger information system, percentage of traffic intersection with pedestrian crossing facility, and extent to which universal accessibility is incorporated in public rights of way. Physical audit was conducted in 110 cities by physical auditors appointed and trained by the consortium. In consultation with ULB nodal person, locations and indicators for physical audit was selected in each city. A mobile based application was developed to capture the physical audit related data.

Primary data collection was done for five indicators such as unemployment rates, mode share of public transport, mode share of non-motorized transport, quality of water supplied, and level of noise pollution. Protocols for water and noise test were prepared in consultation with experts. Water quality test involved physical, chemical and bacteriological test of water as per the CPCB norms. For testing quality of water at consumer end, the auditors worked closely with the ULB and Water department. Samples were collected from consumer end and submitted to the lab suggested by city. For noise pollution, in about 20 cities the state pollution board or city level environment department took the responsibility for providing noise pollution data as per the protocols. In rest of the cities, mobile based application was used to measure noise pollution.

ed the process by conducting video conferences with cities to ance, and ensure that cities adequately engages in the process and submit their responses in time and respond to requests for clarifications.

In addition to secondary data collection, physical audit and primary data collection, citizen survey was conducted to understand their perception and level of satisfaction on various services such as health, education, water supply, electricity, waste management etc. provided by urban local bodies. Over 60000 citizens participated in the survey across India.

The final scores and ranks have been generated based on the scoring methodology that has been discussed extensively and minor modifications made that are summarized as below:

#	Challenges	Proposed Solutions
1	Only 23 cities of 111 cities have City Mobility Plan (CMP) or any and hence able to provide data for Mode Share of Public Transport and Non-Motorised Transport. To address the data gap, as advised by the MoHUA, the consortia undertook a sample dipstick across all cities covering a sample of 150 Households. Understandably, the dipstick findings will not match the rigor of a CMP.	We recommend the following: 1) Cities which have provided CMP Data will be evaluated on 100% of the maximum score 2) For the cities where the dipstick data is used, the city receives a 50% discount on the overall score Alternatively, another approach is to assign 0 score to all 88 cities that don't have a CMP
2	Variance was observed on data reported by cities on road network and data presented in the smart city proposals during the verifications.	We recommend taking the data reported by the cities in the Smart City Proposals.
3	There is no secondary source/ organization that provides unemployment data at city level. As a result, most cities do not have the data. Fully cognizance of the challenges of generating this data in a short span of time, it was agreed to collect this	The indicator on unemployment will be excluded from scores. For final ranking, the cities will

		Proposed Solutions
	data through a dipstick survey on lines of NSSO questions. The data generated needs further scrutiny and triangulation with some inputs from experts. This may not be possible in the short window.	be scored on 78 indicators.
4	Many cities did not have data on noise pollution and it was decided that data will be collected using a mobile app for all the 111 cities. However, many cities have expressed reservations with the approach especially with respect to the reliability of using this data. Further, some cities have relied on the SPCB to collect the data as per the approach proposed by the consortia. Thus, noise pollution data is currently from two sources: 1. SPCB- 20 cities 2. Noise-based app- 91 cities	The data collected through the primary survey will be used for scoring the cities. Currently, there is no differential scoring for the data from the SPCB and the data collected through the mobile app. However, a certain higher weightage can be provided to those cities which used the state apparatus to collect noise pollution data.
5	For the indicator on quality of water supplied, the methodology document states that samples should be drawn both at the treatment plant outlet as well as the consumer end. However, the data provided by the cities were predominantly from the distribution point. Hence for consumer end results with MoHUA intervention, consortia coordinated with cities to collect the data at the consumer end. The cities facilitated the testing. The outcome of the process is as below: 1. Sample given- 102 cities 2. Report received- 86 cities 3. Report awaited- 16 cities 4. Tests not completed due to lack of cooperation and other reasons – 9	The maximum score for this indicator will be distributed equally (50%) for results based on samples from the treatment plant and consumer end. Cities that did not complete tests or provide the results will be given a score 0 for against consumer end tests.
6	City level population is not prcjected annually by most of the cities. So, estimates for 2017 population are not available with the cities.	As recommended by MoHUA, 2011 census population is being used for the ranking purpose.

Click Here to upgrade to Unlimited Pages and Expanded Features

		Proposed Solutions
7	The age category specific data for 9 cities is not available at a city level	The age category specific population data has been taken at a district level for these cities.
8	Indicators on non-motorised transports like- Dedicated bicycle tracks, bicycle parking facilities and mode share of non-motorised transport are not relevant for hilly terrains.	As discussed during the PMC meeting, these indicators have been treated as non-applicable for the hilly cities and the weights have been redistributed among other indicators within the same category.
9	The indicator on increase in professional tax is not relevant to cities which do not levy the professional tax.	As discussed during the PMC meeting, this indicator has been non-applicable to the cities belonging to states where professional tax is not levied, and the weights have been redistributed among other indicators within the same category.
10	The indicator on increase in VAT collection is not applicable to Port Blair and Kavaratti, as there was no provision of VAT collection in these cities.	As discussed during the PMC meeting, these indicatosr has been treated as non-applicable for these two cities and the weights have been redistributed among other indicators within the same category.
11	Indicator on coverage of basic services to slum households does not concern cities with no slums (notified/ non-notified.	As discussed during the PMC meeting, this indicators has been treated as non-applicable for these cities and the weights have been redistributed among other indicators within the same category.

1. Introduction

The Ministry of Housing and Urban Affairs (MoHUA) is implementing several flagship urban missions such as the Smart Cities Mission (SCM), Atal Mission for Urban Rejuvenation and Transformation (AMRUT), Heritage City Development and Augmentation Yojana (HRIDAY), Housing for All (HFA). Theses mission along with other transformative initiatives of the Government including National Water Mission, Power for All, National Health Mission are aimed at making Indian cities more 'liveable.' The overarching goal of these initiatives is to move from an input-based approach to a 'citizen centric-outcome based' assessment of urban liveability.

To develop a common minimum framework for cities to assess their existing status and chart their pathway towards providing a better quality of life to their citizens, the MoHUA developed a set of 'Liveability Standards' relevant to cities to generate a Liveability Index and ranking of cities. These standards were launched in June, 2017. The MoHUA has planned to conduct an 'Annual Assessment of Liveability Standards in Cities – an ambitious national project that will involve yearly submission of data by cities across the various indicators, compilation and analysis, development of indices and ranking of cities. The Liveability Index is envisioned as a 360° tool for tracking, planning and transforming Indian cities. The Liveability Index is aimed at the following objectives:

- Providing strong evidence-based approach for future interventions and investments to deliver liveability outcomes
- Catalysing actions to improve the overall quality of the city's liveability and achieve broader development outcomes including the Sustainable Development Goals
- Assessing the implementation of government policies and schemes governing characteristics of cities that can contribute to creating liveable communities

The first round of the assessment commenced in January 2018 covering 116 major cities including smart cities, capital cities and cities with population of above one million each. Implementation of the liveability assessment commenced in January 2018 with a national level orientation workshop for the urban local bodies. The workshop aimed at orienting the states and urban local bodies on the overall framework, indicators, data sources, methodology and key milestones and timelines involved in the liveability assessment. Subsequently, a series of State/ Union Territory level orientation workshops were carried out in 33 states/UTs for a detailed discussion on the framework. Online data collection commenced from 9th March through an online data collection platform that supported both online and offline data submission modes. On the date of closure of the online data entry portal i.e., 16th April, 2018 112 cities submitted their data. Subsequently, comprehensive checks on the submitted data was undertaken that involved checking for outliers, logical inconsistencies etc. post which round-1 of data reconciliation was conducted. This draft report is based on round-1 of reconciled data as on 28th April, 2018.

icators

The Liveability Framework comprises a total of 79 indicators (57 Core Indicators and 22 Supporting Indicators). A core indicator carries 70% weightage and a supporting indicator carries 30% weightage. These indicators are grouped under 15 thematic categories which in turn are part of four pillars of comprehensive development of cities i.e., institutional, social, economic and physical. Based on the performance of cities against the various core and supporting indicators, various 'Category Sub-Indexes' and a composite 'City Liveability Index' will be developed for each city.

3.1 Scoring and Computing Category Indices of Liveability

The set of 79 indicators, associated categories and pillars are presented in the table below:

Table 1 List of Pillars, Categories and Indicators

Pillars of Comprehensive Development	Category	Indicators
Institutional	1. Governance	1.1 Percentage of citizen services available online
		1.2 Percentage of services integrated through Command Centre
		1.3 Percentage of citizens using online services
		1.4 Average delay in grievance redressal
		1.5 Tax collected as percentage of tax billed
		1.6 Extent of cost recovery (O&M) in water supply services
		1.7 Capital spending as percentage of total expenditure
		1.8 Percentage of population covered under Ward Committees/Area *Sabhas*
Social	**2. Identity and Culture**	2.1 Restoration and reuse of historic buildings
		2.2 Percentage of ecologically important areas covered through projects for restoration
		2.3 Hotel occupancy
		2.4 Percentage of budget allocated towards cultural/sports activities
		2.5 Number of cultural/sports events hosted by city
	3. Education	3.1 Percentage of school-aged population enrolled in schools
		3.2 Percentage of female school-aged population

Development		Indicators
		enrolled in schools
		3.3 Primary education student-teacher ratio
		3.4 Percentage of schools with access to digital education
		3.5 Percentage of students completing primary education
		3.6 Percentage of students completing secondary education
	4. Health	4.1 Number of in-patient hospital beds per 10,000 population
		4.2 Healthcare professionals per 10,000 population
		4.3 Average response time in case of health emergencies
		4.4 Period prevalence of water borne diseases
		4.5 Period prevalence of vector borne diseases
	5. Safety and Security	5.1 Number of CCTV Cameras
		5.2 Number of recorded crimes per lakh population
		5.3 Extent of crimes recorded against women, children and elderly per year
		5.4 Transport-related fatality per lakh population
Economic	**6. Economy and Employment**	6.1 Increase in VAT/GST collection
		6.2 Increase in collection of Professional Tax
		6.3 Increase in issuance of Construction permits
		6.4 Unemployment rate
		6.5 Percentage of vendors registered and provided formal spaces
Physical	**7. Housing and Inclusiveness**	7.1 Percentage of Slum/EWS households covered through formal/affordable housing
		7.2 Percentage of slum areas covered through basic services
	8. Public Open Spaces	8.1 Per capita availability of green spaces
		8.2 Per capita availability of public and recreational places
	9. Mixed Land Use and Compactness	9.1 Share of mixed land use area in overall city land use
		9.2 Net Density
	10. Power Supply	10.1 Percentage of city population with authorized electrical services

Development		Indicators
		10.2 Percentage of electrical connections covered through smart meters
		10.3 Average number of electrical interruptions per year
		10.4 Average length of electrical interruptions per year
		10.5 Percentage of total energy derived from renewable sources
		10.6 Energy consumption per unit - water supply and sewerage
		10.7 Energy consumption per unit - street lighting
		10.8 Percentage of new and redeveloped buildings following green building norms
		10.9 Total energy consumption per capita
	11. Transportation and Mobility	11.1 Geographical coverage of public transport
		11.2 Availability of public transport
		11.3 Mode share of public transport
		11.4 Percentage of road network with dedicated bicycle tracks
		11.5 Percentage of interchanges with bicycle parking facilities
		11.6 Mode share of non-motorized transport
		11.7 Availability of Passenger Information System
		11.8 Extent of signal synchronization
		11.9 Availability of paid parking spaces
		11.10 Percentage coverage of footpaths – wider than 1.2 m
		11.11 Percentage of traffic intersections with pedestrian crossing facilities
		11.12 Extent to which universal accessibility is incorporated in public rights-of-way
	12. Assured Water Supply	12.1 Household level coverage of direct water supply connections
		12.2 Per capita supply of water
		12.3 Quality of water supplied
		12.4 Level of non-revenue water – NRW
		12.5 Percentage of water connections covered through meters
		12.6 Percentage of plots with rainwater harvesting

		facility
	13. Waste Water Management	13.1 Coverage of toilets
		13.2 Coverage of sewerage network and/or septage
		13.3 Collection efficiency of sewerage network
		13.4 Extent of reuse and recycling of waste water
		13.5 Coverage of storm water drains
	14. Solid Waste Management	14.1 Household level coverage of municipal solid waste collection
		14.2 Efficiency of collection of municipal solid waste
		14.3 Extent of municipal solid waste recovered through reuse
	15. Reduced Pollution	15.1 Concentration of SO2- air pollution
		15.2 Concentration of NO2- air pollution
		15.3 Concentration of PM10 - air pollution
		15.4 Level of noise pollution
		15.5 Quality of water in public surface water bodies

3.2 Scoring and Computing Category Indices of Liveability

The performance achieved by cities against 79 indicators, will be assessed against given benchmarks. Where no international/national norms are available, city with the best performance in its group (population range) will be treated as a benchmark. The groups are given in the table below.

Table 2 Details on Population Range

Category	Population range
Category 1	Population ≥ 4 million
Category 2	1 million ≤ Population < 4 million
Category 3	0.5 million ≤ Population < 1 million
Category 4	Population < 0.5 million

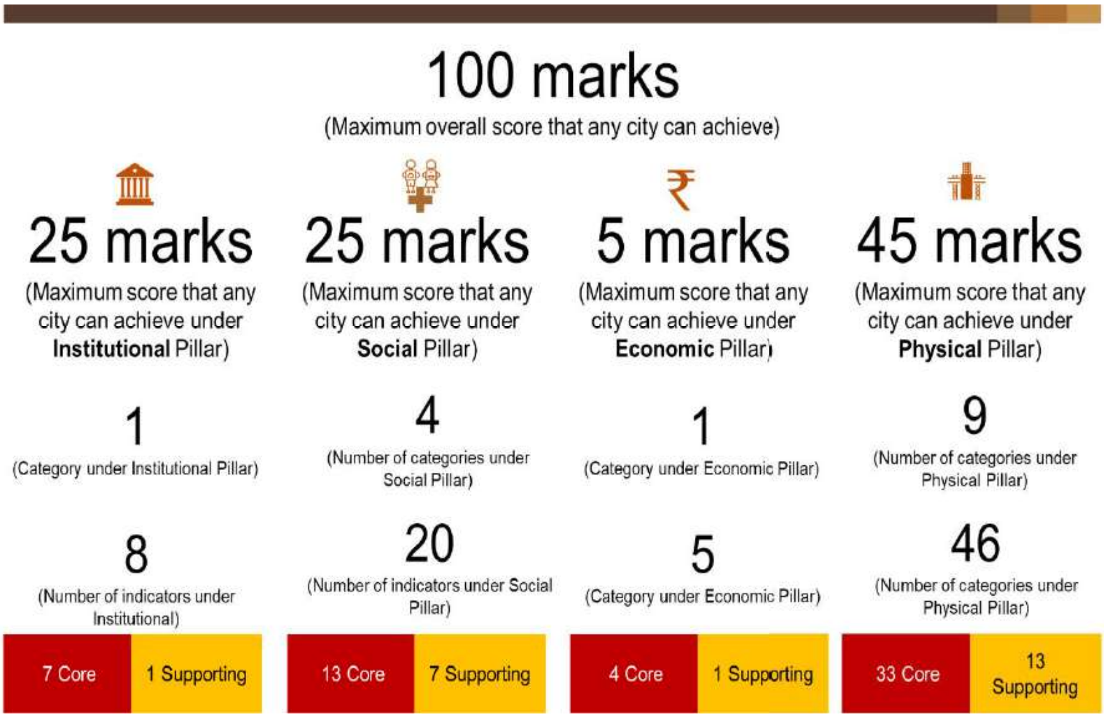
dology

A city can earn a maximum score of 100 points for 79 indicators across four pillars. The pillar weights are as follows: Institutional (25 points), Social (25 points), Economy and Employment (5 points) and Physical (45 points). Based on the number and nature of indicators i.e., core vs. secondary, indicator wise maximum marks were computed.



100 marks
(Maximum overall score that any city can achieve)
25 marks
(Maximum score that any city can achieve under Institutional Pillar)
25 marks
(Maximum score that any city can achieve under Social Pillar)
5 marks
(Maximum score that any city can achieve under Economic Pillar)
45 marks
(Maximum score that any city can achieve under Physical Pillar)
1
(Category under Institutional Pillar)
4
(Number of categories under Social Pillar)
1
(Category under Economic Pillar)
9
(Number of categories under Physical Pillar)
8
(Number of indicators under Institutional)

Dimensional Index Methodology (DIM) has been used to compute scores for each indicator with reference to "maximum within the comparison group" or "absolute benchmarks". For indicators where benchmarks are available, cities getting the benchmark score (or above) are given the maximum mark, and the marks awarded to other cities are calculated proportionately. For indicators where benchmarks are not available, the best performing cities in each population group are given the maximum mark, and the marks awarded to other cities (within the population group) are calculated proportionately. For indicators where benchmarks do not exist, the city data has been tested for outliers before scoring.

To construct aggregate scores across cities as well as to make the scores across indicators comparable, indicator values were normalised using a min-max approach. The following formula was used to normalise the indicator values-

$$\frac{indicator\ value\ for\ the\ city - indicator\ value\ for\ the\ worst\ performing\ city}{benchmark - \ indicator\ value\ for\ the\ worst\ performing\ city}$$

This approach would restrict the normalised indicator value between 0 and 1. Cities that met or exceeded the benchmark received a normalised indicator value of 1. Worst performing cities are given a normalised indicator value of 0. After normalisation, the normalised value is weighted according to the category and the indicator being core or supporting.

To illustrate, consider the indicator 12.3 Quality of Water Supplied in the Category 12 for Assured Water Supply. If in City A 50% of the water samples collected qualify the potable water standards specified by the CPHEEO, and only 10% of the samples from worst performing city qualify the standards. Then, the normalised value for the indicator for city A would be 0.44 [(0.5-0.1)/(1-0.1)].

The weight for indicator 12.3 is 1.03, so the final weighted score for City A would come out to 0.45 [1.03*0.44].

4. Data Collection and Verification

4.1 Submission of Data by the cities

The Liveability Assessment is based on secondary data submitted by the urban local bodies and other concerned government agencies (collectively called as data owners). The 79 indicators were broken down into a set of easy to understand and relatable 553 questions mapped to data owners. Submission of the data was enabled through an online data entry portal on the smartnet platform of the Ministry. The portal also allowed the ULBs to download the liveability assessment questionnaire and upload filled in questionnaire. To familiarise and assist cities in identifying, mapping and collation of data points, a city level nodal person was available during the entire period of data submission process.

the City

For the assessment of liveability indices broadly 12 data owners such as Central/state Pollution control board, Development authority, DISCOM/Electricity Board, State Disaster Management Authority, State Education Department, State Health department, State Renewable energy and development agency, State sales and commercial taxes department, town and country planning department, Traffic and police department, Transport authority, and Urban local body were identified to respond to the questions on the portal. However, during state workshop and subsequent city level discussions, more data owners were mapped to respond to different categories and sub categories. The following table provides the details of city level data owners mapped under the 12 data owner.

Table 3:Details of Data Owners

Designated data owners	Subcategories	Data owners at city level
Urban Local Body	For Accounts Related Questions	Imphal Municipal Corporation (IMC)
Urban Local Body	For Park and Recreation Related Questions	Imphal Municipal Corporation (IMC)
Urban Local Body	For Water Supply and Drainage related questions	PHED
Urban Local Body	For Heritage sites related data	Art & Culture
Urban Local Body	For Ecological sites related data	Dept. of Ecology & Environment
Urban Local Body	For Housing related data	Imphal Municipal Corporation (IMC)
Urban Local Body	For Building plan related data	Imphal Municipal Corporation (IMC)
Urban Local Body	For Roads related data	PWD
Urban Local Body	For Solid waste management related data	Imphal Municipal Corporation (IMC)
Urban Local Body	For IT services related data	Imphal Municipal Coorporation (IMC)
Urban Local Body	For Vendor committee related data	Imphal Municipal Corporation (IMC)
Urban Local Body	Any other departments involved in providing data for questions mentioned under Urban Local Body	(1) PWD (2) PHED (3) Economics & Statistics Deptt. (4) Water Resources Deptt. (5) Commerce & industry (6) Tourism (7) Education (S) (8) Taxation (9) Arts & Culture (10) Youth Affairs & Sports (11) Employment Exchange (12)

4.3 List of secondary documents available as supportive

City has provided supporting documents/evidences against the responses given by city on the online portal. In support of their responses on the portal, city submitted 22 number of documents. Documents submitted includes reports, official orders, copy of data maintained in official register, signed copy of questionnaire, and signed letters/submissions from concern departments. Verification includes mapping of documents against responses given by city, checking the type/category of documents, and validation of data provided.

The following table presents the data owner wise number of documents:

Table 4: Data owner wise number of secondary documents submitted by city

Data Owners	Number of Documents
Sales and Commercial Taxes	2
State Education Department	1
DISCOM/Electricity Department	1
Traffic and Police Department	1
Development Authority	0

A three-stage data quality check comprising verification of data against secondary documents furnished by data owners, logical inconsistency checks including outliers, and physical audit for select indicators (Refer the exhibit below) is being undertaken. The objective of the data quality check is to ensure that data from the source documents are accurate and verifiable. Sources of data included reports, administrative data, survey results and other statistical records, log books among other.

Physical audit of eight indicators – one indicator from the Institutional pillar, one from the Social pillar, one from the Economy pillar and five from the Physical pillar is also being carried out by the field team to ascertain the degree of reliability of data reported by the cities. The list of these eight indicators is presented below:

1.2 | Percentage of services integrated through Command Centre

2.3 | Hotel occupancy

3.4 | Percentage of schools with access to digital education

5.1 | Number of streets, public places, junctions covered through surveillance systems

6.5 | Percentage of vendors registered and provided formal spaces

11.7 | Availability of Passenger Information System

11.11 | Percentage of traffic intersections with pedestrian crossing facilities

11.12 | Extent to which universal accessibility is incorporated in public rights-of-way

For a set of five indicators namely, unemployment rate, mode share of public transport, mode share of non-motorised transport, quality of water supplied and level of noise pollution, existing datasets were found to be not available consistently across all cities and/or were inadequate. To help cities that do not have data on these five indicators, dipstick assessments are being carried to fill data gaps.

6.4 | Unemployment Rate

11.3 | Mode share of public transport

11.5 | Mode share of Non Motorized Transport

12.3 | Quality of Water Supplied

15.4 | Level of Noise Pollution

5. City Score on 15 categories of Assessment

Liveability Assessment covered 15 categories and 78 indicators. The below table presents the scores for all 15 indicators namely governance, identity & culture, education, health, safety and security, economy & employment, housing & inclusiveness, public open spaces, mixed land use & compactness, power supply, transport & mobility, assured water supply, waste water management, solid waste management and reduced pollution.

ative by the Ministry of Housing and Urban Affairs to improve quality of life of citizens and achieve sustainable development goals by encouraging cities to adopt "outcome based" approach for urban planning. Assessment process aimed to provide opportunity to cities to review the development components holistically by involving 79 measurable indicators categorized under governance, health, education, safety, economy, power supply, transportation and mobility, identity, culture, housing, waste management and pollution.

This report highlights the assessment process, key milestones, and the final outcome of the data submitted. Implementation of liveability assessment commenced formally on 19th January 2018. A national level workshop was organized on 13th February 2018 to explain the importance and process of liveability assessment and get feedback on methodology from the city authorities.

This was followed by the next stage of Questionnaire development. The questionnaire was arranged under 12 categories representing 12 data owners namely urban local body, Central and state pollution control board, development authority, DISCOM/Electricity board, State disaster management authority, state education department, state health department, state renewable energy development agency, state sales and commercial taxes department, town and country planning department, traffic and police department and transport authorities.

An online data entry portal was developed to facilitate data submission by the cities. Each city had a unique log in to access the portal and submit the data. Both online and off-line options (download the questionnaire in an excel) to submit the data were available for cities. An email help desk was set up for the cities to raise any queries and seek clarification when responding to the questions.

A team for each state comprising of State Coordinator and City Coordinator (one per city) was deployed that facilitated the process and supported the cities. A total of 6 regional coordinators/ consultants, 29 State Coordinators, and 99 city coordinators were deployed across 116 cities. Training for state coordinators was held from 26th to 28th February 2018 at Chennai to make coordinators understand overall liveability assessment, indicators, data sources, protocols and roles and responsibilities.

City Reconnaissance Meetings were initiated by the state and city coordinators. The discussion began with discussions to finalize the state workshop schedule, mapping of data owners, and assist cities in data collection. The City Coordinators were based in the cities for over 6 weeks and during this time, they liase with ULB and other data owners to explain the liveability framework, online portal, and facilitate the online submission.

A total of 33 state workshops were conducted at the state level. The objective of the workshop was to orient the city stakeholders on liveability assessment, indicators, components of data collection, timelines, expectations of support and support extended by MoHUA. The state level workshops brought

le platform to understand and discuss the methodology and

Nodal agency at state level supported by the City and State Coordinator and city level (Municipality corporation/smart city limited) coordinated with city specific data owners/departments for data gathering, collation, and submission. Nodal persons in each department were appointed for timely data collection and submission. Of 116, 112 cities submitted data as per the timeline on 16th April 2018.

Post submission, the city and state coordinators supported by the central team followed up extensively with the cities to support secondary documents as evidence to substantiate their submissions. Secondary documents such as reports, official orders, copy of office register, signed copy of liveability assessment questionnaire furnished by cities against the submitted data. Documents are verified to map the documents for the reponses provided by city and to check the type data provided by city. The document check outcomes were shared with the cities as a part of data quality check.

For checking consistency of data, logical check of data, verifying data from other public sources were undertaken. Quality check was done to ensure data validity and provide opportunity to cities to review the data provided by them and correct in case of wrong data entry.

For 8 selected indicators namely, percentage of services integrated through command and control center, hotel occupancy rate, percentage of schools with access to digital education, number of CCTV cameras per unit road length, percentage of vendors registered and provided formal spaces, availability of passenger information system, percentage of traffic intersection with pedestrian crossing facility, and extent to which universal accessibility is incorporated in public rights of way. Physical audit was conducted in 110 cities by physical auditors appointed and trained by the consortium. In consultation with ULB nodal person, locations and indicators for physical audit was selected in each city. A mobile based application was developed to capture the physical audit related data.

Primary data collection was done for five indicators such as unemployment rates, mode share of public transport, mode share of non-motorized transport, quality of water supplied, and level of noise pollution. Protocols for water and noise test were prepared in consultation with experts. Water quality test involved physical, chemical and bacteriological test of water as per the CPCB norms. For testing quality of water at consumer end, the auditors worked closely with the ULB and Water department. Samples were collected from consumer end and submitted to the lab suggested by city. For noise pollution, in about 20 cities the state pollution board or city level environment department took the responsibility for providing noise pollution data as per the protocols. In rest of the cities, mobile based application was used to measure noise pollution.

During implementation, MoHUA facilitated the process by conducting video conferences with cities to address any queries, reiterate the importance, and ensure that cities adequately engages in the process and submit their responses in time and respond to requests for clarifications.

use period has ended.

physical audit and primary data collection, citizen survey was n and level of satisfaction on various services such as health, education, water supply, electricity, waste management etc. provided by urban local bodies. Over 60000 citizens participated in the survey across India.

The final scores and ranks have been generated based on the scoring methodology that has been discussed extensively and minor modifications made that are summarized as below:

#	Challenges	Proposed Solutions
1	Only 23 cities of 111 cities have City Mobility Plan (CMP) or any and hence able to provide data for Mode Share of Public Transport and Non-Motorised Transport. To address the data gap, as advised by the MoHUA, the consortia undertook a sample dipstick across all cities covering a sample of 150 Households. Understandably, the dipstick findings will not match the rigor of a CMP.	We recommend the following: 1) Cities which have provided CMP Data will be evaluated on 100% of the maximum score 2) For the cities where the dipstick data is used, the city receives a 50% discount on the overall score Alternatively, another approach is to assign 0 score to all 88 cities that don't have a CMP
2	Variance was observed on data reported by cities on road network and data presented in the smart city proposals during the verifications.	We recommend taking the data reported by the cities in the Smart City Proposals.
3	There is no secondary source/ organization that provides unemployment data at city level. As a result, most cities do not have the data. Fully cognizance of the challenges of generating this data in a short span of time, it was agreed to collect this data through a dipstick survey on lines of NSSO questions. The data generated needs further scrutiny and triangulation with some inputs from	The indicator on unemployment will be excluded from scores. For final ranking, the cities will be scored on 78 indicators.

		Proposed Solutions
	experts. This may not be possible in the short window.	
4	Many cities did not have data on noise pollution and it was decided that data will be collected using a mobile app for all the 111 cities. However, many cities have expressed reservations with the approach especially with respect to the reliability of using this data. Further, some cities have relied on the SPCB to collect the data as per the approach proposed by the consortia. Thus, noise pollution data is currently from two sources: 1. SPCB- 20 cities 2. Noise-based app- 91 cities	The data collected through the primary survey will be used for scoring the cities. Currently, there is no differential scoring for the data from the SPCB and the data collected through the mobile app. However, a certain higher weightage can be provided to those cities which used the state apparatus to collect noise pollution data.
5	For the indicator on quality of water supplied, the methodology document states that samples should be drawn both at the treatment plant outlet as well as the consumer end. However, the data provided by the cities were predominantly from the distribution point. Hence for consumer end results with MoHUA intervention, consortia coordinated with cities to collect the data at the consumer end. The cities facilitated the testing. The outcome of the process is as below: 1. Sample given- 102 cities 2. Report received- 86 cities 3. Report awaited- 16 cities 4. Tests not completed due to lack of cooperation and other reasons – 9	The maximum score for this indicator will be distributed equally (50%) for results based on samples from the treatment plant and consumer end. Cities that did not complete tests or provide the results will be given a score 0 for against consumer end tests.
6	City level population is not projected annually by most of the cities. So, estimates for 2017 population are not available with the cities.	As recommended by MoHUA, 2011 census population is being used for the ranking purpose.

		Proposed Solutions
7	The age category specific data for 9 cities is not available at a city level	The age category specific population data has been taken at a district level for these cities.
8	Indicators on non-motorised transports like- Dedicated bicycle tracks, bicycle parking facilities and mode share of non-motorised transport are not relevant for hilly terrains.	As discussed during the PMC meeting, these indicators have been treated as non-applicable for the hilly cities and the weights have been redistributed among other indicators within the same category.
9	The indicator on increase in professional tax is not relevant to cities which do not levy the professional tax.	As discussed during the PMC meeting, this indicator has been non-applicable to the cities belonging to states where professional tax is not levied, and the weights have been redistributed among other indicators within the same category.
10	The indicator on increase in VAT collection is not applicable to Port Blair and Kavaratti, as there was no provision of VAT collection in these cities.	As discussed during the PMC meeting, these indicatosr has been treated as non-applicable for these two cities and the weights have been redistributed among other indicators within the same category.
11	Indicator on coverage of basic services to slum households does not concern cities with no slums (notified/ non-notified.	As discussed during the PMC meeting, this indicators has been treated as non-applicable for these cities and the weights have been redistributed among other indicators within the same category.

1. Introduction

The Ministry of Housing and Urban Affairs (MoHUA) is implementing several flagship urban missions such as the Smart Cities Mission (SCM), Atal Mission for Urban Rejuvenation and Transformation (AMRUT), Heritage City Development and Augmentation Yojana (HRIDAY), Housing for All (HFA). Theses mission along with other transformative initiatives of the Government including National Water Mission, Power for All, National Health Mission are aimed at making Indian cities more 'liveable.' The overarching goal of these initiatives is to move from an input-based approach to a 'citizen centric-outcome based' assessment of urban liveability.

To develop a common minimum framework for cities to assess their existing status and chart their pathway towards providing a better quality of life to their citizens, the MoHUA developed a set of 'Liveability Standards' relevant to cities to generate a Liveability Index and ranking of cities. These standards were launched in June, 2017. The MoHUA has planned to conduct an 'Annual Assessment of Liveability Standards in Cities – an ambitious national project that will involve yearly submission of data by cities across the various indicators, compilation and analysis, development of indices and ranking of cities. The Liveability Index is envisioned as a 360° tool for tracking, planning and transforming Indian cities. The Liveability Index is aimed at the following objectives:

- Providing strong evidence-based approach for future interventions and investments to deliver liveability outcomes
- Catalysing actions to improve the overall quality of the city's liveability and achieve broader development outcomes including the Sustainable Development Goals
- Assessing the implementation of government policies and schemes governing characteristics of cities that can contribute to creating liveable communities

Tracking
liveability
Urban Planning and Management
City level self-assessment
Citizen driven accountability systems
Use cases and pathways for reform
Unearth blind spots and incentivise action
Institutionalisation of outcome based planning and governance
Cities move to a single, unified data driven decision making paradigm...

The first round of the assessment commenced in January 2018 covering 116 major cities including smart cities, capital cities and cities with population of above one million each. Implementation of the liveability assessment commenced in January 2018 with a national level orientation workshop for the urban local bodies. The workshop aimed at orienting the states and urban local bodies on the overall framework, indicators, data sources, methodology and key milestones and timelines involved in the liveability assessment. Subsequently, a series of State/ Union Territory level orientation workshops were carried out in 33 states/UTs for a detailed discussion on the framework. Online data collection commenced from 9th March through an online data collection platform that supported both online and offline data submission modes. On the date of closure of the online data entry portal i.e., 16th April, 2018 112 cities submitted their data. Subsequently, comprehensive checks on the submitted data was undertaken that involved checking for outliers, logical inconsistencies etc. post which round-1 of data reconciliation was conducted. This draft report is based on round-1 of reconciled data as on 28th April, 2018.

This chapter presents the city profile -Geographic and Demographic, Social (Education Health, Safety and Security, Heritage), Economic profile, and Physical (Water, sanitation and Waste Management, Electricity, Open space and roads).

INDORE

GEOGRAPHICAL PROFILE

State/Union Territory	Madhya Pradesh	Total Geographical Area (Km²)	276	City Category	Metropolis

DEMOGRAPHIC PROFILE

Total Population	2473222
Total Number of Households	544922

SOCIAL PROFILE

Education	Total Number of Schools	1649
	Total Enrolment (Class 1 to 5)	198879
Health	Total Number of In-patient Beds	10090
	Total Health Workforce	9957
Safety and Security	Total Strength of Police Force	392
	Total Number of CCTV Cameras	1450
Heritage Sites	Total Number of Heritage Sites	108

ECONOMIC PROFILE

Total Population in Working Age Group	980990
Total Number of Industries	6816
Total Number of Commercial Enterprises	88512
Total Number of Hotels	91
₹ Total Capital and Revenue Expenditure for the city in FY 2016-17 (INR Lakhs)	106212.67
Total VAT Collection in FY 2016-17 (INR Lakhs)	517903.91

icators

The Liveability Framework comprises a total of 79 indicators (57 Core Indicators and 22 Supporting Indicators). A core indicator carries 70% weightage and a supporting indicator carries 30% weightage. These indicators are grouped under 15 thematic categories which in turn are part of four pillars of comprehensive development of cities i.e., institutional, social, economic and physical. Based on the performance of cities against the various core and supporting indicators, various 'Category Sub-Indexes' and a composite 'City Liveability Index' will be developed for each city.

3.1 Scoring and Computing Category Indices of Liveability

The set of 79 indicators, associated categories and pillars are presented in the table below:

Table 1 List of Pillars, Categories and Indicators

Pillars of Comprehensive Development	Category	Indicators
Institutional	1. Governance	1.1 Percentage of citizen services available online
		1.2 Percentage of services integrated through Command Centre
		1.3 Percentage of citizens using online services
		1.4 Average delay in grievance redressal
		1.5 Tax collected as percentage of tax billed
		1.6 Extent of cost recovery (O&M) in water supply services
		1.7 Capital spending as percentage of total expenditure
		1.8 Percentage of population covered under Ward Committees/Area *Sabhas*
Social	**2. Identity and Culture**	2.1 Restoration and reuse of historic buildings
		2.2 Percentage of ecologically important areas covered through projects for restoration
		2.3 Hotel occupancy
		2.4 Percentage of budget allocated towards cultural/sports activities
		2.5 Number of cultural/sports events hosted by city
	3. Education	3.1 Percentage of school-aged population enrolled in schools
		3.2 Percentage of female school-aged population

Development		Indicators
		enrolled in schools
		3.3 Primary education student-teacher ratio
		3.4 Percentage of schools with access to digital education
		3.5 Percentage of students completing primary education
		3.6 Percentage of students completing secondary education
	4. Health	4.1 Number of in-patient hospital beds per 10,000 population
		4.2 Healthcare professionals per 10,000 population
		4.3 Average response time in case of health emergencies
		4.4 Period prevalence of water borne diseases
		4.5 Period prevalence of vector borne diseases
	5. Safety and Security	5.1 Number of CCTV Cameras
		5.2 Number of recorded crimes per lakh population
		5.3 Extent of crimes recorded against women, children and elderly per year
		5.4 Transport-related fatality per lakh population
Economic	**6. Economy and Employment**	6.1 Increase in VAT/GST collection
		6.2 Increase in collection of Professional Tax
		6.3 Increase in issuance of Construction permits
		6.4 Unemployment rate
		6.5 Percentage of vendors registered and provided formal spaces
Physical	**7. Housing and Inclusiveness**	7.1 Percentage of Slum/EWS households covered through formal/affordable housing
		7.2 Percentage of slum areas covered through basic services
	8. Public Open Spaces	8.1 Per capita availability of green spaces
		8.2 Per capita availability of public and recreational places
	9. Mixed Land Use and Compactness	9.1 Share of mixed land use area in overall city land use
		9.2 Net Density
	10. Power Supply	10.1 Percentage of city population with authorized electrical services

Development		**Indicators**
		10.2 Percentage of electrical connections covered through smart meters
		10.3 Average number of electrical interruptions per year
		10.4 Average length of electrical interruptions per year
		10.5 Percentage of total energy derived from renewable sources
		10.6 Energy consumption per unit - water supply and sewerage
		10.7 Energy consumption per unit - street lighting
		10.8 Percentage of new and redeveloped buildings following green building norms
		10.9 Total energy consumption per capita
	11. Transportation and Mobility	11.1 Geographical coverage of public transport
		11.2 Availability of public transport
		11.3 Mode share of public transport
		11.4 Percentage of road network with dedicated bicycle tracks
		11.5 Percentage of interchanges with bicycle parking facilities
		11.6 Mode share of non-motorized transport
		11.7 Availability of Passenger Information System
		11.8 Extent of signal synchronization
		11.9 Availability of paid parking spaces
		11.10 Percentage coverage of footpaths – wider than 1.2 m
		11.11 Percentage of traffic intersections with pedestrian crossing facilities
		11.12 Extent to which universal accessibility is incorporated in public rights-of-way
	12. Assured Water Supply	12.1 Household level coverage of direct water supply connections
		12.2 Per capita supply of water
		12.3 Quality of water supplied
		12.4 Level of non-revenue water – NRW
		12.5 Percentage of water connections covered through meters
		12.6 Percentage of plots with rainwater harvesting

Development		Indicators
		facility
	13. Waste Water Management	13.1 Coverage of toilets
		13.2 Coverage of sewerage network and/or septage
		13.3 Collection efficiency of sewerage network
		13.4 Extent of reuse and recycling of waste water
		13.5 Coverage of storm water drains
	14. Solid Waste Management	14.1 Household level coverage of municipal solid waste collection
		14.2 Efficiency of collection of municipal solid waste
		14.3 Extent of municipal solid waste recovered through reuse
	15. Reduced Pollution	15.1 Concentration of SO2- air pollution
		15.2 Concentration of NO2- air pollution
		15.3 Concentration of PM10 - air pollution
		15.4 Level of noise pollution
		15.5 Quality of water in public surface water bodies

3.2 Scoring and Computing Category Indices of Liveability

The performance achieved by cities against 79 indicators, will be assessed against given benchmarks. Where no international/national norms are available, city with the best performance in its group (population range) will be treated as a benchmark. The groups are given in the table below.

Table 2 Details on Population Range

Category	Population range
Category 1	Population ≥ 4 million
Category 2	1 million ≤ Population < 4 million
Category 3	0.5 million ≤ Population < 1 million
Category 4	Population < 0.5 million

dology

A city can earn a maximum score of 100 points for 79 indicators across four pillars. The pillar weights are as follows: Institutional (25 points), Social (25 points), Economy and Employment (5 points) and Physical (45 points). Based on the number and nature of indicators i.e., core vs. secondary, indicator wise maximum marks were computed.

100 marks

(Maximum overall score that any city can achieve)

25 marks	25 marks	5 marks	45 marks
(Maximum score that any city can achieve under **Institutional** Pillar)	(Maximum score that any city can achieve under **Social** Pillar)	(Maximum score that any city can achieve under **Economic** Pillar)	(Maximum score that any city can achieve under **Physical** Pillar)
1	4	1	9
(Category under Institutional Pillar)	(Number of categories under Social Pillar)	(Category under Economic Pillar)	(Number of categories under Physical Pillar)
8	20	5	46
(Number of indicators under Institutional)	(Number of indicators under Social Pillar)	(Category under Economic Pillar)	(Number of categories under Physical Pillar)
7 Core 1 Supporting	13 Core 7 Supporting	4 Core 1 Supporting	33 Core 13 Supporting

Dimensional Index Methodology (DIM) has been used to compute scores for each indicator with reference to "maximum within the comparison group" or "absolute benchmarks". For indicators where benchmarks are available, cities getting the benchmark score (or above) are given the maximum mark, and the marks awarded to other cities are calculated proportionately. For indicators where benchmarks are not available, the best performing cities in each population group are given the maximum mark, and the marks awarded to other cities (within the population group) are calculated proportionately. For indicators where benchmarks do not exist, the city data has been tested for outliers before scoring.

To construct aggregate scores across cities as well as to make the scores across indicators comparable, indicator values were normalised using a min-max approach. The following formula was used to normalise the indicator values-

$$\frac{indicator\ value\ for\ the\ city - indicator\ value\ for\ the\ worst\ performing\ city}{benchmark - \ indicator\ value\ for\ the\ worst\ performing\ city}$$

This approach would restrict the normalised indicator value between 0 and 1. Cities that met or exceeded the benchmark received a normalised indicator value of 1. Worst performing cities are given a normalised indicator value of 0. After normalisation, the normalised value is weighted according to the category and the indicator being core or supporting.

To illustrate, consider the indicator 12.3 Quality of Water Supplied in the Category 12 for Assured Water Supply. If in City A 50% of the water samples collected qualify the potable water standards specified by the CPHEEO, and only 10% of the samples from worst performing city qualify the standards. Then, the normalised value for the indicator for city A would be 0.44 [(0.5-0.1)/(1-0.1)].

The weight for indicator 12.3 is 1.03, so the final weighted score for City A would come out to 0.45 [1.03*0.44].

n

4.1 Submission of Data by the cities

The Liveability Assessment is based on secondary data submitted by the urban local bodies and other concerned government agencies (collectively called as data owners). The 79 indicators were broken down into a set of easy to understand and relatable 553 questions mapped to data owners. Submission of the data was enabled through an online data entry portal on the smartnet platform of the Ministry. The portal also allowed the ULBs to download the liveability assessment questionnaire and upload filled in questionnaire. To familiarise and assist cities in identifying, mapping and collation of data points, a city level nodal person was available during the entire period of data submission process.

4.2 Mapping of Data Owners for the City

For the assessment of liveability indices broadly 12 data owners such as Central/state Pollution control board, Development authority, DISCOM/Electricity Board, State Disaster Management Authority, State Education Department, State Health department, State Renewable energy and development agency, State sales and commercial taxes department, town and country planning department, Traffic and police department, Transport authority, and Urban local body were identified to respond to the questions on the portal. However, during state workshop and subsequent city level discussions, more data owners were mapped to respond to different categories and sub categories. The following table provides the details of city level data owners mapped under the 12 data owner.

Table 3:Details of Data Owners

Designated data owners	Sub categories	Data owners at city level
Urban Local Body	Accounts	Accounts Department, Indore Municipal Corporation
	Park and Recreation	Indore Municipal Corporation
	Water Supply and Drainage	Engineering Department, Indore Municipal Corporation
	Heritage sites	Indore Municipal Corporation
	Ecological sites	Indore Municipal Corporation

	Mono Rail Authority	NA
	Tramways	NA
	Marine Transport Authority	NA

4.3 List of secondary documents available as supportive

City has provided supporting documents/evidences against the responses given by city on the online portal. In support of their responses on the portal, city submitted 86 number of documents. Documents submitted includes reports, official orders, copy of data maintained in official register, signed copy of questionnaire, and signed letters/submissions from concern departments. Verification includes mapping of documents against responses given by city, checking the type/category of documents, and validation of data provided.

The following table presents the data owner wise number of documents:

Table 4: Data owner wise number of secondary documents submitted by city

Data Owners	Number of Documents
Sales and Commercial Taxes	2
State Education Department	2
DISCOM/Electricity Department	2
Traffic and Police Department	11
Development Authority	3
Pollution Control Board	4
State Renewable Energy Department	0
Town and Country Planning	3
State Health Department	4
Transport Authority	8
Disaster Management	1
Urban Local Body	46
Total	86

A three-stage data quality check comprising verification of data against secondary documents furnished by data owners, logical inconsistency checks including outliers, and physical audit for select indicators (Refer the exhibit below) is being undertaken. The objective of the data quality check is to ensure that data from the source documents are accurate and verifiable. Sources of data included reports, administrative data, survey results and other statistical records, log books among other.

Physical audit of eight indicators – one indicator from the Institutional pillar, one from the Social pillar, one from the Economy pillar and five from the Physical pillar is also being carried out by the field team to ascertain the degree of reliability of data reported by the cities. The list of these eight indicators is presented below:

- 1.2 | Percentage of services integrated through Command Centre
- 2.3 | Hotel occupancy
- 3.4 | Percentage of schools with access to digital education
- **5.1** | Number of streets, public places, junctions covered through surveillance systems
- 6.5 | Percentage of vendors registered and provided formal spaces
- 11.7 | Availability of Passenger Information System
- 11.11 | Percentage of traffic intersections with pedestrian crossing facilities
- 11.12 | Extent to which universal accessibility is incorporated in public rights-of-way

For a set of five indicators namely, unemployment rate, mode share of public transport, mode share of non-motorised transport, quality of water supplied and level of noise pollution, existing datasets were found to be not available consistently across all cities and/or were inadequate. To help cities that do not have data on these five indicators, dipstick assessments are being carried to fill data gaps.

I Liveability Assessment covered 15 categories and 78 indicators. The below table presents the scores for all 15 indicators namely governance, identity & culture, education, health, safety and security, economy & employment, housing & inclusiveness, public open spaces, mixed land use & compactness, power supply, transport & mobility, assured water supply, waste water management, solid waste management and reduced pollution.

Table 5: Category wise scores

Categories	**Scores in Percentage**
Governance	55.96%
Identity & Culture	57%
Education	76%
Health	87%
Safety & Security	72%
Economy & Employment	16%
Housing & Inclusiveness	2%
Public Open Spaces	4%
Mixed Land Use & Compactness	0%
Power Supply	62%
Transport & Mobility	25%
Assured Water Supply	61%
Waste Water Management	48%
Solid Waste Management	68%
Reduced Pollution	79%

The rank of the city is based on the performance and scores in each of the category. The final city rank is submitted separately.

Assessment of liveability indices is an initiative by the Ministry of Housing and Urban Affairs to improve quality of life of citizens and achieve sustainable development goals by encouraging cities to adopt "outcome based" approach for urban planning. Assessment process aimed to provide opportunity to cities to review the development components holistically by involving 79 measurable indicators categorized under governance, health, education, safety, economy, power supply, transportation and mobility, identity, culture, housing, waste management and pollution.

This report highlights the assessment process, key milestones, and the final outcome of the data submitted. Implementation of liveability assessment commenced formally on 19th January 2018. A national level workshop was organized on 13th February 2018 to explain the importance and process of liveability assessment and get feedback on methodology from the city authorities.

This was followed by the next stage of Questionnaire development. The questionnaire was arranged under 12 categories representing 12 data owners namely urban local body, Central and state pollution control board, development authority, DISCOM/Electricity board, State disaster management authority, state education department, state health department, state renewable energy development agency, state sales and commercial taxes department, town and country planning department, traffic and police department and transport authorities.

An online data entry portal was developed to facilitate data submission by the cities. Each city had a unique log in to access the portal and submit the data. Both online and off-line options (download the questionnaire in an excel) to submit the data were available for cities. An email help desk was set up for the cities to raise any queries and seek clarification when responding to the questions.

A team for each state comprising of State Coordinator and City Coordinator (one per city) was deployed that facilitated the process and supported the cities. A total of 6 regional coordinators/ consultants, 29 State Coordinators, and 99 city coordinators were deployed across 116 cities. Training for state coordinators was held from 26th to 28th February 2018 at Chennai to make coordinators understand overall liveability assessment, indicators, data sources, protocols and roles and responsibilities.

itiated by the state and city coordinators. The discussion state workshop schedule, mapping of data owners, and assist cities in data collection. The City Coordinators were based in the cities for over 6 weeks and during this time, they liase with ULB and other data owners to explain the liveability framework, online portal, and facilitate the online submission.

A total of 33 state workshops were conducted at the state level. The objective of the workshop was to orient the city stakeholders on liveability assessment, indicators, components of data collection, timelines, expectations of support and support extended by MoHUA. The state level workshops brought various city level departments on a single platform to understand and discuss the methodology and components of city liveability assessment.

Nodal agency at state level supported by the City and State Coordinator and city level (Municipality corporation/smart city limited) coordinated with city specific data owners/departments for data gathering, collation, and submission. Nodal persons in each department were appointed for timely data collection and submission. Of 116, 112 cities submitted data as per the timeline on 16th April 2018.

Post submission, the city and state coordinators supported by the central team followed up extensively with the cities to support secondary documents as evidence to substantiate their submissions. Secondary documents such as reports, official orders, copy of office register, signed copy of liveability assessment questionnaire furnished by cities against the submitted data. Documents are verified to map the documents for the reponses provided by city and to check the type data provided by city. The document check outcomes were shared with the cities as a part of data quality check.

For checking consistency of data, logical check of data, verifying data from other public sources were undertaken. Quality check was done to ensure data validity and provide opportunity to cities to review the data provided by them and correct in case of wrong data entry.

For 8 selected indicators namely, percentage of services integrated through command and control center, hotel occupancy rate, percentage of schools with access to digital education, number of CCTV cameras per unit road length, percentage of vendors registered and provided formal spaces, availability of passenger information system, percentage of traffic intersection with pedestrian crossing facility, and extent to which universal accessibility is incorporated in

s conducted in 110 cities by physical auditors appointed sultation with ULB nodal person, locations and indicators for physical audit was selected in each city. A mobile based application was developed to capture the physical audit related data.

Primary data collection was done for five indicators such as unemployment rates, mode share of public transport, mode share of non-motorized transport, quality of water supplied, and level of noise pollution. Protocols for water and noise test were prepared in consultation with experts. Water quality test involved physical, chemical and bacteriological test of water as per the CPCB norms. For testing quality of water at consumer end, the auditors worked closely with the ULB and Water department. Samples were collected from consumer end and submitted to the lab suggested by city. For noise pollution, in about 20 cities the state pollution board or city level environment department took the responsibility for providing noise pollution data as per the protocols. In rest of the cities, mobile based application was used to measure noise pollution.

During implementation, MoHUA facilitated the process by conducting video conferences with cities to address any queries, reiterate the importance, and ensure that cities adequately engages in the process and submit their responses in time and respond to requests for clarifications.

In addition to secondary data collection, physical audit and primary data collection, citizen survey was conducted to understand their perception and level of satisfaction on various services such as health, education, water supply, electricity, waste management etc. provided by urban local bodies. Over 60000 citizens participated in the survey across India.

The final scores and ranks have been generated based on the scoring methodology that has been discussed extensively and minor modifications made that are summarized as below:

		Proposed Solutions
1	Only 23 cities of 111 cities have City Mobility Plan (CMP) or any and hence able to provide data for Mode Share of Public Transport and Non-Motorised Transport. To address the data gap, as advised by the MoHUA, the consortia undertook a sample dipstick across all cities covering a sample of 150 Households. Understandably, the dipstick findings will not match the rigor of a CMP.	We recommend the following: 1) Cities which have provided CMP Data will be evaluated on 100% of the maximum score 2) For the cities where the dipstick data is used, the city receives a 50% discount on the overall score Alternatively, another approach is to assign 0 score to all 88 cities that don't have a CMP
2	Variance was observed on data reported by cities on road network and data presented in the smart city proposals during the verifications.	We recommend taking the data reported by the cities in the Smart City Proposals.
3	There is no secondary source/ organization that provides unemployment data at city level. As a result, most cities do not have the data. Fully cognizance of the challenges of generating this data in a short span of time, it was agreed to collect this data through a dipstick survey on lines of NSSO questions. The data generated needs further scrutiny and triangulation with some inputs from experts. This may not be possible in the short window.	The indicator on unemployment will be excluded from scores. For final ranking, the cities will be scored on 78 indicators.
4	Many cities did not have data on noise pollution and it was decided that data will be collected using a mobile app for all the 111 cities. However, many cities have expressed reservations with the approach especially with respect to the reliability of using this data. Further, some cities have relied on the SPCB to collect the data as per the approach proposed by the consortia. Thus, noise pollution data is currently from two sources: 1. SPCB- 20 cities 2. Noise-based app- 91 cities	The data collected through the primary survey will be used for scoring the cities. Currently, there is no differential scoring for the data from the SPCB and the data collected through the mobile app. However, a certain higher weightage can be provided to those cities which used the state apparatus to collect noise pollution data.

		Proposed Solutions
5	For the indicator on quality of water supplied, the methodology document states that samples should be drawn both at the treatment plant outlet as well as the consumer end. However, the data provided by the cities were predominantly from the distribution point. Hence for consumer end results with MoHUA intervention, consortia coordinated with cities to collect the data at the consumer end. The cities facilitated the testing. The outcome of the process is as below: 1. Sample given- 102 cities 2. Report received- 86 cities 3. Report awaited- 16 cities 4. Tests not completed due to lack of cooperation and other reasons – 9	The maximum score for this indicator will be distributed equally (50%) for results based on samples from the treatment plant and consumer end. Cities that did not complete tests or provide the results will be given a score 0 for against consumer end tests.
6	City level population is not projected annually by most of the cities. So, estimates for 2017 population are not available with the cities.	As recommended by MoHUA, 2011 census population is being used for the ranking purpose.
7	The age category specific data for 9 cities is not available at a city level	The age category specific population data has been taken at a district level for these cities.
8	Indicators on non-motorised transports like- Dedicated bicycle tracks, bicycle parking facilities and mode share of non-motorised transport are not relevant for hilly terrains.	As discussed during the PMC meeting, these indicators have been treated as non-applicable for the hilly cities and the weights have been redistributed among other indicators within the same category.

		Proposed Solutions
9	The indicator on increase in professional tax is not relevant to cities which do not levy the professional tax.	As discussed during the PMC meeting, this indicator has been non-applicable to the cities belonging to states where professional tax is not levied, and the weights have been redistributed among other indicators within the same category.
10	The indicator on increase in VAT collection is not applicable to Port Blair and Kavaratti, as there was no provision of VAT collection in these cities.	As discussed during the PMC meeting, these indicatosr has been treated as non-applicable for these two cities and the weights have been redistributed among other indicators within the same category.
11	Indicator on coverage of basic services to slum households does not concern cities with no slums (notified/ non-notified.	As discussed during the PMC meeting, this indicators has been treated as non-applicable for these cities and the weights have been redistributed among other indicators within the same category.

The Ministry of Housing and Urban Affairs (MoHUA) is implementing several flagship urban missions such as the Smart Cities Mission (SCM), Atal Mission for Urban Rejuvenation and Transformation (AMRUT), Heritage City Development and Augmentation Yojana (HRIDAY), Housing for All (HFA). Theses mission along with other transformative initiatives of the Government including National Water Mission, Power for All, National Health Mission are aimed at making Indian cities more 'liveable.' The overarching goal of these initiatives is to move from an input-based approach to a 'citizen centric-outcome based' assessment of urban liveability.

To develop a common minimum framework for cities to assess their existing status and chart their pathway towards providing a better quality of life to their citizens, the MoHUA developed a set of 'Liveability Standards' relevant to cities to generate a Liveability Index and ranking of cities. These standards were launched in June, 2017. The MoHUA has planned to conduct an 'Annual Assessment of Liveability Standards in Cities – an ambitious national project that will involve yearly submission of data by cities across the various indicators, compilation and analysis, development of indices and ranking of cities. The Liveability Index is envisioned as a 360° tool for tracking, planning and transforming Indian cities. The Liveability Index is aimed at the following objectives:

- Providing strong evidence-based approach for future interventions and investments to deliver liveability outcomes
- Catalysing actions to improve the overall quality of the city's liveability and achieve broader development outcomes including the Sustainable Development Goals
- Assessing the implementation of government policies and schemes governing characteristics of cities that can contribute to creating liveable communities

City level self-assessment
Citizen driven accountability systems
Use cases and pathways for reform
Unearth blind spots and incentivise action
Institutionalisation of outcome based planning and governance
Cities move to a single, unified data driven decision making paradigm...

The first round of the assessment commenced in January 2018 covering 116 major cities including smart cities, capital cities and cities with population of above one million each. Implementation of the liveability assessment commenced in January 2018 with a national level orientation workshop for the urban local bodies. The workshop aimed at orienting the states and urban local bodies on the overall framework, indicators, data sources, methodology and key milestones and timelines involved in the liveability assessment. Subsequently, a series of State/ Union Territory level orientation workshops were carried out in 33 states/UTs for a detailed discussion on the framework. Online data collection commenced from 9th March through an online data collection platform that supported both online and offline data submission modes. On the date of closure of the online data entry portal i.e., 16th April, 2018 112 cities submitted their data. Subsequently, comprehensive checks on the submitted data was undertaken that involved checking for outliers, logical inconsistencies etc. post which round-1 of data reconciliation was conducted. This draft report is based on round-1 of reconciled data as on 28th April, 2018.

HYSICAL PROFILE

Water	Average Quantity of Water Supplied (MLD)	25
	Total Number of Water Connection	18955
Sanitation Facilities	Total number of households with access to individual toilets in the city	43163
	Total number of households in the city with access to community toilets in the city	...
Solid Waste Management	Daily average quantity of municipal solid waste collected in the city (Tonnes/day)	...
	Total number of households covered through door-to-door collection of solid waste	43163
Waste Water	Daily Average Quantum of Waste Water Generated in the City (MLD)	...
	Daily average quantum of waste water treated by STPs in the city (MLD)	...
Electricity	Total number of authorized electrical connections in the city	38179
	Total electricity supplied to the city (kWh)	134135516
Public and Open Spaces	Total area covered by green spaces in the city (m^2)	...
Roads and Transport	Total Length of Road Network in the City (Km)	20
	Total length of arterial and sub-arterial road network in the city (Km)	8.63
	Total length of footpath (wider than 1.2 metres) in the city along the street network (Km)	8

3. Liveability Framework and Indicators

The Liveability Framework comprises a total of 79 indicators (57 Core Indicators and 22 Supporting Indicators). A core indicator carries 70% weightage and a supporting indicator carries 30% weightage. These indicators are grouped under 15 thematic categories which in turn are part of four pillars of comprehensive development of cities i.e., institutional, social, economic and physi-

against the various core and supporting indicators, various e 'City Liveability Index' will be developed for each city.

3.1. Scoring and Computing Category Indices of Liveability

The set of 79 indicators, associated categories and pillars are presented in the table below:

Table 1 List of Pillars, Categories and Indicators

Pillars of Comprehensive Development	Category	Indicators
Institutional	1. Governance	1.1 Percentage of citizen services available online
		1.2 Percentage of services integrated through Command Centre
		1.3 Percentage of citizens using online services
		1.4 Average delay in grievance redressal
		1.5 Tax collected as percentage of tax billed
		1.6 Extent of cost recovery (O&M) in water supply services
		1.7 Capital spending as percentage of total expenditure
		1.8 Percentage of population covered under Ward Committees/Area *Sabhas*
Social	**2. Identity and Culture**	2.1 Restoration and reuse of historic buildings
		2.2 Percentage of ecologically important areas covered through projects for restoration
		2.3 Hotel occupancy

velopment		Indicators
		2.4 Percentage of budget allocated towards cultural/sports activities
		2.5 Number of cultural/sports events hosted by city
	3. Education	3.1 Percentage of school-aged population enrolled in schools
		3.2 Percentage of female school-aged population enrolled in schools
		3.3 Primary education student-teacher ratio
		3.4 Percentage of schools with access to digital education
		3.5 Percentage of students completing primary education
		3.6 Percentage of students completing secondary education
	4. Health	4.1 Number of in-patient hospital beds per 10,000 population
		4.2 Healthcare professionals per 10,000 population
		4.3 Average response time in case of health emergencies
		4.4 Period prevalence of water borne diseases
		4.5 Period prevalence of vector borne diseases
	5. Safety and Se-	5.1 Number of CCTV Cameras

velopment		Indicators
		13.5 Coverage of storm water drains
	14. Solid Waste Management	14.1 Household level coverage of municipal solid waste collection
		14.2 Efficiency of collection of municipal solid waste
		14.3 Extent of municipal solid waste recovered through reuse
	15. Reduced Pollution	15.1 Concentration of SO2- air pollution
		15.2 Concentration of NO2- air pollution
		15.3 Concentration of PM10 - air pollution
		15.4 Level of noise pollution
		15.5 Quality of water in public surface water bodies

3.2. Scoring and Computing Category Indices of Liveability

The performance achieved by cities against 79 indicators, will be assessed against given benchmarks. Where no international/national norms are available, city with the best performance in its group (population range) will be treated as a benchmark. The groups are given in the table below.

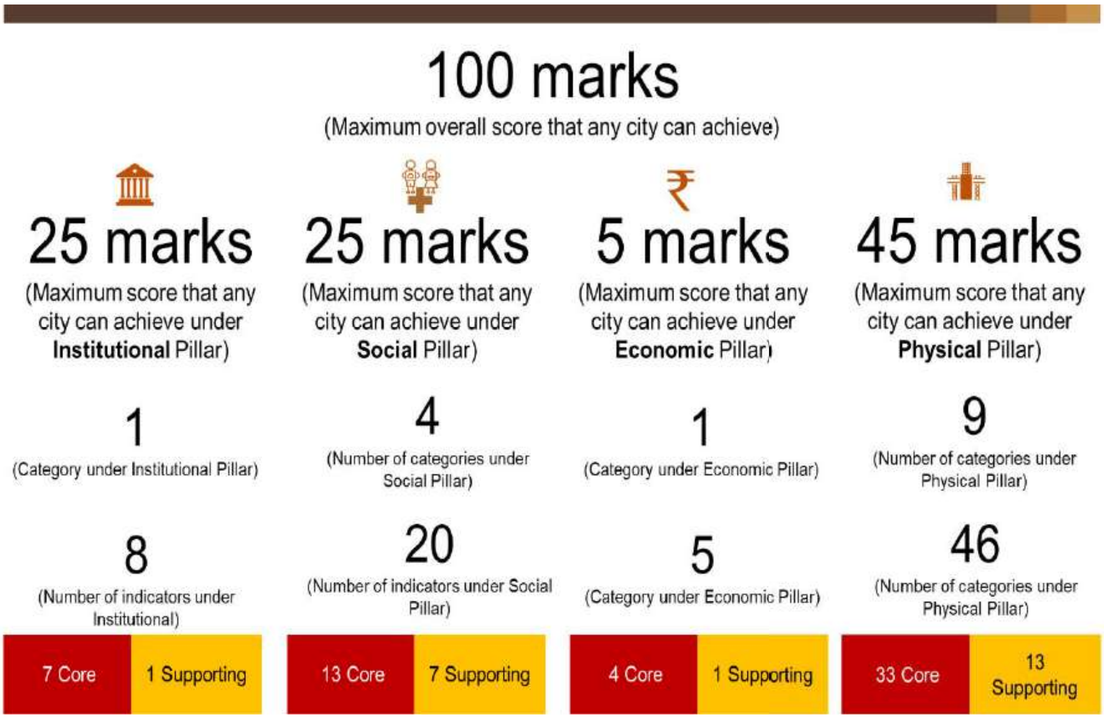
Details on Population Range

Category	Population range
Category 1	Population ≥ 4 million
Category 2	1 million ≤ Population < 4 million
Category 3	0.5 million ≤ Population < 1 million
Category 4	Population < 0.5 million

3.3. Scoring Approach and Methodology

A city can earn a maximum score of 100 points for 79 indicators across four pillars. The pillar weights are as follows: Institutional (25 points), Social (25 points), Economy and Employment (5 points) and Physical (45 points). Based on the number and nature of indicators i.e., core vs. secondary, indicator wise maximum marks were computed.



100 marks
(Maximum overall score that any city can achieve)
25 marks
(Maximum score that any city can achieve under Institutional Pillar)
25 marks
(Maximum score that any city can achieve under Social Pillar)
5 marks
(Maximum score that any city can achieve under Economic Pillar)
45 marks
(Maximum score that any city can achieve under Physical Pillar)

Dimensional Index Methodology (DIM) has been used to compute scores for each indicator with reference to "maximum within the comparison group" or "absolute benchmarks". For indicators where benchmarks are available, cities getting the benchmark score (or above) are given the maximum mark, and the marks awarded to other cities are calculated proportionately. For indicators where benchmarks are not available, the best performing cities in each population group are given the maximum mark, and the marks awarded to other cities (within the population group) are calculated proportionately. For indicators where benchmarks do not exist, the city data has been tested for outliers before scoring

3.4. Scoring Normalisation:

To construct aggregate scores across cities as well as to make the scores across indicators comparable, indicator values were normalised using a min-max approach. The following formula was used to normalise the indicator values.

This approach would restrict the normalised indicator value between 0 and 1. Cities that met or exceeded the benchmark received a normalised indicator value of 1. Worst performing cities are given a normalised indicator value of 0. After normalisation, the normalised value is weighted according to the category and the indicator being core or supporting.

To illustrate, consider the indicator 12.3 Quality of Water Supplied in the Category 12 for Assured Water Supply. If in City A 50% of the water samples collected qualify the potable water standards specified by the CPHEEO, and only 10% of the samples from worst performing city qualify the standards. Then, the normalised value for the indicator for city A would be 0.44 [(0.5-0.1)/(1-0.1)].

The weight for indicator 12.3 is 1.03, so the final weighted score for City A would come out to 0.45 [1.03*0.44].

4. Data Collection and Verification

4.1. Submission of Data by the cities

The Liveability Assessment is based on secondary data submitted by the urban local bodies and other concerned government agencies (collectively called as data owners). The 79 indicators were broken down into a set of easy to understand and relatable 553 questions mapped to data owners. Submission of the data was enabled through an online data entry portal on the smartnet platform of the Ministry. The portal also allowed the ULBs to download the liveability assessment questionnaire and upload filled in questionnaire. To familiarise and assist cities in identifying,

city level nodal person was available during the entire pe-

4.2. Mapping of Data Owners for the City

For the assessment of liveability indices broadly 12 data owners such as Central/state Pollution control board, Development authority, DISCOM/Electricity Board, State Disaster Management Authority, State Education Department, State Health department, State Renewable energy and development agency, State sales and commercial taxes department, town and country planning department, Traffic and police department, Transport authority, and Urban local body were identified to respond to the questions on the portal. However, during state workshop and subsequent city level discussions, more data owners were mapped to respond to different categories and sub categories. The following table provides the details of city level data owners mapped under the 12 data owner.

Table 3:Details of Data Owners

Designated data owners	Subcategories	Data owners at city level
Urban Local Body	For Accounts Related Questions	Itanagar Municipal Council
Urban Local Body	For Park and Recreation Related Questions	Itanagar Municipal Council
Urban Local Body	For Water Supply and Drainage related questions	Itanagar Municipal Council
Urban Local Body	For Heritage sites related data	Itanagar Municipal Council
Urban Local Body	For Ecological sites related data	Itanagar Municipal Council
Urban Local Body	For Housing related data	Itanagar Municipal Council
Urban Local Body	For Building plan related data	Itanagar Municipal Council
Urban Local Body	For Roads related data	Itanagar Municipal Council
Urban Local Body	For Solid waste management related data	Itanagar Municipal Council
Urban Local Body	For IT services related data	Itanagar Municipal Council
Urban Local Body	For Vendor committee related data	Itanagar Municipal Council
Urban Local Body	Any other departments involved in providing data for questions mentioned under Urban Local Body

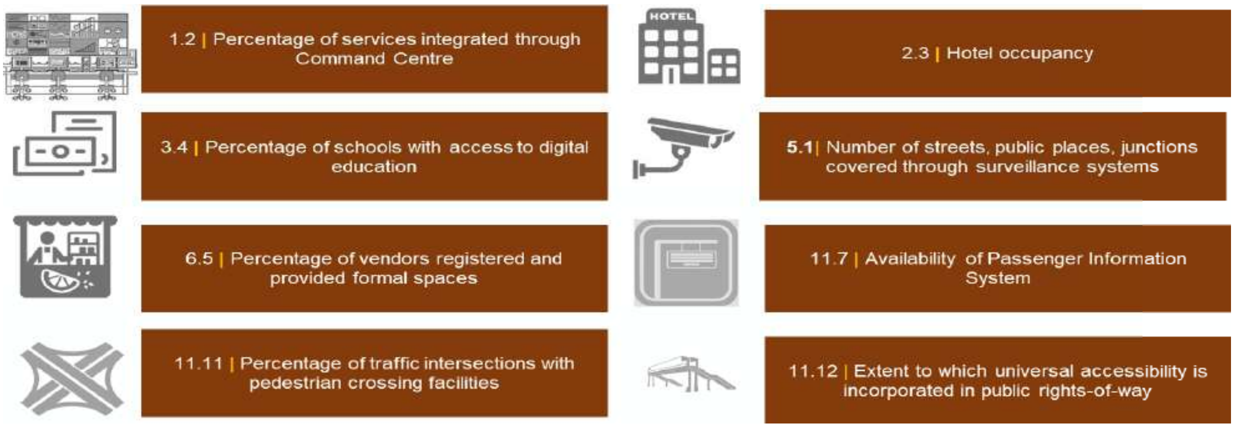
4.4. Data Verification

A three-stage data quality check comprising verification of data against secondary documents furnished by data owners, logical inconsistency checks including outliers, and physical audit for select indicators (Refer the exhibit below) is being undertaken. The objective of the data quality check is to ensure that data from the source documents are accurate and verifiable. Sources of data included reports, administrative data, survey results and other statistical records, log books among other.

Physical audit of eight indicators – one indicator from the Institutional pillar, one from the Social pillar, one from the Economy pillar and five from the Physical pillar is also being carried out by the field team to ascertain the degree of reliability of data reported by the cities. The list of these eight indicators is presented below:



1.2 | Percentage of services integrated through Command Centre

2.3 | Hotel occupancy

3.4 | Percentage of schools with access to digital education

5.1 | Number of streets, public places, junctions covered through surveillance systems

6.5 | Percentage of vendors registered and provided formal spaces

11.7 | Availability of Passenger Information System

11.11 | Percentage of traffic intersections with pedestrian crossing facilities

11.12 | Extent to which universal accessibility is incorporated in public rights-of-way

For a set of five indicators namely, unemployment rate, mode share of public transport, mode share of non-motorised transport, quality of water supplied and level of noise pollution, existing

ative by the Ministry of Housing and Urban Affairs to improve quality of life of citizens and achieve sustainable development goals by encouraging cities to adopt "outcome based" approach for urban planning. Assessment process aimed to provide opportunity to cities to review the development components holistically by involving 79 measurable indicators categorized under governance, health, education, safety, economy, power supply, transportation and mobility, identity, culture, housing, waste management and pollution.

This report highlights the assessment process, key milestones, and the final outcome of the data submitted. Implementation of liveability assessment commenced formally on 19th January 2018. A national level workshop was organized on 13th February 2018 to explain the importance and process of liveability assessment and get feedback on methodology from the city authorities.

This was followed by the next stage of Questionnaire development. The questionnaire was arranged under 12 categories representing 12 data owners namely urban local body, Central and state pollution control board, development authority, DISCOM/Electricity board, State disaster management authority, state education department, state health department, state renewable energy development agency, state sales and commercial taxes department, town and country planning department, traffic and police department and transport authorities.

An online data entry portal was developed to facilitate data submission by the cities. Each city had a unique log in to access the portal and submit the data. Both online and off-line options (download the questionnaire in an excel) to submit the data were available for cities. An email help desk was set up for the cities to raise any queries and seek clarification when responding to the questions.

A team for each state comprising of State Coordinator and City Coordinator (one per city) was deployed that facilitated the process and supported the cities. A total of 6 regional coordinators/ consultants, 29 State Coordinators, and 99 city coordinators were deployed across 116 cities. Training for state coordinators was held from 26th to 28th February 2018 at Chennai to make coordinators understand overall liveability assessment, indicators, data sources, protocols and roles and responsibilities.

City Reconnaissance Meetings were initiated by the state and city coordinators. The discussion began with discussions to finalize the state workshop schedule, mapping of data owners, and assist cities in data collection. The City Coordinators were based in the cities for over 6 weeks and during this time, they liase with ULB and other data owners to explain the liveability framework, online portal, and facilitate the online submission.

A total of 33 state workshops were conducted at the state level. The objective of the workshop was to orient the city stakeholders on liveability assessment, indicators, components of data collection, timelines, expectations of support and support extended by MoHUA. The state level workshops brought

Your complimentary use period has ended. Thank you for using PDF Complete.

le platform to understand and discuss the methodology and

Nodal agency at state level supported by the City and State Coordinator and city level (Municipality corporation/smart city limited) coordinated with city specific data owners/departments for data gathering, collation, and submission. Nodal persons in each department were appointed for timely data collection and submission. Of 116, 112 cities submitted data as per the timeline on 16th April 2018.

Post submission, the city and state coordinators supported by the central team followed up extensively with the cities to support secondary documents as evidence to substantiate their submissions. Secondary documents such as reports, official orders, copy of office register, signed copy of liveability assessment questionnaire furnished by cities against the submitted data. Documents are verified to map the documents for the reponses provided by city and to check the type data provided by city. The document check outcomes were shared with the cities as a part of data quality check.

For checking consistency of data, logical check of data, verifying data from other public sources were undertaken. Quality check was done to ensure data validity and provide opportunity to cities to review the data provided by them and correct in case of wrong data entry.

For 8 selected indicators namely, percentage of services integrated through command and control center, hotel occupancy rate, percentage of schools with access to digital education, number of CCTV cameras per unit road length, percentage of vendors registered and provided formal spaces, availability of passenger information system, percentage of traffic intersection with pedestrian crossing facility, and extent to which universal accessibility is incorporated in public rights of way. Physical audit was conducted in 110 cities by physical auditors appointed and trained by the consortium. In consultation with ULB nodal person, locations and indicators for physical audit was selected in each city. A mobile based application was developed to capture the physical audit related data.

Primary data collection was done for five indicators such as unemployment rates, mode share of public transport, mode share of non-motorized transport, quality of water supplied, and level of noise pollution. Protocols for water and noise test were prepared in consultation with experts. Water quality test involved physical, chemical and bacteriological test of water as per the CPCB norms. For testing quality of water at consumer end, the auditors worked closely with the ULB and Water department. Samples were collected from consumer end and submitted to the lab suggested by city. For noise pollution, in about 20 cities the state pollution board or city level environment department took the responsibility for providing noise pollution data as per the protocols. In rest of the cities, mobile based application was used to measure noise pollution.

During implementation, MoHUA facilitated the process by conducting video conferences with cities to address any queries, reiterate the importance, and ensure that cities adequately engages in the process and submit their responses in time and respond to requests for clarifications.

physical audit and primary data collection, citizen survey was n and level of satisfaction on various services such as health, education, water supply, electricity, waste management etc. provided by urban local bodies. Over 60000 citizens participated in the survey across India.

The final scores and ranks have been generated based on the scoring methodology that has been discussed extensively and minor modifications made that are summarized as below:

#	**Challenges**	**Proposed Solutions**
1	Only 23 cities of 111 cities have City Mobility Plan (CMP) or any and hence able to provide data for Mode Share of Public Transport and Non-Motorised Transport. To address the data gap, as advised by the MoHUA, the consortia undertook a sample dipstick across all cities covering a sample of 150 Households. Understandably, the dipstick findings will not match the rigor of a CMP.	We recommend the following: 1) Cities which have provided CMP Data will be evaluated on 100% of the maximum score 2) For the cities where the dipstick data is used, the city receives a 50% discount on the overall score Alternatively, another approach is to assign 0 score to all 88 cities that don't have a CMP
2	Variance was observed on data reported by cities on road network and data presented in the smart city proposals during the verifications.	We recommend taking the data reported by the cities in the Smart City Proposals.
3	There is no secondary source/ organization that provides unemployment data at city level. As a result, most cities do not have the data. Fully cognizance of the challenges of generating this data in a short span of time, it was agreed to collect this data through a dipstick survey on lines of NSSO questions. The data generated needs further scrutiny and triangulation with some inputs from experts. This may not be possible in the short	The indicator on unemployment will be excluded from scores. For final ranking, the cities will be scored on 78 indicators.

		Proposed Solutions
	window.	
4	Many cities did not have data on noise pollution and it was decided that data will be collected using a mobile app for all the 111 cities. However, many cities have expressed reservations with the approach especially with respect to the reliability of using this data. Further, some cities have relied on the SPCB to collect the data as per the approach proposed by the consortia. Thus, noise pollution data is currently from two sources: 1. SPCB- 20 cities 2. Noise-based app- 91 cities	The data collected through the primary survey will be used for scoring the cities. Currently, there is no differential scoring for the data from the SPCB and the data collected through the mobile app. However, a certain higher weightage can be provided to those cities which used the state apparatus to collect noise pollution data.
5	For the indicator on quality of water supplied, the methodology document states that samples should be drawn both at the treatment plant outlet as well as the consumer end. However, the data provided by the cities were predominantly from the distribution point. Hence for consumer end results with MoHUA intervention, consortia coordinated with cities to collect the data at the consumer end. The cities facilitated the testing. The outcome of the process is as below: 1. Sample given- 102 cities 2. Report received- 86 cities 3. Report awaited- 16 cities 4. Tests not completed due to lack of cooperation and other reasons – 9	The maximum score for this indicator will be distributed equally (50%) for results based on samples from the treatment plant and consumer end. Cities that did not complete tests or provide the results will be given a score 0 for against consumer end tests.
6	City level population is not projected annually by most of the cities. So, estimates for 2017 population are not available with the cities.	As recommended by MoHUA, 2011 census population is being used for the ranking purpose.

		Proposed Solutions
7	The age category specific data for 9 cities is not available at a city level	The age category specific population data has been taken at a district level for these cities.
8	Indicators on non-motorised transports like- Dedicated bicycle tracks, bicycle parking facilities and mode share of non-motorised transport are not relevant for hilly terrains.	As discussed during the PMC meeting, these indicators have been treated as non-applicable for the hilly cities and the weights have been redistributed among other indicators within the same category.
9	The indicator on increase in professional tax is not relevant to cities which do not levy the professional tax.	As discussed during the PMC meeting, this indicator has been non-applicable to the cities belonging to states where professional tax is not levied, and the weights have been redistributed among other indicators within the same category.
10	The indicator on increase in VAT collection is not applicable to Port Blair and Kavaratti, as there was no provision of VAT collection in these cities.	As discussed during the PMC meeting, these indicatosr has been treated as non-applicable for these two cities and the weights have been redistributed among other indicators within the same category.
11	Indicator on coverage of basic services to slum households does not concern cities with no slums (notified/ non-notified.	As discussed during the PMC meeting, this indicators has been treated as non-applicable for these cities and the weights have been redistributed among other indicators within the same category.

1. Introduction

The Ministry of Housing and Urban Affairs (MoHUA) is implementing several flagship urban missions such as the Smart Cities Mission (SCM), Atal Mission for Urban Rejuvenation and Transformation (AMRUT), Heritage City Development and Augmentation Yojana (HRIDAY), Housing for All (HFA). Theses mission along with other transformative initiatives of the Government including National Water Mission, Power for All, National Health Mission are aimed at making Indian cities more 'liveable.' The overarching goal of these initiatives is to move from an input-based approach to a 'citizen centric-outcome based' assessment of urban liveability.

To develop a common minimum framework for cities to assess their existing status and chart their pathway towards providing a better quality of life to their citizens, the MoHUA developed a set of 'Liveability Standards' relevant to cities to generate a Liveability Index and ranking of cities. These standards were launched in June, 2017. The MoHUA has planned to conduct an 'Annual Assessment of Liveability Standards in Cities – an ambitious national project that will involve yearly submission of data by cities across the various indicators, compilation and analysis, development of indices and ranking of cities. The Liveability Index is envisioned as a 360° tool for tracking, planning and transforming Indian cities. The Liveability Index is aimed at the following objectives:

- Providing strong evidence-based approach for future interventions and investments to deliver liveability outcomes
- Catalysing actions to improve the overall quality of the city's liveability and achieve broader development outcomes including the Sustainable Development Goals
- Assessing the implementation of government policies and schemes governing characteristics of cities that can contribute to creating liveable communities

The first round of the assessment commenced in January 2018 covering 116 major cities including smart cities, capital cities and cities with population of above one million each. Implementation of the liveability assessment commenced in January 2018 with a national level orientation workshop for the urban local bodies. The workshop aimed at orienting the states and urban local bodies on the overall framework, indicators, data sources, methodology and key milestones and timelines involved in the liveability assessment. Subsequently, a series of State/ Union Territory level orientation workshops were carried out in 33 states/UTs for a detailed discussion on the framework. Online data collection commenced from 9th March through an online data collection platform that supported both online and offline data submission modes. On the date of closure of the online data entry portal i.e., 16th April, 2018 112 cities submitted their data. Subsequently, comprehensive checks on the submitted data was undertaken that involved checking for outliers, logical inconsistencies etc. post which round-1 of data reconciliation was conducted. This draft report is based on round-1 of reconciled data as on 28th April, 2018.

PHYSICAL PROFILE

Water	Average Quantity of Water Supplied (MLD)	251
	Total Number of Water Connection	143958
Sanitation Facilities	Total number of households with access to individual toilets in the city	244128
	Total number of households in the city with access to community toilets in the city	22443
Solid Waste Management	Daily average quantity of municipal solid waste collected in the city (Tonnes/day)	524
	Total number of households covered through door-to-door collection of solid waste	230356
Waste Water	Daily Average Quantum of Waste Water Generated in the City (MLD)	185
	Daily average quantum of waste water treated by STPs in the city (MLD)	0.15
Electricity	Total number of authorized electrical connections in the city	314783
	Total electricity supplied to the city (kWh)	1180500000
Public and Open Spaces	Total area covered by green spaces in the city (m^2)	8442381
Roads and Transport	Total Length of Road Network in the City (Km)	1050
	Total length of arterial and sub-arterial road network in the city (Km)	131
	Total length of footpath (wider than 1.2 metres) in the city along the street network (Km)	13.39

3. Liveability Framework and Indicators

The Liveability Framework comprises a total of 79 indicators (57 Core Indicators and 22 Supporting Indicators). A core indicator carries 70% weightage and a supporting indicator carries 30% weightage. These indicators are grouped under 15 thematic categories which in turn are part of four pillars of comprehensive development of cities i.e., institutional, social, economic and physical. Based on the performance of cities against the various core and supporting indicators, various 'Category Sub-Indexes' and a composite 'City Liveability Index' will be developed for each city.

5.1 Scoring and Computing Category Indices of Liveability

The set of 79 indicators, associated categories and pillars are presented in the table below:

Table 1 List of Pillars, Categories and Indicators

Pillars of Comprehensive Development	Category	Indicators
Institutional	1. Governance	1.1 Percentage of citizen services available online
		1.2 Percentage of services integrated through Command Centre
		1.3 Percentage of citizens using online services
		1.4 Average delay in grievance redressal
		1.5 Tax collected as percentage of tax billed
		1.6 Extent of cost recovery (O&M) in water supply services
		1.7 Capital spending as percentage of total expenditure
		1.8 Percentage of population covered under Ward Committees/Area *Sabhas*
Social	**2. Identity and Culture**	2.1 Restoration and reuse of historic buildings
		2.2 Percentage of ecologically important areas covered through projects for restoration
		2.3 Hotel occupancy
		2.4 Percentage of budget allocated towards cultural/sports activities
		2.5 Number of cultural/sports events hosted by city
	3. Education	3.1 Percentage of school-aged population enrolled in schools
		3.2 Percentage of female school-aged population enrolled in schools

Development		Indicators
		3.3 Primary education student-teacher ratio
		3.4 Percentage of schools with access to digital education
		3.5 Percentage of students completing primary education
		3.6 Percentage of students completing secondary education
	4. Health	4.1 Number of in-patient hospital beds per 10,000 population
		4.2 Healthcare professionals per 10,000 population
		4.3 Average response time in case of health emergencies
		4.4 Period prevalence of water borne diseases
		4.5 Period prevalence of vector borne diseases
	5. Safety and Security	5.1 Number of CCTV Cameras
		5.2 Number of recorded crimes per lakh population
		5.3 Extent of crimes recorded against women, children and elderly per year
		5.4 Transport-related fatality per lakh population
Economic	**6. Economy and Employment**	6.1 Increase in VAT/GST collection
		6.2 Increase in collection of Professional Tax
		6.3 Increase in issuance of Construction permits
		6.4 Unemployment rate
		6.5 Percentage of vendors registered and provided formal spaces
Physical	**7. Housing and Inclusiveness**	7.1 Percentage of Slum/EWS households covered through formal/affordable housing
		7.2 Percentage of slum areas covered through basic

	Management	collection
		14.2 Efficiency of collection of municipal solid waste
		14.3 Extent of municipal solid waste recovered through reuse
	15. Reduced Pollution	15.1 Concentration of SO2- air pollution
		15.2 Concentration of NO2- air pollution
		15.3 Concentration of PM10 - air pollution
		15.4 Level of noise pollution
		15.5 Quality of water in public surface water bodies

3.2 Scoring and Computing Category Indices of Liveability

The performance achieved by cities against 79 indicators, will be assessed against given benchmarks. Where no international/national norms are available, city with the best performance in its group (population range) will be treated as a benchmark. The groups are given in the table below.

Table 2 Details on Population Range

Category	Population range
Category 1	Population ≥ 4 million
Category 2	1 million ≤ Population < 4 million
Category 3	0.5 million ≤ Population < 1 million
Category 4	Population < 0.5 million

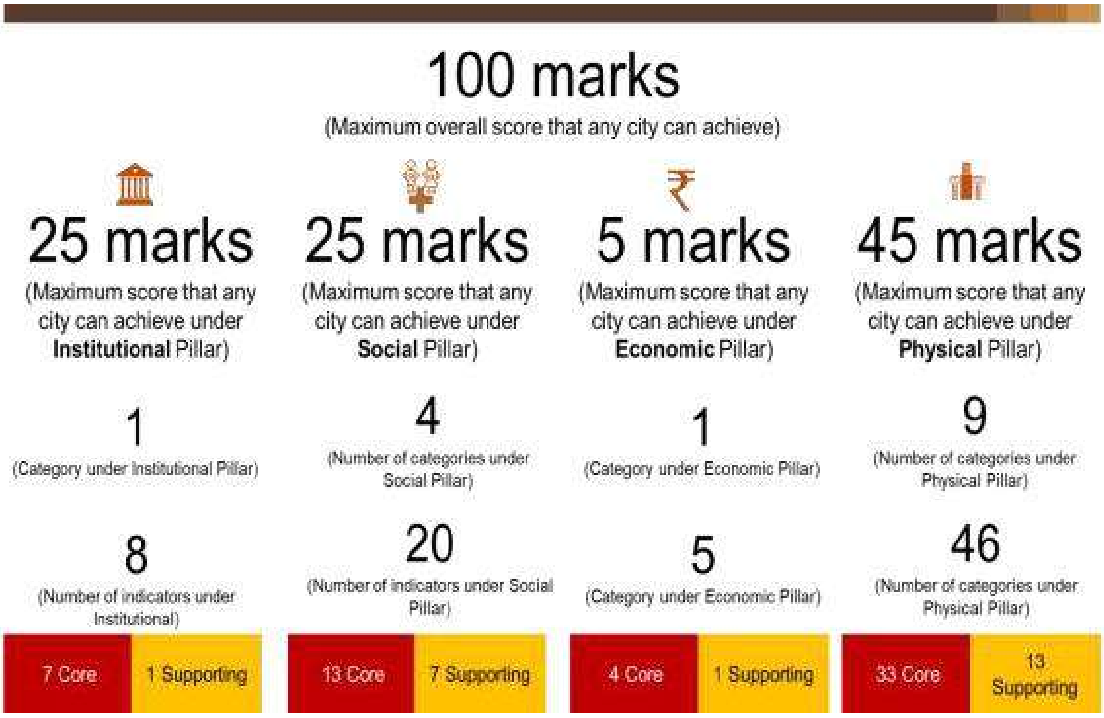
dology

A city can earn a maximum score of 100 points for 79 indicators across four pillars. The pillar weights are as follows: Institutional (25 points), Social (25 points), Economy and Employment (5 points) and Physical (45 points). Based on the number and nature of indicators i.e., core vs. secondary, indicator wise maximum marks were computed.



100 marks
(Maximum overall score that any city can achieve)
25 marks
(Maximum score that any city can achieve under Institutional Pillar)
25 marks
(Maximum score that any city can achieve under Social Pillar)
5 marks
(Maximum score that any city can achieve under Economic Pillar)
45 marks
(Maximum score that any city can achieve under Physical Pillar)
1
(Category under Institutional Pillar)
4
(Number of categories under Social Pillar)
1
(Category under Economic Pillar)
9
(Number of categories under Physical Pillar)
8
(Number of indicators under Institutional)
20
(Number of indicators under Social Pillar)
5
(Category under Economic Pillar)
46
(Number of categories under Physical Pillar)
7 Core

13 Supporting

Dimensional Index Methodology (DIM) has been used to compute scores for each indicator with reference to "maximum within the comparison group" or "absolute benchmarks". For indicators where benchmarks are available, cities getting the benchmark score (or above) are given the maximum mark, and the marks awarded to other cities are calculated proportionately. For indicators where benchmarks are not available, the best performing cities in each population group are given the maximum mark, and the marks awarded to other cities (within the population group) are calculated proportionately. For indicators where benchmarks do not exist, the city data has been tested for outliers before scoring.

use period has ended. Thank you for using PDF Complete.
PDF Complete
Click Here to upgrade to Unlimited Pages and Expanded Features

cities as well as to make the scores across indicators comparable, indicator values were normalised using a min-max approach. The following formula was used to normalise the indicator values-

$$\frac{indicator\ value\ for\ the\ city - indicator\ value\ for\ the\ worst\ performing\ city}{benchmark - \ indicator\ value\ for\ the\ worst\ performing\ city}$$

This approach would restrict the normalised indicator value between 0 and 1. Cities that met or exceeded the benchmark received a normalised indicator value of 1. Worst performing cities are given a normalised indicator value of 0. After normalisation, the normalised value is weighted according to the category and the indicator being core or supporting.

To illustrate, consider the indicator 12.3 Quality of Water Supplied in the Category 12 for Assured Water Supply. If in City A 50% of the water samples collected qualify the potable water standards specified by the CPHEEO, and only 10% of the samples from worst performing city qualify the standards. Then, the normalised value for the indicator for city A would be 0.44 [(0.5-0.1)/(1-0.1)].

The weight for indicator 12.3 is 1.03, so the final weighted score for City A would come out to 0.45 [1.03*0.44].

4. Data Collection and Verification

4.1 Submission of Data by the cities

The Liveability Assessment is based on secondary data submitted by the urban local bodies and other concerned government agencies (collectively called as data owners). The 79 indicators were broken down into a set of easy to understand and relatable 553 questions mapped to data owners. Submission of the data was enabled through an online data entry portal on the smartnet platform of the Ministry. The portal also allowed the ULBs to download the liveability assessment questionnaire and upload filled in questionnaire. To familiarise and assist cities in identifying, mapping and collation of data points, a city level nodal person was available during the entire period of data submission process.

4.2 Mapping of Data Owners for the City

For the assessment of liveability indices broadly 12 data owners such as Central/state Pollution control board, Development authority, DISCOM/Electricity Board, State Disaster Management Authority, State Education Department, State Health department, State Renewable energy and development agency, State sales and commercial taxes department, town and country planning

Your complimentary use period has ended. Thank you for using PDF Complete.

tment, Transport authority, and Urban local body were ns on the portal. However, during state workshop and subsequent city level discussions, more data owners were mapped to respond to different categories and sub categories. The following table provides the details of city level data owners mapped under the 12 data owner.

Table 3:Details of Data Owners

Designated data owners	Sub categories	Data owners at city level
Urban Local Body	Accounts	Accounts Department, Jabalpur Municipal Corporation
	Park and Recreation	Garden Section, Jabalpur Municipal Corporation
	Water Supply and Drainage	Water works and Water Head, Jabalpur Municipal Corporation

	Marine Transport Authority	NA

4.3 List of secondary documents available as supportive

City has provided supporting documents/evidences against the responses given by city on the online portal. In support of their responses on the portal, city submitted 162 number of documents. Documents submitted includes reports, official orders, copy of data maintained in official register, signed copy of questionnaire, and signed letters/submissions from concern departments. Verification includes mapping of documents against responses given by city, checking the type/category of documents, and validation of data provided.

The following table presents the data owner wise number of documents:

Table 4: Data owner wise number of secondary documents submitted by city

Data Owners	Number of Documents
Sales and Commercial Taxes	8
State Education Department	7
DISCOM/Electricity Department	4
Traffic and Police Department	4
Development Authority	2
Pollution Control Board	5
State Renewable Energy Department	3
Town and Country Planning	3
State Health Department	17
Transport Authority	8
Disaster Management	4

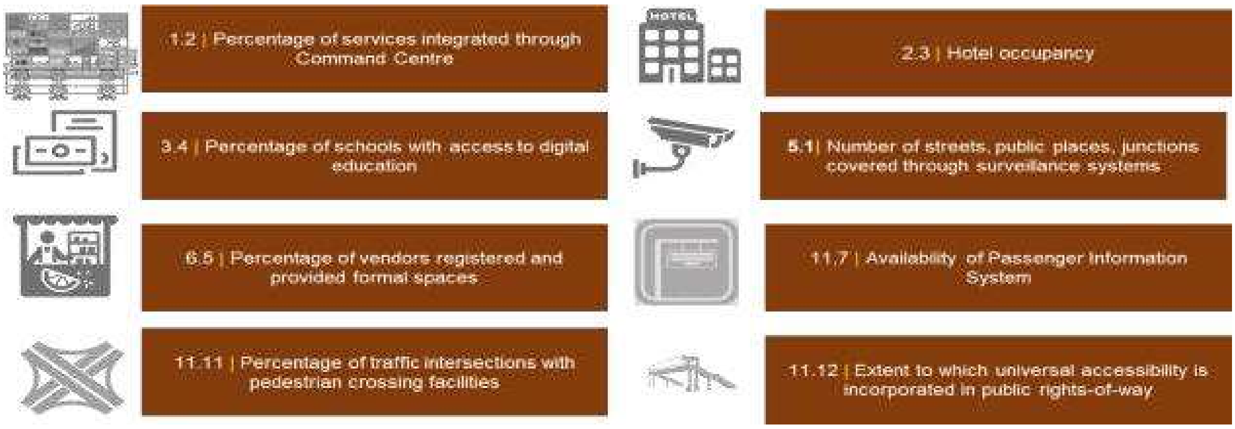
prising verification of data against secondary documents furnished by data owners, logical inconsistency checks including outliers, and physical audit for select indicators (Refer the exhibit below) is being undertaken. The objective of the data quality check is to ensure that data from the source documents are accurate and verifiable. Sources of data included reports, administrative data, survey results and other statistical records, log books among other.

Physical audit of eight indicators – one indicator from the Institutional pillar, one from the Social pillar, one from the Economy pillar and five from the Physical pillar is also being carried out by the field team to ascertain the degree of reliability of data reported by the cities. The list of these eight indicators is presented below:



1.2 | Percentage of services integrated through Command Centre

2.3 | Hotel occupancy

3.4 | Percentage of schools with access to digital education

5.1 | Number of streets, public places, junctions covered through surveillance systems

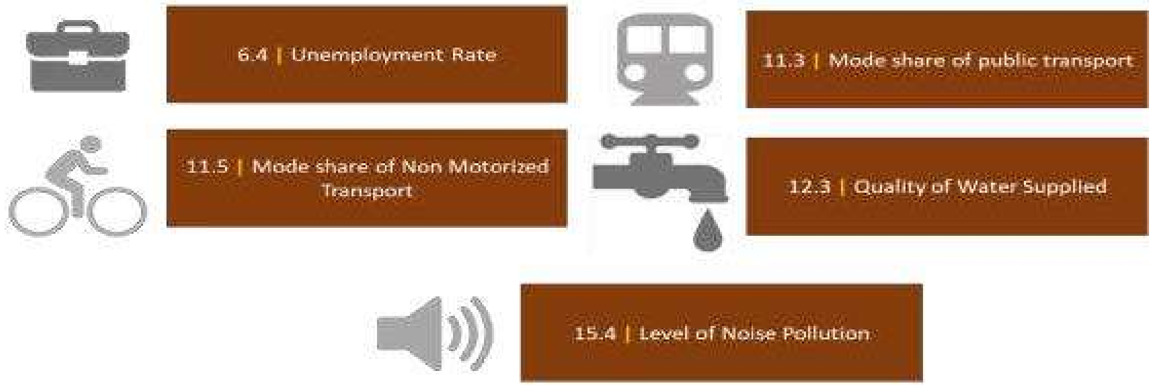
6.5 | Percentage of vendors registered and provided formal spaces

11.7 | Availability of Passenger Information System

11.11 | Percentage of traffic intersections with pedestrian crossing facilities

11.12 | Extent to which universal accessibility is incorporated in public rights-of-way

For a set of five indicators namely, unemployment rate, mode share of public transport, mode share of non-motorised transport, quality of water supplied and level of noise pollution, existing datasets were found to be not available consistently across all cities and/or were inadequate. To help cities that do not have data on these five indicators, dipstick assessments are being carried to fill data gaps.



6.4 | Unemployment Rate

11.3 | Mode share of public transport

11.5 | Mode share of Non Motorized Transport

12.3 | Quality of Water Supplied

15.4 | Level of Noise Pollution

5. Category wise scores

Liveability Assessment covered 15 categories and 78 indicators. The below table presents the scores for all 15 indicators namely governance, identity & culture, education, health, safety and security, economy & employment, housing & inclusiveness, public open spaces, mixed land use & compactness, power supply, transport & mobility, assured water supply, waste water management, solid waste management and reduced pollution.

e 5: Category wise scores

Categories	Scores in Percentage
Governance	59.18%
Identity & Culture	40%
Education	84%
Health	95%
Safety & Security	58%
Economy & Employment	10%
Housing & Inclusiveness	8%
Public Open Spaces	34%
Mixed Land Use & Compactness	1%
Power Supply	50%
Transport & Mobility	36%
Assured Water Supply	74%
Waste Water Management	42%
Solid Waste Management	100%
Reduced Pollution	69%

The rank of the city is based on the performance and scores in each of the category. The final city rank is submitted separately.

ative by the Ministry of Housing and Urban Affairs to improve stainable development goals by encouraging cities to adopt "outcome based" approach for urban planning. Assessment process aimed to provide opportunity to cities to review the development components holistically by involving 79 measurable indicators categorized under governance, health, education, safety, economy, power supply, transportation and mobility, identity, culture, housing, waste management and pollution.

This report highlights the assessment process, key milestones, and the final outcome of the data submitted. Implementation of liveability assessment commenced formally on 19th January 2018. A national level workshop was organized on 13th February 2018 to explain the importance and process of liveability assessment and get feedback on methodology from the city authorities.

This was followed by the next stage of Questionnaire development. The questionnaire was arranged under 12 categories representing 12 data owners namely urban local body, Central and state pollution control board, development authority, DISCOM/Electricity board, State disaster management authority, state education department, state health department, state renewable energy development agency, state sales and commercial taxes department, town and country planning department, traffic and police department and transport authorities.

An online data entry portal was developed to facilitate data submission by the cities. Each city had a unique log in to access the portal and submit the data. Both online and off-line options (download the questionnaire in an excel) to submit the data were available for cities. An email help desk was set up for the cities to raise any queries and seek clarification when responding to the questions.

A team for each state comprising of State Coordinator and City Coordinator (one per city) was deployed that facilitated the process and supported the cities. A total of 6 regional coordinators/ consultants, 29 State Coordinators, and 99 city coordinators were deployed across 116 cities. Training for state coordinators was held from 26th to 28th February 2018 at Chennai to make coordinators understand overall liveability assessment, indicators, data sources, protocols and roles and responsibilities.

City Reconnaissance Meetings were initiated by the state and city coordinators. The discussion began with discussions to finalize the state workshop schedule, mapping of data owners, and assist cities in data collection. The City Coordinators were based in the cities for over 6 weeks and during this time, they liase with ULB and other data owners to explain the liveability framework, online portal, and facilitate the online submission.

A total of 33 state workshops were conducted at the state level. The objective of the workshop was to orient the city stakeholders on liveability assessment, indicators, components of data collection, timelines, expectations of support and support extended by MoHUA. The state level workshops brought

le platform to understand and discuss the methodology and

Nodal agency at state level supported by the City and State Coordinator and city level (Municipality corporation/smart city limited) coordinated with city specific data owners/departments for data gathering, collation, and submission. Nodal persons in each department were appointed for timely data collection and submission. Of 116, 112 cities submitted data as per the timeline on 16th April 2018.

Post submission, the city and state coordinators supported by the central team followed up extensively with the cities to support secondary documents as evidence to substantiate their submissions. Secondary documents such as reports, official orders, copy of office register, signed copy of liveability assessment questionnaire furnished by cities against the submitted data. Documents are verified to map the documents for the reponses provided by city and to check the type data provided by city. The document check outcomes were shared with the cities as a part of data quality check.

For checking consistency of data, logical check of data, verifying data from other public sources were undertaken. Quality check was done to ensure data validity and provide opportunity to cities to review the data provided by them and correct in case of wrong data entry.

For 8 selected indicators namely, percentage of services integrated through command and control center, hotel occupancy rate, percentage of schools with access to digital education, number of CCTV cameras per unit road length, percentage of vendors registered and provided formal spaces, availability of passenger information system, percentage of traffic intersection with pedestrian crossing facility, and extent to which universal accessibility is incorporated in public rights of way. Physical audit was conducted in 110 cities by physical auditors appointed and trained by the consortium. In consultation with ULB nodal person, locations and indicators for physical audit was selected in each city. A mobile based application was developed to capture the physical audit related data.

Primary data collection was done for five indicators such as unemployment rates, mode share of public transport, mode share of non-motorized transport, quality of water supplied, and level of noise pollution. Protocols for water and noise test were prepared in consultation with experts. Water quality test involved physical, chemical and bacteriological test of water as per the CPCB norms. For testing quality of water at consumer end, the auditors worked closely with the ULB and Water department. Samples were collected from consumer end and submitted to the lab suggested by city. For noise pollution, in about 20 cities the state pollution board or city level environment department took the responsibility for providing noise pollution data as per the protocols. In rest of the cities, mobile based application was used to measure noise pollution.

During implementation, MoHUA facilitated the process by conducting video conferences with cities to address any queries, reiterate the importance, and ensure that cities adequately engages in the process and submit their responses in time and respond to requests for clarifications.

physical audit and primary data collection, citizen survey was n and level of satisfaction on various services such as health, education, water supply, electricity, waste management etc. provided by urban local bodies. Over 60000 citizens participated in the survey across India.

The final scores and ranks have been generated based on the scoring methodology that has been discussed extensively and minor modifications made that are summarized as below:

#	Challenges	Proposed Solutions
1	Only 23 cities of 111 cities have City Mobility Plan (CMP) or any and hence able to provide data for Mode Share of Public Transport and Non-Motorised Transport. To address the data gap, as advised by the MoHUA, the consortia undertook a sample dipstick across all cities covering a sample of 150 Households. Understandably, the dipstick findings will not match the rigor of a CMP.	We recommend the following: 1) Cities which have provided CMP Data will be evaluated on 100% of the maximum score 2) For the cities where the dipstick data is used, the city receives a 50% discount on the overall score Alternatively, another approach is to assign 0 score to all 88 cities that don't have a CMP
2	Variance was observed on data reported by cities on road network and data presented in the smart city proposals during the verifications.	We recommend taking the data reported by the cities in the Smart City Proposals.
3	There is no secondary source/ organization that provides unemployment data at city level. As a result, most cities do not have the data. Fully cognizance of the challenges of generating this data in a short span of time, it was agreed to collect this data through a dipstick survey on lines of NSSO questions. The data generated needs further scrutiny and triangulation with some inputs from experts. This may not be possible in the short	The indicator on unemployment will be excluded from scores. For final ranking, the cities will be scored on 78 indicators.

		Proposed Solutions
	window.	
4	Many cities did not have data on noise pollution and it was decided that data will be collected using a mobile app for all the 111 cities. However, many cities have expressed reservations with the approach especially with respect to the reliability of using this data. Further, some cities have relied on the SPCB to collect the data as per the approach proposed by the consortia. Thus, noise pollution data is currently from two sources: 1. SPCB- 20 cities 2. Noise-based app- 91 cities	The data collected through the primary survey will be used for scoring the cities. Currently, there is no differential scoring for the data from the SPCB and the data collected through the mobile app. However, a certain higher weightage can be provided to those cities which used the state apparatus to collect noise pollution data.
5	For the indicator on quality of water supplied, the methodology document states that samples should be drawn both at the treatment plant outlet as well as the consumer end. However, the data provided by the cities were predominantly from the distribution point. Hence for consumer end results with MoHUA intervention, consortia coordinated with cities to collect the data at the consumer end. The cities facilitated the testing. The outcome of the process is as below: 1. Sample given- 102 cities 2. Report received- 86 cities 3. Report awaited- 16 cities 4. Tests not completed due to lack of cooperation and other reasons – 9	The maximum score for this indicator will be distributed equally (50%) for results based on samples from the treatment plant and consumer end. Cities that did not complete tests or provide the results will be given a score 0 for against consumer end tests.
6	City level population is not projected annually by most of the cities. So, estimates for 2017 population are not available with the cities.	As recommended by MoHUA, 2011 census population is being used for the ranking purpose.

Your complimentary use period has ended. Thank you for using PDF Complete.
Click Here to upgrade to Unlimited Pages and Expanded Features

		Proposed Solutions
7	The age category specific data for 9 cities is not available at a city level	The age category specific population data has been taken at a district level for these cities.
8	Indicators on non-motorised transports like- Dedicated bicycle tracks, bicycle parking facilities and mode share of non-motorised transport are not relevant for hilly terrains.	As discussed during the PMC meeting, these indicators have been treated as non-applicable for the hilly cities and the weights have been redistributed among other indicators within the same category.
9	The indicator on increase in professional tax is not relevant to cities which do not levy the professional tax.	As discussed during the PMC meeting, this indicator has been non-applicable to the cities belonging to states where professional tax is not levied, and the weights have been redistributed among other indicators within the same category.
10	The indicator on increase in VAT collection is not applicable to Port Blair and Kavaratti, as there was no provision of VAT collection in these cities.	As discussed during the PMC meeting, these indicatosr has been treated as non-applicable for these two cities and the weights have been redistributed among other indicators within the same category.
11	Indicator on coverage of basic services to slum households does not concern cities with no slums (notified/ non-notified.	As discussed during the PMC meeting, this indicators has been treated as non-applicable for these cities and the weights have been redistributed among other indicators within the same category.

The Ministry of Housing and Urban Affairs (MoHUA) is implementing several flagship urban missions such as the Smart Cities Mission (SCM), Atal Mission for Urban Rejuvenation and Transformation (AMRUT), Heritage City Development and Augmentation Yojana (HRIDAY), Housing for All (HFA). Theses mission along with other transformative initiatives of the Government including National Water Mission, Power for All, National Health Mission are aimed at making Indian cities more 'liveable.' The overarching goal of these initiatives is to move from an input-based approach to a 'citizen centric-outcome based' assessment of urban liveability.

To develop a common minimum framework for cities to assess their existing status and chart their pathway towards providing a better quality of life to their citizens, the MoHUA developed a set of 'Liveability Standards' relevant to cities to generate a Liveability Index and ranking of cities. These standards were launched in June, 2017. The MoHUA has planned to conduct an 'Annual Assessment of Liveability Standards in Cities – an ambitious national project that will involve yearly submission of data by cities across the various indicators, compilation and analysis, development of indices and ranking of cities. The Liveability Index is envisioned as a 360° tool for tracking, planning and transforming Indian cities. The Liveability Index is aimed at the following objectives:

- Providing strong evidence-based approach for future interventions and investments to deliver liveability outcomes
- Catalysing actions to improve the overall quality of the city's liveability and achieve broader development outcomes including the Sustainable Development Goals
- Assessing the implementation of government policies and schemes governing characteristics of cities that can contribute to creating liveable communities

Tracking
liveability
Urban Planning
and Management
City level self-assessment
Citizen driven accountability systems
Use cases and pathways for reform
Unearth blind spots and incentivise action
Institutionalisation of outcome based planning and governance
Cities move to a single, unified data driven decision making paradigm...

The first round of the assessment commenced in January 2018 covering 116 major cities including smart cities, capital cities and cities with population of above one million each. Implementation of the liveability assessment commenced in January 2018 with a national level orientation workshop for the urban local bodies. The workshop aimed at orienting the states and urban local bodies on the overall framework, indicators, data sources, methodology and key milestones and timelines involved in the liveability assessment. Subsequently, a series of State/ Union Territory level orientation workshops were carried out in 33 states/UTs for a detailed discussion on the framework. Online data collection commenced from 9th March through an online data collection platform that supported both online and offline data submission modes. On the date of closure of the online data entry portal i.e., 16th April, 2018 112 cities submitted their data. Subsequently, comprehensive checks on the submitted data was undertaken that involved checking for outliers, logical inconsistencies etc. post which round-1 of data reconciliation was conducted. This draft report is based on round-1 of reconciled data as on 28th April, 2018.

	SICAL PROFILE	
Water	ntity of Water Supplied (MLD)	50.6
	Total Number of Water Connection	471080
Sanitation Facilities	Total number of households with access to individual toilets in the city	638982
	Total number of households in the city with access to community toilets in the city	....
Solid Waste Management	Daily average quantity of municipal solid waste collected in the city (Tonnes/day)	1472.8
	Total number of households covered through door-to-door collection of solid waste	630091
Waste Water	Daily Average Quantum of Waste Water Generated in the City (MLD)	264
	Daily average quantum of waste water treated by STPs in the city (MLD)	202
Electricity	Total number of authorized electrical connections in the city	4131152
	Total electricity supplied to the city (kWh)	4189100000
Public and Open Spaces	Total area covered by green spaces in the city (m²)	....
Roads and Transport	Total Length of Road Network in the City (Km)	6000
	Total length of arterial and sub-arterial road network in the city (Km)	2800
	Total length of footpath (wider than 1.2 metres) in the city along the street network (Km)	400

3. Liveability Framework and Indicators

The Liveability Framework comprises a total of 79 indicators (57 Core Indicators and 22 Supporting Indicators). A core indicator carries 70% weightage and a supporting indicator carries 30% weightage. These indicators are grouped under 15 thematic categories which in turn are part of four pillars of comprehensive development of cities i.e., institutional, social, economic and physical. Based on the performance of cities against the various core and supporting indicators, various 'Category Sub-Indexes' and a composite 'City Liveability Index' will be developed for each city.

ory Indices of Liveability

egories and pillars are presented in the table below:

Table 1 List of Pillars, Categories and Indicators

Pillars of Comprehensive Development	Category	Indicators
Institutional	1. Governance	1.1 Percentage of citizen services available online
		1.2 Percentage of services integrated through Command Centre
		1.3 Percentage of citizens using online services
		1.4 Average delay in grievance redressal
		1.5 Tax collected as percentage of tax billed
		1.6 Extent of cost recovery (O&M) in water supply services
		1.7 Capital spending as percentage of total expenditure
		1.8 Percentage of population covered under Ward Committees/Area *Sabhas*
Social	**2. Identity and Culture**	2.1 Restoration and reuse of historic buildings
		2.2 Percentage of ecologically important areas covered through projects for restoration
		2.3 Hotel occupancy
		2.4 Percentage of budget allocated towards cultural/sports activities
		2.5 Number of cultural/sports events hosted by city
	3. Education	3.1 Percentage of school-aged population enrolled in schools
		3.2 Percentage of female school-aged population enrolled in schools
		3.3 Primary education student-teacher ratio
		3.4 Percentage of schools with access to digital

Development		**Indicators**
		14.2 Efficiency of collection of municipal solid waste
		14.3 Extent of municipal solid waste recovered through reuse
	15. Reduced Pollution	15.1 Concentration of SO2- air pollution
		15.2 Concentration of NO2- air pollution
		15.3 Concentration of PM10 - air pollution
		15.4 Level of noise pollution
		15.5 Quality of water in public surface water bodies

3.2 Scoring and Computing Category Indices of Liveability

The performance achieved by cities against 79 indicators, will be assessed against given benchmarks. Where no international/national norms are available, city with the best performance in its group (population range) will be treated as a benchmark. The groups are given in the table below.

Table 2 Details on Population Range

Category	**Population range**
Category 1	Population ≥ 4 million
Category 2	1 million ≤ Population < 4 million
Category 3	0.5 million ≤ Population < 1 million
Category 4	Population < 0.5 million

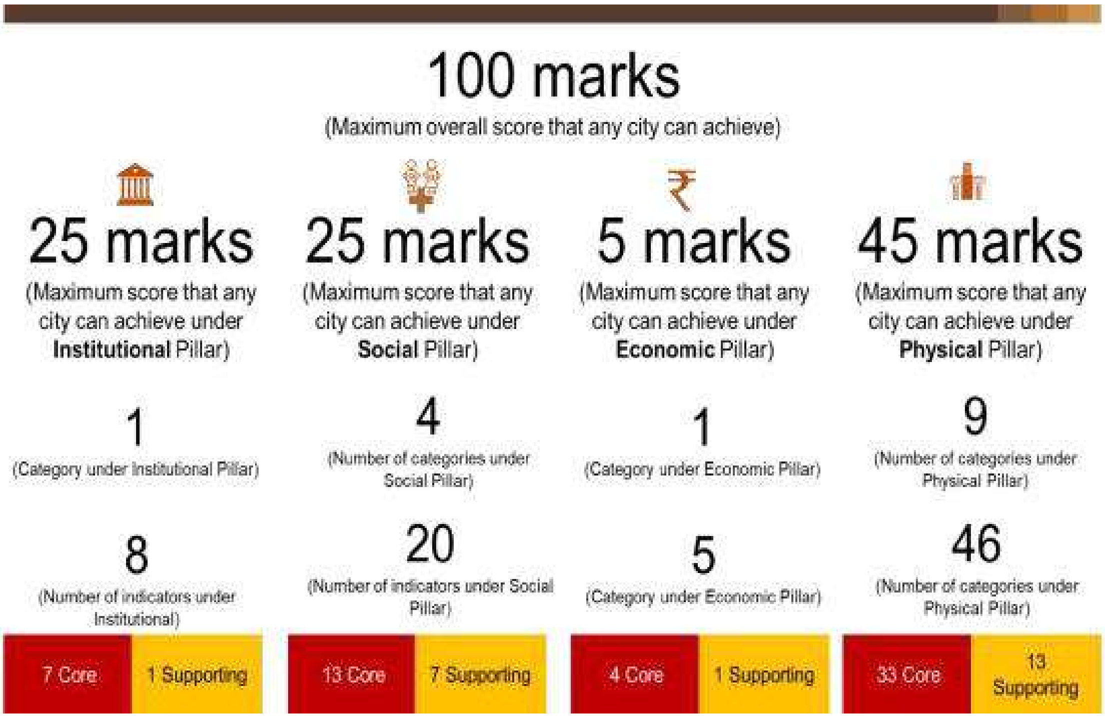
dology

A city can earn a maximum score of 100 points for 79 indicators across four pillars. The pillar weights are as follows: Institutional (25 points), Social (25 points), Economy and Employment (5 points) and Physical (45 points). Based on the number and nature of indicators i.e., core vs. secondary, indicator wise maximum marks were computed.



100 marks

(Maximum overall score that any city can achieve)

25 marks	25 marks	5 marks	45 marks
(Maximum score that any city can achieve under **Institutional** Pillar)	(Maximum score that any city can achieve under **Social** Pillar)	(Maximum score that any city can achieve under **Economic** Pillar)	(Maximum score that any city can achieve under **Physical** Pillar)
1	4	1	9
(Category under Institutional Pillar)	(Number of categories under Social Pillar)	(Category under Economic Pillar)	(Number of categories under Physical Pillar)
8	20	5	46
(Number of indicators under Institutional)	(Number of indicators under Social Pillar)	(Category under Economic Pillar)	(Number of categories under Physical Pillar)
7 Core 1 Supporting	13 Core 7 Supporting	4 Core 1 Supporting	33 Core 13 Supporting

Dimensional Index Methodology (DIM) has been used to compute scores for each indicator with reference to "maximum within the comparison group" or "absolute benchmarks". For indicators where benchmarks are available, cities getting the benchmark score (or above) are given the maximum mark, and the marks awarded to other cities are calculated proportionately. For indicators where benchmarks are not available, the best performing cities in each population group are given the maximum mark, and the marks awarded to other cities (within the population group) are calculated proportionately. For indicators where benchmarks do not exist, the city data has been tested for outliers before scoring.

To construct aggregate scores across cities as well as to make the scores across indicators comparable, indicator values were normalised using a min-max approach. The following formula was used to normalise the indicator values-

$$\frac{indicator\ value\ for\ the\ city - indicator\ value\ for\ the\ worst\ performing\ city}{benchmark - \ indicator\ value\ for\ the\ worst\ performing\ city}$$

This approach would restrict the normalised indicator value between 0 and 1. Cities that met or exceeded the benchmark received a normalised indicator value of 1. Worst performing cities are given a normalised indicator value of 0. After normalisation, the normalised value is weighted according to the category and the indicator being core or supporting.

To illustrate, consider the indicator 12.3 Quality of Water Supplied in the Category 12 for Assured Water Supply. If in City A 50% of the water samples collected qualify the potable water standards specified by the CPHEEO, and only 10% of the samples from worst performing city qualify the standards. Then, the normalised value for the indicator for city A would be 0.44 [(0.5-0.1)/(1-0.1)].

The weight for indicator 12.3 is 1.03, so the final weighted score for City A would come out to 0.45 [1.03*0.44].

4. Data Collection and Verification

4.1 Submission of Data by the cities

The Liveability Assessment is based on secondary data submitted by the urban local bodies and other concerned government agencies (collectively called as data owners). The 79 indicators were broken down into a set of easy to understand and relatable 553 questions mapped to data owners. Submission of the data was enabled through an online data entry portal on the smartnet platform of the Ministry. The portal also allowed the ULBs to download the liveability assessment questionnaire and upload filled in questionnaire. To familiarise and assist cities in identifying, mapping and collation of data points, a city level nodal person was available during the entire period of data submission process.

the City

For the assessment of liveability indices broadly 12 data owners such as Central/state Pollution control board, Development authority, DISCOM/Electricity Board, State Disaster Management Authority, State Education Department, State Health department, State Renewable energy and development agency, State sales and commercial taxes department, town and country planning department, Traffic and police department, Transport authority, and Urban local body were identified to respond to the questions on the portal. However, during state workshop and subsequent city level discussions, more data owners were mapped to respond to different categories and sub categories. The following table provides the details of city level data owners mapped under the 12 data owner.

Table 3:Details of Data Owners

Designated data owners	Subcategories	Data owners at city level
Urban Local Body	For Accounts Related Questions	Municipal Corporation
Urban Local Body	For Park and Recreation Related Questions	Municipal Corporation
Urban Local Body	For Water Supply and Drainage related questions	Public Health Engineering Department
Urban Local Body	For Heritage sites related data	Not Identified
Urban Local Body	For Ecological sites related data	Municipal Corporation
Urban Local Body	For Housing related data	Municipal Corporation
Urban Local Body	For Building plan related data	Municipal Corporation
Urban Local Body	For Roads related data	Municipal Corporation
Urban Local Body	For Solid waste management related data	Municipal Corporation
Urban Local Body	For IT services related data	Municipal Corporation
Urban Local Body	For Vendor committee related data	Municipal Corporation
Urban Local Body	Any other departments involved in providing data for questions mentioned under Urban Local Body	Town & Country Planning
Central / state Pollution control Board	Water Quality, Air Quality, Noise Quality	Pollution Control Board
Development Authority	Building Infrastructure	Development Authority
	Construction planning	Development Authority
	Green Building	Development Authority

Transport Authorities	Buses	Transport Deoartment
	Registered Vehicles	Transport Department
	Sub urban rail transport	Not Applicable
	Mono Rail Authority	Not Applicable
	Tramways	Not Applicable
	Marine Transport Authority	Not Applicable

4.3 List of secondary documents available as supportive

City has provided supporting documents/evidences against the responses given by city on the online portal. In support of their responses on the portal, city submitted 11 number of documents. Documents submitted includes reports, official orders, copy of data maintained in official register, signed copy of questionnaire, and signed letters/submissions from concern departments.

PDF Complete
Your complimentary use period has ended. Thank you for using PDF Complete.

cuments against responses given by city, checking the ation of data provided.

The following table presents the data owner wise number of documents:

Table 4: Data owner wise number of secondary documents submitted by city

Data Owners	Number of Documents
Sales and Commercial Taxes	**0**
State Education Department	**0**
DISCOM/Electricity Department	**0**
Traffic and Police Department	**0**
Development Authority	**0**
Pollution Control Board	**0**
State Renewable Energy Department	**0**
Town and Country Planning	**0**
State Health Department	**4**
Transport Authority	**2**
Disaster Management	**0**
Urban Local Body	**5**
Total	**11***

4.4 Data Verification

A three-stage data quality check comprising verification of data against secondary documents furnished by data owners, logical inconsistency checks including outliers, and physical audit for select indicators (Refer the exhibit below) is being undertaken. The objective of the data quality check is to ensure that data from the source documents are accurate and verifiable. Sources of data included reports, administrative data, survey results and other statistical records, log books among other.

Physical audit of eight indicators – one indicator from the Institutional pillar, one from the Social pillar, one from the Economy pillar and five from the Physical pillar is also being carried out by the field team to ascertain the degree of reliability of data reported by the cities. The list of these eight indicators is presented below:

d through

2.3 | Hotel occupancy

3.4 | Percentage of schools with access to digital education

5.1 | Number of streets, public places, junctions covered through surveillance systems

6.5 | Percentage of vendors registered and provided formal spaces

11.7 | Availability of Passenger Information System

11.11 | Percentage of traffic intersections with pedestrian crossing facilities

11.12 | Extent to which universal accessibility is incorporated in public rights-of-way

For a set of five indicators namely, unemployment rate, mode share of public transport, mode share of non-motorised transport, quality of water supplied and level of noise pollution, existing datasets were found to be not available consistently across all cities and/or were inadequate. To help cities that do not have data on these five indicators, dipstick assessments are being carried to fill data gaps.

6.4 | Unemployment Rate

11.3 | Mode share of public transport

11.5 | Mode share of Non Motorized Transport

12.3 | Quality of Water Supplied

15.4 | Level of Noise Pollution

ative by the Ministry of Housing and Urban Affairs to improve quality of life of citizens and achieve sustainable development goals by encouraging cities to adopt "outcome based" approach for urban planning. Assessment process aimed to provide opportunity to cities to review the development components holistically by involving 79 measurable indicators categorized under governance, health, education, safety, economy, power supply, transportation and mobility, identity, culture, housing, waste management and pollution.

This report highlights the assessment process, key milestones, and the final outcome of the data submitted. Implementation of liveability assessment commenced formally on 19th January 2018. A national level workshop was organized on 13th February 2018 to explain the importance and process of liveability assessment and get feedback on methodology from the city authorities.

This was followed by the next stage of Questionnaire development. The questionnaire was arranged under 12 categories representing 12 data owners namely urban local body, Central and state pollution control board, development authority, DISCOM/Electricity board, State disaster management authority, state education department, state health department, state renewable energy development agency, state sales and commercial taxes department, town and country planning department, traffic and police department and transport authorities.

An online data entry portal was developed to facilitate data submission by the cities. Each city had a unique log in to access the portal and submit the data. Both online and off-line options (download the questionnaire in an excel) to submit the data were available for cities. An email help desk was set up for the cities to raise any queries and seek clarification when responding to the questions.

A team for each state comprising of State Coordinator and City Coordinator (one per city) was deployed that facilitated the process and supported the cities. A total of 6 regional coordinators/ consultants, 29 State Coordinators, and 99 city coordinators were deployed across 116 cities. Training for state coordinators was held from 26th to 28th February 2018 at Chennai to make coordinators understand overall liveability assessment, indicators, data sources, protocols and roles and responsibilities.

City Reconnaissance Meetings were initiated by the state and city coordinators. The discussion began with discussions to finalize the state workshop schedule, mapping of data owners, and assist cities in data collection. The City Coordinators were based in the cities for over 6 weeks and during this time, they liase with ULB and other data owners to explain the liveability framework, online portal, and facilitate the online submission.

A total of 33 state workshops were conducted at the state level. The objective of the workshop was to orient the city stakeholders on liveability assessment, indicators, components of data collection, timelines, expectations of support and support extended by MoHUA. The state level workshops brought

le platform to understand and discuss the methodology and

Nodal agency at state level supported by the City and State Coordinator and city level (Municipality corporation/smart city limited) coordinated with city specific data owners/departments for data gathering, collation, and submission. Nodal persons in each department were appointed for timely data collection and submission. Of 116, 112 cities submitted data as per the timeline on 16th April 2018.

Post submission, the city and state coordinators supported by the central team followed up extensively with the cities to support secondary documents as evidence to substantiate their submissions. Secondary documents such as reports, official orders, copy of office register, signed copy of liveability assessment questionnaire furnished by cities against the submitted data. Documents are verified to map the documents for the reponses provided by city and to check the type data provided by city. The document check outcomes were shared with the cities as a part of data quality check.

For checking consistency of data, logical check of data, verifying data from other public sources were undertaken. Quality check was done to ensure data validity and provide opportunity to cities to review the data provided by them and correct in case of wrong data entry.

For 8 selected indicators namely, percentage of services integrated through command and control center, hotel occupancy rate, percentage of schools with access to digital education, number of CCTV cameras per unit road length, percentage of vendors registered and provided formal spaces, availability of passenger information system, percentage of traffic intersection with pedestrian crossing facility, and extent to which universal accessibility is incorporated in public rights of way. Physical audit was conducted in 110 cities by physical auditors appointed and trained by the consortium. In consultation with ULB nodal person, locations and indicators for physical audit was selected in each city. A mobile based application was developed to capture the physical audit related data.

Primary data collection was done for five indicators such as unemployment rates, mode share of public transport, mode share of non-motorized transport, quality of water supplied, and level of noise pollution. Protocols for water and noise test were prepared in consultation with experts. Water quality test involved physical, chemical and bacteriological test of water as per the CPCB norms. For testing quality of water at consumer end, the auditors worked closely with the ULB and Water department. Samples were collected from consumer end and submitted to the lab suggested by city. For noise pollution, in about 20 cities the state pollution board or city level environment department took the responsibility for providing noise pollution data as per the protocols. In rest of the cities, mobile based application was used to measure noise pollution.

During implementation, MoHUA facilitated the process by conducting video conferences with cities to address any queries, reiterate the importance, and ensure that cities adequately engages in the process and submit their responses in time and respond to requests for clarifications.

physical audit and primary data collection, citizen survey was n and level of satisfaction on various services such as health, education, water supply, electricity, waste management etc. provided by urban local bodies. Over 60000 citizens participated in the survey across India.

The final scores and ranks have been generated based on the scoring methodology that has been discussed extensively and minor modifications made that are summarized as below:

#	Challenges	Proposed Solutions
1	Only 23 cities of 111 cities have City Mobility Plan (CMP) or any and hence able to provide data for Mode Share of Public Transport and Non-Motorised Transport. To address the data gap, as advised by the MoHUA, the consortia undertook a sample dipstick across all cities covering a sample of 150 Households. Understandably, the dipstick findings will not match the rigor of a CMP.	We recommend the following: 1) Cities which have provided CMP Data will be evaluated on 100% of the maximum score 2) For the cities where the dipstick data is used, the city receives a 50% discount on the overall score Alternatively, another approach is to assign 0 score to all 88 cities that don't have a CMP
2	Variance was observed on data reported by cities on road network and data presented in the smart city proposals during the verifications.	We recommend taking the data reported by the cities in the Smart City Proposals.
3	There is no secondary source/ organization that provides unemployment data at city level. As a result, most cities do not have the data. Fully cognizance of the challenges of generating this data in a short span of time, it was agreed to collect this data through a dipstick survey on lines of NSSO questions. The data generated needs further scrutiny and triangulation with some inputs from experts. This may not be	The indicator on unemployment will be excluded from scores. For final ranking, the cities will be scored on 78 indicators.

PDF Complete
use period has ended.
Thank you for using

Unlimited Pages and Expanded Features

		Proposed Solutions
	possible in the short window.	
4	Many cities did not have data on noise pollution and it was decided that data will be collected using a mobile app for all the 111 cities. However, many cities have expressed reservations with the approach especially with respect to the reliability of using this data. Further, some cities have relied on the SPCB to collect the data as per the approach proposed by the consortia. Thus, noise pollution data is currently from two sources: 1. SPCB- 20 cities 2. Noise-based app- 91 cities	The data collected through the primary survey will be used for scoring the cities. Currently, there is no differential scoring for the data from the SPCB and the data collected through the mobile app. However, a certain higher weightage can be provided to those cities which used the state apparatus to collect noise pollution data.
5	For the indicator on quality of water supplied, the methodology document states that samples should be drawn both at the treatment plant outlet as well as the consumer end. However, the data provided by the cities were predominantly from the distribution point. Hence for consumer end results with MoHUA intervention, consortia coordinated with cities to collect the data at the consumer end. The cities facilitated the testing. The outcome of the process is as below: 1. Sample given- 102 cities 2. Report received- 86 cities 3. Report awaited- 16 cities 4. Tests not completed due to lack of cooperation and other reasons – 9	The maximum score for this indicator will be distributed equally (50%) for results based on samples from the treatment plant and consumer end. Cities that did not complete tests or provide the results will be given a score 0 for against consumer end tests.
6	City level population is not projected annually by most of the cities. So, estimates for 2017 population are not available with the cities.	As recommended by MoHUA, 2011 census population is being used for the ranking purpose.

Click Here to upgrade to Unlimited Pages and Expanded Features

		Proposed Solutions
7	The age category specific data for 9 cities is not available at a city level	The age category specific population data has been taken at a district level for these cities.
8	Indicators on non-motorised transports like- Dedicated bicycle tracks, bicycle parking facilities and mode share of non-motorised transport are not relevant for hilly terrains.	As discussed during the PMC meeting, these indicators have been treated as non-applicable for the hilly cities and the weights have been redistributed among other indicators within the same category.
9	The indicator on increase in professional tax is not relevant to cities which do not levy the professional tax.	As discussed during the PMC meeting, this indicator has been non-applicable to the cities belonging to states where professional tax is not levied, and the weights have been redistributed among other indicators within the same category.
10	The indicator on increase in VAT collection is not applicable to Port Blair and Kavaratti, as there was no provision of VAT collection in these cities.	As discussed during the PMC meeting, these indicatosr has been treated as non-applicable for these two cities and the weights have been redistributed among other indicators within the same category.
11	Indicator on coverage of basic services to slum households does not concern cities with no slums (notified/ non-notified.	As discussed during the PMC meeting, this indicators has been treated as non-applicable for these cities and the weights have been redistributed among other indicators within the same category.

1. Introduction

The Ministry of Housing and Urban Affairs (MoHUA) is implementing several flagship urban missions such as the Smart Cities Mission (SCM), Atal Mission for Urban Rejuvenation and Transformation (AMRUT), Heritage City Development and Augmentation Yojana (HRIDAY), Housing for All (HFA). Theses mission along with other transformative initiatives of the Government including National Water Mission, Power for All, National Health Mission are aimed at making Indian cities more 'liveable.' The overarching goal of these initiatives is to move from an input-based approach to a 'citizen centric-outcome based' assessment of urban liveability.

To develop a common minimum framework for cities to assess their existing status and chart their pathway towards providing a better quality of life to their citizens, the MoHUA developed a set of 'Liveability Standards' relevant to cities to generate a Liveability Index and ranking of cities. These standards were launched in June, 2017. The MoHUA has planned to conduct an 'Annual Assessment of Liveability Standards in Cities – an ambitious national project that will involve yearly submission of data by cities across the various indicators, compilation and analysis, development of indices and ranking of cities. The Liveability Index is envisioned as a 360° tool for tracking, planning and transforming Indian cities. The Liveability Index is aimed at the following objectives:

- Providing strong evidence-based approach for future interventions and investments to deliver liveability outcomes
- Catalysing actions to improve the overall quality of the city's liveability and achieve broader development outcomes including the Sustainable Development Goals
- Assessing the implementation of government policies and schemes governing characteristics of cities that can contribute to creating liveable communities

Tracking
liveability
Urban Planning
and Management
City level self-assessment
Citizen driven accountability systems
Use cases and pathways for reform
Unearth blind spots and incentivise action
Institutionalisation of outcome based planning and governance
Cities move to a single, unified data driven decision making paradigm...

The first round of the assessment commenced in January 2018 covering 116 major cities including smart cities, capital cities and cities with population of above one million each. Implementation of the liveability assessment commenced in January 2018 with a national level orientation workshop for the urban local bodies. The workshop aimed at orienting the states and urban local bodies on the overall framework, indicators, data sources, methodology and key milestones and timelines involved in the liveability assessment. Subsequently, a series of State/ Union Territory level orientation workshops were carried out in 33 states/UTs for a detailed discussion on the framework. Online data collection commenced from 9th March through an online data collection platform that supported both online and offline data submission modes. On the date of closure of the online data entry portal i.e., 16th April, 2018 112 cities submitted their data. Subsequently, comprehensive checks on the submitted data was undertaken that involved checking for outliers, logical inconsistencies etc. post which round-1 of data reconciliation was conducted. This draft report is based on round-1 of reconciled data as on 28th April, 2018.

tors

The Liveability Framework comprises a total of 79 indicators (57 Core Indicators and 22 Supporting Indicators). A core indicator carries 70% weightage and a supporting indicator carries 30% weightage. These indicators are grouped under 15 thematic categories which in turn are part of four pillars of comprehensive development of cities i.e., institutional, social, economic and physical. Based on the performance of cities against the various core and supporting indicators, various 'Category Sub-Indexes' and a composite 'City Liveability Index' will be developed for each city.

3.1 Scoring and Computing Category Indices of Liveability

The set of 79 indicators, associated categories and pillars are presented in the table below:

Table 1 List of Pillars, Categories and Indicators

Pillars of Comprehensive Development	**Category**	**Indicators**
Institutional	1. Governance	1.1 Percentage of citizen services available online
		1.2 Percentage of services integrated through Command Centre
		1.3 Percentage of citizens using online services
		1.4 Average delay in grievance redressal
		1.5 Tax collected as percentage of tax billed
		1.6 Extent of cost recovery (O&M) in water supply services
		1.7 Capital spending as percentage of total expenditure
		1.8 Percentage of population covered under Ward Committees/Area *Sabhas*
Social	**2. Identity and Culture**	2.1 Restoration and reuse of historic buildings
		2.2 Percentage of ecologically important areas covered through projects for restoration
		2.3 Hotel occupancy
		2.4 Percentage of budget allocated towards cultural/sports activities
		2.5 Number of cultural/sports events hosted by city
	3. Education	3.1 Percentage of school-aged population enrolled in schools
		3.2 Percentage of female school-aged population

Development		Indicators
		enrolled in schools
		3.3 Primary education student-teacher ratio
		3.4 Percentage of schools with access to digital education
		3.5 Percentage of students completing primary education
		3.6 Percentage of students completing secondary education
	4. Health	4.1 Number of in-patient hospital beds per 10,000 population
		4.2 Healthcare professionals per 10,000 population
		4.3 Average response time in case of health emergencies
		4.4 Period prevalence of water borne diseases
		4.5 Period prevalence of vector borne diseases
	5. Safety and Security	5.1 Number of CCTV Cameras
		5.2 Number of recorded crimes per lakh population
		5.3 Extent of crimes recorded against women, children and elderly per year
		5.4 Transport-related fatality per lakh population
Economic	**6. Economy and Employment**	6.1 Increase in VAT/GST collection
		6.2 Increase in collection of Professional Tax
		6.3 Increase in issuance of Construction permits
		6.4 Unemployment rate
		6.5 Percentage of vendors registered and provided formal spaces
Physical	**7. Housing and Inclusiveness**	7.1 Percentage of Slum/EWS households covered through formal/affordable housing
		7.2 Percentage of slum areas covered through basic services
	8. Public Open Spaces	8.1 Per capita availability of green spaces
		8.2 Per capita availability of public and recreational places
	9. Mixed Land Use and Compactness	9.1 Share of mixed land use area in overall city land use
		9.2 Net Density
	10. Power Supply	10.1 Percentage of city population with authorized electrical services

Development		Indicators
		10.2 Percentage of electrical connections covered through smart meters
		10.3 Average number of electrical interruptions per year
		10.4 Average length of electrical interruptions per year
		10.5 Percentage of total energy derived from renewable sources
		10.6 Energy consumption per unit - water supply and sewerage
		10.7 Energy consumption per unit - street lighting
		10.8 Percentage of new and redeveloped buildings following green building norms
		10.9 Total energy consumption per capita
	11. Transportation and Mobility	11.1 Geographical coverage of public transport
		11.2 Availability of public transport
		11.3 Mode share of public transport
		11.4 Percentage of road network with dedicated bicycle tracks
		11.5 Percentage of interchanges with bicycle parking facilities
		11.6 Mode share of non-motorized transport
		11.7 Availability of Passenger Information System
		11.8 Extent of signal synchronization
		11.9 Availability of paid parking spaces
		11.10 Percentage coverage of footpaths – wider than 1.2 m
		11.11 Percentage of traffic intersections with pedestrian crossing facilities
		11.12 Extent to which universal accessibility is incorporated in public rights-of-way
	12. Assured Water Supply	12.1 Household level coverage of direct water supply connections
		12.2 Per capita supply of water
		12.3 Quality of water supplied
		12.4 Level of non-revenue water – NRW
		12.5 Percentage of water connections covered through meters
		12.6 Percentage of plots with rainwater harvesting

		15.5 Quality of water in public surface water bodies

3.2 Scoring and Computing Category Indices of Liveability

The performance achieved by cities against 79 indicators, will be assessed against given benchmarks. Where no international/national norms are available, city with the best performance in its group (population range) will be treated as a benchmark. The groups are given in the table below.

Table 2 Details on Population Range

Category	Population range
Category 1	Population ≥ 4 million
Category 2	1 million ≤ Population < 4 million
Category 3	0.5 million ≤ Population < 1 million
Category 4	Population < 0.5 million

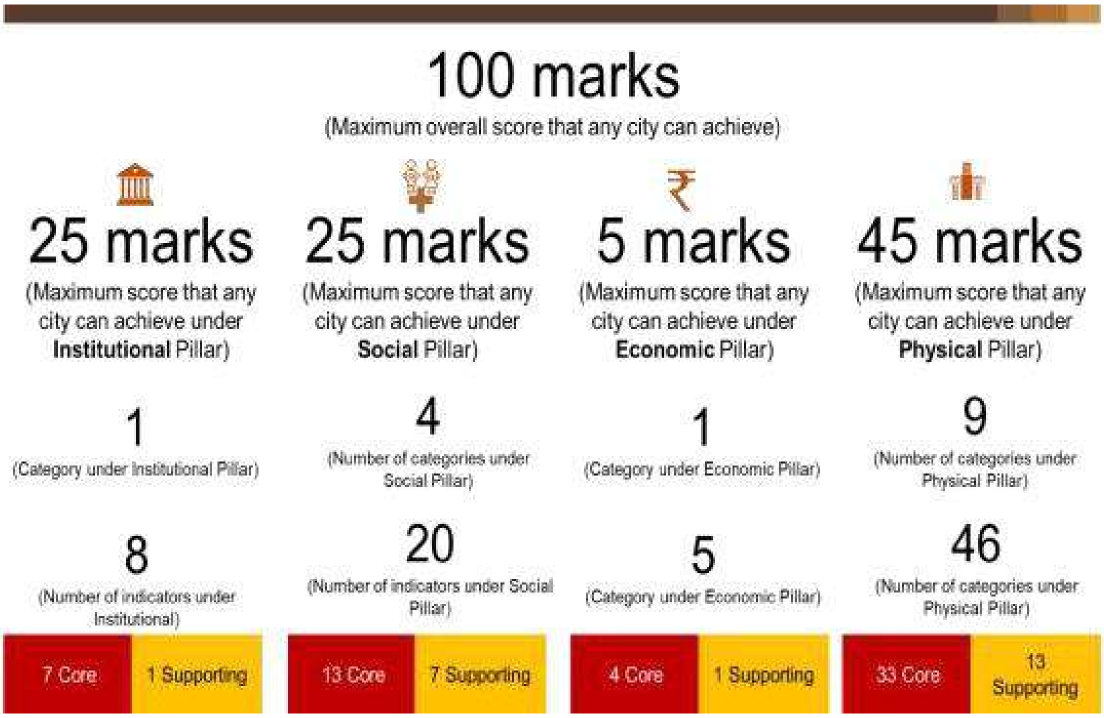
dology

A city can earn a maximum score of 100 points for 79 indicators across four pillars. The pillar weights are as follows: Institutional (25 points), Social (25 points), Economy and Employment (5 points) and Physical (45 points). Based on the number and nature of indicators i.e., core vs. secondary, indicator wise maximum marks were computed.



100 marks
(Maximum overall score that any city can achieve)
25 marks
(Maximum score that any city can achieve under **Institutional** Pillar)
25 marks
(Maximum score that any city can achieve under **Social** Pillar)
5 marks

Dimensional Index Methodology (DIM) has been used to compute scores for each indicator with reference to "maximum within the comparison group" or "absolute benchmarks". For indicators where benchmarks are available, cities getting the benchmark score (or above) are given the maximum mark, and the marks awarded to other cities are calculated proportionately. For indicators where benchmarks are not available, the best performing cities in each population group are given the maximum mark, and the marks awarded to other cities (within the population group) are calculated proportionately. For indicators where benchmarks do not exist, the city data has been tested for outliers before scoring.

PDF Complete

To construct aggregate scores across cities as well as to make the scores across indicators comparable, indicator values were normalised using a min-max approach. The following formula was used to normalise the indicator values-

$$\frac{indicator\ value\ for\ the\ city - indicator\ value\ for\ the\ worst\ performing\ city}{benchmark - \ indicator\ value\ for\ the\ worst\ performing\ city}$$

This approach would restrict the normalised indicator value between 0 and 1. Cities that met or exceeded the benchmark received a normalised indicator value of 1. Worst performing cities are given a normalised indicator value of 0. After normalisation, the normalised value is weighted according to the category and the indicator being core or supporting.

To illustrate, consider the indicator 12.3 Quality of Water Supplied in the Category 12 for Assured Water Supply. If in City A 50% of the water samples collected qualify the potable water standards specified by the CPHEEO, and only 10% of the samples from worst performing city qualify the standards. Then, the normalised value for the indicator for city A would be 0.44 [(0.5-0.1)/(1-0.1)].

The weight for indicator 12.3 is 1.03, so the final weighted score for City A would come out to 0.45 [1.03*0.44].

4. Data Collection and Verification

4.1 Submission of Data by the cities

The Liveability Assessment is based on secondary data submitted by the urban local bodies and other concerned government agencies (collectively called as data owners). The 79 indicators were broken down into a set of easy to understand and relatable 553 questions mapped to data owners. Submission of the data was enabled through an online data entry portal on the smartnet platform of the Ministry. The portal also allowed the ULBs to download the liveability assessment questionnaire and upload filled in questionnaire. To familiarise and assist cities in identifying, mapping and collation of data points, a city level nodal person was available during the entire period of data submission process.

the City

For the assessment of liveability indices broadly 12 data owners such as Central/state Pollution control board, Development authority, DISCOM/Electricity Board, State Disaster Management Authority, State Education Department, State Health department, State Renewable energy and development agency, State sales and commercial taxes department, town and country planning department, Traffic and police department, Transport authority, and Urban local body were identified to respond to the questions on the portal. However, during state workshop and subsequent city level discussions, more data owners were mapped to respond to different categories and sub categories. The following table provides the details of city level data owners mapped under the 12 data owner.

Table 3:Details of Data Owners

Designated data owners	**Subcategories**	**Data owners at city level**
Urban Local Body	For Accounts Related Questions	Deputy Controller (Finance & Accounts)
Urban Local Body	For Park and Recreation Related Questions	Horticulture
Urban Local Body	For Water Supply and Drainage related questions	Operation & Maintenance
Urban Local Body	For Heritage sites related data	There are no Heritage sites in Jalandhar
Urban Local Body	For Ecological sites related data	There are no ecological sites in Jalandhar
Urban Local Body	For Housing related data	Housing Branch
Urban Local Body	For Building plan related data	Building Branch
Urban Local Body	For Roads related data	Buildings & Roads Branch
Urban Local Body	For Solid waste management related data	Medical Officer of Health
Urban Local Body	For IT services related data	Information Technology Department
Urban Local Body	For Vendor committee related data	Advertisement Department
Urban Local Body	Any other departments involved in providing data for questions mentioned under Urban Local Body	District Sports Office District Employment Exchange District Transport Office
For questions under Central / state Pollution control Board	Water Quality, Air Quality, Noise Quality	Punjab Pollution Control Board

vailable as supportive

City has provided supporting documents/evidences against the responses given by city on the online portal. In support of their responses on the portal, city submitted 101 number of documents. Documents submitted includes reports, official orders, copy of data maintained in official register, signed copy of questionnaire, and signed letters/submissions from concern departments. Verification includes mapping of documents against responses given by city, checking the type/category of documents, and validation of data provided.

The following table presents the data owner wise number of documents:

Table 4: Data owner wise number of secondary documents submitted by city

Data Owners	Number of Documents
Sales and Commercial Taxes	1
State Education Department	1
DISCOM/Electricity Department	4
Traffic and Police Department	7
Development Authority	0
Pollution Control Board	4
State Renewable Energy Department	1
Town and Country Planning	5
State Health Department	11
Transport Authority	7
Disaster Management	1
Urban Local Body	59
Total	101

4.4 Data Verification

A three-stage data quality check comprising verification of data against secondary documents furnished by data owners, logical inconsistency checks including outliers, and physical audit for select indicators (Refer the exhibit below) is being undertaken. The objective of the data quality check is to ensure that data from the source documents are accurate and verifiable. Sources of data included reports, administrative data, survey results and other statistical records, log books among other.

Physical audit of eight indicators – one indicator from the Institutional pillar, one from the Social pillar, one from the Economy pillar and five from the Physical pillar is also being carried out by the

reliability of data reported by the cities. The list of these

1.2 | Percentage of services integrated through Command Centre

2.3 | Hotel occupancy

3.4 | Percentage of schools with access to digital education

5.1 | Number of streets, public places, junctions covered through surveillance systems

6.5 | Percentage of vendors registered and provided formal spaces

11.7 | Availability of Passenger Information System

11.11 | Percentage of traffic intersections with pedestrian crossing facilities

11.12 | Extent to which universal accessibility is incorporated in public rights-of-way

For a set of five indicators namely, unemployment rate, mode share of public transport, mode share of non-motorised transport, quality of water supplied and level of noise pollution, existing datasets were found to be not available consistently across all cities and/or were inadequate. To help cities that do not have data on these five indicators, dipstick assessments are being carried to fill data gaps.

6.4 | Unemployment Rate

11.3 | Mode share of public transport

11.5 | Mode share of Non Motorized Transport

12.3 | Quality of Water Supplied

15.4 | Level of Noise Pollution

ative by the Ministry of Housing and Urban Affairs to improve quality of life of citizens and achieve sustainable development goals by encouraging cities to adopt "outcome based" approach for urban planning. Assessment process aimed to provide opportunity to cities to review the development components holistically by involving 79 measurable indicators categorized under governance, health, education, safety, economy, power supply, transportation and mobility, identity, culture, housing, waste management and pollution.

This report highlights the assessment process, key milestones, and the final outcome of the data submitted. Implementation of liveability assessment commenced formally on 19th January 2018. A national level workshop was organized on 13th February 2018 to explain the importance and process of liveability assessment and get feedback on methodology from the city authorities.

This was followed by the next stage of Questionnaire development. The questionnaire was arranged under 12 categories representing 12 data owners namely urban local body, Central and state pollution control board, development authority, DISCOM/Electricity board, State disaster management authority, state education department, state health department, state renewable energy development agency, state sales and commercial taxes department, town and country planning department, traffic and police department and transport authorities.

An online data entry portal was developed to facilitate data submission by the cities. Each city had a unique log in to access the portal and submit the data. Both online and off-line options (download the questionnaire in an excel) to submit the data were available for cities. An email help desk was set up for the cities to raise any queries and seek clarification when responding to the questions.

A team for each state comprising of State Coordinator and City Coordinator (one per city) was deployed that facilitated the process and supported the cities. A total of 6 regional coordinators/ consultants, 29 State Coordinators, and 99 city coordinators were deployed across 116 cities. Training for state coordinators was held from 26th to 28th February 2018 at Chennai to make coordinators understand overall liveability assessment, indicators, data sources, protocols and roles and responsibilities.

City Reconnaissance Meetings were initiated by the state and city coordinators. The discussion began with discussions to finalize the state workshop schedule, mapping of data owners, and assist cities in data collection. The City Coordinators were based in the cities for over 6 weeks and during this time, they liase with ULB and other data owners to explain the liveability framework, online portal, and facilitate the online submission.

A total of 33 state workshops were conducted at the state level. The objective of the workshop was to orient the city stakeholders on liveability assessment, indicators, components of data collection, timelines, expectations of support and support extended by MoHUA. The state level workshops brought

le platform to understand and discuss the methodology and

Nodal agency at state level supported by the City and State Coordinator and city level (Municipality corporation/smart city limited) coordinated with city specific data owners/departments for data gathering, collation, and submission. Nodal persons in each department were appointed for timely data collection and submission. Of 116, 112 cities submitted data as per the timeline on 16th April 2018.

Post submission, the city and state coordinators supported by the central team followed up extensively with the cities to support secondary documents as evidence to substantiate their submissions. Secondary documents such as reports, official orders, copy of office register, signed copy of liveability assessment questionnaire furnished by cities against the submitted data. Documents are verified to map the documents for the reponses provided by city and to check the type data provided by city. The document check outcomes were shared with the cities as a part of data quality check.

For checking consistency of data, logical check of data, verifying data from other public sources were undertaken. Quality check was done to ensure data validity and provide opportunity to cities to review the data provided by them and correct in case of wrong data entry.

For 8 selected indicators namely, percentage of services integrated through command and control center, hotel occupancy rate, percentage of schools with access to digital education, number of CCTV cameras per unit road length, percentage of vendors registered and provided formal spaces, availability of passenger information system, percentage of traffic intersection with pedestrian crossing facility, and extent to which universal accessibility is incorporated in public rights of way. Physical audit was conducted in 110 cities by physical auditors appointed and trained by the consortium. In consultation with ULB nodal person, locations and indicators for physical audit was selected in each city. A mobile based application was developed to capture the physical audit related data.

Primary data collection was done for five indicators such as unemployment rates, mode share of public transport, mode share of non-motorized transport, quality of water supplied, and level of noise pollution. Protocols for water and noise test were prepared in consultation with experts. Water quality test involved physical, chemical and bacteriological test of water as per the CPCB norms. For testing quality of water at consumer end, the auditors worked closely with the ULB and Water department. Samples were collected from consumer end and submitted to the lab suggested by city. For noise pollution, in about 20 cities the state pollution board or city level environment department took the responsibility for providing noise pollution data as per the protocols. In rest of the cities, mobile based application was used to measure noise pollution.

During implementation, MoHUA facilitated the process by conducting video conferences with cities to address any queries, reiterate the importance, and ensure that cities adequately engages in the process and submit their responses in time and respond to requests for clarifications.

physical audit and primary data collection, citizen survey was
n and level of satisfaction on various services such as health, education, water supply, electricity, waste management etc. provided by urban local bodies. Over 60000 citizens participated in the survey across India.

The final scores and ranks have been generated based on the scoring methodology that has been discussed extensively and minor modifications made that are summarized as below:

#	Challenges	Proposed Solutions
1	Only 23 cities of 111 cities have City Mobility Plan (CMP) or any and hence able to provide data for Mode Share of Public Transport and Non-Motorised Transport. To address the data gap, as advised by the MoHUA, the consortia undertook a sample dipstick across all cities covering a sample of 150 Households. Understandably, the dipstick findings will not match the rigor of a CMP.	We recommend the following: 1) Cities which have provided CMP Data will be evaluated on 100% of the maximum score 2) For the cities where the dipstick data is used, the city receives a 50% discount on the overall score Alternatively, another approach is to assign 0 score to all 88 cities that don't have a CMP
2	Variance was observed on data reported by cities on road network and data presented in the smart city proposals during the verifications.	We recommend taking the data reported by the cities in the Smart City Proposals.
3	There is no secondary source/ organization that provides unemployment data at city level. As a result, most cities do not have the data. Fully cognizance of the challenges of generating this data in a short span of time, it was agreed to collect this data through a dipstick survey on lines of NSSO questions. The data generated needs further scrutiny and triangulation with some inputs from experts. This may not be	The indicator on unemployment will be excluded from scores. For final ranking, the cities will be scored on 78 indicators.

PDF Complete
use period has ended.
Thank you for using

Click Here to upgrade to
Unlimited Pages and Expanded Features

		Proposed Solutions
	possible in the short window.	
4	Many cities did not have data on noise pollution and it was decided that data will be collected using a mobile app for all the 111 cities. However, many cities have expressed reservations with the approach especially with respect to the reliability of using this data. Further, some cities have relied on the SPCB to collect the data as per the approach proposed by the consortia. Thus, noise pollution data is currently from two sources: 1. SPCB- 20 cities 2. Noise-based app- 91 cities	The data collected through the primary survey will be used for scoring the cities. Currently, there is no differential scoring for the data from the SPCB and the data collected through the mobile app. However, a certain higher weightage can be provided to those cities which used the state apparatus to collect noise pollution data.
5	For the indicator on quality of water supplied, the methodology document states that samples should be drawn both at the treatment plant outlet as well as the consumer end. However, the data provided by the cities were predominantly from the distribution point. Hence for consumer end results with MoHUA intervention, consortia coordinated with cities to collect the data at the consumer end. The cities facilitated the testing. The outcome of the process is as below: 1. Sample given- 102 cities 2. Report received- 86 cities 3. Report awaited- 16 cities 4. Tests not completed due to lack of cooperation and other reasons – 9	The maximum score for this indicator will be distributed equally (50%) for results based on samples from the treatment plant and consumer end. Cities that did not complete tests or provide the results will be given a score 0 for against consumer end tests.
6	City level population is not projected annually by most of the cities. So, estimates for 2017 population are not available with the cities.	As recommended by MoHUA, 2011 census population is being used for the ranking purpose.

Your complimentary use period has ended. Thank you for using PDF Complete.
Click Here to upgrade to Unlimited Pages and Expanded Features

		Proposed Solutions
7	The age category specific data for 9 cities is not available at a city level	The age category specific population data has been taken at a district level for these cities.
8	Indicators on non-motorised transports like- Dedicated bicycle tracks, bicycle parking facilities and mode share of non-motorised transport are not relevant for hilly terrains.	As discussed during the PMC meeting, these indicators have been treated as non-applicable for the hilly cities and the weights have been redistributed among other indicators within the same category.
9	The indicator on increase in professional tax is not relevant to cities which do not levy the professional tax.	As discussed during the PMC meeting, this indicator has been non-applicable to the cities belonging to states where professional tax is not levied, and the weights have been redistributed among other indicators within the same category.
10	The indicator on increase in VAT collection is not applicable to Port Blair and Kavaratti, as there was no provision of VAT collection in these cities.	As discussed during the PMC meeting, these indicatosr has been treated as non-applicable for these two cities and the weights have been redistributed among other indicators within the same category.
11	Indicator on coverage of basic services to slum households does not concern cities with no slums (notified/ non-notified.	As discussed during the PMC meeting, this indicators has been treated as non-applicable for these cities and the weights have been redistributed among other indicators within the same category.

1. Introduction

The Ministry of Housing and Urban Affairs (MoHUA) is implementing several flagship urban missions such as the Smart Cities Mission (SCM), Atal Mission for Urban Rejuvenation and Transformation (AMRUT), Heritage City Development and Augmentation Yojana (HRIDAY), Housing for All (HFA). Theses mission along with other transformative initiatives of the Government including National Water Mission, Power for All, National Health Mission are aimed at making Indian cities more 'liveable.' The overarching goal of these initiatives is to move from an input-based approach to a 'citizen centric-outcome based' assessment of urban liveability.

To develop a common minimum framework for cities to assess their existing status and chart their pathway towards providing a better quality of life to their citizens, the MoHUA developed a set of 'Liveability Standards' relevant to cities to generate a Liveability Index and ranking of cities. These standards were launched in June, 2017. The MoHUA has planned to conduct an 'Annual Assessment of Liveability Standards in Cities – an ambitious national project that will involve yearly submission of data by cities across the various indicators, compilation and analysis, development of indices and ranking of cities. The Liveability Index is envisioned as a 360° tool for tracking, planning and transforming Indian cities. The Liveability Index is aimed at the following objectives:

- Providing strong evidence-based approach for future interventions and investments to deliver liveability outcomes
- Catalysing actions to improve the overall quality of the city's liveability and achieve broader development outcomes including the Sustainable Development Goals
- Assessing the implementation of government policies and schemes governing characteristics of cities that can contribute to creating liveable communities

Tracking
liveability
Urban Planning
and Management
City level self-assessment
Citizen driven accountability systems
Use cases and pathways for reform
Unearth blind spots and incentivise action
Institutionalisation of outcome based planning and governance
Cities move to a single, unified data driven decision making paradigm...

The first round of the assessment commenced in January 2018 covering 116 major cities including smart cities, capital cities and cities with population of above one million each. Implementation of the liveability assessment commenced in January 2018 with a national level orientation workshop for the urban local bodies. The workshop aimed at orienting the states and urban local bodies on the overall framework, indicators, data sources, methodology and key milestones and timelines involved in the liveability assessment. Subsequently, a series of State/ Union Territory level orientation workshops were carried out in 33 states/UTs for a detailed discussion on the framework. Online data collection commenced from 9th March through an online data collection platform that supported both online and offline data submission modes. On the date of closure of the online data entry portal i.e., 16th April, 2018 112 cities submitted their data. Subsequently, comprehensive checks on the submitted data was undertaken that involved checking for outliers, logical inconsistencies etc. post which round-1 of data reconciliation was conducted. This draft report is based on round-1 of reconciled data as on 28th April, 2018.

tors

The Liveability Framework comprises a total of 79 indicators (57 Core Indicators and 22 Supporting Indicators). A core indicator carries 70% weightage and a supporting indicator carries 30% weightage. These indicators are grouped under 15 thematic categories which in turn are part of four pillars of comprehensive development of cities i.e., institutional, social, economic and physical. Based on the performance of cities against the various core and supporting indicators, various 'Category Sub-Indexes' and a composite 'City Liveability Index' will be developed for each city.

3.1 Scoring and Computing Category Indices of Liveability

The set of 79 indicators, associated categories and pillars are presented in the table below:

Table 1 List of Pillars, Categories and Indicators

Pillars of Comprehensive Development	Category	Indicators
Institutional	1. Governance	1.1 Percentage of citizen services available online
		1.2 Percentage of services integrated through Command Centre
		1.3 Percentage of citizens using online services
		1.4 Average delay in grievance redressal
		1.5 Tax collected as percentage of tax billed
		1.6 Extent of cost recovery (O&M) in water supply services
		1.7 Capital spending as percentage of total expenditure
		1.8 Percentage of population covered under Ward Committees/Area *Sabhas*
Social	**2. Identity and Culture**	2.1 Restoration and reuse of historic buildings
		2.2 Percentage of ecologically important areas covered through projects for restoration
		2.3 Hotel occupancy
		2.4 Percentage of budget allocated towards cultural/sports activities
		2.5 Number of cultural/sports events hosted by city
	3. Education	3.1 Percentage of school-aged population enrolled in

Development		Indicators
		schools
		3.2 Percentage of female school-aged population enrolled in schools
		3.3 Primary education student-teacher ratio
		3.4 Percentage of schools with access to digital education
		3.5 Percentage of students completing primary education
		3.6 Percentage of students completing secondary education
	4. Health	4.1 Number of in-patient hospital beds per 10,000 population
		4.2 Healthcare professionals per 10,000 population
		4.3 Average response time in case of health emergencies
		4.4 Period prevalence of water borne diseases
		4.5 Period prevalence of vector borne diseases
	5. Safety and Security	5.1 Number of CCTV Cameras
		5.2 Number of recorded crimes per lakh population
		5.3 Extent of crimes recorded against women, children and elderly per year
		5.4 Transport-related fatality per lakh population
Economic	**6. Economy and Employment**	6.1 Increase in VAT/GST collection
		6.2 Increase in collection of Professional Tax
		6.3 Increase in issuance of Construction permits
		6.4 Unemployment rate
		6.5 Percentage of vendors registered and provided formal spaces
Physical	**7. Housing and Inclusiveness**	7.1 Percentage of Slum/EWS households covered through formal/affordable housing
		7.2 Percentage of slum areas covered through basic services
	8. Public Open Spaces	8.1 Per capita availability of green spaces
		8.2 Per capita availability of public and recreational places
	9. Mixed Land Use and Compactness	9.1 Share of mixed land use area in overall city land use
		9.2 Net Density

Development		Indicators
	10. Power Supply	10.1 Percentage of city population with authorized electrical services
		10.2 Percentage of electrical connections covered through smart meters
		10.3 Average number of electrical interruptions per year
		10.4 Average length of electrical interruptions per year
		10.5 Percentage of total energy derived from renewable sources
		10.6 Energy consumption per unit - water supply and sewerage
		10.7 Energy consumption per unit - street lighting
		10.8 Percentage of new and redeveloped buildings following green building norms
		10.9 Total energy consumption per capita
	11. Transportation and Mobility	11.1 Geographical coverage of public transport
		11.2 Availability of public transport
		11.3 Mode share of public transport
		11.4 Percentage of road network with dedicated bicycle tracks
		11.5 Percentage of interchanges with bicycle parking facilities
		11.6 Mode share of non-motorized transport
		11.7 Availability of Passenger Information System
		11.8 Extent of signal synchronization
		11.9 Availability of paid parking spaces
		11.10 Percentage coverage of footpaths – wider than 1.2 m
		11.11 Percentage of traffic intersections with pedestrian crossing facilities
		11.12 Extent to which universal accessibility is incorporated in public rights-of-way
	12. Assured Water Supply	12.1 Household level coverage of direct water supply connections
		12.2 Per capita supply of water
		12.3 Quality of water supplied
		12.4 Level of non-revenue water – NRW
		12.5 Percentage of water connections covered through

Development		Indicators
		meters
		12.6 Percentage of plots with rainwater harvesting facility
	13. Waste Water Management	13.1 Coverage of toilets
		13.2 Coverage of sewerage network and/or septage
		13.3 Collection efficiency of sewerage network
		13.4 Extent of reuse and recycling of waste water
		13.5 Coverage of storm water drains
	14. Solid Waste Management	14.1 Household level coverage of municipal solid waste collection
		14.2 Efficiency of collection of municipal solid waste
		14.3 Extent of municipal solid waste recovered through reuse
	15. Reduced Pollution	15.1 Concentration of SO2- air pollution
		15.2 Concentration of NO2- air pollution
		15.3 Concentration of PM10 - air pollution
		15.4 Level of noise pollution
		15.5 Quality of water in public surface water bodies

3.2 Scoring and Computing Category Indices of Liveability

The performance achieved by cities against 79 indicators, will be assessed against given benchmarks. Where no international/national norms are available, city with the best performance in its group (population range) will be treated as a benchmark. The groups are given in the table below.

Table 2 Details on Population Range

Category	Population range
Category 1	Population ≥ 4 million
Category 2	1 million ≤ Population < 4 million
Category 3	0.5 million ≤ Population < 1 million
Category 4	Population < 0.5 million

use period has ended.

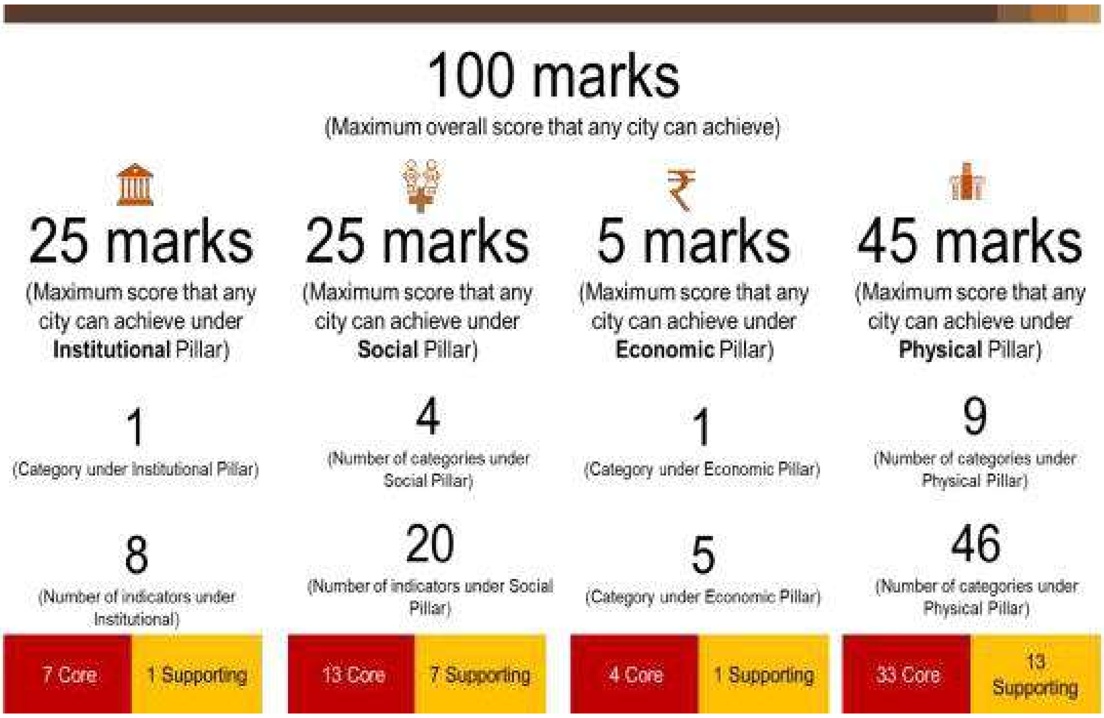
dology

A city can earn a maximum score of 100 points for 79 indicators across four pillars. The pillar weights are as follows: Institutional (25 points), Social (25 points), Economy and Employment (5 points) and Physical (45 points). Based on the number and nature of indicators i.e., core vs. secondary, indicator wise maximum marks were computed.



100 marks

(Maximum overall score that any city can achieve)

25 marks	25 marks	5 marks	45 marks
(Maximum score that any city can achieve under **Institutional** Pillar)	(Maximum score that any city can achieve under **Social** Pillar)	(Maximum score that any city can achieve under **Economic** Pillar)	(Maximum score that any city can achieve under **Physical** Pillar)
1 (Category under Institutional Pillar)	4 (Number of categories under Social Pillar)	1 (Category under Economic Pillar)	9 (Number of categories under Physical Pillar)
8 (Number of indicators under Institutional)	20 (Number of indicators under Social Pillar)	5 (Category under Economic Pillar)	46 (Number of categories under Physical Pillar)
7 Core 1 Supporting	13 Core 7 Supporting	4 Core 1 Supporting	33 Core 13 Supporting

Dimensional Index Methodology (DIM) has been used to compute scores for each indicator with reference to “maximum within the comparison group” or “absolute benchmarks”. For indicators where benchmarks are available, cities getting the benchmark score (or above) are given the maximum mark, and the marks awarded to other cities are calculated proportionately. For indicators where benchmarks are not available, the best performing cities in each population group are given the maximum mark, and the marks awarded to other cities (within the population group) are calculated proportionately. For indicators where benchmarks do not exist, the city data has been tested for outliers before scoring.

To construct aggregate scores across cities as well as to make the scores across indicators comparable, indicator values were normalised using a min-max approach. The following formula was used to normalise the indicator values-

$$\frac{indicator\ value\ for\ the\ city - indicator\ value\ for\ the\ worst\ performing\ city}{benchmark - \ indicator\ value\ for\ the\ worst\ performing\ city}$$

This approach would restrict the normalised indicator value between 0 and 1. Cities that met or exceeded the benchmark received a normalised indicator value of 1. Worst performing cities are given a normalised indicator value of 0. After normalisation, the normalised value is weighted according to the category and the indicator being core or supporting.

To illustrate, consider the indicator 12.3 Quality of Water Supplied in the Category 12 for Assured Water Supply. If in City A 50% of the water samples collected qualify the potable water standards specified by the CPHEEO, and only 10% of the samples from worst performing city qualify the standards. Then, the normalised value for the indicator for city A would be 0.44 [(0.5-0.1)/(1-0.1)].

The weight for indicator 12.3 is 1.03, so the final weighted score for City A would come out to 0.45 [1.03*0.44].

4. Data Collection and Verification

4.1 Submission of Data by the cities

The Liveability Assessment is based on secondary data submitted by the urban local bodies and other concerned government agencies (collectively called as data owners). The 79 indicators were broken down into a set of easy to understand and relatable 553 questions mapped to data owners. Submission of the data was enabled through an online data entry portal on the smartnet platform of the Ministry. The portal also allowed the ULBs to download the liveability assessment questionnaire and upload filled in questionnaire. To familiarise and assist cities in identifying, mapping and collation of data points, a city level nodal person was available during the entire period of data submission process.

the City

For the assessment of liveability indices broadly 12 data owners such as Central/state Pollution control board, Development authority, DISCOM/Electricity Board, State Disaster Management Authority, State Education Department, State Health department, State Renewable energy and development agency, State sales and commercial taxes department, town and country planning department, Traffic and police department, Transport authority, and Urban local body were identified to respond to the questions on the portal. However, during state workshop and subsequent city level discussions, more data owners were mapped to respond to different categories and sub categories. The following table provides the details of city level data owners mapped under the 12 data owner.

Table 3:Details of Data Owners

Designated data owners	Subcategories	Data owners at city level
Urban Local Body	For Accounts Related Questions	Department of Accounts
Urban Local Body	For Park and Recreation Related Questions	Jammu Muncipal Cooperation
Urban Local Body	For Water Supply and Drainage related questions	Public Health Engeenering Department (PHE)
Urban Local Body	For Heritage sites related data	Jammu Development Authority (JDA)
Urban Local Body	For Ecological sites related data	Jammu Development Authority (JDA)
Urban Local Body	For Housing related data	Jammu Development Authority (JDA)
Urban Local Body	For Building plan related data	Jammu Development Authority (JDA)
Urban Local Body	For Roads related data	Jammu Development Authority (JDA)
Urban Local Body	For Solid waste management related data	Jammu Pollution Control Board
Urban Local Body	For IT services related data	Department of Information Technology
Urban Local Body	For Vendor committee related data	
Urban Local Body	Any other departments involved in providing data for questions mentioned under Urban Local Body	
Central / state Pollution control Board	Water Quality, Air Quality, Noise Quality	Jammu Pollution Control Board

available as supportive

City has provided supporting documents/evidences against the responses given by city on the online portal. In support of their responses on the portal, city submitted 06 number of documents. Documents submitted includes reports, official orders, copy of data maintained in official register, signed copy of questionnaire, and signed letters/submissions from concern departments. Verification includes mapping of documents against responses given by city, checking the type/category of documents, and validation of data provided.

The following table presents the data owner wise number of documents:

Table 4: Data owner wise number of secondary documents submitted by city

Data Owners	Number of Documents
Sales and Commercial Taxes	0
State Education Department	0
DISCOM/Electricity Department	0
Traffic and Police Department	6
Development Authority	0
Pollution Control Board	0
State Renewable Energy Department	0
Town and Country Planning	0
State Health Department	0
Transport Authority	0
Disaster Management	0
Urban Local Body	0
Total	6*

4.4 Data Verification

A three-stage data quality check comprising verification of data against secondary documents furnished by data owners, logical inconsistency checks including outliers, and physical audit for select indicators (Refer the exhibit below) is being undertaken. The objective of the data quality check is to ensure that data from the source documents are accurate and verifiable. Sources of data included reports, administrative data, survey results and other statistical records, log books among other.

indicator from the Institutional pillar, one from the Social five from the Physical pillar is also being carried out by the field team to ascertain the degree of reliability of data reported by the cities. The list of these eight indicators is presented below:

- 1.2 | Percentage of services integrated through Command Centre
- 2.3 | Hotel occupancy
- 3.4 | Percentage of schools with access to digital education
- 5.1 | Number of streets, public places, junctions covered through surveillance systems
- 6.5 | Percentage of vendors registered and provided formal spaces
- 11.7 | Availability of Passenger Information System
- 11.11 | Percentage of traffic intersections with pedestrian crossing facilities
- 11.12 | Extent to which universal accessibility is incorporated in public rights-of-way

For a set of five indicators namely, unemployment rate, mode share of public transport, mode share of non-motorised transport, quality of water supplied and level of noise pollution, existing datasets were found to be not available consistently across all cities and/or were inadequate. To help cities that do not have data on these five indicators, dipstick assessments are being carried to fill data gaps.

- 6.4 | Unemployment Rate
- 11.3 | Mode share of public transport
- 11.5 | Mode share of Non Motorized Transport
- 12.3 | Quality of Water Supplied
- 15.4 | Level of Noise Pollution

essment

Liveability Assessment covered 15 categories and 78 indicators. The below table presents the scores for all 15 indicators namely governance, identity & culture, education, health, safety and security, economy & employment, housing & inclusiveness, public open spaces, mixed land use & compactness, power supply, transport & mobility, assured water supply, waste water management, solid waste management and reduced pollution.

Table 5: Category wise scores

Categories	**Scores in Percentage**
Governance	22.57%
Identity & Culture	44%
Education	80%
Health	57%
Safety & Security	68%
Economy & Employment	24%
Housing & Inclusiveness	33%
Public Open Spaces	50%
Mixed Land Use & Compactness	0%
Power Supply	17%
Transport & Mobility	0%
Assured Water Supply	52%
Waste Water Management	33%
Solid Waste Management	39%
Reduced Pollution	20%

The rank of the city is based on the performance and scores in each of the category. The final city rank is submitted separately.

ative by the Ministry of Housing and Urban Affairs to improve quality of life of citizens and achieve sustainable development goals by encouraging cities to adopt "outcome based" approach for urban planning. Assessment process aimed to provide opportunity to cities to review the development components holistically by involving 79 measurable indicators categorized under governance, health, education, safety, economy, power supply, transportation and mobility, identity, culture, housing, waste management and pollution.

This report highlights the assessment process, key milestones, and the final outcome of the data submitted. Implementation of liveability assessment commenced formally on 19th January 2018. A national level workshop was organized on 13th February 2018 to explain the importance and process of liveability assessment and get feedback on methodology from the city authorities.

This was followed by the next stage of Questionnaire development. The questionnaire was arranged under 12 categories representing 12 data owners namely urban local body, Central and state pollution control board, development authority, DISCOM/Electricity board, State disaster management authority, state education department, state health department, state renewable energy development agency, state sales and commercial taxes department, town and country planning department, traffic and police department and transport authorities.

An online data entry portal was developed to facilitate data submission by the cities. Each city had a unique log in to access the portal and submit the data. Both online and off-line options (download the questionnaire in an excel) to submit the data were available for cities. An email help desk was set up for the cities to raise any queries and seek clarification when responding to the questions.

A team for each state comprising of State Coordinator and City Coordinator (one per city) was deployed that facilitated the process and supported the cities. A total of 6 regional coordinators/ consultants, 29 State Coordinators, and 99 city coordinators were deployed across 116 cities. Training for state coordinators was held from 26th to 28th February 2018 at Chennai to make coordinators understand overall liveability assessment, indicators, data sources, protocols and roles and responsibilities.

City Reconnaissance Meetings were initiated by the state and city coordinators. The discussion began with discussions to finalize the state workshop schedule, mapping of data owners, and assist cities in data collection. The City Coordinators were based in the cities for over 6 weeks and during this time, they liase with ULB and other data owners to explain the liveability framework, online portal, and facilitate the online submission.

A total of 33 state workshops were conducted at the state level. The objective of the workshop was to orient the city stakeholders on liveability assessment, indicators, components of data collection, timelines, expectations of support and support extended by MoHUA. The state level workshops brought

le platform to understand and discuss the methodology and

Nodal agency at state level supported by the City and State Coordinator and city level (Municipality corporation/smart city limited) coordinated with city specific data owners/departments for data gathering, collation, and submission. Nodal persons in each department were appointed for timely data collection and submission. Of 116, 112 cities submitted data as per the timeline on 16th April 2018.

Post submission, the city and state coordinators supported by the central team followed up extensively with the cities to support secondary documents as evidence to substantiate their submissions. Secondary documents such as reports, official orders, copy of office register, signed copy of liveability assessment questionnaire furnished by cities against the submitted data. Documents are verified to map the documents for the reponses provided by city and to check the type data provided by city. The document check outcomes were shared with the cities as a part of data quality check.

For checking consistency of data, logical check of data, verifying data from other public sources were undertaken. Quality check was done to ensure data validity and provide opportunity to cities to review the data provided by them and correct in case of wrong data entry.

For 8 selected indicators namely, percentage of services integrated through command and control center, hotel occupancy rate, percentage of schools with access to digital education, number of CCTV cameras per unit road length, percentage of vendors registered and provided formal spaces, availability of passenger information system, percentage of traffic intersection with pedestrian crossing facility, and extent to which universal accessibility is incorporated in public rights of way. Physical audit was conducted in 110 cities by physical auditors appointed and trained by the consortium. In consultation with ULB nodal person, locations and indicators for physical audit was selected in each city. A mobile based application was developed to capture the physical audit related data.

Primary data collection was done for five indicators such as unemployment rates, mode share of public transport, mode share of non-motorized transport, quality of water supplied, and level of noise pollution. Protocols for water and noise test were prepared in consultation with experts. Water quality test involved physical, chemical and bacteriological test of water as per the CPCB norms. For testing quality of water at consumer end, the auditors worked closely with the ULB and Water department. Samples were collected from consumer end and submitted to the lab suggested by city. For noise pollution, in about 20 cities the state pollution board or city level environment department took the responsibility for providing noise pollution data as per the protocols. In rest of the cities, mobile based application was used to measure noise pollution.

During implementation, MoHUA facilitated the process by conducting video conferences with cities to address any queries, reiterate the importance, and ensure that cities adequately engages in the process and submit their responses in time and respond to requests for clarifications.

physical audit and primary data collection, citizen survey was
n and level of satisfaction on various services such as health, education, water supply, electricity, waste management etc. provided by urban local bodies. Over 60000 citizens participated in the survey across India.

The final scores and ranks have been generated based on the scoring methodology that has been discussed extensively and minor modifications made that are summarized as below:

#	Challenges	Proposed Solutions
1	Only 23 cities of 111 cities have City Mobility Plan (CMP) or any and hence able to provide data for Mode Share of Public Transport and Non-Motorised Transport. To address the data gap, as advised by the MoHUA, the consortia undertook a sample dipstick across all cities covering a sample of 150 Households. Understandably, the dipstick findings will not match the rigor of a CMP.	We recommend the following: 1) Cities which have provided CMP Data will be evaluated on 100% of the maximum score 2) For the cities where the dipstick data is used, the city receives a 50% discount on the overall score Alternatively, another approach is to assign 0 score to all 88 cities that don't have a CMP
2	Variance was observed on data reported by cities on road network and data presented in the smart city proposals during the verifications.	We recommend taking the data reported by the cities in the Smart City Proposals.
3	There is no secondary source/ organization that provides unemployment data at city level. As a result, most cities do not have the data. Fully cognizance of the challenges of generating this data in a short span of time, it was agreed to collect this data through a dipstick survey on lines of NSSO questions. The data generated needs further scrutiny and triangulation with some inputs from experts. This may not be	The indicator on unemployment will be excluded from scores. For final ranking, the cities will be scored on 78 indicators.

Your complimentary use period has ended. Thank you for using PDF Complete.
PDF Complete
Click Here to upgrade to Unlimited Pages and Expanded Features

		Proposed Solutions
	possible in the short window.	
4	Many cities did not have data on noise pollution and it was decided that data will be collected using a mobile app for all the 111 cities. However, many cities have expressed reservations with the approach especially with respect to the reliability of using this data. Further, some cities have relied on the SPCB to collect the data as per the approach proposed by the consortia. Thus, noise pollution data is currently from two sources: 1. SPCB- 20 cities 2. Noise-based app- 91 cities	The data collected through the primary survey will be used for scoring the cities. Currently, there is no differential scoring for the data from the SPCB and the data collected through the mobile app. However, a certain higher weightage can be provided to those cities which used the state apparatus to collect noise pollution data.
5	For the indicator on quality of water supplied, the methodology document states that samples should be drawn both at the treatment plant outlet as well as the consumer end. However, the data provided by the cities were predominantly from the distribution point. Hence for consumer end results with MoHUA intervention, consortia coordinated with cities to collect the data at the consumer end. The cities facilitated the testing. The outcome of the process is as below: 1. Sample given- 102 cities 2. Report received- 86 cities 3. Report awaited- 16 cities 4. Tests not completed due to lack of cooperation and other reasons – 9	The maximum score for this indicator will be distributed equally (50%) for results based on samples from the treatment plant and consumer end. Cities that did not complete tests or provide the results will be given a score 0 for against consumer end tests.
6	City level population is not projected annually by most of the cities. So, estimates for 2017 population are not available with the cities.	As recommended by MoHUA, 2011 census population is being used for the ranking purpose.

Your complimentary use period has ended. Thank you for using PDF Complete.
Click Here to upgrade to Unlimited Pages and Expanded Features

		Proposed Solutions
7	The age category specific data for 9 cities is not available at a city level	The age category specific population data has been taken at a district level for these cities.
8	Indicators on non-motorised transports like- Dedicated bicycle tracks, bicycle parking facilities and mode share of non-motorised transport are not relevant for hilly terrains.	As discussed during the PMC meeting, these indicators have been treated as non-applicable for the hilly cities and the weights have been redistributed among other indicators within the same category.
9	The indicator on increase in professional tax is not relevant to cities which do not levy the professional tax.	As discussed during the PMC meeting, this indicator has been non-applicable to the cities belonging to states where professional tax is not levied, and the weights have been redistributed among other indicators within the same category.
10	The indicator on increase in VAT collection is not applicable to Port Blair and Kavaratti, as there was no provision of VAT collection in these cities.	As discussed during the PMC meeting, these indicatosr has been treated as non-applicable for these two cities and the weights have been redistributed among other indicators within the same category.
11	Indicator on coverage of basic services to slum households does not concern cities with no slums (notified/ non-notified.	As discussed during the PMC meeting, this indicators has been treated as non-applicable for these cities and the weights have been redistributed among other indicators within the same category.

1. Introduction

The Ministry of Housing and Urban Affairs (MoHUA) is implementing several flagship urban missions such as the Smart Cities Mission (SCM), Atal Mission for Urban Rejuvenation and Transformation (AMRUT), Heritage City Development and Augmentation Yojana (HRIDAY), Housing for All (HFA). Theses mission along with other transformative initiatives of the Government including National Water Mission, Power for All, National Health Mission are aimed at making Indian cities more 'liveable.' The overarching goal of these initiatives is to move from an input-based approach to a 'citizen centric-outcome based' assessment of urban liveability.

To develop a common minimum framework for cities to assess their existing status and chart their pathway towards providing a better quality of life to their citizens, the MoHUA developed a set of 'Liveability Standards' relevant to cities to generate a Liveability Index and ranking of cities. These standards were launched in June, 2017. The MoHUA has planned to conduct an 'Annual Assessment of Liveability Standards in Cities – an ambitious national project that will involve yearly submission of data by cities across the various indicators, compilation and analysis, development of indices and ranking of cities. The Liveability Index is envisioned as a 360° tool for tracking, planning and transforming Indian cities. The Liveability Index is aimed at the following objectives:

- Providing strong evidence-based approach for future interventions and investments to deliver liveability outcomes
- Catalysing actions to improve the overall quality of the city's liveability and achieve broader development outcomes including the Sustainable Development Goals
- Assessing the implementation of government policies and schemes governing characteristics of cities that can contribute to creating liveable communities

The first round of the assessment commenced in January 2018 covering 116 major cities including smart cities, capital cities and cities with population of above one million each. Implementation of the liveability assessment commenced in January 2018 with a national level orientation workshop for the urban local bodies. The workshop aimed at orienting the states and urban local bodies on the overall framework, indicators, data sources, methodology and key milestones and timelines involved in the liveability assessment. Subsequently, a series of State/ Union Territory level orientation workshops were carried out in 33 states/UTs for a detailed discussion on the framework. Online data collection commenced from 9th March through an online data collection platform that supported both online and offline data submission modes. On the date of closure of the online data entry portal i.e., 16th April, 2018 112 cities submitted their data. Subsequently, comprehensive checks on the submitted data was undertaken that involved checking for outliers, logical inconsistencies etc. post which round-1 of data reconciliation was conducted. This draft report is based on round-1 of reconciled data as on 28th April, 2018.

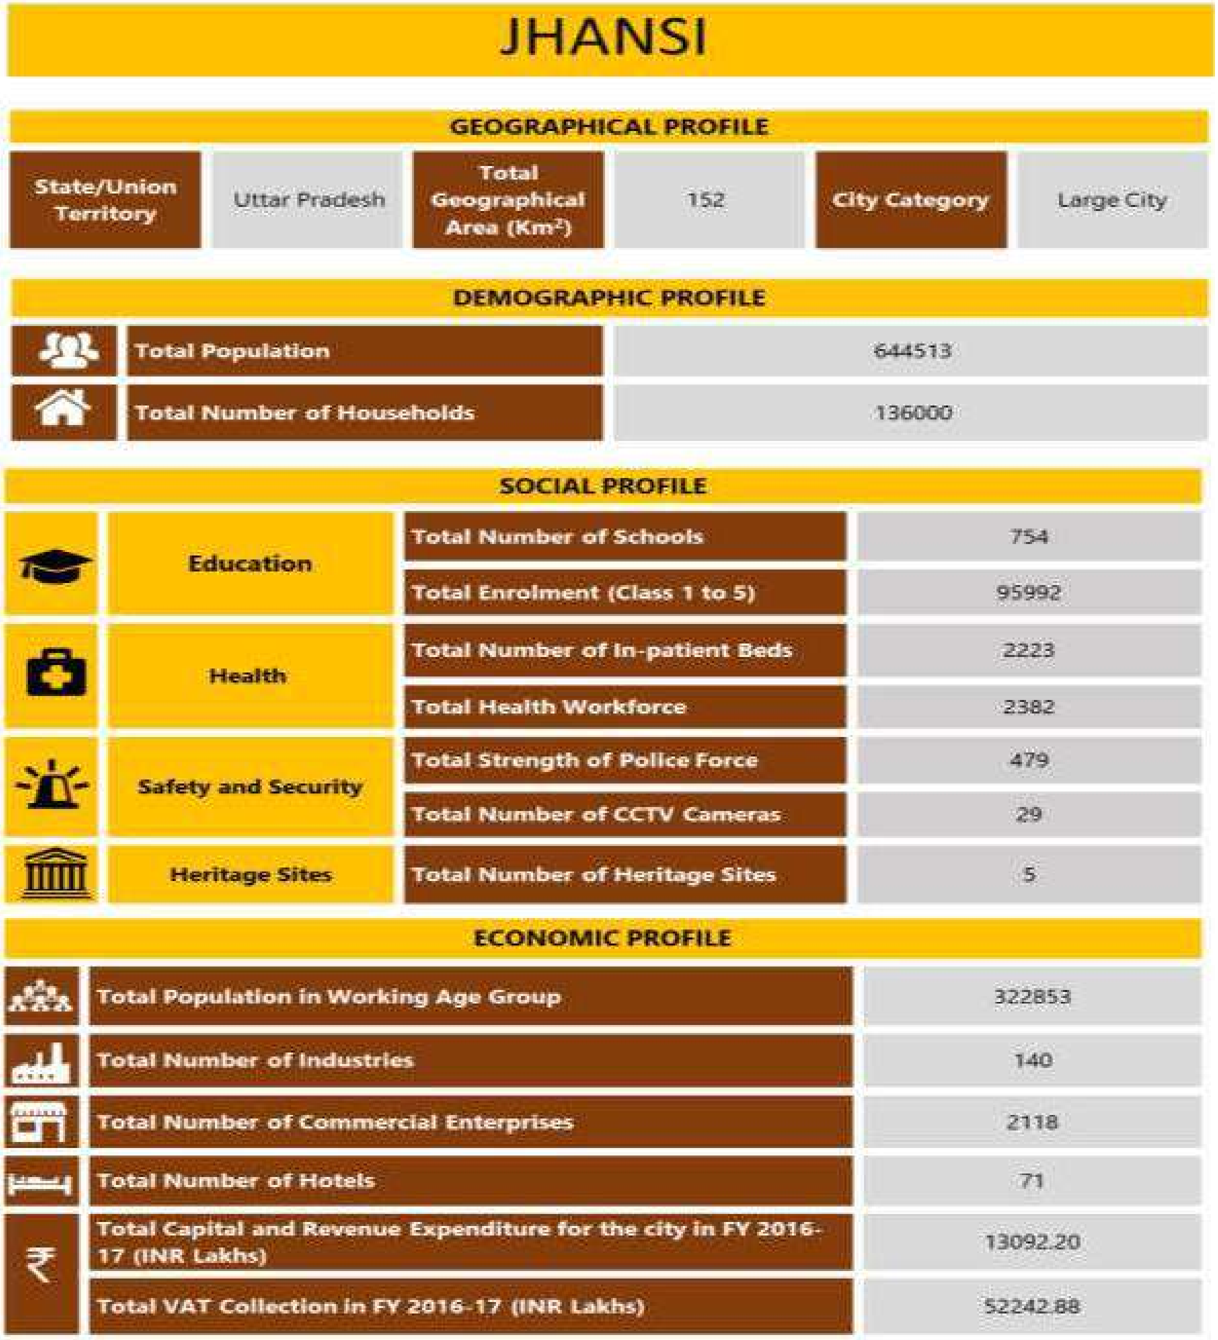
This chapter presents the city profile -Geographic and Demographic, Social (Education Health, Safety and Security, Heritage), Economic profile, and Physical (Water, sanitation and Waste Management, Electricity, Open space and roads).



JHANSI

GEOGRAPHICAL PROFILE

State/Union Territory	Uttar Pradesh	**Total Geographical Area (Km²)**	152	**City Category**	Large City

DEMOGRAPHIC PROFILE

Total Population	644513
Total Number of Households	136000

SOCIAL PROFILE

Education	**Total Number of Schools**	754
	Total Enrolment (Class 1 to 5)	95992
Health	**Total Number of In-patient Beds**	2223
	Total Health Workforce	2382
Safety and Security	**Total Strength of Police Force**	479
	Total Number of CCTV Cameras	29
Heritage Sites	**Total Number of Heritage Sites**	5

ECONOMIC PROFILE

Total Population in Working Age Group	322853
Total Number of Industries	140
Total Number of Commercial Enterprises	2118
Total Number of Hotels	71
Total Capital and Revenue Expenditure for the city in FY 2016-17 (INR Lakhs)	13092.20
Total VAT Collection in FY 2016-17 (INR Lakhs)	52242.88

PHYSICAL PROFILE

Water	ge Quantity of Water Supplied (MLD)	88
	Total Number of Water Connection	40443
Sanitation Facilities	Total number of households with access to individual toilets in the city	102000
	Total number of households in the city with access to community toilets in the city	15544
Solid Waste Management	Daily average quantity of municipal solid waste collected in the city (Tonnes/day)	250
	Total number of households covered through door-to-door collection of solid waste	136000
Waste Water	Daily Average Quantum of Waste Water Generated in the City (MLD)	66
	Daily average quantum of waste water treated by STPs in the city (MLD)	...
Electricity	Total number of authorized electrical connections in the city	109921
	Total electricity supplied to the city (kWh)	579534515
Public and Open Spaces	Total area covered by green spaces in the city (m²)	857638.28
Roads and Transport	Total Length of Road Network in the City (Km)	599.45
	Total length of arterial and sub-arterial road network in the city (Km)	55
	Total length of footpath (wider than 1.2 metres) in the city along the street network (Km)	20

3. Liveability Framework and Indicators

The Liveability Framework comprises a total of 79 indicators (57 Core Indicators and 22 Supporting Indicators). A core indicator carries 70% weightage and a supporting indicator carries 30% weightage. These indicators are grouped under 15 thematic categories which in turn are part of four pillars of comprehensive development of cities i.e., institutional, social, economic and physical. Based on the performance of cities against the various core and supporting indicators, various 'Category Sub-Indexes' and a composite 'City Liveability Index' will be developed for each city.

ory Indices of Liveability

The set of 79 indicators, associated categories and pillars are presented in the table below:

Table 1 List of Pillars, Categories and Indicators

Pillars of Comprehensive Development	Category	Indicators
Institutional	1. Governance	1.1 Percentage of citizen services available online
		1.2 Percentage of services integrated through Command Centre
		1.3 Percentage of citizens using online services
		1.4 Average delay in grievance redressal
		1.5 Tax collected as percentage of tax billed
		1.6 Extent of cost recovery (O&M) in water supply services
		1.7 Capital spending as percentage of total expenditure
		1.8 Percentage of population covered under Ward Committees/Area *Sabhas*
Social	**2. Identity and Culture**	2.1 Restoration and reuse of historic buildings
		2.2 Percentage of ecologically important areas covered through projects for restoration
		2.3 Hotel occupancy
		2.4 Percentage of budget allocated towards cultural/sports activities
		2.5 Number of cultural/sports events hosted by city
	3. Education	3.1 Percentage of school-aged population enrolled in schools
		3.2 Percentage of female school-aged population enrolled in schools
		3.3 Primary education student-teacher ratio
		3.4 Percentage of schools with access to digital education
		3.5 Percentage of students completing primary education
		3.6 Percentage of students completing secondary education
	4. Health	4.1 Number of in-patient hospital beds per 10,000 population

Development		Indicators
		4.2 Healthcare professionals per 10,000 population
		4.3 Average response time in case of health emergencies
		4.4 Period prevalence of water borne diseases
		4.5 Period prevalence of vector borne diseases
	5. Safety and Security	5.1 Number of CCTV Cameras
		5.2 Number of recorded crimes per lakh population
		5.3 Extent of crimes recorded against women, children and elderly per year
		5.4 Transport-related fatality per lakh population
Economic	**6. Economy and Employment**	6.1 Increase in VAT/GST collection
		6.2 Increase in collection of Professional Tax
		6.3 Increase in issuance of Construction permits
		6.4 Unemployment rate
		6.5 Percentage of vendors registered and provided formal spaces
Physical	**7. Housing and Inclusiveness**	7.1 Percentage of Slum/EWS households covered through formal/affordable housing
		7.2 Percentage of slum areas covered through basic services
	8. Public Open Spaces	8.1 Per capita availability of green spaces
		8.2 Per capita availability of public and recreational places
	9. Mixed Land Use and Compactness	9.1 Share of mixed land use area in overall city land use
		9.2 Net Density
	10. Power Supply	10.1 Percentage of city population with authorized electrical services
		10.2 Percentage of electrical connections covered through smart meters
		10.3 Average number of electrical interruptions per year
		10.4 Average length of electrical interruptions per year
		10.5 Percentage of total energy derived from renewable sources
		10.6 Energy consumption per unit - water supply and sewerage
		10.7 Energy consumption per unit - street lighting
		10.8 Percentage of new and redeveloped buildings

Development		Indicators
		following green building norms
		10.9 Total energy consumption per capita
	11. Transportation and Mobility	11.1 Geographical coverage of public transport
		11.2 Availability of public transport
		11.3 Mode share of public transport
		11.4 Percentage of road network with dedicated bicycle tracks
		11.5 Percentage of interchanges with bicycle parking facilities
		11.6 Mode share of non-motorized transport
		11.7 Availability of Passenger Information System
		11.8 Extent of signal synchronization
		11.9 Availability of paid parking spaces
		11.10 Percentage coverage of footpaths – wider than 1.2 m
		11.11 Percentage of traffic intersections with pedestrian crossing facilities
		11.12 Extent to which universal accessibility is incorporated in public rights-of-way
	12. Assured Water Supply	12.1 Household level coverage of direct water supply connections
		12.2 Per capita supply of water
		12.3 Quality of water supplied
		12.4 Level of non-revenue water – NRW
		12.5 Percentage of water connections covered through meters
		12.6 Percentage of plots with rainwater harvesting facility
	13. Waste Water Management	13.1 Coverage of toilets
		13.2 Coverage of sewerage network and/or septage
		13.3 Collection efficiency of sewerage network
		13.4 Extent of reuse and recycling of waste water
		13.5 Coverage of storm water drains
	14. Solid Waste Management	14.1 Household level coverage of municipal solid waste collection
		14.2 Efficiency of collection of municipal solid waste
		14.3 Extent of municipal solid waste recovered through

Development		**Indicators**
		reuse
	15. Reduced Pollution	15.1 Concentration of SO2- air pollution
		15.2 Concentration of NO2- air pollution
		15.3 Concentration of PM10 - air pollution
		15.4 Level of noise pollution
		15.5 Quality of water in public surface water bodies

3.2 Scoring and Computing Category Indices of Liveability

The performance achieved by cities against 79 indicators, will be assessed against given benchmarks. Where no international/national norms are available, city with the best performance in its group (population range) will be treated as a benchmark. The groups are given in the table below.

Table 2 Details on Population Range

Category	**Population range**
Category 1	Population ≥ 4 million
Category 2	1 million ≤ Population < 4 million
Category 3	0.5 million ≤ Population < 1 million
Category 4	Population < 0.5 million

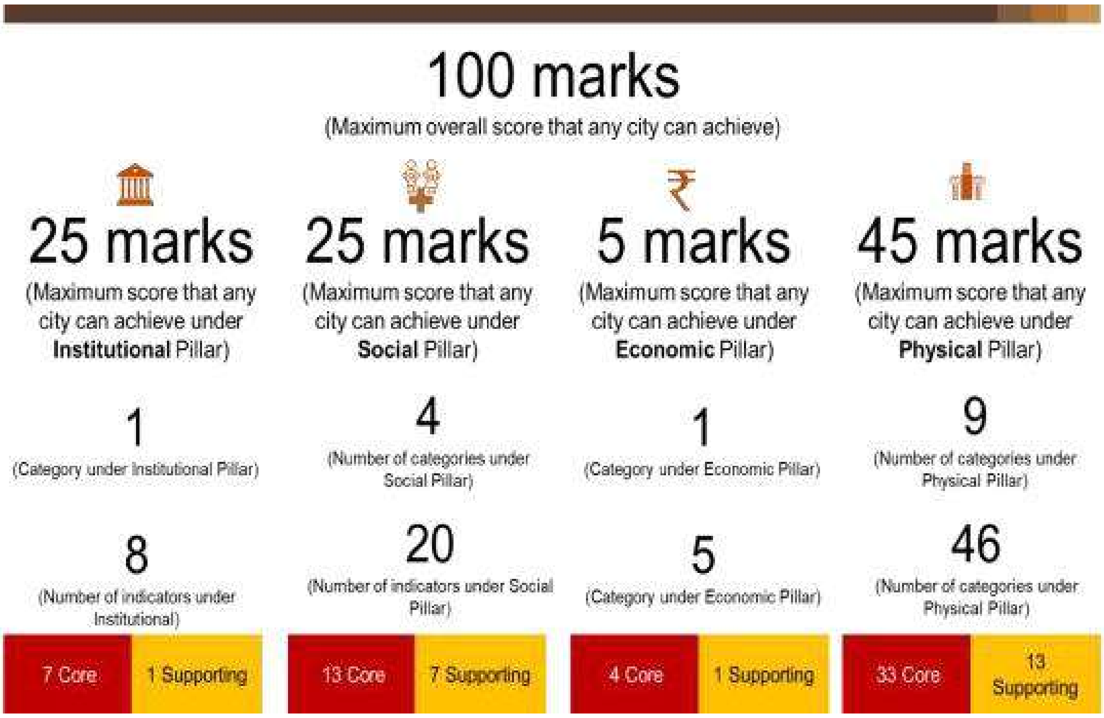
dology

A city can earn a maximum score of 100 points for 79 indicators across four pillars. The pillar weights are as follows: Institutional (25 points), Social (25 points), Economy and Employment (5 points) and Physical (45 points). Based on the number and nature of indicators i.e., core vs. secondary, indicator wise maximum marks were computed.



100 marks

(Maximum overall score that any city can achieve)

25 marks	25 marks	5 marks	45 marks
(Maximum score that any city can achieve under **Institutional** Pillar)	(Maximum score that any city can achieve under **Social** Pillar)	(Maximum score that any city can achieve under **Economic** Pillar)	(Maximum score that any city can achieve under **Physical** Pillar)
1 (Category under Institutional Pillar)	4 (Number of categories under Social Pillar)	1 (Category under Economic Pillar)	9 (Number of categories under Physical Pillar)
8 (Number of indicators under Institutional)	20 (Number of indicators under Social Pillar)	5 (Category under Economic Pillar)	46 (Number of categories under Physical Pillar)
7 Core 1 Supporting	13 Core 7 Supporting	4 Core 1 Supporting	33 Core 13 Supporting

Dimensional Index Methodology (DIM) has been used to compute scores for each indicator with reference to “maximum within the comparison group” or “absolute benchmarks”. For indicators where benchmarks are available, cities getting the benchmark score (or above) are given the maximum mark, and the marks awarded to other cities are calculated proportionately. For indicators where benchmarks are not available, the best performing cities in each population group are given the maximum mark, and the marks awarded to other cities (within the population group) are calculated proportionately. For indicators where benchmarks do not exist, the city data has been tested for outliers before scoring.

3.4 Scoring Normalisation:

To construct aggregate scores across cities as well as to make the scores across indicators comparable, indicator values were normalised using a min-max approach. The following formula was used to normalise the indicator values-

$$\frac{indicator\ value\ for\ the\ city - indicator\ value\ for\ the\ worst\ performing\ city}{benchmark - \ indicator\ value\ for\ the\ worst\ performing\ city}$$

This approach would restrict the normalised indicator value between 0 and 1. Cities that met or exceeded the benchmark received a normalised indicator value of 1. Worst performing cities are given a normalised indicator value of 0. After normalisation, the normalised value is weighted according to the category and the indicator being core or supporting.

To illustrate, consider the indicator 12.3 Quality of Water Supplied in the Category 12 for Assured Water Supply. If in City A 50% of the water samples collected qualify the potable water standards specified by the CPHEEO, and only 10% of the samples from worst performing city qualify the standards. Then, the normalised value for the indicator for city A would be 0.44 [(0.5-0.1)/(1-0.1)].

The weight for indicator 12.3 is 1.03, so the final weighted score for City A would come out to 0.45 [1.03*0.44].

4. Data Collection and Verification

4.1 Submission of Data by the cities

The Liveability Assessment is based on secondary data submitted by the urban local bodies and other concerned government agencies (collectively called as data owners). The 79 indicators were broken down into a set of easy to understand and relatable 553 questions mapped to data owners. Submission of the data was enabled through an online data entry portal on the smartnet platform of the Ministry. The portal also allowed the ULBs to download the liveability assessment questionnaire and upload filled in questionnaire. To familiarise and assist cities in identifying, mapping and collation of data points, a city level nodal person was available during the entire period of data submission process.

4.2 Mapping of Data Owners for the City
